This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32 chip.
Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then building, and flashing firmware onto an ESP32 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.
1.2 What You Need

Hardware:

- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full Application for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
- **Text editor** to write programs (Projects) in C, e.g., Eclipse

![Fig. 1: Development of applications for ESP32](image)

1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-DevKitC V4 Getting Started Guide

[]
This guide shows how to start using the ESP32-DevKitC V4 development board. For description of other versions of ESP32-DevKitC check *ESP32 Hardware Reference.*

### What You Need

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development.*

### Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - *ESP32-WROOM-32*
  - *ESP32-WROOM-32D*
  - *ESP32-WROOM-32U*
  - *ESP32-SOLO-1*
  - *ESP32-WROVER*
  - *ESP32-WROVER-B*
  - *ESP32-WROVER-I*
  - *ESP32-WROVER-B (IPEX)*
- male or female pin headers.

For details please refer to *Espressif Product Ordering Information.*

### Functional Description

The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.
### Key Component

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROOM-32</td>
<td>A module with ESP32 at its core.</td>
</tr>
<tr>
<td>EN</td>
<td>Reset button.</td>
</tr>
<tr>
<td>Boot</td>
<td>Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates of up to 3 Mbps.</td>
</tr>
<tr>
<td>Micro USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32 module.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>Turns on when the USB or an external 5V power supply is connected to the board. For details see the schematics in Related Documents.</td>
</tr>
<tr>
<td>I/O</td>
<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>

**Note:** The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

**Note:** The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for
Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows C15 highlighted in yellow.

![Fig. 3: Location of C15 (yellow) on ESP32-DevKitC V4 board](image)

Start Application Development

Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *ESP32 Hardware Reference*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check *ESP32 Hardware Reference*.

What You Need

• *ESP-WROVER-KIT V4.1 board*
• USB 2.0 cableA to Micro-B
• Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

• ESP32-WROOM-B module
• LCD screen
• MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

**Functionality Overview**

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

![ESP-WROVER-KIT block diagram](image)

Fig. 6: ESP-WROVER-KIT block diagram

**Functional Description**

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Fig. 7: ESP-WROVER-KIT board layout - front

Fig. 8: ESP-WROVER-KIT board layout - back
<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT2232</td>
<td>The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V4.1 schematic.</td>
</tr>
<tr>

</tbody>
</table>

1.3. Development Board Overviews
Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>
<thead>
<tr>

- **Camera** - Camera / JP4
- **LED** - RGB LED
- **MicroSD** - MicroSD Card / J4
- **LCD** - LCD / U5
- **PSRAM** - ESP32-WROVER-B’s PSRAM
32.768 kHz Oscillator

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

SPI Flash / JP2

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLK / GPIO6</td>
</tr>
<tr>
<td>2</td>
<td>SD0 / GPIO7</td>
</tr>
<tr>

<td>SD2 / GPIO9</td>
</tr>
<tr>
<td>5</td>
<td>SD3 / GPIO10</td>
</tr>
<tr>
<td>6</td>
<td>CMD / GPIO11</td>
</tr>
</tbody>
</table>

Important: The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

### Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

### Initial Setup

Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

### Now to Development

Please proceed to *ESP32 Hardware Reference*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V3 Getting Started Guide

[]

This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable A to Micro-B
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

It’s another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.
Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture
Fig. 10: ESP-WROVER-KIT board layout - front
Fig. 11: ESP-WROVER-KIT board layout - back

Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>

**32.768 kHz Oscillator**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

**SPI Flash / JP13**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLK / GPIO6</td>
</tr>
<tr>
<td>2</td>
<td>SD0 / GPIO7</td>

<td>SD2 / GPIO9</td>
</tr>
<tr>
<td>5</td>
<td>SD3 / GPIO10</td>
</tr>
<tr>
<td>6</td>
<td>CMD / GPIO11</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the Power Switch to ON, the 5V Power On LED should light up.

Now to Development

Please proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable A to Micro-B
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.
Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

![ESP-WROVER-KIT block diagram](image)

Fig. 12: ESP-WROVER-KIT block diagram

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Fig. 13: ESP-WROVER-KIT board layout - front
Fig. 14: ESP-WROVER-KIT board layout - back
### Key Component | Description
---|---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
ESP32 Module | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
CTS/RTS | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
UART | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
JTAG | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.
FT2232 | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.
EN | Reset button.
Boot | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
USB | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Select | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.
Power Key | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
LDO | NCP1117(1A). 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.
Camera | Camera interface, a standard OV7670 camera module.
RGB | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).
I/O | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.
MicroSD Card | MicroSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the MicroSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.
LCD | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.
Setup Options

There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

What You Need

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.

2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.
Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
### 1.3. Development Board Overviews

Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using *one and only one of the options above*, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions

The two tables below provide the Name and Function of I/O header pins on both sides of the board, see *ESP32-PICO-KIT board layout*. The pin numbering and header names are the same as in the schematic given in Related Documents.

1.3. Development Board Overviews
The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.
After that, proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions

The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-PICO-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

**1.3.4 ESP32-Ethernet-Kit V1.1 Getting Started Guide**

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.
The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)

The table below provides description starting from the picture’s top right corner and going clockwise.

</tr>
</tbody>
</table>
PoE Board (B)

This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

<td>GPIO14</td>
</tr>
</tbody>
</table>
**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

---

**RMII Clock Selection**

The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.

---

**RMII Clock Sourced Externally by PHY**

By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMII Clock Sourced Internally from ESP32’s APLL**

Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

---

**GPIO Allocation**

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**

The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).
Fig. 24: RMII Clock from IP101GRI PHY

</tr>
</tbody>
</table>
Note:

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

2. Functionality depends on the settings of the Function Switch.

---

Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also RMII Clock Sourced Externally by PHY. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the
Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the *5V Power On LED* should light up.

Now to Development

Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example

After setting up the development environment and testing the board, you can configure and flash the *ethernet/ethernet* example. This example has been created for testing Ethernet functionality. It supports different PHY, including *IP101GRI* installed on *ESP32-Ethernet-Kit V1.1*.

Summary of Changes from ESP32-Ethernet-Kit V1.0

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

ESP32-Ethernet-Kit V1.0 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.
Fig. 26: ESP32-Ethernet-Kit V1.0
Functional Description

The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)

The table below provides description starting from the picture’s top right corner and going clockwise.
### Component Description

<table>
<thead>
<tr>
<th>Key Component</th>

---

**Fig. 28: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)**
PoE Board (B)

This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

IP101GRI (PHY) Interface

The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>GPIO21</td>
<td>TX_EN</td>
</tr>
<tr>
<td>2</td>
<td>GPIO19</td>
<td>TXD[0]</td>
</tr>
<tr>
<td>3</td>
<td>GPIO22</td>
<td>TXD[1]</td>
</tr>
<tr>
<td>4</td>
<td>GPIO25</td>
<td>RXD[0]</td>
</tr>
<tr>
<td>5</td>
<td>GPIO26</td>
<td>RXD[1]</td>
</tr>
<tr>
<td>6</td>
<td>GPIO27</td>
<td>CRS_DV</td>
</tr>
<tr>
<td>7</td>
<td>GPIO0</td>
<td>REF_CLK</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>GPIO23</td>
<td>MDC</td>
</tr>
<tr>
<td>9</td>
<td>GPIO18</td>
<td>MDIO</td>
</tr>
<tr>
<td>PHY Reset</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

**Note:** Except for REF_CLK, the allocation of all pins under the RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

GPIO Header 1

This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.
### GPIO Header 2

This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see *IP101GRI (PHY) Interface*. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>

</tr>
<tr>
<td>GPIO4</td>
<td>EMAC_TX_ER</td>
<td></td>
</tr>
<tr>
<td>GPIO2</td>
<td>n/a</td>
<td>See note 2</td>
</tr>
<tr>
<td>GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>See note 2</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

2. Functionality depends on the settings of the *Function Switch*.

### GPIO Header 3

The functionality of GPIOs connected to this header depends on the settings of the *Function Switch*.

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

### Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.

2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.

3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.

4. Connect the *Ethernet board (A)* to the PC with a USB cable.

5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

Now to Development

Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example

After setting up the development environment and testing the board, you can configure and flash the *ethernet/ethernet* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.0 board*.

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- Step 1. Install prerequisites for *Windows, Linux* or *macOS*
- Step 2. Get ESP-IDF
- Step 3. Set up the tools
- Step 4. Set up the environment variables
1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

[ ]

Note: Currently only 64-bit versions of Windows are supported. 32-bit Windows can use the Legacy GNU Make Build System.

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note: Previous versions of ESP-IDF used the Legacy GNU Make Build System and MSYS2 Unix compatibility environment. This is no longer required, ESP-IDF can be used from the Windows Command Prompt.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download the ESP-IDF Tools installer from this URL: https://dl.espressif.com/dl/esp-idf-tools-setup-2.2.exe

The installer includes the cross-compilers, OpenOCD, cmake and Ninja build tool. The installer can also download and run installers for Python 3.7 and Git For Windows if they are not already installed on the computer.

The installer also offers to download one of the ESP-IDF release versions.
Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.

2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Related Documents

For advanced users who want to customize the install process:

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Note: The GNU Make based build system requires the MSYS2 Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

Get ESP-IDF

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

1.5. Step 1. Install prerequisites
mkdir %userprofile%\esp

cd %userprofile%\esp

git clone --recursive https://github.com/espressif/esp-idf.git

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

**Note:** This command will clone the master branch, which has the latest development (“bleeding edge”) version of ESP-IDF. It is fully functional and updated on weekly basis with the most recent features and bugfixes.

**Note:** GitHub’s “Download zip file” feature does not work with ESP-IDF, a `git clone` is required. As a fallback, Stable version can be installed without Git.

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

cd esp-idf

git submodule update --init

**Tools**

cmake

Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

**Ninja build**

**Note:** Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

Download the ninja latest stable Windows release from the (download page).

The Ninja for Windows download is a .zip file containing a single ninja.exe file which needs to be unzipped to a directory which is then added to your Path (or you can choose a directory which is already on your Path).

**Python 2.x**

Download the latest Python 2.7 for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path”. Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:
Toolchain Setup

Download the precompiled Windows toolchain:

Unzip the zip file to C:\Program Files (or some other location). The zip file contains a single directory xtensa-esp32-elf.

Next, the bin subdirectory of this directory must be added to your Path. For example, the directory to add may be C:\Program Files\xtensa-esp32-elf\bin.

Note: If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory C:\msys32\opt\xtensa-esp32-elf\bin to the Path instead, as the toolchain is included in the MSYS2 environment.

Adding Directory to Path

To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ;<new value>.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script

From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

install.bat

For Powershell, change to the directory where ESP-IDF is installed. Then run:

install.ps1

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

1.5. Step 1. Install prerequisites
Add ESP-IDF tools to PATH using an export script

ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
    cd %userprofile%\esp\esp-idf
    export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
    cd ~/esp/esp-idf
    export.ps1
```

When this is done, the tools will be available in this command prompt.

### 1.5.2 Standard Setup of Toolchain for Linux

[]

#### Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- **CentOS 7**:

  ```
  sudo yum install git wget flex bison gperf python pyserial python-pyelftools
  → cmake ninja-build ccache
  ```

- **Ubuntu and Debian**:

  ```
  sudo apt-get install git wget flex bison gperf python python-pip python-
  → setuptools python-serial python-click python-cryptography python-future python-
  → pyParsing python-pyelftools cmake ninja-build ccache libffi-dev libssl-dev
  ```

- **Arch**:

  ```
  sudo pacman -S --needed gcc git make flex bison gperf python2-pip python2-
  → pySerial python2-click python2-cryptography python2-future python2-pyparsing,
  → python2-pyelftools cmake ninja ccache
  ```

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”. 
Additional Tips

Permission issues /dev/ttyUSB0

With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

Related Documents

Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section Standard Setup of Toolchain for Linux.

Note: The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

  ```bash
  sudo yum install git wget ncurses-devel flex bison gperf python pyserial python-
  →pyelftools cmake ninja-build ccache
  ```

- Ubuntu and Debian:

  ```bash
  sudo apt-get install git wget libncurses-dev flex bison gperf python python-pip-
  →python-setuptools python-serial python-click python-cryptography python-future-
  →python-pyparsing python-pyelftools cmake ninja-build ccache libffi-dev libssl-
  →dev
  ```

- Arch:

  ```bash
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python2-pyserial-
  →python2-click python2-cryptography python2-future python2-pyparsing python2-
  →pyelftools cmake ninja ccache
  ```

Note: CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.  

1.5. Step 1. Install prerequisites
Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    
    ```bash
    sudo yum install gawk gperf grep gettext ncurses-devel python python-devel →automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu pre-16.04:
    
    ```bash
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev →automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu 16.04 or newer:
    
    ```bash
    sudo apt-get install gawk gperf grep gettext python python-dev automake bison →flex texinfo help2man libtool libtool-bin make
    ```
  - Debian 9:
    
    ```bash
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev →automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Arch:
    
    ```bash
    TODO
    ```

Create the working directory and go into it:

```bash
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2019r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

**Note:** To create a toolchain with support for 64-bit time_t, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

Build the toolchain:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32-elf`. Follow instructions for standard setup to add the toolchain to your PATH.
Next Steps

To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF.*

### 1.5.3 Standard Setup of Toolchain for Mac OS

#### Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- **install pip:**
  
  ```bash
  sudo easy_install pip
  ```

- **install pyserial:**
  
  ```bash
  pip install --user pyserial
  ```

- **install CMake & Ninja build:**
  
  - If you have *HomeBrew,* you can run:
    
    ```bash
    brew install cmake ninja
    ```
  
  - If you have *MacPorts,* you can run:
    
    ```bash
    sudo port install cmake ninja
    ```
  
  - Otherwise, consult the [CMake](https://cmake.org/) and [Ninja](https://ninja-build.org/) home pages for macOS installation downloads.

  - It is strongly recommended to also install `ccache` for faster builds. If you have *HomeBrew,* this can be done via `brew install ccache` or `sudo port install ccache` on *MacPorts.*

**Note:** If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

Next Steps

To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF.*

**Setup Toolchain for Mac OS from Scratch**

[]

1.5. Step 1. Install prerequisites
Package Manager

To set up the toolchain from scratch, rather than downloading a pre-compiled toolchain, you will need to install either the MacPorts or homebrew package manager.

MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.

See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:
  
  ```
  sudo easy_install pip
  ```

- install pyserial:
  
  ```
  pip install --user pyserial
  ```

- install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    
    ```
    brew install cmake ninja
    ```
  
  - If you have MacPorts, you can run:
    
    ```
    sudo port install cmake ninja
    ```

Compile the Toolchain from Source

- Install dependencies:
  - with MacPorts:
    
    ```
    sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf
    ```

  - with homebrew:
    
    ```
    brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
    ```

Create a case-sensitive filesystem image:

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive HFS+"
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume

Go into the newly created directory:

cd ~/esp/ctng-volume

Download crosstool-NG and build it:

git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2019r2
git submodule update --init
./bootstrap && ./configure --enable-local && make

Build the toolchain:

./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin to PATH environment variable.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>Mac OS</th>
</tr>
</thead>
</table>

1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

**Note:** This guide uses the directory ~/esp on Linux and macOS or %userprofile%\esp on Windows as
an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into ~/esp/esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

1.6.2 Windows

In addition to installing the tools, ESP-IDF Tools Installer for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these instructions.

1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

1.7.1 Windows

ESP-IDF Tools Installer for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1
```

1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh
```
1.7.3 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: 
$HOME/.espressif on Linux and macOS, %USERPROFILE%\.espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.psl or install.sh) and an Export script (export.bat, export.psl or export.sh) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

ESP-IDF Tools Installer for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```bat
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```ps
. $HOME/esp/esp-idf/export.psl
```

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```bash
. $HOME/esp/esp-idf/export.sh
```

Note the space between the leading dot and the path!

You can also automate this step, making ESP-IDF tools available in every terminal, by adding this line to your .profile or .bash_profile script.

1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy get-started/hello_world to ~/esp directory:
1.9.1 Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

### 1.10 Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

### 1.11 Step 7. Configure

Navigate to your hello_world directory from *Step 5. Start a Project* and run the project configuration utility menuconfig.

#### 1.11.1 Linux and macOS

```bash
 cd ~/esp/hello_world
 idf.py menuconfig
```

If your default version of Python is 3.x, you may need to run `python2 $(which idf.py) menuconfig` instead.
1.11.2 Windows

```bash
cd %userprofile%/esp/hello_world
idf.py menuconfig
```

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

To navigate and use `menuconfig`, press the following keys:

- Arrow keys for navigation
- `Enter` to go into a submenu
- `Esc` to go up one level or exit
- `?` to see a help screen. Enter key exits the help screen
- `Space`, `Y`, and `N` keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- `/` while highlighting a configuration item to display help about that item
- `/` to find configuration items

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing examples.

### 1.12 Step 8. Build the Project

Build the project by running:

```bash
idf.py build
```
This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello-world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
././././components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.bin
--build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/partition-
--table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin file.

### 1.13 Step 9. Flash onto the Device

Flash the binaries that you just built onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name from Step 6. Connect Your Device.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

```
Running esptool.py in directory [...]/esp/hello_world
Executing "python [...]/esp-idf/components/esptool_py/esptool/esptool.py -b 460800_
--write_flash @flash_project_args"
esptool.py -b 460800 write_flash --flash_mode dio --flash_size detect --flash_freq_
--40m 0x10000 bootloader/bootloader.bin 0x80000 build/partition_table/partition-table.bin
--0x10000 hello-world.bin
esptool.py v2.3.1
Connecting....
Detecting chip type... ESP32
Chip is ESP32D0WDQ6 (revision 1)
Features: WiFi, BT, Dual Core
Uploading stub...
Running stub... (continues on next page)```
If there are no issues by the end of the flash process, the module will be reset and the “hello_world” application will be running.

### 1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...].esp/hello_world/build
Executing "python [...].esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_world/...build/hello-world.elf"
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
... Hello world! Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].
If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

```
e666(Xn@yy.!!00(6PW+)6Hn9a~/96!t566P6-6k66e6ea56jA
~zY6V1l,100 e666)(Xn@yy.!!00(z6Y(0 jp61|0+z5Ymp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config – ESP32-specific – Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26MHz.
4. After that, build and flash the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:
- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

### 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

### 1.16 Related Documents

#### 1.16.1 Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.
Connect ESP32 to PC

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 boards produced by Espressif:

<table>
<thead>
<tr>

<td>Use with ESP-Prog</td>
</tr>
<tr>
<td>ESP32-Sense Kit</td>
<td>n/a</td>
<td>Use with ESP-Prog</td>
</tr>
</tbody>
</table>

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Check port on Linux and MacOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*  
```

MacOS

```
ls /dev/cu.*
```

Note: MacOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For MacOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.
Fig. 31: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 32: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Adding user to `dialout` on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

On Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 33: Setting Serial Communication in PuTTY on Windows
Fig. 34: Setting Serial Communication in PuTTY on Linux
Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
test 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

**Note:** Close serial terminal after verification that communication is working. In the next step we are going to use a different application to upload a new firmware to ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from *Step 6. Connect Your Device* when installing s/w for ESP32 development, then you can continue with *Step 7. Configure.*

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system. There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md](https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md) for further instructions.

If you require Eclipse IDE support for legacy ESP_IDF Make build system, you can follow the *legacy GNU Make build system Getting Started guide* which has steps for *Building and Flashing with Eclipse IDE.*

### 1.16.3 IDF Monitor

[]
The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

(For the legacy GNU Make system, run `make monitor`.)

**Keyboard Shortcuts**

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to start up.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses <code>idf_monitor</code> to run the project <code>flash</code> target, then resumes <code>idf_monitor</code>. Any changed source files are recompiled and then re-flashed.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses <code>idf_monitor</code> to run the <code>app-flash</code> target, then resumes <code>idf_monitor</code>. Similar to the <code>flash</code> target, but only the main app is built and re-flashed.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
</tbody>
</table>
Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

### Automatic Address Decoding

Whenever ESP-IDF outputs a hexadecimal code address of the form `0x4________`, IDF Monitor uses `addr2line` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.
Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : 0x3ffb7e00
A2 : 0x3ffb136c A3 : 0x00000005 A4 : 0x00000000 A5 : 0x00000000

To decode each address, IDF Monitor runs the following command in the background:
Launching GDB with GDBStub

By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP32_PANIC to Invoke GDBStub.

In this case, if the panic handler is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xtena-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex
interrupt build/PROJECT.elf
```

Output Filtering

IDF monitor can be invoked as idf.py monitor --print-filter="xyz", where --print-filter is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...). Not specifying a `<log_level>` or using * defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, and semicolons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means matching everything.
"*:N" suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.

- Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example

The following log snippet was acquired without any filtering options:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID 1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```plaintext
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `":PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N
vfs:N wifi:N *:V"` show the following output:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

- If in the Windows environment you receive the error “winpty: command not found”, fix it by running `pacman -S winpty`.
- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

### 1.16.4 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

### 1.16.5 Get Started (Legacy GNU Make)

This document is intended to help you set up the software development environment for the hardware based on Espressif ESP32.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then how to build and flash firmware onto an ESP32 board.

This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

### Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals
Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

**What You Need**

**Hardware:**
- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

**Software:**
- **Toolchain** to build the **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
- **Text editor** to write programs (**Projects**) in C, e.g., Eclipse

**Development Board Overviews**

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.
Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment

- Step 1. Set up the Toolchain for Windows, Linux or macOS
- Step 2. Get ESP-IDF
- Step 3. Set Environment Variables
- Step 4. Install the Required Python Packages

Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build and Flash
- Step 9. Monitor

Step 1. Set up the Toolchain

The toolchain is a set of programs for compiling code and building applications.

The quickest way to start development with ESP32 is by installing a prebuilt toolchain. Pick up your OS below and follow the provided instructions.

Standard Setup of Toolchain for Windows (Legacy GNU Make)

[]

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Introduction

Windows doesn’t have a built-in “make” environment, so as well as installing the toolchain you will need a GNU-compatible environment. We use the MSYS2 environment to provide this. You don’t need to use this environment all the time (you can use Eclipse or some other front-end), but it runs behind the scenes.
Toolchain Setup

The quick setup is to download the Windows all-in-one toolchain & MSYS2 zip file from dl.espressif.com:
https://dl.espressif.com/dl/esp32_win32_msys2_environment_and_gcc8_toolchain-20191231.zip

Unzip the zip file to C:\ (or some other location, but this guide assumes C:\) and it will create an msys32 directory with a pre-prepared environment.

**Important:** If another toolchain location is used (different than the default C:\msys32), please ensure that the path where the all-in-one toolchain gets unzipped is a plain ASCII, contains no spaces, symlinks or accents.

Check it Out

Open a MSYS2 MINGW32 terminal window by running C:\msys32\mingw32.exe. The environment in this window is a bash shell. Create a directory named esp that is a default location to develop ESP32 applications. To do so, run the following shell command:

```bash
mkdir -p ~/esp
```

By typing `cd ~/esp` you can then move to the newly created directory. If there are no error messages you are done with this step.

```
Krzsytstof@tdk-kmb-op780 MINGW32 ~
$ mkdir -p ~/esp
Krzsytstof@tdk-kmb-op780 MINGW32 ~
$ cd ~/esp
Krzsytstof@tdk-kmb-op780 MINGW32 ~/esp
```

Fig. 36: MSYS2 MINGW32 shell window

Use this window in the following steps setting up development environment for ESP32.

Next Steps

To carry on with development environment setup, proceed to section **Step 2. Get ESP-IDF.**

Updating The Environment

When IDF is updated, sometimes new toolchains are required or new requirements are added to the Windows MSYS2 environment. To move any data from an old version of the precompiled environment to a new one:

- Take the old MSYS2 environment (ie C:\msys32) and move/rename it to a different directory (ie C:\msys32_old).
- Download the new precompiled environment using the steps above.
• Unzip the new MSYS2 environment to C:\msys32 (or another location).
• Find the old C:\msys32_old\home directory and move this into C:\msys32.
• You can now delete the C:\msys32_old directory if you no longer need it.

You can have independent different MSYS2 environments on your system, as long as they are in different directories. There are also steps to update the existing environment without downloading a new one, although this is more complex.

Related Documents

Setup Windows Toolchain from Scratch (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Setting up the environment gives you some more control over the process, and also provides the information for advanced users to customize the install. The pre-built environment, addressed to less experienced users, has been prepared by following these steps.

To quickly setup the toolchain in standard way, using a prebuilt environment, proceed to section Standard Setup of Toolchain for Windows (Legacy GNU Make).

Configure Toolchain & Environment from Scratch

This process involves installing MSYS2, then installing the MSYS2 and Python packages which ESP-IDF uses, and finally downloading and installing the Xtensa toolchain.

• Navigate to the MSYS2 installer page and download the msys2-i686-xxxxxxx.exe installer executable (we only support a 32-bit MSYS environment, it works on both 32-bit and 64-bit Windows.) At time of writing, the latest installer is msys2-i686-20161025.exe.
• Run through the installer steps. Uncheck the “Run MSYS2 32-bit now” checkbox at the end.
• Once the installer exits, open Start Menu and find “MSYS2 MinGW 32-bit” to run the terminal.
  (Why launch this different terminal? MSYS2 has the concept of different kinds of environments. The default “MSYS” environment is Cygwin-like and uses a translation layer for all Windows API calls. We need the “MinGW” environment in order to have a native Python which supports COM ports.)
• The ESP-IDF repository on github contains a script in the tools directory titled windows_install_prerequisites.sh. If you haven’t got a local copy of the ESP-IDF yet, that’s OK - you can just download that one file in Raw format from here: tools/windows/windows_install_prerequisites.sh. Save it somewhere on your computer.
• Type the path to the shell script into the MSYS2 terminal window. You can type it as a normal Windows path, but use forward-slashes instead of back-slashes. ie: C:/Users/myuser/Downloads/windows_install_prerequisites.sh. You can read the script beforehand to check what it does.
• The windows_install_prerequisites.sh script will download and install packages for ESP-IDF support, and the ESP32 toolchain.
Troubleshooting

• While the install script runs, MSYS may update itself into a state where it can no longer operate. You may see errors like the following:

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408. This problem is probably due to using incompatible versions of the cygwin DLL.
```

If you see errors like this, close the terminal window entirely (terminating the processes running there) and then re-open a new terminal. Re-run `windows_install_prerequisites.sh` (tip: use the up arrow key to see the last run command). The update process will resume after this step.

• MSYS2 is a “rolling” distribution so running the installer script may install newer packages than what is used in the prebuilt environments. If you see any errors that appear to be related to installing MSYS2 packages, please check the MSYS2-packages issues list for known issues. If you don’t see any relevant issues, please raise an IDF issue.

MSYS2 Mirrors in China

There are some (unofficial) MSYS2 mirrors inside China, which substantially improves download speeds inside China. To add these mirrors, edit the following two MSYS2 mirrorlist files before running the setup script. The mirrorlist files can be found in the `/etc/pacman.d` directory (i.e. `c:\msys2\etc\pacman.d`).

Add these lines at the top of `mirrorlist.mingw32`:

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

Add these lines at the top of `mirrorlist.msys`:

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

HTTP Proxy

You can enable an HTTP proxy for MSYS and PIP downloads by setting the `http_proxy` variable in the terminal before running the setup script:

```
export http_proxy='http://http.proxy.server:PORT'
```

Or with credentials:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

Add this line to `/etc/profile` in the MSYS directory in order to permanently enable the proxy when using MSYS.

Alternative Setup: Just download a toolchain

If you already have an MSYS2 install or want to do things differently, you can download just the toolchain here:

Note: If you followed instructions *Configure Toolchain & Environment from Scratch*, you already have the toolchain and you won’t need this download.

Important: Just having this toolchain is *not enough* to use ESP-IDF on Windows. You will need GNU make, bash, and sed at minimum. The above environments provide all this, plus a host compiler (required for menuconfig support).

Next Steps

To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

Updating The Environment

When IDF is updated, sometimes new toolchains are required or new system requirements are added to the Windows MSYS2 environment.

Rather than setting up a new environment, you can update an existing Windows environment & toolchain:

- Update IDF to the new version you want to use.
- Run the `tools/windows/windows_install_prerequisites.sh` script inside IDF. This will install any new software packages that weren’t previously installed, and download and replace the toolchain with the latest version.

The script to update MSYS2 may also fail with the same errors mentioned under *Troubleshooting*.

If you need to support multiple IDF versions concurrently, you can have different independent MSYS2 environments in different directories. Alternatively you can download multiple toolchains and unzip these to different directories, then use the PATH environment variable to set which one is the default.

Standard Setup of Toolchain for Linux (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- CentOS 7:
  ```bash
  sudo yum install gcc git wget make flex bison gperf python python2-cryptography
  ```

- Ubuntu and Debian:
  ```bash
  sudo apt-get install gcc git wget make flex bison gperf python python-pip python-
  →setuptools python-serial python-cryptography python-future python-pyparsing
  →python-pyelftools libffi-dev libssl-dev
  ```

(continues on next page)
• Arch:

```bash
sudo pacman -S --needed gcc git make flex bison gperf python2-pyserial python2-
cryptography python2-future python2-pyparsing python2-pyelftools
```

**Note:** Some older Linux distributions may be missing some of the Python packages listed above (or may use pyserial version 2.x which is not supported by ESP-IDF). It is possible to install these packages via pip instead - as described in section *Step 4. Install the Required Python Packages*.

**Toolchain Setup**

ESP32 toolchain for Linux is available for download from Espressif website:

- for 64-bit Linux:
  ```
  https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_2_0-esp-2019r2-linux-amd64.tar.gz
  ```
- for 32-bit Linux:
  ```
  ```

1. Download this file, then extract it in `~/esp` directory:

   - for 64-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar -xzsf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2019r2-linux-amd64.tar.gz
     ```
   
   - for 32-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2019r2-linux-i686.tar.gz
     ```

2. The toolchain will be extracted into `~/esp/xtensa-esp32-elf/` directory.

To use it, you will need to update your `PATH` environment variable in `~/.profile` file. To make `xtensa-esp32-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

```
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your `~/.profile` file:

```
alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
```

Then when you need the toolchain you can type `get_esp32` on the command line and the toolchain will be added to your `PATH`.

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, alias should set in `.bashrc`. 

---
3. Log off and log in back to make the `.profile` changes effective. Run the following command to verify if `PATH` is correctly set:

```bash
printenv PATH
```

You are looking for similar result containing toolchain’s path at the beginning of displayed string:

```bash
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

**Permission issues /dev/ttyUSB0**

With some Linux distributions you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

**Next Steps**

To carry on with development environment setup, proceed to section **Step 2. Get ESP-IDF**.

**Related Documents**

**Setup Linux Toolchain from Scratch (Legacy GNU Make)**

[]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Note:** Standard process for installing the toolchain is described [here](#). See [Customized Setup of Toolchain](#) section for some of the reasons why installing the toolchain from scratch may be necessary.

**Install Prerequisites**

To compile with ESP-IDF you need to get the following packages:

- **Ubuntu and Debian:**
  ```bash
  sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python
  python-pip python-setuptools python-serial python-cryptography python-future
  python-pyparsing python-pyelftools libffi-dev libssl-dev
  ```

- **Arch:**
  ```bash
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python2-pyserial
  python2-cryptography python2-future python2-pyparsing python2-pyelftools
  ```
Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    ```
    sudo yum install gawk gperf grep gettext ncurses-devel python python-devel
    →automake bison flex texinfo help2man libtool
    ```
  - Ubuntu pre-16.04:
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
    →automake bison flex texinfo help2man libtool
    ```
  - Ubuntu 16.04 or newer:
    ```
    sudo apt-get install gawk gperf grep gettext python python-dev automake bison
    →flex texinfo help2man libtool libtool-bin
    ```
  - Debian 9:
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
    →automake bison flex texinfo help2man libtool libtool-bin
    ```
  - Arch:
    ```
    TODO
    ```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2019r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.
Next Steps

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Standard Setup of Toolchain for Mac OS (Legacy GNU Make)

[]

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites

- install pip:

  ```
sudo easy_install pip
  ```

Note: pip will be used later for installing the required Python packages.

Toolchain Setup

ESP32 toolchain for macOS is available for download from Espressif website:

Download this file, then extract it in ~/esp directory:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2019r2-macos.tar.gz
```

The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory.

To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Then when you need the toolchain you can type get_esp32 on the command line and the toolchain will be added to your PATH.

Next Steps

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

1.16. Related Documents 107
Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:
  
  ```
  sudo easy_install pip
  ```

Note: pip will be used later for installing the required Python packages.

Compile the Toolchain from Source

- Install dependencies:
  
  - Install either MacPorts or homebrew package manager. MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.
  
  - with MacPorts:
    
    ```
    sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf automake
    ```

  - with homebrew:
    
    ```
    brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool automake
    ```

Create a case-sensitive filesystem image:

```
hdutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive HFS+
``` 

Mount it:

```
hdutil mount ~/esp/crosstool.dmg
``` 

Create a symlink to your work directory:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```
Go into the newly created directory:

```
(cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2019r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

**Next Steps**

To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>macOS</th>
</tr>
</thead>
</table>

**Note:** This guide uses the directory ~/esp on Linux and macOS or %userprofile%\esp on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

Depending on your experience and preferences, you may want to customize your environment instead of using a prebuilt toolchain. To set up the system your own way go to Section *Customized Setup of Toolchain (Legacy GNU Make)*.

**Step 2. Get ESP-IDF**

Besides the toolchain, you also need ESP32-specific API (software libraries and source code). They are provided by Espressif in ESP-IDF repository.
To get a local copy of ESP-IDF, navigate to your installation directory and clone the repository with `git clone`.

Open Terminal, and run the following commands:

```bash
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

**Note:** This command will clone the master branch, which has the latest development (“bleeding edge”) version of ESP-IDF. It is fully functional and updated on weekly basis with the most recent features and bugfixes.

**Note:** GitHub’s “Download zip file” feature does not work with ESP-IDF, a `git clone` is required. As a fallback, Stable version can be installed without Git.

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

### Step 3. Set Environment Variables

The toolchain uses the environment variable `IDF_PATH` to access the ESP-IDF directory. This variable should be set up on your computer, otherwise projects will not build.

These variables can be set temporarily (per session) or permanently. Please follow the instructions specific to Windows, Linux and macOS in Section *Add IDF_PATH to User Profile (Legacy GNU Make)*.

### Step 4. Install the Required Python Packages

The python packages required by ESP-IDF are located in `IDF_PATH/requirements.txt`. You can install them by running:

```bash
python -m pip install --user -r $IDF_PATH/requirements.txt
```

**Note:** Please check the version of the Python interpreter that you will be using with ESP-IDF. For this, run the command `python --version` and depending on the result, you might want to use `python2`, `python2.7` or similar instead of just `python`, e.g.:

```bash
python2.7 -m pip install --user -r $IDF_PATH/requirements.txt
```

### Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in IDF.
Copy `get-started/hello_world` to the `~/.esp` directory:

**Linux and macOS**

```bash
cd ~/.esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

**Important:** The esp-idf build system does not support spaces in the paths to either esp-idf or to projects.

---

### Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32 (Legacy GNU Make)* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

---

### Step 7. Configure

Navigate to your `hello_world` directory from *Step 5. Start a Project* and run the project configuration utility `menuconfig`.

**Linux and macOS**

```bash
cd ~/.esp/hello_world
make menuconfig
```
Windows

```bash
cd %userprofile%\esp\hello_world
make menuconfig
```

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

In the menu, navigate to **Serial flasher config > Default serial port** to configure the serial port, where project will be loaded to. Confirm selection by pressing enter, save configuration by selecting `< Save >` and then exit `menuconfig` by selecting `< Exit >`.

To navigate and use `menuconfig`, press the following keys:

- Arrow keys for navigation
- `Enter` to go into a submenu
- `Esc` to go up one level or exit
- `?` to see a help screen. Enter key exits the help screen
- `Space`, or `Y` and `N` keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- `?` while highlighting a configuration item to display help about that item
- `/` to find configuration items

**Note:** If you are Arch Linux user, navigate to **SDK tool configuration** and change the name of Python 2 interpreter from `python` to `python2`.

**Attention:** If you use ESP32-DevKitC board with the **ESP32-SOLO-1** module, enable single core mode (**CONFIG_FREERTOS_UNICORE**) in menuconfig before flashing examples.

**Step 8. Build and Flash**

Build and flash the project by running:
make flash

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries. After that, these binaries will be flashed onto your ESP32 board.

If there are no issues by the end of the flash process, you will see messages (below) describing progress of the loading process. Then the board will be reset and the “hello_world” application will start up.

```
esptool.py v2.0-beta2
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...
esptool.py v2.0-beta2

Hash of data verified.
Leaving...
Hard resetting...
```

If you’d like to use the Eclipse IDE instead of running `make`, check out the *Eclipse guide*.

**Step 9. Monitor**

To check if “hello_world” is indeed running, type `make monitor`.

This command launches the *IDF Monitor* application:

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.
... Hello world!
Restarting in 10 seconds...
1 (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or if instead of the messages above you see a random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CON-FIG_ESP32_XTAL_FREQ_SEL to 26MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

```
make flash monitor
```

See also IDF Monitor for handy shortcuts and more details on using IDF monitor.

That's all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Environment Variables**

Some environment variables can be specified whilst calling make allowing users to override arguments without the need to reconfigure them using make menuconfig.

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description &amp; Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESPPORT</td>
<td>Overrides the serial port used in flash and monitor.</td>
</tr>
<tr>
<td></td>
<td>Examples: make flash ESPPORT=/dev/ttyUSB1, make monitor ESPPORT=COM1</td>
</tr>
<tr>
<td>ESPBAUD</td>
<td>Overrides the serial baud rate when flashing the ESP32.</td>
</tr>
<tr>
<td></td>
<td>Example: make flash ESPBAUD=9600</td>
</tr>
<tr>
<td>MONITORBAUD</td>
<td>Overrides the serial baud rate used when monitoring.</td>
</tr>
<tr>
<td></td>
<td>Example: make monitor MONITORBAUD=9600</td>
</tr>
</tbody>
</table>
Note: You can export environment variables (e.g. `export ESPPORT=/dev/ttyUSB1`). All subsequent calls of `make` within the same terminal session will use the exported value given that the variable is not simultaneously overridden.

### Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

If downloading to a new path, remember to Add IDF_PATH to User Profile (Legacy GNU Make) so that the toolchain scripts can find ESP-IDF in its release specific location.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

### Related Documents

#### Add IDF_PATH to User Profile (Legacy GNU Make)

[]

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

To preserve setting of `IDF_PATH` environment variable between system restarts, add it to the user profile, following instructions below.

### Windows

The user profile scripts are contained in `C:/msys32/etc/profile.d/` directory. They are executed every time you open an MSYS2 window.

1. Create a new script file in `C:/msys32/etc/profile.d/` directory. Name it `export_idf_path.sh`.
2. Identify the path to ESP-IDF directory. It is specific to your system configuration and may look something like `C:\msys32\home\user-name\esp\esp-idf`
3. Add the `export` command to the script file, e.g.:

```bash
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

Remember to replace backslashes with forward slashes in the original Windows path.

4. Save the script file.
5. Close MSYS2 window and open it again. Check if `IDF_PATH` is set, by typing:

```bash
printenv IDF_PATH
```

The path previously entered in the script file should be printed out.

1.16. Related Documents 115
If you do not like to have `IDF_PATH` set up permanently in user profile, you should enter it manually on opening of an MSYS2 window:

```bash
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

If you got here from section *Step 3. Set Environment Variables*, while installing s/w for ESP32 development, then go back to section *Step 5. Start a Project*.

**Linux and MacOS**

Set up `IDF_PATH` by adding the following line to `~/.profile` file:

```bash
export IDF_PATH=~/.esp/esp-idf
```

Log off and log in back to make this change effective.

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead.

Run the following command to check if `IDF_PATH` is set:

```bash
printenv IDF_PATH
```

The path previously entered in `~/.profile` file (or set manually) should be printed out.

If you do not like to have `IDF_PATH` set up permanently, you should enter it manually in terminal window on each restart or logout:

```bash
export IDF_PATH=~/.esp/esp-idf
```

If you got here from section *Step 3. Set Environment Variables*, while installing s/w for ESP32 development, then go back to section *Step 5. Start a Project*.

**Establish Serial Connection with ESP32 (Legacy GNU Make)**

[]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This section provides guidance how to establish serial connection between ESP32 and PC.

**Connect ESP32 to PC**

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 and other boards produced by Espressif:
<table>
<thead>
<tr>
<th>Development Board</th>
<th>USB Driver</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-DevKitC</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-LyraT</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-LyraTD-MSC</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-PICO-KIT</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP-WROVER-KIT</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32 Demo Board</td>
<td>FTDI</td>
<td></td>
</tr>
<tr>
<td>ESP-Prog</td>
<td>FTDI</td>
<td>Programmer board (w/o ESP32)</td>
</tr>
<tr>
<td>ESP32-MeshKit-Sense</td>
<td>n/a</td>
<td>Use with ESP-Prog</td>
</tr>
<tr>
<td>ESP32-Sense Kit</td>
<td>n/a</td>
<td>Use with ESP-Prog</td>
</tr>
</tbody>
</table>

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

### Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

### Check port on Linux and MacOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```bash
ls /dev/tty*
```

MacOS

```bash
ls /dev/cu.*
```

### Adding user to dialout on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```bash
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```bash
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

1.16. Related Documents
Fig. 38: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 39: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 40: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```markdown
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
```
Fig. 41: Setting Serial Communication in PuTTY on Linux
If you see some legible log, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](https://docs.espressif.com/projects/esp-idf/en/latest/techniques/debugging/esptoolGuide.html) for more details.

---

**Note:** Close serial terminal after verification that communication is working. In next step we are going to use another application to upload ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from section *Step 6. Connect Your Device* when installing s/w for ESP32 development, then go back to section *Step 7. Configure.*

### Build and Flash with Make (Legacy GNU Make)

[]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

#### Finding a project

As well as the esp-idf-template project, ESP-IDF comes with some example projects on github in the examples directory.

Once you’ve found the project you want to work with, change to its directory and you can configure and build it.

#### Configuring your project

```
make menuconfig
```

#### Compiling your project

```
make all
```

… will compile app, bootloader and generate a partition table based on the config.
Flashing your project

When `make all` finishes, it will print a command line to use esptool.py to flash the chip. However, you can also do this from `make` by running:

```
make flash
```

This will flash the entire project (app, bootloader, and partition table) to a new chip. Also, if the partition table has ota_data, then this command will flash an initial ota_data. It allows to run the newly loaded app from a factory partition (or the first OTA partition, if factory partition is not present). The settings for serial port flashing can be configured with `make menuconfig`.

You don’t need to run `make all` before running `make flash`. `make flash` will automatically rebuild anything which needs it.

Compiling & Flashing Just the App

After the initial flash, you may just want to build and flash just your app, not the bootloader and partition table:

- `make app` - build just the app.
- `make app-flash` - flash just the app.

`make app-flash` will automatically rebuild the app if it needs it.

There’s no downside to reflashing the bootloader and partition table each time, if they haven’t changed.

The Partition Table

Once you’ve compiled your project, the “build” directory will contain a binary file with a name like “my_app.bin”. This is an ESP32 image binary that can be loaded by the bootloader.

A single ESP32’s flash can contain multiple apps, as well as many kinds of data (calibration data, filesystems, parameter storage, etc). For this reason, a partition table is flashed to offset 0x8000 in the flash.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype, and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to `make menuconfig` and choose one of the simple predefined partition tables:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you `make partition_table` then it will print a summary of the partition table.

For more details about partition tables and how to create custom variations, view the documentation.

Build and Flash with Eclipse IDE (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.
Installing Eclipse IDE

The Eclipse IDE gives you a graphical integrated development environment for writing, compiling and debugging ESP-IDF projects.

- Start by installing the esp-idf for your platform (see files in this directory with steps for Windows, OS X, Linux).
- We suggest building a project from the command line first, to get a feel for how that process works. You also need to use the command line to configure your esp-idf project (via `make menuconfig`), this is not currently supported inside Eclipse.
- Download the Eclipse Installer for your platform from eclipse.org.
- When running the Eclipse Installer, choose “Eclipse for C/C++ Development” (in other places you’ll see this referred to as CDT.)

Setting up Eclipse

Once your new Eclipse installation launches, follow these steps:

Import New Project

- Eclipse makes use of the Makefile support in ESP-IDF. This means you need to start by creating an ESP-IDF project. You can use the idf-template project from github, or open one of the examples in the esp-idf examples subdirectory.
- Once Eclipse is running, choose File -> Import . . .
- In the dialog that pops up, choose “C/C++” -> “Existing Code as Makefile Project” and click Next.
- On the next page, enter “Existing Code Location” to be the directory of your IDF project. Don’t specify the path to the ESP-IDF directory itself (that comes later). The directory you specify should contain a file named “Makefile” (the project Makefile).
- On the same page, under “Toolchain for Indexer Settings” choose “Cross GCC”. Then click Finish.

Project Properties

- The new project will appear under Project Explorer. Right-click the project and choose Properties from the context menu.
- Click on the “Environment” properties page under “C/C++ Build”. Click “Add . . .” and enter name `BATCH_BUILD` and value 1.
- Click “Add . . .” again, and enter name `IDF_PATH`. The value should be the full path where ESP-IDF is installed. Windows users can copy the `IDF_PATH` from windows explorer.
- Edit the `PATH` environment variable. Keep the current value, and append the path to the Xtensa toolchain installed as part of IDF setup, if this is not already listed on the PATH. A typical path to the toolchain looks like `/home/user-name/esp/xtensa-esp32-elf/bin`. Note that you need to add a colon `:` before the appended path. Windows users will need to prepend `C:\msys32\mingw32\bin; C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin` to `PATH` environment variable (If you installed msys32 to a different directory then you’ll need to change these paths to match).
- On macOS, add a `PYTHONPATH` environment variable and set it to `/Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages`. This is so that the system Python, which has pyserial installed as part of the setup steps, overrides any built-in Eclipse Python.
**ADDITIONAL NOTE:** If either the IDF_PATH directory or the project directory is located outside C:\msys32\home directory, you will have to give custom build command in C/C++ Build properties as: `python $(IDF_PATH)/tools/windows/eclipse_make.py` (Please note that the build time may get significantly increased by this method.)

Navigate to “C/C++ General” -> “Preprocessor Include Paths” property page:
- Click the “Providers” tab
- In the list of providers, click “CDT Cross GCC Built-in Compiler Settings”. Change “Command to get compiler specs” to `xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "$(INPUTS)"`.
- In the list of providers, click “CDT GCC Build Output Parser” and change the “Compiler command pattern” to `xtensa-esp32-elf-(gcc|g++|c++|cc|cpp|clang)`.

Navigate to “C/C++ General” -> “Indexer” property page:
- Check “Enable project specific settings” to enable the rest of the settings on this page.
- Uncheck “Allow heuristic resolution of includes”. When this option is enabled Eclipse sometimes fails to find correct header directories.

Navigate to “C/C++ Build” -> “Behavior” property page:
- Check “Enable parallel build” to enable multiple build jobs in parallel.

### Building in Eclipse

Before your project is first built, Eclipse may show a lot of errors and warnings about undefined values. This is because some source files are automatically generated as part of the esp-idf build process. These errors and warnings will go away after you build the project.

- Click OK to close the Properties dialog in Eclipse.
- Outside Eclipse, open a command line prompt. Navigate to your project directory, and run `make menuconfig` to configure your project’s esp-idf settings. This step currently has to be run outside Eclipse.

*If you try to build without running a configuration step first, esp-idf will prompt for configuration on the command line - but Eclipse is not able to deal with this, so the build will hang or fail.*

- Back in Eclipse, choose Project -> Build to build your project.

**TIP:** If your project had already been built outside Eclipse, you may need to do a Project -> Clean before choosing Project -> Build. This is so Eclipse can see the compiler arguments for all source files. It uses these to determine the header include paths.

### Flash from Eclipse

You can integrate the “make flash” target into your Eclipse project to flash using esptool.py from the Eclipse UI:
- Right-click your project in Project Explorer (important to make sure you select the project, not a directory in the project, or Eclipse may find the wrong Makefile.)
- Select Build Targets -> Create... from the context menu.
- Type “flash” as the target name. Leave the other options as their defaults.
- Now you can use Project -> Build Target -> Build (Shift+F9) to build the custom flash target, which will compile and flash the project.

1.16. Related Documents 125
Read the Docs Template Documentation, Release v4.1-dev-2071-gf91080637

Note that you will need to use "make menuconfig" to set the serial port and other config options for flashing. "make menuconfig" still requires a command line terminal (see the instructions for your platform.)

Follow the same steps to add bootloader and partition_table targets, if necessary.

Customized Setup of Toolchain (Legacy GNU Make)

Instead of downloading binary toolchain from Espressif website (see Step 1. Set up the Toolchain) you may build the toolchain yourself.

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

• if you want to customize toolchain build configuration
• if you want to use a different GCC version (such as 4.8.5)
• if you want to hack gcc or newlib or libstdc++
• if you are curious and/or have time to spare
• if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
2.1 Bluetooth API

2.1.1 Controller && VHCI

Overview

Instructions

Application Example

Check `bluetooth/bluedroid/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - `bluetooth/bluedroid/hci/controller_vhci_ble_adv`.

API Reference

Header File

- `bt/include/esp_bt.h`
Functions

```c
esp_err_t esp_ble_tx_power_set(esp_ble_power_type_t power_type, esp_power_level_t power_level)
```
Set BLE TX power. Connection Tx power should only be set after connection created.

**Return** ESP_OK - success, other - failed

**Parameters**

- **power_type**: The type of which tx power, could set Advertising/Connection/Default and etc
- **power_level**: Power level(index) corresponding to absolute value(dbm)

```c
esp_power_level_t esp_ble_tx_power_get(esp_ble_power_type_t power_type)
```
Get BLE TX power. Connection Tx power should only be set after connection created.

**Return** >= 0 - Power level, < 0 - Invalid

**Parameters**

- **power_type**: The type of which tx power, could set Advertising/Connection/Default and etc

```c
esp_err_t esp_bredr_tx_power_set(esp_power_level_t min_power_level, esp_power_level_t max_power_level)
```
Set BR/EDR TX power. BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Return** ESP_OK - success, other - failed

**Parameters**

- **min_power_level**: The minimum power level
- **max_power_level**: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```
Get BR/EDR TX power. If the argument is not NULL, then store the corresponding value.

**Return** ESP_OK - success, other - failed

**Parameters**

- **min_power_level**: The minimum power level
- **max_power_level**: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set(esp_sco_data_path_t data_path)
```
Set default SCO data path. Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP_OK - success, other - failed

**Parameters**

- **data_path**: SCO data path
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return ESP_OK - success, other - failed

Parameters

• cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

esp_err_t esp_bt_controller_deinit (void)
De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)
Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Return ESP_OK - success, other - failed

Parameters

• mode: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

esp_err_t esp_bt_controller_disable (void)
Disable BT controller.

Return ESP_OK - success, other - failed

esp_bt_controller_status_t esp_bt_controller_get_status (void)
Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

bool esp_vhci_host_check_send_available (void)
esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Return true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

• data: the packet point
• len: the packet length
esp_err_t esp_vhci_host_register_callback(const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback struc-
ture.

Return ESP_OK - success, ESP_FAIL - failed

Parameters

• callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release(esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k
bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after
esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the
blueooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled)
then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call
esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Clas-

ic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls
esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data
consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of
esp_bt_mem_release() function

Return ESP_OK - success, other - failed

Parameters

• mode: : the mode want to release memory

esp_err_t esp_bt_mem_release(esp_bt_mode_t mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the
mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Addi-
tionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE
host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the blueooth
mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled)
then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call
esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in
the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit
blueoth and release its memory. Below is the sequence of APIs to be called for such scenarios:
In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

Return ESP_OK - success, other - failed

Parameters

- **mode**: the mode whose memory is to be released

**esp_err_t esp_bt_sleep_enable**(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

Return

- ESP_OK : success
- other : failed

**esp_err_t esp_bt_sleep_disable**(void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

Return

- ESP_OK : success
- other : failed

**bool esp_bt_controller_is_sleeping**(void)

to check whether bluetooth controller is sleeping at the instant, if modem sleep is enabled

Note that this function shall not be invoked before esp_bt_controller_enable() This function is supposed to be used ORIG mode of modem sleep

Return true if in modem sleep state, false otherwise
void esp_bt_controller_wakeup_request (void)
request controller to wakeup from sleeping state during sleep mode

Note that this function shall not be invoked before esp_bt_controller_enable() Note that this function is supposed to be used ORIG mode of modem sleep Note that after this request, bluetooth controller may again enter sleep as long as the modem sleep is enabled

Profiling shows that it takes several milliseconds to wakeup from modem sleep after this request. Generally it takes longer if 32kHz XTAL is used than the main XTAL, due to the lower frequency of the former as the bluetooth low power clock source.

esp_err_t esp_ble_scan_duplicate_list_flush (void)
Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

Return

• ESP_OK : success
• other : failed

Structures

struct esp_bt_controller_config_t
Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size
Bluetooth controller task stack size

uint8_t controller_task_prio
Bluetooth controller task priority

uint8_t hci_uart_no
If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate
If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
scan duplicate mode

uint8_t scan_duplicate_type
scan duplicate type

uint16_t normal_adv_size
Normal adv size for scan duplicate

uint16_t mesh_adv_size
Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
Controller minimum memory value

uint32_t controller_debug_flag
Controller debug log flag
uint8_t mode
    Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
    BLE maximum connection numbers

uint8_t bt_max_acl_conn
    BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
    SCO data path, i.e. HCI or PCM module

bool auto_latency
    BLE auto latency, used to enhance classic BT performance

uint8_t bt_max_sync_conn
    BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
    BLE low power crystal accuracy index

uint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
    callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
    BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
    Bluetooth mode for controller enable/disable.
    Values:
    
    ESP_BT_MODE_IDLE = 0x00
        Bluetooth is not running
ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]
BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm

ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

ESP_BT_CONTROLLER_STATUS_IDLE = 0

ESP_BT_CONTROLLER_STATUS_INITED

ESP_BT_CONTROLLER_STATUS_ENABLED

ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN: for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
ESP_BLE_PWR_TYPE_CONN_hdl1 = 1
For connection handle 1

ESP_BLE_PWR_TYPE_CONN_hdl2 = 2
For connection handle 2

ESP_BLE_PWR_TYPE_CONN_hdl3 = 3
For connection handle 3

ESP_BLE_PWR_TYPE_CONN_hdl4 = 4
For connection handle 4

ESP_BLE_PWR_TYPE_CONN_hdl5 = 5
For connection handle 5

ESP_BLE_PWR_TYPE_CONN_hdl6 = 6
For connection handle 6

ESP_BLE_PWR_TYPE_CONN_hdl7 = 7
For connection handle 7

ESP_BLE_PWR_TYPE_CONN_hdl8 = 8
For connection handle 8

ESP_BLE_PWR_TYPE_ADV = 9
For advertising

ESP_BLE_PWR_TYPE_SCAN = 10
For scan

ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value

ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers

type esp_power_level_t
Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
Corresponding to -6dbm

ESP_PWR_LVL_N3 = 3
Corresponding to -3dbm

ESP_PWR_LVL_N0 = 4
Corresponding to 0dbm

ESP_PWR_LVL_P3 = 5
Corresponding to +3dbm

ESP_PWR_LVL_P6 = 6
Corresponding to +6dbm

ESP_PWR_LVL_P9 = 7
Corresponding to +9dbm
ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t
  Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
  data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
  data over PCM interface

BT MAIN API

Overview

Instructions

Application Example

Instructions
API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status(void)`
Get bluetooth stack status.

**Return** Bluetooth stack status

`esp_err_t esp_bluedroid_enable(void)`
Enable bluetooth, must after esp_bluedroid_init()

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_disable(void)`
Disable bluetooth, must prior to esp_bluedroid_deinit()

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_init(void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_deinit(void)`
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

Enumerations

`enum esp_bluedroid_status_t`
Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**
ESP_BLUE_DROID_STATUS_UNINITIALIZED = 0
   Bluetooth not initialized

ESP_BLUE_DROID_STATUS_INITIALIZED
   Bluetooth initialized but not enabled

ESP_BLUE_DROID_STATUS_ENABLED
   Bluetooth initialized and enabled

BT DEVICE APIs

Overview

Bluetooth device reference APIs.

Instructions

Application Example

Instructions

API Reference

Header File

- `bt/host/bluedroid/api/include/api/esp_bt_device.h`

Functions

**const** uint8_t *`esp_bt_dev_get_address` (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

**Return** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

**esp_err_t** `esp_bt_dev_set_device_name` (const char *`name`)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

**Parameters**
- `name`: device name to be set

2.1. Bluetooth API
2.1.3 BT LE

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough

- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

`esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)`

This function is called to occur gap event, such as scan result.

Return

- ESP_OK : success
- other : failed

Parameters

- callback: callback function

`esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)`

This function is called to override the BTA default ADV parameters.

Return

- ESP_OK : success
- other : failed

Parameters
• **adv_data**: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

\[
\text{esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t \*scan_params)}
\]

This function is called to set scan parameters.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• **scan_params**: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params.

\[
\text{esp_err_t esp_ble_gap_start_scanning (uint32_t duration)}
\]

This procedure keep the device scanning the peer device which advertising on the air.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• **duration**: Keeping the scanning time, the unit is second.

\[
\text{esp_err_t esp_ble_gap_stop_scanning (void)}
\]

This function call to stop the device scanning the peer device which advertising on the air.

**Return**

• ESP_OK : success
• other : failed

\[
\text{esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t \*adv_params)}
\]

This function is called to start advertising.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• **adv_params**: pointer to User defined adv_params data structure.

\[
\text{esp_err_t esp_ble_gap_stop_advertising (void)}
\]

This function is called to stop advertising.

**Return**

• ESP_OK : success
• other : failed
**esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)**

Update connection parameters, can only be used when connection is up.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- **params**: connection update parameters

**esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)**

This function is to set maximum LE data packet size.

**Return**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)**

This function sets the random address for the application.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- **rand_addr**: the random address which should be setting

**esp_err_t esp_ble_gap_clear_rand_addr(void)**

This function clears the random address for the application.

**Return**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_privacy(bool privacy_enable)**

Enable/disable privacy on the local device.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- **privacy_enable**: enable/disable privacy on remote device.

**esp_err_t esp_ble_gap_config_local_icon(uint16_t icon)**

set local gap appearance icon

**Return**
• ESP_OK : success
• other : failed

Parameters
• icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

\[
\text{esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)}
\]
Add or remove device from white list.

Return
• ESP_OK : success
• other : failed

Parameters
• add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
• remote_bda: the remote device address add/remove from the white list.
• wl_addr_type: whitelist address type

\[
\text{esp_err_t esp_ble_gap_get_whitelist_size (uint16_t *length)}
\]
Get the whitelist size in the controller.

Return
• ESP_OK : success
• other : failed

Parameters
• length: the white list length.

\[
\text{esp_err_t esp_ble_gap_set_prefer_conn_params (esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)}
\]
This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return
• ESP_OK : success
• other : failed

Parameters
• bd_addr: BD address of the peripheral
• min_conn_int: minimum preferred connection interval
• max_conn_int: maximum preferred connection interval
• slave_latency: preferred slave latency
• supervision_tout: preferred supervision timeout

2.1. Bluetooth API
esp_err_t esp_ble_gap_set_device_name(const char *name)
Set device name to the local device.

Return
• ESP_OK : success
• other : failed

Parameters
• name: - device name.

esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Return - ESP_OK : success
• other : failed

Parameters
• local_used_addr: - current local used ble address (six bytes)
• addr_type: - ble address type

uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
This function is called to get ADV data for a specific type.

Return pointer of ADV data

Parameters
• adv_data: - pointer of ADV data which to be resolved
• type: - finding ADV data type
• length: - return the length of ADV data not including type

esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw advertising data. User need to fill ADV data by self.

Return
• ESP_OK : success
• other : failed

Parameters
• raw_data:: raw advertising data
• raw_data_len: : raw advertising data length , less than 31 bytes

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw scan response data. User need to fill scan response data by self.

Return
• ESP_OK : success
• other : failed
Parameters

- `raw_data`: raw scan response data
- `raw_data_len`: raw scan response data length, less than 31 bytes

```c
esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
```
This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return

- ESP_OK: success
- other: failed

Parameters

- `remote_addr`: The remote connection device address.

```c
esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                         esp_duplicate_info_t device_info)
```
This function is called to add a device info into the duplicate scan exceptional list.

Return

- ESP_OK: success
- other: failed

Parameters

- `type`: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- `device_info`: the device information.

```c
esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                             esp_duplicate_info_t device_info)
```
This function is called to remove a device info from the duplicate scan exceptional list.

Return

- ESP_OK: success
- other: failed

Parameters

- `type`: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- `device_info`: the device information.
**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list** (esp_duplicate_scan_exceptional_list_type_t list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Return

- ESP_OK : success
- other : failed

Parameters

- list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**esp_err_t esp_ble_gap_set_security_param** (esp_ble_sm_param_t param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK : success

- other : failed

Parameters

- param_type: the type of the param which to be set
- value: the param value
- len: the length of the param value

**esp_err_t esp_ble_gap_security_rsp** (esp_bd_addr_t bd_addr, bool accept)

Grant security request access.

Return - ESP_OK : success

- other : failed

Parameters

- bd_addr: BD address of the peer
- accept: accept the security request or not

**esp_err_t esp_ble_set_encryption** (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success

- other : failed

Parameters

- bd_addr: the address of the peer device need to encryption
- sec_act: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**esp_err_t esp_ble_passkey_reply** (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
- other : failed

Parameters
- bd_addr: BD address of the peer
- accept: passkey entry successful or declined.
- passkey: passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
- other : failed

Parameters
- bd_addr: BD address of the peer device

int esp_ble_get_bond_device_num(void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
- ESP_FAIL : failed

esp_err_t esp_ble_get_bond_device_list(int *dev_num, esp_ble_bond_dev_t *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return - ESP_OK : success
- other : failed

Parameters
- dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK : success
esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)

This function is to disconnect the physical connection of the peer device. gattc may have multiple virtual
GATT server connections when multiple app_id registered. esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t
conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections,
it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) discon-
nect the physical connection directly.

Return - ESP_OK : success
• other : failed

Parameters
• remote_device: : BD address of the peer device

esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t
*conn_params)

This function is called to read the connection parameters information of the device.

Return - ESP_OK : success
• other : failed

Parameters
• bd_addr: BD address of the peer device.
• conn_params: the connection parameters information

esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)

BLE set channels.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters
• channels: The n th such field (in the range 0 to 36) contains the value for the link layer channel
index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are
reserved and shall be set to 0. At least one channel shall be marked as unknown.

Unions
union esp_ble_key_value_t

Public Members

esp_bt_status_t status
    Indicate the add or remove whitelist operation success status

esp_ble_wl_operation_t wl_operation
    The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

struct esp_ble_adv_params_t
    Advertising parameters.

Public Members

uint16_t adv_int_min
    Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t adv_int_max
    Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

adv_filter_policy
    Advertising filter policy

Structures
**Public Members**

```cpp
bool set_scan_rsp
    Set this advertising data as scan response or not

bool include_name
    Advertising data include device name or not

bool include_txpower
    Advertising data include TX power

int min_interval
    Advertising data show slave preferred connection min interval. The connection interval in the following manner:
    \( \text{connInterval} = \text{Conn\_Interval\_Min} \times 1.25 \text{ ms} \)
    Conn\_Interval\_Min range: 0x0006 to 0x0C80
    Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval
    Advertising data show slave preferred connection max interval. The connection interval in the following manner:
    \( \text{connInterval} = \text{Conn\_Interval\_Max} \times 1.25 \text{ ms} \)
    Conn\_Interval\_Max range: 0x0006 to 0x0C80
    Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
    External appearance of device

uint16_t manufacturer_len
    Manufacturer data length

uint8_t *p_manufacturer_data
    Manufacturer data point

uint16_t service_data_len
    Service data length

uint8_t *p_service_data
    Service data point

uint16_t service_uuid_len
    Service uuid length

uint8_t *p_service_uuid
    Service uuid array point

uint8_t flag
    Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail
```

**struct esp_ble_scan_params_t**

Ble scan parameters.

**Public Members**

```cpp
estpble_scan_type_t scan_type
    Scan type

estpble_addr_type_t own_addr_type
    Owner address type

estpble_scan_filter_t scan_filter_policy
    Scan filter policy
```
uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
connection parameters information

Public Members

uint16_t interval
collection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
Connection update parameters.

Public Members

esp_bd_addr_t bda
Bluetooth device address

uint16_t min_int
Min connection interval

uint16_t max_int
Max connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
BLE pkt date length keys.
Public Members

uint16_t rx_len
pkt rx data length value

uint16_t tx_len
pkt tx data length value

struct esp_ble_penc_keys_t
BLE encryption keys.

Public Members

esp_bt_octet16_t ltk
The long term key

esp_bt_octet8_t rand
The random number

uint16_t ediv
The ediv value

uint8_t sec_level
The security level of the security link

uint8_t key_size
The key size(7~16) of the security link

struct esp_ble_pcsrk_keys_t
BLE CSRK keys.

Public Members

uint32_t counter
The counter

esp_bt_octet16_t csrk
The csrk key

uint8_t sec_level
The security level

struct esp_ble_pid_keys_t
BLE pid keys.

Public Members

esp_bt_octet16_t irk
The irk value

esp_ble_addr_type_t addr_type
The address type

esp_bd_addr_t static_addr
The static address

struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.
Public Members

`esp_bt_octet16_t ltk`
The long term key

`uint16_t div`
The div value

`uint8_t key_size`
The key size of the security link

`uint8_t sec_level`
The security level of the security link

`struct esp_ble_lcsrk_keys`
BLE SRK keys.

Public Members

`uint32_t counter`
The counter value

`uint16_t div`
The div value

`uint8_t sec_level`
The security level of the security link

`esp_bt_octet16_t csrk`
The csrk key value

`struct esp_ble_sec_key_notif_t`
Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

`esp_bd_addr_t bd_addr`
peer address

`uint32_t passkey`
the numeric value for comparison. If just_works, do not show this number to UI

`struct esp_ble_sec_req_t`
Structure of the security request.

Public Members

`esp_bd_addr_t bd_addr`
peer address

`struct esp_ble_bond_key_info_t`
struct type of the bond key information value

2.1. Bluetooth API
**Public Members**

*esp_ble_key_mask_t* `key_mask`
the key mask to indicate which key is present

*esp_ble_penc_keys_t* `penc_key`
received peer encryption key

*esp_ble_pcsrk_keys_t* `pcsrk_key`
received peer device SRK

*esp_ble_pid_keys_t* `pid_key`
peer device ID key

**struct esp_ble_bond_dev_t**
struct type of the bond device value

**Public Members**

*esp_bd_addr_t* `bd_addr`
peer address

*esp_ble_bond_key_info_t* `bond_key`
the bond key information

**struct esp_ble_key_t**
union type of the security key value

**Public Members**

*esp_bd_addr_t* `bd_addr`
peer address

*esp_ble_key_type_t* `key_type`
key type of the security link

*esp_ble_key_value_t* `p_key_value`
the pointer to the key value

**struct esp_ble_local_id_keys_t**
structure type of the ble local id keys value

**Public Members**

*esp_bt_octet16_t* `ir`
the 16 bits of the ir value

*esp_bt_octet16_t* `irk`
the 16 bits of the ir key value

*esp_bt_octet16_t* `dhk`
the 16 bits of the dh key value

**struct esp_ble_auth_cmpl_t**
Structure associated with ESP_AUTH_CMPL_EVT.
Public Members

```c
esp_bd_addr_t bd_addr
    BD address peer device.

bool key_present
    Valid link key value in key element

esp_link_key key
    Link key associated with peer device.

uint8_t key_type
    The type of Link Key

bool success
    TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
    The HCI reason/error code for when success=FALSE
```

```c
esp_ble_addr_type_t addr_type
    Peer device address type

esp_bt_dev_type_t dev_type
    Device type

esp_ble_auth_req_t auth_mode
    authentication mode
```

Macros

```c
ESP_BLE_ADV_FLAG_LIMIT_DISC
    BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_GAP_BLE_CHANNELS_LEN
ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT
   This is the old name, just for backwards compatibility.
ESP_BLE_ADV_DATA_LEN_MAX
   Advertising data maximum length.
ESP_BLE_SCAN_RSP_DATA_LEN_MAX
   Scan response data maximum length.
BLE_BIT(n)

Type Definitions

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t
   combination of the above bit pattern

typedef uint8_t esp_ble_io_cap_t
   combination of the io capability

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
   GAP callback function type.

Parameters
   * event: Event type
   * param: Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t
   GAP BLE callback event type.

   Values:
   ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
      When advertising data set complete, the event comes
   ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
      When scan response data set complete, the event comes
   ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
      When scan parameters set complete, the event comes
   ESP_GAP_BLE_SCAN_RESULT_EVT
      When one scan result ready, the event comes each time
   ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
      When raw advertising data set complete, the event comes
ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_ADV_START_COMPLETE_EVT
When starting advertising complete, the event comes

ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
When starting scan complete, the event comes

ESP_GAP_BLE_AUTH_CMPL_EVT
Authentication complete indication.

ESP_GAP_BLE_KEY_EVT
BLE key event for peer device keys

ESP_GAP_BLE_SEC_REQ_EVT
BLE security request

ESP_GAP_BLE_PASSKEY_NOTIF_EVT
passkey notification event

ESP_GAP_BLE_PASSKEY_REQ_EVT
passkey request event

ESP_GAP_BLE_OOB_REQ_EVT
OOB request event

ESP_GAP_BLE_LOCAL_IR_EVT
BLE local IR event

ESP_GAP_BLE_LOCAL_ER_EVT
BLE local ER event

ESP_GAP_BLE_NC_REQ_EVT
Numeric Comparison request event

ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
When stopping adv complete, the event comes

ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
When stopping scan complete, the event comes

ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT
When setting the static rand address complete, the event comes

ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
When updating connection parameters complete, the event comes

ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
When setting pkt length complete, the event comes

ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
When enabling/disabling privacy on the local device complete, the event comes

ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When removing the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clearing the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When getting the bond device list complete, the event comes

2.1. Bluetooth API
ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When reading the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When adding or removing whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When updating duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT
When setting BLE channels complete, the event comes

ESP_GAP_BLE_EVT_MAX

enum esp_ble_adv_data_type
The type of advertising data(not adv_type)

Values:

ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
Values:
ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
  Allow both scan and connection requests from anyone.
ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
  Allow both scan req from White List devices only and connection req from anyone.
ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
  Allow both scan req from anyone and connection req from White List devices only.
ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
  Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
Values:
ESP_BLE_SEC_ENCRYPT = 1
ESP_BLE_SEC_ENCRYPT_NO_MITM

2.1. Bluetooth API
enum esp_ble_sm_param_t

Values:

- **ESP_BLE_SM_PASSKEY** = 0
- **ESP_BLE_SM_AUTHEN_REQ_MODE**
- **ESP_BLE_SM_IOCAP_MODE**
- **ESP_BLE_SM_SET_INIT_KEY**
- **ESP_BLE_SM_SET_RSP_KEY**
- **ESP_BLE_SM_MAX_KEY_SIZE**
- **ESP_BLE_SM_MIN_KEY_SIZE**
- **ESP_BLE_SM_SET_STATIC_PASSKEY**
- **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**
- **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**
- **ESP_BLE_SM_OOB_SUPPORT**
- **ESP_BLE_SM_MAX_PARAM**

enum esp_ble_scan_type_t

Ble scan type.

Values:

- **BLE_SCAN_TYPE_PASSIVE** = 0x0
  
  Passive scan
- **BLE_SCAN_TYPE_ACTIVE** = 0x1
  
  Active scan

enum esp_ble_scan_filter_t

Ble scan filter type.

Values:

- **BLE_SCAN_FILTER_ALLOW_ALL** = 0x0
  
  Accept all:
  
  1. advertisement packets except directed advertising packets not addressed to this device (default).

- **BLE_SCAN_FILTER_ALLOW_ONLY_WLST** = 0x1
  
  Accept only:
  
  1. advertisement packets from devices where the advertiser’s address is in the White list.
  
  2. Directed advertising packets which are not addressed for this device shall be ignored.

- **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR** = 0x2
  
  Accept all:
  
  1. undirected advertisement packets, and
  
  2. directed advertising packets where the initiator address is a resolvable private address, and
  
  3. directed advertising packets addressed to this device.

- **BLE_SCAN_FILTER_ALLOW_WLIST_PRA_DIR** = 0x3
  
  Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**enum esp_ble_scan_duplicate_t**
Ble scan duplicate type.

*Values:*

- **BLE_SCAN_DUPLICATE_DISABLE** = 0x0
  the Link Layer should generate advertising reports to the host for each packet received
- **BLE_SCAN_DUPLICATE_ENABLE** = 0x1
  the Link Layer should filter out duplicate advertising reports to the Host
- **BLE_SCAN_DUPLICATE_MAX** = 0x2
  0x02 – 0xFF, Reserved for future use

**enum esp_gap_search_evt_t**
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

*Values:*

- **ESP_GAP_SEARCH_INQ_RES_EVT** = 0
  Inquiry result for a peer device.
- **ESP_GAP_SEARCH_INQ_CMPL_EVT** = 1
  Inquiry complete.
- **ESP_GAP_SEARCH_DISC_RES_EVT** = 2
  Discovery result for a peer device.
- **ESP_GAP_SEARCH_DISC_BLE_RES_EVT** = 3
  Discovery result for BLE GATT based service on a peer device.
- **ESP_GAP_SEARCH_DISC_CMPL_EVT** = 4
  Discovery complete.
- **ESP_GAP_SEARCH_DISC_BLE_RES_EVT** = 5
  Discovery complete.
- **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT** = 6
  Search cancelled
- **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT** = 7
  The number of pkt discarded by flow control

**enum esp_ble_evt_type_t**
Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

- **ESP_BLE_EVT_CONN_ADV** = 0x00
  Connectable undirected advertising (ADV_IND)
- **ESP_BLE_EVT_CONN_DIR_ADV** = 0x01
  Connectable directed advertising (ADV_DIRECT_IND)
- **ESP_BLE_EVT_DISC_ADV** = 0x02
  Scannable undirected advertising (ADV_SCAN_IND)
- **ESP_BLE_EVT_NON_CONN_ADV** = 0x03
  Non connectable undirected advertising (ADV_NONCONN_IND)

---

2.1. Bluetooth API
ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opreration_t
Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t
Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | . . . . |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | . . . . |

enum esp_duplicate_scan_exceptional_list_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
duplicate scan exceptional addr list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
duplicate scan exceptional mesh link ID list

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t
#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

 esp_gatt_value_t attr_value
  Gatt attribute structure

uint16_t handle
  Gatt attribute handle

Structures

struct esp_gatt_id_t
  Gatt id, include uuid and instance id.

Public Members

 esp_bt_uuid_t uuid
  UUID

uint8_t inst_id
  Instance id

struct esp_gatt_srvc_id_t
  Gatt service id, include id (uuid and instance id) and primary flag.
Public Members

`esp_gatt_id_t id`
- Gatt id, include uuid and instance

`bool is_primary`
- This service is primary or not

`struct esp_attr_desc_t`
- Attribute description (used to create database)

Public Members

`uint16_t uuid_length`
- UUID length

`uint8_t *uuid_p`
- UUID value

`uint16_t perm`
- Attribute permission

`uint16_t max_length`
- Maximum length of the element

`uint16_t length`
- Current length of the element

`uint8_t *value`
- Element value array

`struct esp_attr_control_t`
- attribute auto response flag

Public Members

`uint8_t auto_rsp`
- if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

`struct esp_gatts_attr_db_t`
- attribute type added to the gatt server database

Public Members

`esp_attr_control_t attr_control`
- The attribute control type

`esp_attr_desc_t attr_desc`
- The attribute type

`struct esp_attr_value_t`
- set the attribute value type
Public Members

`uint16_t attr_max_len`
attribute max value length

`uint16_t attr_len`
attribute current value length

`uint8_t *attr_value`
the pointer to attribute value

`struct esp_gatts_incl_svc_desc_t`
Gatt include service entry element.

Public Members

`uint16_t start_hdl`
Gatt start handle value of included service

`uint16_t end_hdl`
Gatt end handle value of included service

`uint16_t uuid`
Gatt attribute value UUID of included service

`struct esp_gatts_incl128_svc_desc_t`
Gatt include 128 bit service entry element.

Public Members

`uint16_t start_hdl`
Gatt start handle value of included 128 bit service

`uint16_t end_hdl`
Gatt end handle value of included 128 bit service

`struct esp_gatt_value_t`
Gatt attribute value.

Public Members

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`
Gatt attribute value

`uint16_t handle`
Gatt attribute handle

`uint16_t offset`
Gatt attribute value offset

`uint16_t len`
Gatt attribute value length

`uint8_t auth_req`
Gatt authentication request

`struct esp_gatt_conn_params_t`
Connection parameters information.

2.1. Bluetooth API
Public Members

uint16_t interval
   connection interval

uint16_t latency
   Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
   Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
   Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
   read multiple attribute

Public Members

uint8_t num_attr
   The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
   The handles list

struct esp_gattc_db_elem_t
   data base attribute element

Public Members

est_gatt_db_attr_type_t type
   The attribute type

uint16_t attribute_handle
   The attribute handle, it’s valid for all of the type

uint16_t start_handle
   The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
   ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
   The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
   ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
   The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
   The attribute uuid, it’s valid for all of the type

struct esp_gattc_service_elem_t
   service element

Public Members

bool is_primary
   The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
   The start handle of the service
uint16_t end_handle
    The end handle of the service

esp_bt_uuid_t uuid
    The uuid of the service

struct esp_gattc_char_elem_t
    characteristic element

Public Members

uint16_t char_handle
    The characteristic handle

esp_gatt_char_prop_t properties
    The characteristic properties

esp_bt_uuid_t uuid
    The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members

uint16_t handle
    The characteristic descriptor handle

esp_bt_uuid_t uuid
    The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
    include service element

Public Members

uint16_t handle
    The include service current attribute handle

uint16_t incl_svc_s_handle
    The start handle of the service which has been included

uint16_t incl_svc_e_handle
    The end handle of the service which has been included

esp_bt_uuid_t uuid
    The include service uuid

Macros

Type Definitions

typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:
    ESP_GATT_PREP_WRITE_CANCEL = 0x00
        Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
        Prepare write execute

enum esp_gatt_status_t
    GATT success code and error codes.
    Values:
    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03

ESP_GATT_CCC_CFG_ERR = 0xfd
```c
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.
    Values:
    ESP_GATT_CONN_UNKNOWN = 0
        Gatt connection unknown
    ESP_GATT_CONN_L2C_FAILURE = 1
        General L2cap failure
    ESP_GATT_CONN_TIMEOUT = 0x08
        Connection timeout
    ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
        Connection terminate by peer user
    ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
        Connection terminated by local host
    ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
        Connection fail to establish
    ESP_GATT_CONN_LMP_TIMEOUT = 0x22
        Connection fail for LMP response tout
    ESP_GATT_CONN_CONN_CANCEL = 0x0100
        L2CAP connection cancelled
    ESP_GATT_CONN_NONE = 0x0101
        No connection to cancel

enum esp_gatt_auth_req_t
    Gatt authentication request type.
    Values:
    ESP_GATT_AUTH_REQ_NONE = 0
    ESP_GATT_AUTH_REQ_NO_MITM = 1
    ESP_GATT_AUTH_REQ_MITM = 2
    ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
    ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t
    Values:
    ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
    ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
    ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t
    Gatt write type.
    Values:
    ESP_GATT_WRITE_TYPE_NO_RSP = 1
        Gatt write attribute need no response
```

2.1. Bluetooth API
**ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

**enum esp_gatt_db_attr_type_t**

the type of attribute element

**Values:**

**ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

**ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

**ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

**ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

**ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache

**ESP_GATT_DB_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

---

**GATT SERVER API**

**Overview**

**Instructions**

**Application Example**

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough

- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough

- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server
API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

`esp_err_t esp_ble_gatts_register_callback(esp_gatts_cb_t callback)`

This function is called to register application callbacks with BTA GATTS module.

**Return**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gatts_app_register(uint16_t app_id)`

This function is called to register application identifier.

**Return**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gatts_app_unregister(esp_gatt_if_t gatts_if)`

unregister with GATT Server.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- `gatts_if`: GATT server access interface

`esp_err_t esp_ble_gatts_create_service(esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)`

Create a service. When service creation is done, a callback event BTA_GATTS_CREATE_SRVC_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- `gatts_if`: GATT server access interface
- `service_id`: service ID.
- `num_handle`: number of handle requested for this service.
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)

Create a service attribute tab.

Return

• ESP_OK : success
• other : failed

Parameters

• gatts_attr_db: the pointer to the service attr tab
• gatts_if: GATT server access interface
• max_nb_attr: the number of attribute to be added to the service database.
• srvc_inst_id: the instance id of the service

esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event BTA_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: service handle to which this included service is to be added.
• included_service_handle: the service ID to be included.

esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)

This function is called to add a characteristic into a service.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: service handle to which this included service is to be added.
• char_uuid: Characteristic UUID.
• perm: Characteristic value declaration attribute permission.
• property: Characteristic Properties
• char_val: Characteristic value
• control: attribute response control byte
esp_err_t esp_ble_gatts_add_char descr(uint16_t service_handle, esp.bt.uuid_t *descr_uuid, esp.gatt.perm_t perm, esp.attr.value_t *char_descr_val, esp.attr.control_t *control)

This function is called to add characteristic descriptor. When it’s done, a callback event BTA_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: service handle to which this characteristic descriptor is to be added.
• perm: descriptor access permission.
• descr_uuid: descriptor UUID.
• char_descr_val: Characteristic descriptor value
• control: attribute response control byte

esp_err_t esp_ble_gatts_delete_service(uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event BTA_GATTS_DELETE_EVT is report with the status.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: service_handle to be deleted.

esp_err_t esp_ble_gatts_start_service(uint16_t service_handle)

This function is called to start a service.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: the service handle to be started.

esp_err_t esp_ble_gatts_stop_service(uint16_t service_handle)

This function is called to stop a service.

Return

• ESP_OK : success
• other : failed

Parameters

• service_handle: - service to be topped.
esp_err_t esp_ble_gatts_send_indicate(esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
- ESP_OK : success
- other : failed

Parameters
- gatts_if: GATT server access interface
- conn_id: - connection id to indicate.
- attr_handle: - attribute handle to indicate.
- value_len: - indicate value length.
- value: value to indicate.
- need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)

This function is called to send a response to a request.

Return
- ESP_OK : success
- other : failed

Parameters
- gatts_if: GATT server access interface
- conn_id: - connection identifier.
- trans_id: - transfer id
- status: - response status
- rsp: - response data.

esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Return
- ESP_OK : success
- other : failed

Parameters
- attr_handle: the attribute handle which to be set
- length: the value length
- value: the pointer to the attribute value
`esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)`

Retrieve attribute value.

Return

- ESP_GATT_OK : success
- other : failed

Parameters

- `attr_handle`: Attribute handle.
- `length`: pointer to the attribute value length
- `value`: Pointer to attribute value payload, the value cannot be modified by user

`esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`

Open a direct open connection or add a background auto connection.

Return

- ESP_OK : success
- other : failed

Parameters

- `gatts_if`: GATT server access interface
- `remote_bda`: remote device bluetooth device address.
- `is_direct`: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

Return

- ESP_OK : success
- other : failed

Parameters

- `gatts_if`: GATT server access interface
- `conn_id`: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

Return

- ESP_OK : success
- other : failed

Parameters

- `gatts_if`: GATT server access interface
• remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Unions

union esp_ble_gatts_cb_param_t
    #include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg

uint32_t trans_id
       Transfer id
```

```c
esp_bd_addr_t bda
       The bluetooth device address which been written
```
uint16_t handle
    The attribute handle

uint16_t offset
    Offset of the value, if the value is too long

bool need_rsp
    The write operation need to do response

bool is_prep
    This write operation is prepare write

uint16_t len
    The write attribute value length

uint8_t *value
    The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL
    Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC
    Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
                             esp_ble_gatts_cb_param_t *param)
    GATT Server callback function type.

Parameters

• event:: Event type
• gatts_if:: GATT server access interface, normally different gatts_if correspond to different profile
• param:: Point to callback parameter, currently is union type

Enumerations

enum esp_gatts_cb_event_t
    GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
    When register application id, the event comes

ESP_GATTS_READ_EVT = 1
    When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
    When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
    When gatt client request execute write, the event comes
ESP_GATTS_MTU_EVT = 4
    When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
    When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
    When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
    When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
    When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
    When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
    When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
    When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
    When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
    When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
    When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
    When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
    When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
    When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
    When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
    When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
    When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
    When gatt send response complete, the event comes

ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
    When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23
    When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
    When gatt send service change indication complete, the event comes
GATT CLIENT API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gatc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gattc_api.h

Functions

`esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)`

This function is called to register application callbacks with GATTC module.

Return

- ESP_OK: success
- other: failed

Parameters

- callback: pointer to the application callback function.

`esp_err_t esp_ble_gattc_app_register (uint16_t app_id)`

This function is called to register application callbacks with GATTC module.

Return

- ESP_OK: success

2.1. Bluetooth API
esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)

This function is called to unregister an application from GATTC module.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.

esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• remote_bda: remote device bluetooth device address.
• remote_addr_type: remote device bluetooth device the address type.
• is_direct: direct connection or background auto connection

esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID to be closed.

esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Return
• ESP_OK: success
Parameters
- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID.

```
esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
```

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return
- ESP_OK: success
- other: failed

Parameters
- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID.
- `filter_uuid`: a UUID of the service application is interested in. If Null, discover for all services.

```
esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                         esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result,
                                         uint16_t *count, uint16_t offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service.

Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_search_service.

Return
- ESP_OK: success
- other: failed

Parameters
- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID which identify the server.
- `svc_uuid`: the pointer to the service uuid.
- `result`: The pointer to the service which has been found in the gattc cache.
- `count`: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- `offset`: Offset of the service position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          uint16_t start_handle, uint16_t end_handle,
                                          esp_gattc_char_elem_t *result, uint16_t *count,
                                          uint16_t offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle.
• end_handle: the attribute end handle
• result: The pointer to the characteristic in the service.
• count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• offset: Offset of the characteristic position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• char_handle: the given characteristic handle
• result: The pointer to the descriptor in the characteristic.
• count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• offset: Offset of the descriptor position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle
• end_handle: the attribute end handle
• char_uuid: the characteristic uuid
• result: The pointer to the characteristic in the service.
• count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

\[ \text{esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)} \]

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle
• end_handle: the attribute end handle
• char_uuid: the characteristic uuid.
• descr_uuid: the descriptor uuid.
• result: The pointer to the descriptor in the given characteristic.
• count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

\[ \text{esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)} \]

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• char_handle: the characteristic handle.
• descr_uuid: the descriptor uuid.
• result: The pointer to the descriptor in the given characteristic.
• count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid,
                                                esp_gattc_incl_svc_elem_t *result,
                                                uint16_t *count)
```

Find the include service with the given service handle in the gattc cache. Note: It just get include service from local cache, won’t get from remote devices.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle
• end_handle: the attribute end handle
• incl_uuid: the include service uuid
• result: The pointer to the include service in the given service.
• count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle,
                                                char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• type: the attribute type.
• start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
• end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
• **char_handle**: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.

• **count**: output the number of attribute has been found in the gattc cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**

• ESP_OK: success

• other: failed

**Parameters**

• **gattc_if**: Gatt client access interface.

• **start_handle**: the attribute start handle

• **end_handle**: the attribute end handle

• **conn_id**: connection ID which identify the server.

• **db**: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.

• **count**: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**

• ESP_OK: success

• other: failed

**Parameters**

• **gattc_if**: Gatt client access interface.

• **conn_id**: connection ID.

• **handle**: characteristic handle to read.

• **auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**

• ESP_OK: success

• other: failed

**Parameters**

• **gattc_if**: Gatt client access interface.
• conn_id: connection ID.
• read_multi: pointer to the read multiple parameter.
• auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_read_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**

• ESP_OK: success
• other: failed

**Parameters**

• gattc_if: Gatt client access interface.
• conn_id: connection ID.
• handle: descriptor handle to read.
• auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_write_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                    uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**

• ESP_OK: success
• other: failed

**Parameters**

• gattc_if: Gatt client access interface.
• conn_id: connection ID.
• handle: characteristic handle to write.
• value_len: length of the value to be written.
• value: the value to be written.
• write_type: the type of attribute write operation.
• auth_req: authentication request.

```
esp_err_t esp_ble_gattc_write_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          uint16_t handle, uint16_t value_len, uint8_t *value,
                                          esp_gatt_write_type_t write_type,
                                          esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**

• ESP_OK: success
• other: failed
Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID
- `handle`: descriptor handle to write.
- `value_len`: length of the value to be written.
- `value`: the value to be written.
- `write_type`: the type of attribute write operation.
- `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

Return

- ESP_OK: success
- other: failed

Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID
- `handle`: characteristic handle to prepare write.
- `offset`: offset of the write value.
- `value_len`: length of the value to be written.
- `value`: the value to be written.
- `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

Return

- ESP_OK: success
- other: failed

Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID
- `handle`: characteristic descriptor handle to prepare write.
- `offset`: offset of the write value.
- `value_len`: length of the value to be written.
• value:: the value to be written.
• auth_req:: authentication request.

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id:: connection ID.
• is_execute:: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

Return

• ESP_OK: registration succeeds
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• server_bda:: target GATT server.
• handle:: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

Return

• ESP_OK: unregister succeeds
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• server_bda:: target GATT server.
• handle:: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Return

• ESP_OK: success
\* other: failed

**Parameters**

- `remote_bda`: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr,
                                   esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `gattc_if`: Gatt client access interface.
- `src_addr`: the source address which provide the attribute table.
- `assoc_addr`: the associated device address which went to share the attribute table with the source address.
- `is_assoc`: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `remote_bda`: remote device BD address.
Unions

union esp_ble_gattc_cb_param_t

**Type Definitions**

```c
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
                              esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

**Parameters**

- `event`: Event type
- `gatts_if`: GATT client access interface, normally different gattc_if correspond to different profile
- `param`: Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

**Values:**

- `ESP_GATTC_REG_EVT = 0`
  - When GATT client is registered, the event comes
- `ESP_GATTC_UNREG_EVT = 1`
  - When GATT client is unregistered, the event comes
- `ESP_GATTC_OPEN_EVT = 2`
  - When GATT virtual connection is set up, the event comes
- `ESP_GATTC_READ_CHAR_EVT = 3`
  - When GATT characteristic is read, the event comes
- `ESP_GATTC_WRITE_CHAR_EVT = 4`
  - When GATT characteristic write operation completes, the event comes
- `ESP_GATTC_CLOSE_EVT = 5`
  - When GATT virtual connection is closed, the event comes
- `ESP_GATTC_SEARCH_CMPL_EVT = 6`
  - When GATT service discovery is completed, the event comes
- `ESP_GATTC_SEARCH_RES_EVT = 7`
  - When GATT service discovery result is got, the event comes
- `ESP_GATTC_READ_DESCR_EVT = 8`
  - When GATT characteristic descriptor read completes, the event comes
- `ESP_GATTC_WRITE_DESCR_EVT = 9`
  - When GATT characteristic descriptor write completes, the event comes
- `ESP_GATTC_NOTIFY_EVT = 10`
  - When GATT notification or indication arrives, the event comes
ESP_GATTC_PREP_WRITE_EVT = 11
    When GATT prepare-write operation completes, the event comes

ESP_GATTC_EXEC_EVT = 12
    When write execution completes, the event comes

ESP_GATTC_ACL_EVT = 13
    When ACL connection is up, the event comes

ESP_GATTC_CANCEL_OPEN_EVT = 14
    When GATT client ongoing connection is cancelled, the event comes

ESP_GATTC_SRVC_CHG_EVT = 15
    When “service changed” occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
    When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
    When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
    When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
    When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
    When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
    When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
    When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
    When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
    When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
    When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
    When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
    When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
    When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
    When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
    When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
    When Scan filter parameters are set, the event comes
**ESP_GATTC_SCANFLT_STATUS_EVT** = 33
When Scan filter status is reported, the event comes

**ESP_GATTC_ADV_VSC_EVT** = 34
When advertising vendor spec content event is reported, the event comes

**ESP_GATTC_REG_FOR_NOTIFY_EVT** = 38
When register for notification of a service completes, the event comes

**ESP_GATTC_UNREG_FOR_NOTIFY_EVT** = 39
When unregister for notification of a service completes, the event comes

**ESP_GATTC_CONNECT_EVT** = 40
When the ble physical connection is set up, the event comes

**ESP_GATTC_DISCONNECT_EVT** = 41
When the ble physical connection disconnected, the event comes

**ESP_GATTC_READ_MULTIPLE_EVT** = 42
When the ble characteristic or descriptor multiple complete, the event comes

**ESP_GATTC_QUEUE_FULL_EVT** = 43
When the gattc command queue full, the event comes

**ESP_GATTC_SET_ASSOC_EVT** = 44
When the ble gattc set the associated address complete, the event comes

**ESP_GATTC_GET_ADDR_LIST_EVT** = 45
When the ble get gattc address list in cache finish, the event comes

**ESP_GATTC_DIS_SRVC_CMPL_EVT** = 46
When the ble discover service complete, the event comes

**BLUFI API**

**Overview**

BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/bluedroid/ble/blufi

**API Reference**

**Header File**

- bt/host/bluedroid/api/include/api/esp_blufi_api.h
Functions

`esp_err_t esp_blufi_register_callbacks(esp_blufi_callbacks_t *callbacks)`
This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters

• callbacks: callback functions

`esp_err_t esp_blufi_profile_init(void)`
This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit(void)`
This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report(wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`
This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters

• opmode: wifi opmode
• sta_conn_state: station is already in connection or not
• softap_conn_num: softap connection number
• extra_info: extra information, such as sta_ssid, softap_ssid and etc.

`esp_err_t esp_blufi_send_wifi_list(uint16_t apCount, esp_blufi_ap_record_t *list)`
This function is called to send wifi list.

Return ESP_OK - success, other - failed

Parameters

• apCount: wifi list count
• list: wifi list

`uint16_t esp_blufi_get_version(void)`
Get BLUFI profile version.

Return Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`
Close a connection a remote device.

Return
• ESP_OK : success
• other : failed

Parameters

• gatts_if: GATT server access interface
• conn_id: connection ID to be closed.

`esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)`
This function is called to send blufi error information.

Return ESP_OK - success, other - failed

Parameters

• state: : error state

`esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)`
This function is called to custom data.

Return ESP_OK - success, other - failed

Parameters

• data: : custom data value
• data_len: : the length of custom data

Unions

union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

struct esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct esp_blufi_cb_param_t::blufi_connect_evt_param connect
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param sta_ssid
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

struct esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param sta_passwd
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD
**struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param softap_ssid**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID

**struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

**struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

**struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

**struct esp_blufi_cb_param_t::blufi_recv_softap_channel_evt_param softap_channel**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

**struct esp_blufi_cb_param_t::blufi_recv_username_evt_param username**
Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

**struct esp_blufi_cb_param_t::blufi_recv_ca_evt_param ca**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

**struct esp_blufi_cb_param_t::blufi_recv_client_cert_evt_param client_cert**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

**struct esp_blufi_cb_param_t::blufi_recv_server_cert_evt_param server_cert**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

**struct esp_blufi_cb_param_t::blufi_recv_client_pkey_evt_param client_pkey**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

**struct esp_blufi_cb_param_t::blufi_recv_server_pkey_evt_param server_pkey**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

**struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error**
Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

**struct esp_blufi_cb_param_t::blufi_recv_custom_data_evt_param custom_data**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

**struct blufi_connect_evt_param**
#include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.

**Public Members**

**esp_bd_addr_t remote_bda**

    authentication mode of softap interface

bool softap_authmode_set
    is authentication mode of softap interface set

uint8_t *softap_max_conn_num
    max connection number of softap interface

bool softap_max_conn_num_set
    is max connection number of softap interface set

uint8_t *softap_channel
    channel of softap interface

bool softap_channel_set
    is channel of softap interface set

struct esp_blufi_ap_record_t
    Description of an WiFi AP.

Public Members

uint8_t ssid[33]
    SSID of AP

int8_t rssi
    signal strength of AP

struct esp_blufi_callbacks_t
    BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
    BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
    BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
    BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
    BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
    BLUFI check sum function (FCS)
Type Definitions

typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)

BLUFI event callback function type.

Parameters
• event: Event type
• param: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Parameters
• data: data from phone
• len: length of data from phone
• output_data: data want to send to phone
• output_len: length of data want to send to phone

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int cyprt_len)

BLUFI encrypt the data after negotiate a share key.

Return Nonnegative number is encrypted length, if error, return negative number;

Parameters
• iv8: initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data: plain text and encrypted data, the encrypt function must support autochthonous encrypt
• crypt_len: length of plain text

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters
• iv8: initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data: encrypted data and plain text, the encrypt function must support autochthonous decrypt
• crypt_len: length of encrypted text

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Parameters
• iv8: initial vector(8bit), normally, blufi core will input packet sequence number
• data: data need to checksum
• len: length of data

Enumerations

enum esp_blufi_cb_event_t
    Values:
    ESP_BLUFI_EVENT_INIT_FINISH = 0
    ESP_BLUFI_EVENT_DEINIT_FINISH

    ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
    ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
    ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE
    ESP_BLUFI_EVENT_GET_WIFI_LIST
    ESP_BLUFI_EVENT_REPORT_ERROR
    ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

enum esp_blufi_sta_conn_state_t
    BLUFI config status.
    Values:
ESP_BLUFI_STA_CONN_SUCCESS = 0x00
ESP_BLUFI_STA_CONN_FAIL = 0x01

enum esp_blufi_init_state_t
BLUFI init status.

Values:
ESP_BLUFI_INIT_OK = 0
ESP_BLUFI_INIT_FAILED

enum esp_blufi_deinit_state_t
BLUFI deinit status.

Values:
ESP_BLUFI_DEINIT_OK = 0
ESP_BLUFI_DEINIT_FAILED

enum esp_blufi_error_state_t
Values:
ESP_BLUFI_SEQUENCE_ERROR = 0
ESP_BLUFI_CHECKSUM_ERROR
ESP_BLUFI_DECRYPT_ERROR
ESP_BLUFI_ENCRYPT_ERROR
ESP_BLUFI_INIT_SECURITY_ERROR
ESP_BLUFI_DH_MALLOC_ERROR
ESP_BLUFI_DH_PARAM_ERROR
ESP_BLUFI_READ_PARAM_ERROR
ESP_BLUFI.Make_PUBLIC_ERROR

2.1.4 CLASSIC BT

CLASSIC BLUETOOTH GAP API

Overview

Instructions

Application Example

Instructions

API Reference

Header File

• bt/host/bluedroid/api/include/api/esp_gap_bt_api.h
Functions

```c
static uint32_t esp_bt_gap_get_cod_svc(uint32_t cod)
    get major service field of COD

    Return major service bits

    Parameters
        • cod: Class of Device

static uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)
    get major device field of COD

    Return major device bits

    Parameters
        • cod: Class of Device

static uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)
    get minor service field of COD

    Return minor service bits

    Parameters
        • cod: Class of Device

static uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)
    get format type of COD

    Return format type

    Parameters
        • cod: Class of Device

static bool esp_bt_gap_is_valid_cod(uint32_t cod)
    decide the integrity of COD

    Return

    • true if cod is valid
    • false otherwise

    Parameters
        • cod: Class of Device

esp_err_t esp_bt_gap_register_callback(esp_bt_gap_cb_t callback)
    register callback function. This function should be called after esp_bluedroid_enable() completes successfully

    Return

    • ESP_OK : Succeed
    • ESP_FAIL: others
```
esp_err_t esp_bt_gap_set_scan_mode(esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- c_mode: one of the enums of esp_bt_connection_mode_t
- d_mode: one of the enums of esp_bt_discovery_mode_t

esp_err_t esp_bt_gap_start_discovery(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)

Start device discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if discovery is started or halted. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT if discovery result is got.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

Parameters

- mode: - inquiry mode
- inq_len: - inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30
- num_rsps: - number of inquiry responses that can be received, value 0 indicates an unlimited number of responses

esp_err_t esp_bt_gap_cancel_discovery(void)

Cancel device discovery. This function should be called after esp_bluedroid_enable() completes successfully esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if discovery is stopped.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_gap_get_remote_services(esp_bd_addr_t remote_bda)

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

2.1. Bluetooth API
Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_remote_service_record(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)
```

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
uint8_t *esp_bt_gap_resolve_eir_data(uint8_t *eir, esp.bt.eir_type_t type, uint8_t *length)
```

This function is called to get EIR data for a specific type.

Return  pointer of starting position of eir data excluding eir data type, NULL if not found

Parameters

• eir: - pointer of raw eir data to be resolved
• type: - specific EIR data type
• length: - return the length of EIR data excluding fields of length and data type

```c
esp_err_t esp_bt_gap_config_eir_data(esp.bt.eir_data_t *eir_data)
```

This function is called to config EIR data.

esp_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if param is invalid
• ESP_FAIL: others

Parameters

• eir_data: - pointer of EIR data content

```c
esp_err_t esp_bt_gap_set_cod(esp.bt.cod_t cod, esp.bt.cod_mode_t mode)
```

This function is called to set class of device. esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends Some profile have special restrictions on class of device, changes may cause these profile do not work.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if param is invalid
• ESP_FAIL: others

Parameters
• cod: - class of device
• mode: - setting mode

```c
esp_err_t esp_bt_gap_get_cod(esp_bt_cod_t *cod)
```
This function is called to get class of device.

Return
• ESP_OK : Succeed
• ESP_FAIL: others

Parameters
• cod: - class of device

```c
esp_err_t esp_bt_gap_read_rssi_delta(esp_bd_addr_t remote_addr)
```
This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Return
• ESP_OK : Succeed
• ESP_FAIL: others

Parameters
• remote_addr: - remote device address, corresponding to a certain connection handle.

```c
esp_err_t esp_bt_gap_remove_bond_device(esp_bd_addr_t bd_addr)
```
Removes a device from the security database list of peer device.

Return - ESP_OK : success
• ESP_FAIL : failed

Parameters
• bd_addr: : BD address of the peer device

```c
int esp_bt_gap_get_bond_device_num(void)
```
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
• ESP_FAIL : failed

```c
esp_err_t esp_bt_gap_get_bond_device_list(int *dev_num, esp_bd_addr_t *dev_list)
```
Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return
• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

```c
esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
```
Set pin type and default pin code for legacy pairing.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters

• pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
• pin_code_len: Length of pin_code
• pin_code: Pin_code

```c
esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
```
Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters

• bd_addr: BD address of the peer
• accept: Pin_code reply successful or declined.
• pin_code_len: Length of pin_code
• pin_code: Pin_code

```c
esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)
```
Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters
• **param_type**: the type of the param which is to be set
• **value**: the param value
• **len**: the length of the param value

```c
esp_err_t esp_bt_gap_ssp_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```
Reply the key value to the peer device in the legacy connection stage.

**Return**  - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

**Parameters**
• **bd_addr**: BD address of the peer
• **accept**: passkey entry successful or declined.
• **passkey**: passkey value, must be a 6 digit number, can be lead by 0.

```c
esp_err_t esp_bt_gap_ssp_confirm_reply(esp_bd_addr_t bd_addr, bool accept)
```
Reply the confirm value to the peer device in the legacy connection stage.

**Return**  - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

**Parameters**
• **bd_addr**: BD address of the peer device
• **accept**: numbers to compare are the same or different.

```c
esp_err_t esp_bt_gap_set_afh_channels(esp_bt_gap_afh_channels channels)
```
Set the AFH channels.

**Return**  - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

**Parameters**
• **channels**: The n th such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

```c
esp_err_t esp_bt_gap_read_remote_name(esp_bd_addr_t remote_bda)
```
Read the remote device name.

**Return**  - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

**Parameters**
remote_bda: The remote device’s address

Unions

union esp_bt_gap_cb_param_t

  uint32_t minor
  minor class

  uint32_t major
  major class

  uint32_t service
  service class
uint32_t reserved_8
    undefined

struct esp_bt_gap_dev_prop_t
    Bluetooth Device Property Descriptor.

**Public Members**

*esp_bt_gap_dev_prop_type_t* type
    device property type

int len
    device property value length

void *val
    device property value

struct esp_bt_eir_data_t
    EIR data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

bool fec_required
    FEC is required or not, true by default

bool include_txpower
    EIR data include TX power, false by default

bool include_uuid
    EIR data include UUID, false by default

uint8_t flag
    EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16_t manufacturer_len
    Manufacturer data length, 0 by default

uint8_t *p_manufacturer_data
    Manufacturer data point

uint16_t url_len
    URL length, 0 by default

uint8_t *p_url
    URL point

**Macros**

**ESP_BT_GAP_RSSI_HIGH_THRLD**
    RSSI threshold.
    High RSSI threshold

**ESP_BT_GAP_RSSI_LOW_THRLD**
    Low RSSI threshold

**ESP_BT_GAP_AFH_CHANNELS_LEN**
ESP_BT_GAP_MAX_BDNAME_LEN
Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN
Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_MAX_NUM
MAX number of EIR type

ESP_BT_EIR_FLAG_LIMIT_DISC
ESP_BT_EIR_FLAG_GEN_DISC
ESP_BT_EIR_FLAG_BREDR_NOT_SPT
ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT
ESP_BT_EIR_FLAG_DMT_HOST_SPT
ESP_BT_EIR_MAX_LEN

ESP_BT_PIN_CODE_LEN
Max pin code length

ESP_BT_IO_CAP_OUT
ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE

ESP_BT_COD_SRVC_BIT_MASK
Bits of major service class field.

ESP_BT_COD_SRVC_BIT_OFFSET
Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
Bits of major device class field.

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
Bits of minor device class field.

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
Bits of format type.

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1
Class of device format type 1.
**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0
typedef uint8_t esp_bt_io_cap_t
combination of the io capability
typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bruetooth GAP callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

**enum esp.bt.cod_mode_t**
class of device settings

*Values:*

- **ESP_BT_SET_COD_MAJOR_MINOR** = 0x01
  overwrite major, minor class
- **ESP_BT_SET_COD_SERVICE_CLASS** = 0x02
  set the bits in the input, the current bit will remain
- **ESP_BT_CLR_COD_SERVICE_CLASS** = 0x04
  clear the bits in the input, others will remain
- **ESP_BT_SET_COD_ALL** = 0x08
  overwrite major, minor, set the bits in service class
- **ESP_BT_INIT_COD** = 0x0a
  overwrite major, minor, and service class

**enum esp.bt.connection_mode_t**
Discoverability and Connectability mode.

*Values:*

- **ESP_BT_NON_CONNECTABLE**
  Non-connectable
- **ESP_BT_CONNECTABLE**
  Connectable

**enum esp.bt.discovery_mode_t**

*Values:*
ESP_BT_NON_DISCOVERABLE
Non-discoverable

ESP_BT_LIMITED_DISCOVERABLE
Limited Discoverable

ESP_BT_GENERAL_DISCOVERABLE
General Discoverable

enum esp_bt_gap_dev_prop_type_t
Bluetooth Device Property type.

Values:

ESP_BT_GAP_DEV_PROP_BDNAME = 1
Bluetooth device name, value type is int8_t []

ESP_BT_GAP_DEV_PROP_COD
Class of Device, value type is uint32_t

ESP_BT_GAP_DEV_PROP_RSSI
Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

ESP_BT_GAP_DEV_PROP_EIR
Extended Inquiry Response, value type is uint8_t []

enum esp_bt_eir_type_t
Extended Inquiry Response data type.

Values:

ESP_BT_EIR_TYPE_FLAGS = 0x01
Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID = 0x02
Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID = 0x03
Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID = 0x04
Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID = 0x05
Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID = 0x06
Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID = 0x07
Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME = 0x08
Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME = 0x09
Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL = 0x0a
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL = 0x24
Uniform resource identifier
ESP_BT_EIR_TYPE_MANU_SPECIFIC = 0xff
    Manufacturer specific data

enum esp_bt_cod_svc_t
    Major service class field of Class of Device, multiple bits can be set.
    Values:

    ESP_BT_COD_SRVC_NONE = 0
        None indicates an invalid value

    ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x1
        Limited Discoverable Mode

    ESP_BT_COD_SRVC_POSITIONING = 0x8
        Positioning (Location identification)

    ESP_BT_COD_SRVC_NETWORKING = 0x10
        Networking, e.g. LAN, Ad hoc

    ESP_BT_COD_SRVC_RENDERING = 0x20
        Rendering, e.g. Printing, Speakers

    ESP_BT_COD_SRVC_CAPTURING = 0x40
        Capturing, e.g. Scanner, Microphone

    ESP_BT_COD_SRVC_OBJ_TRANSFER = 0x80
        Object Transfer, e.g. v-Inbox, v-Folder

    ESP_BT_COD_SRVC_AUDIO = 0x100
        Audio, e.g. Speaker, Microphone, Headset service

    ESP_BT_COD_SRVC_TELEPHONY = 0x200
        Telephony, e.g. Cordless telephony, Modem, Headset service

    ESP_BT_COD_SRVC_INFORMATION = 0x400
        Information, e.g., WEB-server, WAP-server

enum esp_bt_pin_type_t
    Values:

    ESP_BT_PIN_TYPE_VARIABLE = 0
        Refer to BTM_PIN_TYPE_VARIABLE

    ESP_BT_PIN_TYPE_FIXED = 1
        Refer to BTM_PIN_TYPE_FIXED

def esp_bt_sp_param_t
    Values:

    ESP_BT_SP_IOCAP_MODE = 0
        Set IO mode

enum esp_bt_cod_major_dev_t
    Major device class field of Class of Device.
    Values:

    ESP_BT_COD_MAJOR_DEV_MISC = 0
        Miscellaneous

    ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
        Computer
ESP_BT_COD_MAJOR_DEV_PHONE = 2
    Phone(cellular, cordless, pay phone, modem

ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
    LAN, Network Access Point

ESP_BT_COD_MAJOR_DEV_AV = 4
    Audio/Video(headset, speaker, stereo, video display, VCR

ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5
    Peripheral(mouse, joystick, keyboard)

ESP_BT_COD_MAJOR_DEV_IMAGING = 6
    Imaging(printer, scanner, camera, display

ESP_BT_COD_MAJOR_DEV_WEARABLE = 7
    Wearable

ESP_BT_COD_MAJOR_DEV_TOY = 8
    Toy

ESP_BT_COD_MAJOR_DEV_HEALTH = 9
    Health

ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
    Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
    Bluetooth Device Discovery state
    Values:
        ESP_BT_GAP_DISCOVERY_STOPPED
            device discovery stopped
        ESP_BT_GAP_DISCOVERY_STARTED
            device discovery started

enum esp_bt_gap_cb_event_t
    BT GAP callback events.
    Values:
        ESP_BT_GAP_DISC_RES_EVT = 0
            device discovery result event
        ESP_BT_GAP_DISC_STATE_CHANGED_EVT
            discovery state changed event
        ESP_BT_GAP_RMT_SRVCS_EVT
            get remote services event
        ESP_BT_GAP_RMT_SRVC_REC_EVT
            get remote service record event
        ESP_BT_GAP_AUTH_CMPL_EVT
            AUTH complete event
        ESP_BT_GAP_PIN_REQ_EVT
            Legacy Pairing Pin code request
        ESP_BT_GAP_CFM_REQ_EVT
            Simple Pairing User Confirmation request.
ESP_BT_GAP_KEY_NOTIF_EVT
Simple Pairing Passkey Notification

ESP_BT_GAP_KEY_REQ_EVT
Simple Pairing Passkey request

ESP_BT_GAP_READ_RSSI_DELTA_EVT
read rssi event

ESP_BT_GAP_CONFIG_EIR_DATA_EVT
config EIR data event

ESP_BT_GAP_SET_AFH_CHANNELS_EVT
set AFH channels event

ESP_BT_GAP_READ_REMOTE_NAME_EVT
read Remote Name event

ESP_BT_GAP_EVT_MAX

defined

enum esp_bt_inq_mode_t
Inquiry Mode

Values:

ESP_BT_INQ_MODE_GENERAL_INQUIRY
General inquiry mode

ESP_BT_INQ_MODE_LIMTED_INQUIRY
Limited inquiry mode

Bluetooth A2DP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

• This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

• bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

est_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)
Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.
Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- callback: A2DP event callback function

```c
esp_err_t esp_a2d_sink_register_data_callback(esp_a2d_sink_data_cb_t callback)
```

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menu-config.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- callback: A2DP sink data callback function

```c
esp_err_t esp_a2d_sink_init(void)
```

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_a2d_sink_deinit(void)
```

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_a2d_sink_connect(esp_bd_addr_t remote_bda)
```

Connect to remote bluetooth A2DP source device, must after esp_a2d_sink_init()

Return

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled

2.1. Bluetooth API
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address

esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)
Disconnect from the remote A2DP source device.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address

esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)
media control commands; this API can be used for both A2DP sink and source

Return
• ESP_OK: control command is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• ctrl: control commands for A2DP data channel

esp_err_t esp_a2d_source_init (void)
Initialize the bluetooth A2DP source module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_a2d_source_deinit (void)
De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
**esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)**

Register A2DP source data input function; For now the input is PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**

- `callback`: A2DP source data callback function

**esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)**

Connect to remote A2DP sink device, must after esp_a2d_source_init()

**Return**

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `remote_bda`: remote bluetooth device address

**esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)**

Disconnect from the remote A2DP sink device.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `remote_bda`: remote bluetooth device address

**Unions**

```c
union esp_a2d_cb_param_t
#include <esp_a2dp_api.h> A2DP state callback parameters.
```

**Public Members**

```c
struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat
A2DP connection status
```

```c
struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat
audio stream playing state
```
struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg
    media codec configuration information

struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat
    status in acknowledgement to media control commands

struct a2d_audio_cfg_param

ESP_A2D_CIE_LEN_ATRAC
```

Type Definitions

```c
typedef uint8_t esp_a2d_mct_t
```

```c
typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
    A2DP profile callback function type.
```

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t *buf, uint32_t len)
    A2DP profile data callback function.
```

Parameters
buf:: data received from A2DP source device and is PCM format decoder from SBC decoder; buf
    references to a static memory block and can be overwritten by upcoming data

- len:: size(in bytes) in buf

```c
typedef int32_t (*esp_a2d_source_data_cb_t) (uint8_t *buf, int32_t len)
```

A2DP source data read callback function.

**Return** size of bytes read successfully, if the argument len is -1, this value is ignored.

**Parameters**

- buf:: buffer to be filled with PCM data stream from higher layer
- len:: size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

### Enumerations

#### enum esp_a2d_connection_state_t

Bluetooth A2DP connection states.

**Values:**

- `ESP_A2D_CONNECTION_STATE_DISCONNECTED` = 0
  - connection released
- `ESP_A2D_CONNECTION_STATE_CONNECTING`
  - connecting remote device
- `ESP_A2D_CONNECTION_STATE_CONNECTED`
  - connection established
- `ESP_A2D_CONNECTION_STATE_DISCONNECTING`
  - disconnecting remote device

#### enum esp_a2d_disc_rsn_t

Bluetooth A2DP disconnection reason.

**Values:**

- `ESP_A2D_DISC_RSN_NORMAL` = 0
  - Finished disconnection that is initiated by local or remote device
- `ESP_A2D_DISC_RSN_ABNORMAL`
  - Abnormal disconnection caused by signal loss

#### enum esp_a2d_audio_state_t

Bluetooth A2DP datapath states.

**Values:**

- `ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND` = 0
  - audio stream datapath suspended by remote device
- `ESP_A2D_AUDIO_STATE_STOPPED`
  - audio stream datapath stopped
- `ESP_A2D_AUDIO_STATE_STARTED`
  - audio stream datapath started
enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.

Values:

ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
media control command is acknowledged with success

ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.

Values:

ESP_A2D_MEDIA_CTRL_NONE = 0
dummy command

ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_cb_event_t
A2DP callback events.

Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

BT AVRCP APIs

Overview

Bluetooth AVRCP reference APIs.

Instructions

2.1. Bluetooth API
Application Example

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_avrc_api.h

Functions

```
esp_err_t esp_avrc_ct_register_callback (esp_avrc_ct_cb_t callback)
```
Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- callback: AVRCP controller callback function

```
esp_err_t esp_avrc_ct_init (void)
```
Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_avrc_ct_deinit (void)
```
De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() com-
pletes successfully.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_t tl, uint8_t attr_id, uint8_t value_id)
```
Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• \( tl \): transaction label, 0 to 15, consecutive commands should use different values.
• attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
• value_id: attribute value defined for the specific player application setting attribute

\texttt{esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd}(uint8_t \( tl \))
Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• \( tl \): transaction label, 0 to 15, consecutive commands should use different values.

\texttt{esp_err_t esp_avrc_ct_send_register_notification_cmd}(uint8_t \( tl \), uint8_t \( event\_id \), uint32_t \( event\_parameter \))
Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters
• \( tl \): transaction label, 0 to 15, consecutive commands should use different values.
• \( event\_id \): id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• \( event\_parameter \): playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

\texttt{esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd}(uint8_t \( tl \), uint8_t \( volume \))
Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• volume: volume, 0 to 0x7f, means 0% to 100%

`esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)`  
Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• attr_mask: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

`esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)`  
Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• key_code: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
• key_state: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

`esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)`  
Register application callbacks to AVRCP target module; This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• callback: AVRCP target callback function

`esp_err_t esp_avrc_tg_init (void)`
Initialize the bluetooth AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_avrc_tg_deinit (void)`
De-initialize AVRCP target module. This function should be called after after `esp_bluedroid_enable()` completes successfully.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)`
Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. For filter type `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type `ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS`, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using `esp_avrc_tg_set_psth_cmd_filter()`.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)`
Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. If filter type is `ESP_AVRC_PSTH_FILTER_SUPPORT_CMD`, the passthrough commands which are set “1” as given in cmd_set will generate `ESP_AVRC_CT_PASSTHROUGH_RSP_EVT` callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using `esp_avrc_tg_get_psth_cmd_filter()` with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

**Return**
- ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
• ESP_ERR_NOT_SUPPORTED:: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes unallowed commands

bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

Return For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false

Parameters
• op: operation requested on the bit mask field
• psth: pointer to passthrough command bit mask structure
• cmd: passthrough command code

esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)

Get the requested event notification capabilities on local AVRCP target. The capability is returned in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init(). For capability type “ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation. For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap()

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
• ESP_ERR_INVALID_ARG: if cap is invalid or evt_set is NULL
• ESP_FAIL: otherwise

esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in evt_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if evt_set is NULL

bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)

Operate on the type esp_avrc_rn_evt_cap_mask_t with regard to a specific event.
**Return** For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

**Parameters**

- **op**: operation requested on the bit mask field
- **events**: pointer to event notification capability bit mask structure
- **event_id**: notification event code

```c
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using esp_avrc_tg_set_rn_evt_cap(), in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

**Parameters**

- **event_id**: notification event ID that remote AVRCP CT registers
- **rsp**: notification response code
- **param**: parameters included in the specific notification

**Unions**

```c
union esp_avrc_rn_param_t
```

`#include <esp_avrc_api.h>` AVRCP notification parameters.

**Public Members**

- **volume**: response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127
- **playback**: response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE
- **elm_id[8]**: response data for ESP_AVRC_RN_TRACK_CHANGE
- **play_pos**: response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond
- **batt**: response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

```c
union esp_avrc_ct_cb_param_t
```

`#include <esp_avrc_api.h>` AVRCP controller callback parameters.

AVRC passthrough command bit mask.

**Public Members**

`uint16_t bits[8]`  
bit mask representation of PASSTHROUGH commands

**struct esp_avrc_rn_evt_cap_mask_t**  
AVRC target notification event capability bit mask.

**Public Members**

`uint16_t bits`  
bit mask representation of PASSTHROUGH commands

**Macros**

`ESP_AVRC_TRANS_LABEL_MAX`  
max transaction label

**Type Definitions**

`typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)`  
AVRCP controller callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter union

`typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)`  
AVRCP target callback function type.

**Parameters**
• \texttt{event: : Event type}
• \texttt{param: : Pointer to callback parameter union}

Enumerations

\begin{verbatim}
enum esp_avrc_features_t
    AVRC feature bit mask.
    
    Values:

enum esp_avrc_psth_filter_t
    AVRC passthrough command filter.

Values:

ESP_AVRC_PSTH_FILTER_ALLOWED_CMD = 0
    all of the PASSTHROUGH commands that can possibly be used, immutable
ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD = 1
    PASSTHROUGH commands selectively supported according to the current configuration
ESP_AVRC_PSTH_FILTER_SUPPORT_MAX

enum esp_avrc_bit_mask_op_t
    Values:

ESP_AVRC_BIT_MASK_OP_TEST = 0
    operation code to test a specific bit
ESP_AVRC_BIT_MASK_OP_SET = 1
operation code to set a specific bit

ESP_AVRC_BIT_MASK_OP_CLEAR = 2
operation code to clear a specific bit

enum esp_avrc_pt_cmd_state_t
AVRC passthrough command state.

Values:

ESP_AVRC_PT_CMD_STATE_PRESSED = 0
key pressed

ESP_AVRC_PT_CMD_STATE_RELEASED = 1
key released

enum esp_avrc_ct_cb_event_t
AVRC Controller callback events.

Values:

ESP_AVRC_CT_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_AVRC_CT_PASSTHROUGH_RSP_EVT = 1
passthrough response event

ESP_AVRC_CT_METADATA_RSP_EVT = 2
metadata response event

ESP_AVRC_CT_PLAY_STATUS_RSP_EVT = 3
play status response event

ESP_AVRC_CT_CHANGE_NOTIFY_EVT = 4
notification event

ESP_AVRC_CT_REMOTE_FEATURES_EVT = 5
feature of remote device indication event

ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT = 6
supported notification events capability of peer device

ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT = 7
set absolute volume response event

enum esp_avrc_tg_cb_event_t
AVRC Target callback events.

Values:

ESP_AVRC_TG_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_AVRC_TG_REMOTE_FEATURES_EVT = 1
feature of remote device indication event

ESP_AVRC_TG_PASSTHROUGH_CMD_EVT = 2
passthrough command event

ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT = 3
set absolute volume command from remote device

ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT = 4
register notification event
enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.

Values:

ESP_AVRC_MD_ATTR_TITLE = 0x1
  title of the playing track
ESP_AVRC_MD_ATTR_ARTIST = 0x2
  track artist
ESP_AVRC_MD_ATTR_ALBUM = 0x4
  album name
ESP_AVRC_MD_ATTR_TRACK_NUM = 0x8
  track position on the album
ESP_AVRC_MD_ATTR_NUM_TRACKS = 0x10
  number of tracks on the album
ESP_AVRC_MD_ATTR_GENRE = 0x20
  track genre
ESP_AVRC_MD_ATTR_PLAYING_TIME = 0x40
  total album playing time in miliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.

Values:

ESP_AVRC_RN_PLAY_STATUS_CHANGE = 0x01
  track status change, eg. from playing to paused
ESP_AVRC_RN_TRACK_CHANGE = 0x02
  new track is loaded
ESP_AVRC_RN_TRACK_REACHED_END = 0x03
  current track reached end
ESP_AVRC_RN_TRACK_REACHED_START = 0x04
  current track reached start position
ESP_AVRC_RN_PLAY_POS_CHANGED = 0x05
  track playing position changed
ESP_AVRC_RN_BATTERY_STATUS_CHANGE = 0x06
  battery status changed
ESP_AVRC_RN_SYSTEM_STATUS_CHANGE = 0x07
  system status changed
ESP_AVRC_RN_APP_SETTING_CHANGE = 0x08
  application settings changed
ESP_AVRC_RN_NOW_PLAYING_CHANGE = 0x09
  now playing content changed
ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
  available players changed
ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
  the addressed player changed
ESP_AVRC_RN_UIDS_CHANGE = 0x0c
UIDs changed

ESP_AVRC_RN_VOLUME_CHANGE = 0x0d
volume changed locally on TG

ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.

    Values:

    ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
    all of the notification events that can possibly be supported, immutable

    ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
    notification events selectively supported according to the current configuration

ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.

    Values:

    ESP_AVRC_RN_RSP_INTERIM = 13
    initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

    ESP_AVRC_RN_RSP_CHANGED = 15
    final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.

    Values:

    ESP_AVRC_PS_EQUALIZER = 0x01
    equalizer, on or off

    ESP_AVRC_PS_REPEAT_MODE = 0x02
    repeat mode

    ESP_AVRC_PS_SHUFFLE_MODE = 0x03
    shuffle mode

    ESP_AVRC_PS_SCAN_MODE = 0x04
    scan mode on or off

    ESP_AVRC_PS_MAX_ATTR

enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.

    Values:

    ESP_AVRC_PS_EQUALIZER_OFF = 0x1
    equalizer OFF

    ESP_AVRC_PS_EQUALIZER_ON = 0x2
    equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.

    Values:
ESP_AVRC_PS_REPEAT_OFF = 0x1
repeat mode off
ESP_AVRC_PS_REPEAT_SINGLE = 0x2
single track repeat
ESP_AVRC_PS_REPEAT_GROUP = 0x3
group repeat

enum esp_avrc_ps_shf_value_ids_t
AVRC shuffle modes.

Values:
ESP_AVRC_PS_SHUFFLE_OFF = 0x1
ESP_AVRC_PS_SHUFFLE_ALL = 0x2
ESP_AVRC_PS_SHUFFLE_GROUP = 0x3

enum esp_avrc_ps_scn_value_ids_t
AVRC scan modes.

Values:
ESP_AVRC_PS_SCAN_OFF = 0x1
scan off
ESP_AVRC_PS_SCAN_ALL = 0x2
all tracks scan
ESP_AVRC_PS_SCAN_GROUP = 0x3
group scan

enum esp_avrc_rsp_t
AVCTP response codes.

Values:
ESP_AVRC_RSP_NOT_IMPL = 8
not implemented
ESP_AVRC_RSP_ACCEPT = 9
accept
ESP_AVRC_RSP_REJECT = 10
reject
ESP_AVRC_RSP_IN_TRANS = 11
in transition
ESP_AVRC_RSP_IMPL_STBL = 12
implemented/stable
ESP_AVRC_RSP_CHANGED = 13
changed
ESP_AVRC_RSP_INTERIM = 15
interim

enum esp_avrc_batt_stat_t
AVRCP battery status.

Values:
ESP_AVRC_BATT_NORMAL = 0
    normal state
ESP_AVRC_BATT_WARNING = 1
    unable to operate soon
ESP_AVRC_BATT_CRITICAL = 2
    cannot operate any more
ESP_AVRC_BATT_EXTERNAL = 3
    plugged to external power supply
ESP_AVRC_BATT_FULL_CHARGE = 4
    when completely charged from external power supply

enum esp_avrc_playback_stat_t
    AVRCP current status of playback.

    Values:

    ESP_AVRC_PLAYBACK_STOPPED = 0
        stopped
    ESP_AVRC_PLAYBACK_PLAYING = 1
        playing
    ESP_AVRC_PLAYBACK_PAUSED = 2
        paused
    ESP_AVRC_PLAYBACK_FWD_SEEK = 3
        forward seek
    ESP_AVRC_PLAYBACK_REV_SEEK = 4
        reverse seek
    ESP_AVRC_PLAYBACK_ERROR = 0xFF
        error

SPP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and recive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_spp_api.h
**Functions**

*esp_err_t* `esp_spp_register_callback` *(esp_spp_cb_t callback)*

This function is called to init callbacks with SPP module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- callback: pointer to the init callback function.

*esp_err_t* `esp_spp_init` *(esp_spp_mode_t mode)*

This function is called to init SPP.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

*esp_err_t* `esp_spp_deinit` *(void)*

This function is called to uninit SPP.

**Return**
- ESP_OK: success
- other: failed

*esp_err_t* `esp_spp_start_discovery` *(esp_bd_addr_t bd_addr)*

This function is called to performs service discovery for the services provided by the given peer device. When the operation is complete the callback function will be called with a ESP_SPP_DISCOVERY_COMP_EVT.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- bd_addr: Remote device bluetooth device address.

*esp_err_t* `esp_spp_connect` *(esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)*

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT.

**Return**
- ESP_OK: success
- other: failed
Parameters

- **sec_mask**: Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role**: Master or slave.
- **remote_scn**: Remote device bluetooth device SCN.
- **peer_bd_addr**: Remote device bluetooth device address.

```c
esp_err_t esp_spp_disconnect (uint32_t handle)
```

This function closes an SPP connection.

Return

- ESP_OK: success
- other: failed

Parameters

- **handle**: The connection handle.

```c
esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)
```

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT.

Return

- ESP_OK: success
- other: failed

Parameters

- **sec_mask**: Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role**: Master or slave.
- **local_scn**: The specific channel you want to get. If channel is 0, means get any channel.
- **name**: Server’s name.

```c
esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)
```

This function is used to write data, only for ESP_SPP_MODE_CB.

Return

- ESP_OK: success
- other: failed

Parameters

- **handle**: The connection handle.
- **len**: The length of the data written.
- **p_data**: The data written.
esp_err_t esp_spp_vfs_register(void)
This function is used to register VFS.

Return

• ESP_OK: success
• other: failed

Unions

union esp_spp_cb_param_t
#include <esp_spp_api.h> SPP callback parameters union.

Public Members

struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

esp_spp_status_t status
status

uint32_t handle
The connection handle

2.1. Bluetooth API 275
uint8_t sec_id
    security ID used by this server

bool use_co
    TRUE to use co_rfc_data

struct spp_close_evt_param

```

```c

uint32_t handle
```

The connection handle

```c

uint32_t new_listen_handle
```

The new listen handle

```c

int fd
```

The file descriptor only for ESP_SPP_MODE_VFS

```c

esp_bd_addr_t rem_bda
```

The peer address

```c

struct `spp_start_evt_param`

```
```c
#include <esp_spp_api.h> ESP_SPP_START_EVT.
```

2.1. Bluetooth API
Public Members

```c
esp_spp_status_t status
```

- `status`:

```c
uint32_t handle
```
- Handle:

```c
uint8_t sec_id
```
- Security ID used by this server:

```c
bool use_co
```
- TRUE to use co_rfc_data:

```c
struct spp_write_evt_param
```
- Include `<esp_spp_api.h>` ESP_SPP_WRITE_EVT.

Public Members

```c
esp_spp_status_t status
```

- `status`:

```c
uint32_t handle
```
- Handle:

```c
int len
```
- Length of the data written:

```c
bool cong
```
- Congestion status

Macros

```c
ESP_SPP_SEC_NONE
```
- No security, relate to BTA_SEC_NONE in bta/bta_api.h

```c
ESP_SPP_SEC_AUTHORIZE
```
- Authorization required (only needed for outgoing connection), relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

```c
ESP_SPP_SEC_AUTHENTICATE
```
- Authentication required, relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

```c
ESP_SPP_SEC_ENCRYPT
```
- Encryption required, relate to BTA_SEC_ENCRYPT in bta/bta_api.h

```c
ESP_SPP_SEC_MODE4_LEVEL4
```
- Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

```c
ESP_SPP_SEC_MITM
```
- Man-In-The-Middle protection, relate to BTA_SEC_MITM in bta/bta_api.h

```c
ESP_SPP_SEC_IN_16_DIGITS
```
- Min 16 digit for pin code, relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

```c
ESP_SPP_MAX_MTU
```
- SPP max MTU
ESP_SPP_MAX_SCN
SPP max SCN

Type Definitions

typedef uint16_t esp_spp_sec_t
typedef void() esp_spp_cb_t(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)

SPP callback function type.

Parameters

• event: Event type
• param: Point to callback parameter, currently is union type

Enumerations

defined esp_spp_status_t

Values:

ESP_SPP_SUCCESS = 0
Successful operation.

ESP_SPP_FAILURE
Generic failure.

ESP_SPP_BUSY
Temporarily can not handle this request.

ESP_SPP_NO_DATA
no data.

ESP_SPP_NO_RESOURCE
No more set pm control block

defined esp_spp_role_t

Values:

ESP_SPP_ROLE_MASTER = 0
Role: master

ESP_SPP_ROLE_SLAVE = 1
Role: slave

defined esp_spp_mode_t

Values:

ESP_SPP_MODE_CB = 0
When data is coming, a callback will come with data

ESP_SPP_MODE_VFS = 1
Use VFS to write/read data

defined esp_spp_cb_event_t

SPP callback function events.

Values:

2.1. Bluetooth API
ESP_SPP_INIT_EVT = 0
  When SPP is initied, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
  When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
  When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
  When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
  When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
  When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
  When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
  When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
  When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
  When SPP Server connection open, the event comes

BTC_HF_CALL_END_TIMEOUT
BTC_HF_INVALID_IDX

Type Definitions

typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)
Callback for connection state change. state will have one of the values from BtHfConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)
Callback for audio connection state change. state will have one of the values from BtHfAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)
Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)
Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char *number, esp_bd_addr_t *bd_addr)
Callback for dialing an outgoing call. If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)
Callback for sending DTMF tones. tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)
Callback for enabling/disabling noise reduction/echo cancellation. value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)
Callback for AT+BCS and event from BAC. WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)
Callback for call hold handling (AT+CHLD). value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)
Callback for unknown AT command recd from AG. at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)
Callback for keypressed (HSP) event.
Enumerations

```c
enum esp_hf_in_band_ring_state_t
    in-band ring tone state

    Values:

    ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0
    ESP_HF_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_vr_state_t
    voice recognition state

    Values:

    ESP_HF_VR_STATE_DISABLED = 0
    voice recognition disabled
    ESP_HF_VR_STATE_ENABLED
    voice recognition enabled

enum esp_hf_volume_control_target_t
    Bluetooth HFP audio volume control target.

    Values:

    ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
    speaker
    ESP_HF_VOLUME_CONTROL_TARGET_MIC
    microphone

enum esp_hf_audio_state_t
    Bluetooth HFP audio connection status.

    Values:

    ESP_HF_AUDIO_STATE_DISCONNECTED = 0
    audio connection released
    ESP_HF_AUDIO_STATE_CONNECTING
    audio connection has been initiated
    ESP_HF_AUDIO_STATE_CONNECTED
    audio connection is established
    ESP_HF_AUDIO_STATE_CONNECTED_MSBC
    mSBC audio connection is established

enum esp_hf_volume_type_t
    Values:

    ESP_HF_VOLUME_TYPE_SPK = 0
    ESP_HF_VOLUME_TYPE_MIC

enum esp_hf_network_state_t
    +CIND network service availability status

    Values:

    ESP_HF_NETWORK_STATE_NOT_AVAILABLE = 0
    ESP_HF_NETWORK_STATE_AVAILABLE
```
enum esp_hf_service_type_t
+CIEV Service type

Values:

ESP_HF_SERVICE_TYPE_HOME = 0
ESP_HF_SERVICE_TYPE_ROAMING

enum esp_hf_call_status_t
+CIND call status indicator values

Values:

ESP_HF_CALL_STATUS_NO_CALLS = 0
no call in progress
ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
call is present(active or held)

enum esp_hf_call_setup_status_t
+CIND call setup status indicator values

Values:

ESP_HF_CALL_SETUP_STATUS_IDLE = 0
no call setup in progress
ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
incoming call setup in progress
ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
outgoing call setup in dialing state
ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
outgoing call setup in alerting state

enum esp_hf_roaming_status_t
+CIND roaming status indicator values

Values:

ESP_HF_ROAMING_STATUS_INACTIVE = 0
roaming is not active
ESP_HF_ROAMING_STATUS_ACTIVE
a roaming is active

enum esp_hf_call_held_status_t
+CIND call held indicator values

Values:

ESP_HF_CALL_HELD_STATUS_NONE = 0
no calls held
ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE = 1
both active and held call
ESP_HF_CALL_HELD_STATUS_HELD = 2
call on hold, no active call

enum esp_hf_current_call_status_t
+CLCC status of the call

Values:
ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
active

ESP_HF_CURRENT_CALL_STATUS_HELD = 1
held

ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
dialing (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS_ALERTING = 3
alerting (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS_INCOMING = 4
incoming (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
waiting (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD = 6
call held by response and hold

define enum esp_hf_current_call_direction_t
+CLCC direction of the call
Values:

ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
outgoing

ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
incoming

define enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag
Values:

ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
not a member of a multi-party call

ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
member of a multi-party call

define enum esp_hf_current_call_mode_t
+CLCC call mode
Values:

ESP_HF_CURRENT_CALL_MODE_VOICE = 0
ESP_HF_CURRENT_CALL_MODE_DATA = 1
ESP_HF_CURRENT_CALL_MODE_FAX = 2

define enum esp_hf_call_addr_type_t
+CLCC address type
Values:

ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
unknown address type

ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
international address

284 Chapter 2. API Reference
enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number

Values:

ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
unknown

ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
voice service

ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
fax service

enum esp_hf_btrh_status_t
+BTRH response and hold result code

Values:

ESP_HF_BTRH_STATUS_HELD = 0
incoming call is put on held in AG

ESP_HF_BTRH_STATUS_ACCEPTED
held incoming call is accepted in AG

ESP_HF_BTRH_STATUS_REJECTED
held incoming call is rejected in AG

enum esp_hf_btrh_cmd_t
AT+BTRH response and hold action code.

Values:

ESP_HF_BTRH_CMD_HOLD = 0
put the incoming call on hold

ESP_HF_BTRH_CMD_ACCEPT = 1
accept a held incoming call

ESP_HF_BTRH_CMD_REJECT = 2
reject a held incoming call

enum esp_hf_nrec_t

Values:

ESP_HF_NREC_STOP = 0

ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t
+COWA response status

Values:

ESP_HF_CALL_WAITING_INACTIVE

ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t

Values:

ESP_HF_WBS_NONE

ESP_HF_WBS_NO

ESP_HF_WBS_YES
enum esp_hf_connection_state_t
  Bluetooth HFP RFCOMM connection and service level connection status.

Values:

ESP_HF_CONNECTION_STATE_DISCONNECTED = 0
  RFCOMM data link channel released

ESP_HF_CONNECTION_STATE_CONNECTING
  connecting remote device on the RFCOMM data link

ESP_HF_CONNECTION_STATE_CONNECTED
  RFCOMM connection established

ESP_HF_CONNECTION_STATE_SLC_CONNECTED
  service level connection established

ESP_HF_CONNECTION_STATE_DISCONNECTING
  disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t
  AT+CHLD command values.

Values:

ESP_HF_CHLD_TYPE_REL = 0
  <0>, Terminate all held or set UDUB(“busy”) to a waiting call

ESP_HF_CHLD_TYPE_REL_ACC
  <1>, Terminate all active calls and accepts a waiting/held call

ESP_HF_CHLD_TYPE_HOLD_ACC
  <2>, Hold all active calls and accepts a waiting/held call

ESP_HF_CHLD_TYPE_MERGE
  <3>, Add all held calls to a conference

ESP_HF_CHLD_TYPE_MERGE_DETACH
  <4>, connect the two calls and disconnects the subscriber from both calls

ESP_HF_CHLD_TYPE_REL_X
  <1x>, releases specified calls only

ESP_HF_CHLD_TYPE_PRIV_X
  <2x>, request private consultation mode with specified call

enum esp_hf_at_response_code_t
  Values:

ESP_HF_AT_RESPONSE_CODE_OK = 0
  acknowledges execution of a command line

ESP_HF_AT_RESPONSE_CODE_ERR
  command not accepted

ESP_HF_AT_RESPONSE_CODE_NO CARRIER
  connection terminated

ESP_HF_AT_RESPONSE_CODE_BUSY
  busy signal detected

ESP_HF_AT_RESPONSE_CODE_NO ANSWER
  connection completion timeout
ESP_HF_AT_RESPONSE_CODE_DELAYED
    delayed
ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
    blacklisted
ESP_HF_AT_RESPONSE_CODE_CME
    CME error

enum esp_hf_at_response_t
Values:
    ESP_HF_AT_RESPONSE_ERROR = 0
    ESP_HF_AT_RESPONSE_OK

enum esp_hf_cme_err_t
    Extended Audio Gateway Error Result Code Response.
Values:
    ESP_HF_CME_AG_FAILURE = 0
        ag failure
    ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
        no connection to phone
    ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
        operation not allowed
    ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
        operation not supported
    ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
        PH-SIM PIN Required
    ESP_HF_CME_SIM_NOT_INSERTED = 10
        SIM not inserted
    ESP_HF_CME_SIM_PIN_REQUIRED = 11
        SIM PIN required
    ESP_HF_CME_SIM_PUK_REQUIRED = 12
        SIM PUK required
    ESP_HF_CME_SIM_FAILURE = 13
        SIM failure
    ESP_HF_CME_SIM_BUSY = 14
        SIM busy
    ESP_HF_CME_INCORRECT_PASSWORD = 16
        incorrect password
    ESP_HF_CME_SIM_PIN2_REQUIRED = 17
        SIM PIN2 required
    ESP_HF_CME_SIM_PUK2_REQUIRED = 18
        SIM PUK2 required
    ESP_HF_CME_MEMORY_FULL = 20
        memory full
    ESP_HF_CME_INVALID_INDEX = 21
        invalid index
ESP_HF_CME_MEMORY_FAILURE = 23
memory failure

ESP_HF_CME_TEXT_STRING_TOO_LONG = 24
text string too long

ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING = 25
invalid characters in text string

ESP_HF_CME_DIAL_STRING_TOO_LONG = 26
dial string too long

ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING = 27
invalid characters in dial string

ESP_HF_CME_NO_NETWORK_SERVICE = 30
no network service

ESP_HF_CME_NETWORK_TIMEOUT = 31
network timeout

ESP_HF_CME_NETWORK_NOT_ALLOWED = 32
network not allowed emergency calls only

HFP CLIENT API

Overview

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_hf_client_api.h

Functions

`esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)`
Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully, used by HFP client.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- callback: HFP client event callback function

`esp_err_t esp_hf_client_init (void)`
Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.
De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_hf_client_deinit (void)
```

Connect to remote Bluetooth HFP audio gateway (AG) device, must after esp_hf_client_init().

Return

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote Bluetooth device address

```
esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)
```

Disconnect from the remote HFP audio gateway.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote Bluetooth device address

```
esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)
```

Create audio connection with remote HFP AG. As a precondition to use this API, the Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote Bluetooth device address

```
esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)
```
- remote_bda: remote bluetooth device address

```c
esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)
```

Release the established audio connection with remote HFP AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_bda: remote bluetooth device address

```c
esp_err_t esp_hf_client_start_voice_recognition(void)
```

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_stop_voice_recognition(void)
```

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)
```

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- type: volume control target, speaker or microphone
- volume: gain of the speaker or microphone, ranges 0 to 15

```c
esp_err_t esp_hf_client_dial(const char *number)
```

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.
Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- number: number string of the call. If NULL, the last number is called(aka re-dial)

`esp_err_t esp_hf_client_dial_memory (int location)`

Place a call with number specified by location(speed dial). As a precondition, to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- location: location of the number in the memory

`esp_err_t esp_hf_client_send_chld_cmd (esp_hf_chld_type_t chld, int idx)`

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- chld: AT+CHLD call hold and multiparty handling AT command.
- idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

`esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)`

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- btrh: response and hold action to send
**esp_err_t esp_hf_client_answer_call (void)**

Answer an incoming call (send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_reject_call (void)**

Reject an incoming call (send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_query_current_calls (void)**

Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_query_current_operator_name (void)**

Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_retrieve_subscriber_info (void)**

Get subscriber information number from AG (send AT+CNUM command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
esp_err_t esp_hf_client_send_dtmf(char code)
Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• code: dtmf code, single ascii character in the set 0-9, #, *, A-D

esp_err_t esp_hf_client_request_last_voice_tag_number(void)
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_send_nrec(void)
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: NREC=0 request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_register_data_callback(esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

Return
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters
• recv: HFP client incoming data callback function
• send: HFP client outgoing data callback function

void esp_hf_client_outgoing_data_ready(void)
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.
void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

Parameters
- src_sps: original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- bits: number of bits per pcm sample (16)
- channels: number of channels (i.e. mono(1), stereo(2)...) 

void esp_hf_client_pcm_resample_deinit (void)
Deinitialize the down sampling converter.

int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)
Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

Return number of samples converted

Parameters
- src: pointer to the buffer where the original sampling PCM are stored
- in_bytes: length of the input PCM sample buffer in byte
- dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions

union esp_hf_client_cb_param_t
#include <esp_hf_client_api.h> HFP client callback parameters.

    phone number (optional)
```

### struct hf_client_clip_param

```c
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLIP_EVT.
```

Public Members

```
const char *number
    phone number string of call
```

### struct hf_client_cnum_param

```c
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CNUM_EVT.
```
Public Members

`const char *number`  
phone number string

`esp_hf_subscriber_service_type_t type`  
service type that the phone number relates to

```c
struct hf_client_conn_stat_param
```

#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CONNECTION_STATE_EVT.

Public Members

```c
esp_hf_client_connection_state_t state`  
HF connection state

`uint32_t peer_feat`  
AG supported features

`uint32_t chld_feat`  
AG supported features on call hold and multiparty services

```c
esp_bd_addr_t remote_bda`  
remote bluetooth device address
```

```c
struct hf_client_current_operator_param
```

#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT.

Public Members

```c
const char *name`  
name of the network operator
```

```c
struct hf_client_network_roaming_param
```

#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT.

Public Members

```c
esp_hf_roaming_status_t status`  
roaming status
```

```c
struct hf_client_service_availability_param
```

#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT.

Public Members

```c
esp_hf_network_state_t status`  
service availability status
```

```c
struct hf_client_signal_strength_ind_param
```

#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT.
Public Members

int value
signal strength value, ranges from 0 to 5

struct hf_client_volume_control_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_VOLUME_CONTROL_EVT.

Public Members

esp_hf_volume_control_target_t type
volume control target, speaker or microphone

int volume
gain, ranges from 0 to 15

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.
Parameters

- `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- `len`: size (in bytes) in `buf`

```c
typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
```

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Parameters

- `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- `len`: size (in bytes) in `buf`
- `length`: of data successfully read

```c
typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
```

HFP client callback function type.

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```c
typedef enum esp_hf_client_connection_state_t
```

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED` = 0
  - RFCOMM data link channel released
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING`
  - connecting remote device on the RFCOMM data link
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED`
  - RFCOMM connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED`
  - service level connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING`
  - disconnecting with remote device on the RFCOMM data link

```c
typedef enum esp_hf_client_audio_state_t
```

Bluetooth HFP audio connection status.

Values:

- `ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED` = 0
  - audio connection released
ESP_HF_CLIENT_AUDIO_STATE_CONNECTING
  audio connection has been initiated

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
  audio connection is established

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
  mSBC audio connection is established

enum esp_hf_client_in_band_ring_state_t
  in-band ring tone state

  Values:

  ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0
  ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_client_cb_event_t
  HF CLIENT callback events.

  Values:

  ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
    connection state changed event
  ESP_HF_CLIENT_AUDIO_STATE_EVT
    audio connection state change event
  ESP_HF_CLIENT_BVRA_EVT
    voice recognition state change event
  ESP_HF_CLIENT_CIND_CALL_EVT
    call indication
  ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
    call setup indication
  ESP_HF_CLIENT_CIND_CALL_HELD_EVT
    call held indication
  ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
    network service availability indication
  ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
    signal strength indication
  ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
    roaming status indication
  ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
    battery level indication
  ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
    current operator information
  ESP_HF_CLIENT_BTRH_EVT
    call response and hold event
  ESP_HF_CLIENT_CLIP_EVT
    Calling Line Identification notification
  ESP_HF_CLIENT_CCWA_EVT
    call waiting notification

2.1. Bluetooth API
ESP_HF_CLIENT_CLCC_EVT
   list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL_EVT
   audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
   AT command response event

ESP_HF_CLIENT_CNUM_EVT
   subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
   setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
   requested number of last voice tag from AG

ESP_HF_CLIENT_RING_IND_EVT
   ring indication event

HFP AG API

Overview

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_hf_ag_api.h

Functions

esp_err_t esp.bt.hf_register_callback (esp_hf_cb_t callback)
   Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully, used by HFP AG.

   Return

   - ESP_OK: success
   - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
   - ESP_FAIL: if callback is a NULL function pointer

   Parameters

   - callback: HFP AG event callback function

esp.err_t esp.bt.hf_init (esp_bd_addr_t remote_addr)
   Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

   Return
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_addr: remote bluetooth device address

```c
esp_err_t esp_bt_hf_deinit (esp_bd_addr_t remote_addr)
```

De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_addr: remote bluetooth device address

```c
esp_err_t esp_bt_hf_connect (esp_bd_addr_t remote_bda)
```

Connect to remote bluetooth HFP client device, must after esp_bt_hf_init()

**Return**

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_bda: remote bluetooth HFP client device address

```c
esp_err_t esp_bt_hf_disconnect (esp_bd_addr_t remote_bda)
```

Disconnect from the remote HFP client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_bda: remote bluetooth device address

```c
esp_err_t esp_bt_hf_connect_audio (esp_bd_addr_t remote_bda)
```

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist between HF client and AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address

esp_err_t esp_bt_hf_disconnect_audio(esp_bd_addr_t remote_bda)
Release the established audio connection with remote HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address

esp_err_t esp_bt_hf_vra(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)
Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: volume control target, speaker or microphone
• value: gain of the speaker of microphone, ranges 0 to 15

esp_err_t esp_bt_hf_volume_control(esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)
Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address
• type: volume control target, speaker or microphone
• volume: gain of the speaker of microphone, ranges 0 to 15

esp_err_t esp_hf_unat_response (esp_bd_addr_t remote_addr, char *unat)
Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.
Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- unat: AT command string from HF Client

```c
esp_err_t esp_bt_hf_cmee_response(esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)
```

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote bluetooth device address
- response_code: AT command response code
- error_code: CME error code

```c
esp_err_t esp_bt_hf_indchange_notification(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)
```

Usolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- call_state: call state
- call_setup_state: call setup state
- ntk_state: network service state
- signal: signal strength from 0 to 5
```c
esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state,
                                 esp_hf_call_setup_status_t call_setup_state,
                                 esp_hf_network_state_t ntk_state, int signal,
                                 esp_hf_roaming_status_t roam, int batt_lev,
                                 esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level
Connection shall exist between AG and HF Client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_addr: remote bluetooth device address
- call_state: call state
- call_setup_state: call setup state
- ntk_state: network service state
- signal: signal strength from 0 to 5
- roam: roam state
- batt_lev: battery level from 0 to 5
- call_held_status: call held status

```c
esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)
```

Reponse for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection
shall exist with HFP Client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- remote_addr: remote bluetooth device address
- name: current operator name

```c
esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index,
                                   esp_hf_current_call_direction_t dir,
                                   esp_hf_current_call_status_t current_call_state,
                                   esp_hf_current_call_mode_t mode,
                                   esp_hf_current_call_mpty_type_t mpty, char *number,
                                   esp_hf_call_addr_type_t type)
```

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection
shall exist between AG and HF Client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• index: the index of current call
• dir: call direction (incoming/outgoing)
• current_call_state: current call state
• mode: current call mode (voice/data/fax)
• mpty: single or multi type
• number: current call number
• type: international type or unknow

```c
esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number, esp_hf_subscriber_service_type_t type)
```

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• number: registration number
• type: service type (unknown/voice/fax)

```c
esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)
```

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• state: in-band ring tone state
**esp_err_t esp_bt_hf_answer_call**

```
esp_err_t esp_bt_hf_answer_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                                esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                                char *number, esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- remote_addr: remote bluetooth device address
- num_active: the number of active call
- num_held: the number of held call
- call_state: call state
- call_setup_state: call setup state
- number: number of the incoming call
- call_addr_type: call address type

**esp_err_t esp_bt_hf_reject_call**

```
esp_err_t esp_bt_hf_reject_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                                esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                                char *number, esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- remote_addr: remote bluetooth device address
- num_active: the number of active call
- num_held: the number of held call
- call_state: call state
- call_setup_state: call setup state
- number: number of the incoming call
- call_addr_type: call address type
**esp_err_t esp_bt_hf_out_call**

```c
esp_err_t esp_bt_hf_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                           esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                           char *number, esp_hf_call_addr_type_t call_addr_type)
```

Reject incoming call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- **ESP_OK**: disconnect request is sent to lower layer
- **ESP_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

**Parameters**

- `remote_addr`: remote bluetooth device address
- `num_active`: the number of active call
- `num_held`: the number of held call
- `call_state`: call state
- `call_setup_state`: call setup state
- `number`: number of the outgoing call
- `call_addr_type`: call address type

**esp_err_t esp_bt_hf_end_call**

```c
esp_err_t esp_bt_hf_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                           esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                           char *number, esp_hf_call_addr_type_t call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- **ESP_OK**: disconnect request is sent to lower layer
- **ESP_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

**Parameters**

- `remote_addr`: remote bluetooth device address
- `num_active`: the number of active call
- `num_held`: the number of held call
- `call_state`: call state
- `call_setup_state`: call setup state
- `number`: number of the call
- `call_addr_type`: call address type

**esp_err_t esp_bt_hf_register_data_callback**

```c
esp_err_t esp_bt_hf_register_data_callback(esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)
```

Register AG data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters
• recv: HFP client incoming data callback function
• send: HFP client outgoing data callback function

void `esp_hf_outgoing_data_ready` (void)
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

Unions

union esp_hf_cb_param_t

Type Definitions

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters

- buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- len: size(in bytes) in buf
typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Parameters

- buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- len: size(in bytes) in buf
- length: of data successfully read

typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)
HF AG callback function type.

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

enum esp_hf_cb_event_t
HF callback events.

Values:

ESP_HF_CONNECTION_STATE_EVT = 0
Connection state changed event

ESP_HF_AUDIO_STATE_EVT
Audio connection state change event

ESP_HF_BVRA_RESPONSE_EVT
Voice recognition state change event

ESP_HF_VOLUME_CONTROL_EVT
Audio volume control command from HF Client, provided by +VGM or +VGS message

ESP_HF_UNAT_RESPONSE_EVT
Unknown AT cmd Response

ESP_HF_IND_UPDATE_EVT
Indicator Update Event

ESP_HF_CIND_RESPONSE_EVT
Call And Device Indicator Response

ESP_HF_COPS_RESPONSE_EVT
Current operator information

ESP_HF_CLCC_RESPONSE_EVT
List of current calls notification

ESP_HF_CNUM_RESPONSE_EVT
Subscriber information response from HF Client
**ESP_HF_VTS_RESPONSE_EVT**
Enable or not DTMF

**ESP_HF_NREC_RESPONSE_EVT**
Enable or not NREC

**ESP_HF_ATA_RESPONSE_EVT**
Answer an Incoming Call

**ESP_HF_CHUP_RESPONSE_EVT**
Reject an Incoming Call

**ESP_HF_DIAL_EVT**
Origin an outgoing call with specific number or the dial the last number

**ESP_HF_WBS_RESPONSE_EVT**
Codec Status

**ESP_HF_BCS_RESPONSE_EVT**
Final Codec Choice

### 2.1.5 NimBLE-based host APIs

**Overview**

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

**Architecture**

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

**Fig. 1: ESP NimBLE Stack**
Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, an additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*. Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- *bt/host/nimble/esp-hci/include/esp_nimble_hci.h*

Functions

```c
esp_err_t esp_nimble_hci_init (void)
```

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_and_controller_init (void)
```

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.
Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();
//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit` (void)
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with error:", ret);
    }
}```
If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**Macros**

```
BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO
BLE_HCI_UART_H4_EVT
```

### 2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *Getting Started with ESP-BLE-MESH*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH Architecture*.

**Application Examples and Demos**

Please refer to Sections *ESP-BLE-MESH Examples* and *ESP-BLE-MESH Demo Videos*.

**API Reference**

ESP-BLE-MESH APIs are divided into the following parts:

- *ESP-BLE-MESH Definitions*
- *ESP-BLE-MESH Core API Reference*
- *ESP-BLE-MESH Models API Reference*
ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

```

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT.

### Public Members

```c
uint8_t dev_uuid[16]
```
Device UUID of the unprovisioned device

```c
esp_ble_mesh_bd_addr_t addr
```
Device address of the unprovisioned device

```c
esp_ble_mesh_addr_type_t addr_type
```
Device address type

```c
uint16_t oob_info
```
OOB Info of the unprovisioned device

```c
uint8_t adv_type
```
Advertising type of the unprovisioned device

```c
esp_ble_mesh_prov_bearer_t bearer
```
Bearer of the unprovisioned device

### Public Members

```c
int err_code
```
Indicate the result of setting Device UUID match value by the Provisioner

### Public Members

```c
int err_code
```
Indicate the result of setting provisioned device name by the Provisioner

```c
int node_index
```
Index of the provisioned device

### Public Members

```c
int err_code
```
Indicate the result of setting provisioning info by the Provisioner

        Device address
    esp_ble_mesh_addr_type_t addr_type
        Device address type
    uint16_t net_idx
        Network ID related NetKey Index
    uint8_t net_id[8]
        Network ID contained in the advertising packet

struct ble_mesh_proxy_client_recv_filter_status_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT.

Public Members

    uint8_t conn_handle
        Proxy connection handle
    uint16_t server_addr
        Proxy Server primary element address
    uint16_t net_idx
        Corresponding NetKey Index
    uint8_t filter_type
        Proxy Server filter type(whitelist or blacklist)
uint16_t list_size
    Number of addresses in the Proxy Server filter list

struct ble_mesh_proxy_client_remove_filter_addr_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT.

Public Members

int err_code
    Indicate the result of Proxy Client remove filter address

uint8_t conn_handle
    Proxy connection handle

uint16_t net_idx
    Corresponding NetKey Index

struct ble_mesh_proxy_client_set_filter_type_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT.

Public Members

int err_code
    Indicate the result of Proxy Client set filter type

uint8_t conn_handle
    Proxy connection handle

uint16_t net_idx
    Corresponding NetKey Index

struct ble_mesh_proxy_gatt_disable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT.

Public Members

int err_code
    Indicate the result of disabling Mesh Proxy Service

struct ble_mesh_proxy_gatt_enable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT.

Public Members

    Indicate the result of enabling Mesh Proxy Service

struct ble_mesh_proxy_identity_enable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT.
Public Members

- int `err_code`
  Indicate the result of enabling Mesh Proxy advertising

```c
struct ble_mesh_set_fast_prov_action_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.
```

Public Members

- uint8_t `status_action`
  Indicate the result of setting action of fast provisioning

```c
struct ble_mesh_set_fast_prov_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.
```

Public Members

- uint8_t `status_unicast`
  Indicate the result of setting unicast address range of fast provisioning

- uint8_t `status_net_idx`
  Indicate the result of setting NetKey Index of fast provisioning

- uint8_t `status_match`
  Indicate the result of setting matching Device UUID of fast provisioning

```c
struct ble_mesh_set_oob_pub_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.
```

Public Members

- int `err_code`
  Indicate the result of setting OOB Public Key

```c
struct ble_mesh_set_unprov_dev_name_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.
```

Public Members

- int `err_code`
  Indicate the result of setting BLE Mesh device name

```c
union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.
```

Public Members

- uint8_t `onoff`
  The value of the Generic OnOff state
  The value of the Light LC Light OnOff state
struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onoff
  The Generic OnOff state

int16_t level
  The value of the Generic Level state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_level
  The Generic Level state

uint8_t onpowerup
  The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onpowerup
  The Generic OnPowerUp state

uint16_t power
  The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
  The Generic Power Actual state

uint16_t lightness
  The value of the Light Lightness Actual state
  The value of the Light Lightness Linear state
  The value of the Light CTL Lightness state
  The value of the Light HSL Lightness state
  The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
  The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
  The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
  The Light CTL Lightness state

uint16_t temperature
  The value of the Light CTL Temperature state

int16_t delta_uv
  The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
  The Light CTL Temperature & Delta UV states

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
  The Light HSL Lightness state

uint16_t hue
  The value of the Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
  The Light HSL Hue state

uint16_t saturation
  The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
  The Light HSL Saturation state
```c
struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
   The Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
   The Light LC Light OnOff state
```

```c
union esp_ble_mesh_model_cb_param_t
   #include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
   Event parameter of ESP_BLE_MESH_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
   Event parameter of ESP_BLE_MESH_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
   Event parameter of ESP_BLE_MESH_PUBLISH_COMP_EVT

   Event parameter of ESP_BLE_MESH_SERVER_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode
   Opcode of the previously sent message

esp_ble_mesh_model_t *model
   Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
   Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode
   Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
   Pointer to the model which receives the message
```

2.1. Bluetooth API
Read the Docs Template Documentation, Release v4.1-dev-2071-gf91080637

```c
esp_ble_mesh_msg_ctx_t *ctx
   Pointer to the context of the message
uint16_t length
   Length of the received message
uint8_t *msg
   Value of the received message
```

```c
struct ble_mesh_model_operation_evt_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t opcode
   Opcode of the recieved message
esp_ble_mesh_model_t *model
   Pointer to the model which receives the message
esp_ble_mesh_msg_ctx_t *ctx
   Pointer to the context of the received message
uint16_t length
   Length of the received message
uint8_t *msg
   Value of the received message
```

```c
struct ble_mesh_model_publish_comp_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
   Indicate the result of publishing a message
esp_ble_mesh_model_t *model
   Pointer to the model which publishes the message
```

```c
struct ble_mesh_model_publish_update_evt_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
   Pointer to the model which is going to update its publish message
```

```c
struct ble_mesh_model_send_comp_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
   Indicate the result of sending a message
uint32_t **opcode
  Opcode of the message

*esp_ble_mesh_model_t* **model
  Pointer to the model which sends the message

*esp_ble_mesh_msg_ctx_t* **ctx
  Context of the message

```
struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
```

**Public Members**

```
int **err_code
  Indicate the result of updating server model state

*esp_ble_mesh_model_t* **model
  Pointer to the server model which state value is updated

*esp_ble_mesh_server_state_type_t* **type
  Type of the updated server state
```

**Structures**

```
struct esp_ble_mesh_elem_t
  Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h
```

**Public Members**

```
uint16_t **element_addr
  Element Address, assigned during provisioning.

const uint16_t **location
  Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count
  SIG Model count

const uint8_t **vnd_model_count
  Vendor Model count

*esp_ble_mesh_model_t* **sig_models
  SIG Models

*esp_ble_mesh_model_t* **vnd_models
  Vendor Models
```

```
struct esp_ble_mesh_model_pub_t
  Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h
```

2.1. Bluetooth API
### Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the model to which the context belongs. Initialized by the stack.

`uint16_t publish_addr`
- Publish Address.

`uint16_t app_idx`
- Publish AppKey Index.

`uint16_t cred`
- Friendship Credentials Flag.

`uint8_t ttl`
- Publish Time to Live.

`uint8_t retransmit`
- Retransmit Count & Interval Steps.

`uint8_t period`
- Publish Period.

`uint8_t period_div`
- Divisor for the Period.

`uint8_t fast_period`
- Use FastPeriodDivisor

`uint8_t count`
- Retransmissions left.

`uint32_t period_start`
- Start of the current period.

```c
struct net_buf_simple *msg
```
- Publication buffer, containing the publication message.
  - This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.
  - `ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

`esp_ble_mesh_pub_update`
- Callback used to update publish message. Initialized by the stack.

`uint8_t dev_role`
- Role of the device that is going to publish messages

```c
struct k_delayed_work timer
```
- Publish Period Timer. Initialized by the stack.

```c
struct esp_ble_mesh_model_op_t
```
- Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

### Public Members

`const uint32_t opcode`
- Message opcode
const size_t min_len
Message minimum length

esp_ble_mesh_cb_t param_cb
Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage. Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.

uint16_t recv_dst
Destination address of a received message. Not used for sending.

int8_t recv_rssi
RSSI of received packet. Not used for sending.
uint8_t recv_ttl
    Received TTL value. Not used for sending.

uint8_t send_rel
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

public Members

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

public Members

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer
    Provisioning Bearer
struct esp_ble_mesh_device_delete_t
   Information of the device which is going to be deleted.

   **Public Members**

   * esp_ble_mesh_bd_addr_t addr
     Device address

   * esp_ble_mesh_addr_type_t addr_type
     Device address type

   * uint8_t uuid[16]
     Device UUID

   * uint8_t flag
     BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t
   Information of the provisioner which is going to be updated.

   **Public Members**

   * uint16_t net_idx
     NetKey Index

   * uint8_t flags
     Flags

   * uint32_t iv_index
     IV Index

   * uint8_t flag
     BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

   **Public Members**

   * uint16_t unicast_min
     Minimum unicast address used for fast provisioning

   * uint16_t unicast_max
     Maximum unicast address used for fast provisioning

   * uint16_t net_idx
     Netkey index used for fast provisioning

   * uint8_t flags
     Flags used for fast provisioning

   * uint32_t iv_index
     IV Index used for fast provisioning

   * uint8_t offset
     Offset of the UUID to be compared

   * uint8_t match_len
     Length of the UUID to be compared

2.1. Bluetooth API
uint8_t match_val[16]
Value of UUID to be compared

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

estp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.

Public Members

estp_ble_mesh_opcode_t opcode
Message opcode

estp_ble_mesh_model_t *model
Pointer to the client model structure

esp_ble_mesh_msg_ctx_t ctx
The context used to send message

int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
Role of the device - Node/Provisioner
struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to
ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the
users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool just_started
Indicate if the state transition has just started

uint8_t trans_time
State transition time

uint8_t remain_time
Remaining time of state transition

uint8_t delay
Delay before starting state transition

uint32_t quo_tt
Duration of each divided transition step

uint32_t counter
Number of steps which the transition duration is divided

uint32_t total_duration
State transition total duration

int64_t start_timestamp
Time when the state transition is started

struct k_delayed_work timer
Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
Parameters of the server model received last same set message.

Public Members

uint8_t tid
Transaction number of the last message

uint16_t src
Source address of the last message

uint16_t dst
Destination address of the last message

int64_t timestamp
Time when the last message is received

2.1. Bluetooth API
struct esp_ble_mesh_server_rsp_ctrl_t
Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp
BLE Mesh Server Response Option.

1. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get
   messages need to be replied by the application;
2. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get
   messages will be replied by the server models;
3. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set
   messages need to be replied by the application;
4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set
   messages will be replied by the server models;
5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server
   Status messages need to be replied by the application;
6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server
   Status messages will be replied by the server models;Response control for Client Get messages

uint8_t set_auto_rsp
Response control for Client Set messages

uint8_t status_auto_rsp
Response control for Server Status messages

Macros

ESP_BLE_HOST_STATUS_ENABLED
ESP_BLE_HOST_STATUS_CHECK (status)
The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC

ESP_BLE_MESH_SDU_MAX_LEN
The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN
The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN
ESP_BLE_MESH_OCTET8_LEN
ESP_BLE_MESH_ADDR_UNASSIGNED
ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
    Encode transmission count & interval steps.

2.1. Bluetooth API
Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90 ms (count is 3, step is 1, interval is 30 ms which includes 10 ms of advertising interval random delay).

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters

- count: Number of retransmissions (first transmission is excluded).
- int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)
Decode transmit count from a transmit value.

Return Transmission count (actual transmissions equal to N + 1).

Parameters

- transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decode transmit interval from a transmit value.

Return Transmission interval in milliseconds.

Parameters

- transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encode Publish Retransmit count & interval steps.

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters

- count: Number of retransmissions (first transmission is excluded).
- int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)
Decode Publish Retransmit count from a given value.

Return Retransmission count (actual transmissions equal to N + 1).

Parameters

- transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Return Transmission interval in milliseconds.

Parameters

- transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_MODEL_OP_1 (b0)
ESP_BLE_MESH_MODEL_OP_2 (b0, b1)
ESP_BLE_MESH_MODEL_OP_3 (b0, cid)
This macro is associated with BLE_MESH_MODEL in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.
In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note  This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
• _loc: Location Descriptor.
• _mods: Array of SIG models.
• _vnd_mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_MODEL_PUBLIC_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
• _name: Variable name given to the context.
• _msg_len: Length of the publication message.
• _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
• _opcode: Message opcode.
• _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

2.1. Bluetooth API
ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG
DEL_DEV_UUID_FLAG
PROV_DATA_NET_IDX_FLAG
PROV_DATA_FLAGS_FLAG
PROV_DATA_IV_INDEX_FLAG
ESP_BLE_MESH_MODEL_ID_CONFIG_SRV

Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t
    [ESP_BLE_MESH_OCTET16_LEN]  
    Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t
    [ESP_BLE_MESH_OCTET8_LEN]

typedef uint8_t esp_ble_mesh_octet.cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64

typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]

typedef uint8_t BD_ADDR[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t
    [BD_ADDR_LEN]

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
    esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
    esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
    esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t
    This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
    esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
    esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
    esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
    This typedef is only used to indicate the status code contained in some of the Generic Message Model messages.
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t
esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t
End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t
Values:

defined esp_ble_mesh_addr_type_t
BLE device address type.
Values:
ESP_BLE_MESH_ADDR_TYPE_PUBLIC = 0x00
ESP_BLE_MESH_ADDR_TYPE_RANDOM = 0x01
ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC = 0x02
ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM = 0x03

defined esp_ble_mesh_dev_role_t
Values:
ROLE_NODE = 0
ROLE_PROVISIONER
ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
Values:
  FAST_PROV_ACT_NONE
  FAST_PROV_ACT_ENTER
  FAST_PROV_ACT_SUSPEND
  FAST_PROV_ACT_EXIT
  FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
Values:
  PROXY_FILTER_WHITELIST
  PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
Values:
  ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
  Initialize BLE Mesh provisioning capabilities and internal data information completion event
  ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
  Set the unprovisioned device name completion event
  ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
  Enable node provisioning functionality completion event
  ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
  Disable node provisioning functionality completion event
  ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
  Establish a BLE Mesh link event
  ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
  Close a BLE Mesh link event
  ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
  Generate Node input OOB public key event
  ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
  Generate Node Output Number event
  ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
  Generate Node Output String event
  ESP_BLE_MESH_NODE_PROV_INPUT_EVT
  Event requiring the user to input a number or string
  ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
  Provisioning done event
  ESP_BLE_MESH_NODE_PROV_RESET_EVT
  Provisioning reset event
ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device if it exists and remove the device from network completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event
ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

2.1. Bluetooth API

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

Values:
ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states

Values:
ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:
ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
• Reading of Local Data Information
• Low Power Operation (Updating)
• Send/Publish Messages, add Local AppKey, etc.
• ESP-BLE-MESH Node/Provisioner Provisioning
• ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

• bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

\texttt{esp\_err\_t esp\_ble\_mesh\_init (esp\_ble\_mesh\_prov\_t *prov, esp\_ble\_mesh\_comp\_t *comp)}
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

\textbf{Note} After calling this API, the device needs to call esp\_ble\_mesh\_prov\_enable() to enable provisioning functionality again.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

• prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.

• comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.
Reading of Local Data Information

Header File

- bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
Get the model publish period, the unit is ms.

Return Publish period value on success, 0 or (negative) error code from errno.h on failure.

Parameters
- model: Model instance pointer.

uint16_t esp_ble_mesh_get_primary_element_address(void)
Get the address of the primary element.

Return Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)
Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Return Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

Parameters
- model: Pointer to the model.
- group_addr: Group address.

esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)
Find the BLE Mesh element pointer via the element address.

Return Pointer to the element on success, or NULL on failure.

Parameters
- element_addr: Element address.

uint8_t esp_ble_mesh_get_element_count(void)
Get the number of elements that have been registered.

Return Number of elements.
esp_ble_mesh_find_vendor_model

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Return Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

Parameters

- element: Element to which the model belongs.
- company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

esp_ble_mesh_find_sig_model

Find the SIG model with the given element and Model id.

Return Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

Parameters

- element: Element to which the model belongs.
- model_id: SIG model identifier.

esp_ble_mesh_get_composition_data

Get the Composition data which has been registered.

Return Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

Low Power Operation (Updating)

Header File

- bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

Functions

- esp_ble_mesh_lpn_enable
  Enable BLE Mesh device LPN functionality.
  
  Note This API enables LPN functionality. Once called, the proper Friend Request will be sent.
  
  Return ESP_OK on success or error code otherwise.

- esp_ble_mesh_lpn_disable
  Disable BLE Mesh device LPN functionality.
  
  Return ESP_OK on success or error code otherwise.

Parameters
• **force:** when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll (void)
```

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.

#### Header File

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h`

#### Functions

```c
esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)
```

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

#### Parameters

- **callback**: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)
```

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.
Parameters

• `data`: Pointer to the message data.
• `opcode`: The message opcode.

```c
esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)
```

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t_`) of the client model need to be initialized.

Return ESP_OK on success or error code otherwise.

Parameters

• `model`: BLE Mesh Client model to which the message belongs.

```c
esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model,
                                       esp_ble_mesh_msg_ctx_t *ctx,
                                       uint32_t opcode,
                                       uint16_t length,
                                       uint8_t *data)
```

Send server model messages (such as server model status messages).

Return ESP_OK on success or error code otherwise.

Parameters

• `model`: BLE Mesh Server Model to which the message belongs.
• `ctx`: Message context, includes keys, TTL, etc.
• `opcode`: Message opcode.
• `length`: Message length (exclude the message opcode).
• `data`: Parameters of Access Payload (exclude the message opcode) to be sent.

```c
esp_err_t esp_ble_mesh_client_model_send_msg (esp_ble_mesh_model_t *model,
                                       esp_ble_mesh_msg_ctx_t *ctx,
                                       uint32_t opcode,
                                       uint16_t length,
                                       uint8_t *data,
                                       int32_t msg_timeout, bool need_rsp,
                                       esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters

• `model`: BLE Mesh Client Model to which the message belongs.
• `ctx`: Message context, includes keys, TTL, etc.
• `opcode`: Message opcode.
• `length`: Message length (exclude the message opcode).
• `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
• `msg_timeout`: Time to get response to the message (in milliseconds).
• `need_rsp`: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
• `device_role`: Role of the device (Node/Provisioner) that sends the message.
**esp_err_t esp_ble_mesh_model_publish**

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: Mesh (client) Model publishing the message.
- **opcode**: Message opcode.
- **length**: Message length (exclude the message opcode).
- **data**: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role**: Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

**esp_err_t esp_ble_mesh_server_model_update_state**

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: Server model which is going to update the state.
- **type**: Server model state type.
- **value**: Server model state value.

**esp_err_t esp_ble_mesh_node_local_reset**

```c
void esp_ble_mesh_node_local_reset()
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_set_node_name**

```c
int esp_ble_mesh_provisioner_set_node_name(int index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **index**: Index of the node in the node queue.
• name: Name (end by ‘\0’) to be set for the node.

```c
const char *esp_ble_mesh_provisioner_get_node_name(int index)
```
This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**

- index: Index of the node in the node queue.

```c
int esp_ble_mesh_provisioner_get_node_index(const char *name)
```
This function is called to get the node (provisioned device) index.

**Return** Node index on success, or (negative) error code from errno.h on failure.

**Parameters**

- name: Name of the node (end by ‘\0’).

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```
This function is called to set the app key for the local BLE Mesh stack.

**Note**
- app_key: If set to NULL, app_key will be generated internally.
- net_idx: Should be an existing one.
- app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- app_key: The app key to be set for the local BLE Mesh stack.
- net_idx: The network key index.
- app_idx: The app key index.

```c
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```
This function is called by Provisioner to get the local app key value.

**Return** App key on success, or NULL on failure.

**Parameters**

- net_idx: Network key index.
- app_idx: Application key index.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)
```
This function is called by Provisioner to bind own model with proper app key.

**Note** company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.
Return ESP_OK on success or error code otherwise.

Parameters

- `element_addr`: Provisioner local element address
- `app_idx`: Provisioner local appkey index
- `model_id`: Provisioner local model id
- `company_id`: Provisioner local company id

```
esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

Note net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters

- `net_key`: The network key to be added to the Provisioner local BLE Mesh stack.
- `net_idx`: The network key index.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

- `net_idx`: Network key index.

```
const uint8_t *esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters

- `net_idx`: Network key index.
- `app_idx`: Application key index.

Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events
Functions

**esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)**

- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - callback: Pointer to the callback function.

**bool esp_ble_mesh_node_is_provisioned (void)**

- **Return** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

- **Note** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.
- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - pub_key_x: Unprovisioned device’s Public Key X
  - pub_key_y: Unprovisioned device’s Public Key Y
  - private_key: Unprovisioned device’s Private Key

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**

- **Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.
- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - number: Number input by device.
`esp_err_t esp_ble_mesh_node_input_string(const char *string)`

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `string`: String input by device.

`esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)`

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `name`: Unprovisioned device name

`esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])`

Provisioner inputs unprovisioned device’s oob public key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `link_idx`: The provisioning link index
- `pub_key_x`: Unprovisioned device’s Public Key X
- `pub_key_y`: Unprovisioned device’s Public Key Y

`esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)`

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `string`: String input by Provisioner.
- `link_idx`: The provisioning link index.

`esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)`

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.
Parameters
- **number**: Number input by Provisioner.
- **link_idx**: The provisioning link index.

```c
esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
```
Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **bearers**: Bit-wise OR of provisioning bearers.

```c
esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
```
Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **bearers**: Bit-wise OR of provisioning bearers.

```c
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev,
                                               esp_ble_mesh_dev_add_flag_t flags)
```
Add unprovisioned device info to the unprov_dev queue.

**Return** ESP_OK on success or error code otherwise.

**Note**:
1. Currently address type only supports public address and static random address.
2. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   - In this situation, the Provisioner can set bearers with each one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled, and cannot set flags with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
   - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with `ESP_BLE_MESH_PROV_ADV` enabled and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
   - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with `ESP_BLE_MESH_PROV_GATT` enabled, and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
• If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g., after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

• Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

• add_dev: Pointer to a struct containing the device information
• flags: Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

\[ \text{esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)} \]
Delete device from queue, reset current provisioning link and reset the node.

Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure; if the device has already been provisioned, reset the device. And either one of the addr or device UUID can be input.

Return ESP_OK on success or error code otherwise.

Parameters

• del_dev: Pointer to a struct containing the device information.

\[ \text{esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,}\]
\[ \text{uint8_t match_len, uint8_t offset, bool prov_after_match)} \]
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• match_val: Value to be compared with the part of the device UUID.
• match_len: Length of the compared match value.
• offset: Offset of the device UUID to be compared (based on zero).
• prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

\[ \text{esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(exp_ble_mesh_prov_data_info_t *prov_data_info)} \]
This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.
Parameters

- **prov_data_info**: Pointer to a struct containing net_idx or flags or iv_index.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info (esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP_OK on success or error code otherwise.

Parameters

- **fast_prov_info**: Pointer to a struct containing unicast address range, net_idx, etc.

```c
esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)
```

This function is called to start/suspend/exit fast provisioning.

**Return** ESP_OK on success or error code otherwise.

Parameters

- **action**: fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters

- **addr**: Pointer to the unprovisioned device address.
- **addr_type**: Unprovisioned device address type.
- **adv_type**: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- **dev_uuid**: Unprovisioned device UUID pointer.
- **oob_info**: OOB information of the unprovisioned device.
- **bearer**: Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h
Functions

`esp_err_t esp_ble_mesh_proxy_identity_enable (void)`
Enable advertising with Node Identity.

**Note** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable (void)`
Enable BLE Mesh GATT Proxy Service.

**Return** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable (void)`
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)`
Proxy Client creates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `addr`: Device address of the Proxy Server.
- `addr_type`: Device address type(public or static random).
- `net_idx`: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

`esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)`
Proxy Client terminates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `conn_handle`: Proxy connection handle.

`esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)`
Proxy Client sets the filter type of the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `conn_handle`: Proxy connection handle.
• net_idx: Corresponding NetKey Index.
• filter_type: whitelist or blacklist.

`esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• conn_handle: Proxy connection handle.
• net_idx: Corresponding NetKey Index.
• addr: Pointer to the filter address.
• addr_num: Number of the filter address.

`esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• conn_handle: Proxy connection handle.
• net_idx: Corresponding NetKey Index.
• addr: Pointer to the filter address.
• addr_num: Number of the filter address.

### ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

• **Configuration Client/Server Models**
• **Health Client/Server Models**
• **Generic Client/Server Models**
• **Sensor Client/Server Models**
• **Time and Scenes Client/Server Models**
• **Lighting Client/Server Models**

**Note:** Definitions related to Server Models are being updated, and will be released soon.
Configuration Client/Server Models

Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- params: Pointer to BLE Mesh common client parameters.
- get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- params: Pointer to BLE Mesh common client parameters.
**set_state**: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

## Unions

**union esp_ble_mesh_cfg_client_get_state_t**

```c
#include <esp_ble_mesh_config_model_api.h>

For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
the get_state parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.
```

Parameters of Config Node Identity Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_sig_model_app_get_t
Parameters of Config SIG Model App Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

struct esp_ble_mesh_cfg_vnd_model_app_get_t
Parameters of Config Vendor Model App Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
struct esp_ble_mesh_cfg_kr_phase_get_t
Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.
Public Members

```
uint8_t relay
    The relay value
```

```
uint8_t relay_retransmit
    The relay retransmit value
```

```
struct esp_ble_mesh_cfg_net_key_add_t
    Parameters of Config NetKey Add.
```

Public Members

```
uint16_t net_idx
    The network key index
```

```
uint8_t net_key[16]
    The network key value
```

```
struct esp_ble_mesh_cfg_app_key_add_t
    Parameters of Config AppKey Add.
```

Public Members

```
uint16_t net_idx
    The network key index
```

```
uint16_t app_idx
    The app key index
```

```
uint8_t app_key[16]
    The app key value
```

```
struct esp_ble_mesh_cfg_model_app_bind_t
    Parameters of Config Model App Bind.
```

Public Members

```
uint16_t element_addr
    The element address
```

```
uint16_t model_app_idx
    Index of the app key to bind with the model
```

uint16_t model_id
    The model id
```

```
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```
struct esp_ble_mesh_cfg_model_pub_set_t
    Parameters of Config Model Publication Set.
```

2.1. Bluetooth API
Public Members

uint16_t element_addr
    The element address

uint16_t publish_addr
    Value of the publish address

uint16_t publish_app_idx
    Index of the application key

bool cred_flag
    Value of the Friendship Credential Flag

uint8_t publish_ttl
    Default TTL value for the publishing messages

uint8_t publish_period
    Period for periodic status publishing

uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add.

Public Members

uint16_t element_addr
    The element address

uint16_t sub_addr
    The address to be added to the Subscription List

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete.

Public Members

uint16_t element_addr
    The element address

uint16_t sub_addr
    The address to be removed from the Subscription List

uint16_t model_id
    The model id

```c
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t element_addr
   The element address

uint16_t sub_addr
   The address to be added to the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t element_addr
   The element address

uint8_t label_uuid[16]
   The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr
   The element address

uint8_t label_uuid[16]
   The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.
```

2.1. Bluetooth API
Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List

The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_pub_va_set_t**
Parameters of Config Model Publication Virtual Address Set.

Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
Value of the Label UUID publish address

`uint16_t publish_app_idx`
Index of the application key

`bool cred_flag`
Value of the Friendship Credential Flag

`uint8_t publish_ttl`
Default TTL value for the publishing messages

`uint8_t publish_period`
Period for periodic status publishing

`uint8_t publish_retransmit`
Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_delete_all_t**
Parameters of Config Model Subscription Delete All.

Public Members

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF
struct esp_ble_mesh_cfg_net_key_update_t
Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_app_key_update_t
Parameters of Config AppKey Update.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
Parameters of Config AppKey Delete.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
Parameters of Config Node Identity Set.

Public Members

uint16_t net_idx
The network key index

uint8_t identity
New Node Identity state
\textbf{struct esp_ble_mesh_cfg_model_app_unbind_t}

Parameters of Config Model App Unbind.

\textbf{Public Members}

- \texttt{uint16_t element_addr}
  The element address

- \texttt{uint16_t model_app_idx}
  Index of the app key to bind with the model

- \texttt{uint16_t model_id}
  The model id

- \texttt{uint16_t company_id}
  The company id, if not a vendor model, shall set to 0xFFFF

\textbf{struct esp_ble_mesh_cfg_kr_phase_set_t}

Parameters of Config Key Refresh Phase Set.

\textbf{Public Members}

- \texttt{uint16_t net_idx}
  The network key index

- \texttt{uint8_t transition}
  New Key Refresh Phase Transition

\textbf{struct esp_ble_mesh_cfg_net_transmit_set_t}

Parameters of Config Network Transmit Set.

\textbf{Public Members}

- \texttt{uint8_t net_transmit}
  Network Transmit State

\textbf{struct esp_ble_mesh_cfg_heartbeat_pub_set_t}

Parameters of Config Model Heartbeat Publication Set.

\textbf{Public Members}

- \texttt{uint16_t dst}
  Destination address for Heartbeat messages

- \texttt{uint8_t count}
  Number of Heartbeat messages to be sent

- \texttt{uint8_t period}
  Period for sending Heartbeat messages

- \texttt{uint8_t ttl}
  TTL to be used when sending Heartbeat messages

- \texttt{uint16_t feature}
  Bit field indicating features that trigger Heartbeat messages when changed
**Public Members**

- `uint16_t src`
  
  Source address for Heartbeat messages

- `uint16_t dst`
  
  Destination address for Heartbeat messages

- `uint8_t period`
  
  Period for receiving Heartbeat messages

**Public Members**

- `uint8_t beacon`
  
  Secure Network Beacon state value

**Public Members**

- `uint8_t page`
  
  Page number of the Composition Data

- `struct net_buf_simple *composition_data`
  
  Pointer to Composition Data for the identified page

**Public Members**

- `uint8_t default_ttl`
  
  Default TTL state value

**Public Members**

- `uint8_t gatt_proxy`
  
  GATT Proxy state value

---

2.1. Bluetooth API
Public Members

uint8_t relay
   Relay state value

uint8_t retransmit
   Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
   Parameters of Config Model Publication Status

Public Members

uint8_t status
   Status Code for the request message

uint16_t element_addr
   Address of the element

uint16_t publish_addr
   Value of the publish address

uint16_t app_idx
   Index of the application key

bool cred_flag
   Value of the Friendship Credential Flag

uint8_t ttl
   Default TTL value for the outgoing messages

uint8_t period
   Period for periodic status publishing

uint8_t transmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
   Parameters of Config Model Subscription Status

Public Members

uint8_t status
   Status Code for the request message

uint16_t element_addr
   Address of the element

uint16_t sub_addr
   Value of the address

uint16_t company_id
   Company ID
```c
uint16_t model_id
   Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
   Parameters of Config NetKey Status

   Public Members

   uint8_t status
      Status Code for the request message

   uint16_t net_idx
      Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
   Parameters of Config AppKey Status

   Public Members

   uint8_t status
      Status Code for the request message

   uint16_t net_idx
      Index of the NetKey

   uint16_t app_idx
      Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
   Parameters of Config Model App Status

   Public Members

   uint8_t status
      Status Code for the request message

   uint16_t element_addr
      Address of the element

   uint16_t app_idx
      Index of the application key

   uint16_t company_id
      Company ID

   uint16_t model_id
      Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
   Parameter of Config Friend Status

   Public Members

   uint8_t friend_state
      Friend state value
```

2.1. Bluetooth API
struct esp_ble_mesh_cfg_hb_pub_status_cb_t
Parameters of Config Heartbeat Publication Status

Public Members

uint8_t status
    Status Code for the request message

tuint16_t dst
    Destination address for Heartbeat messages

tuint8_t count
    Number of Heartbeat messages remaining to be sent

tuint8_t period
    Period for sending Heartbeat messages

tuint8_t ttl
    TTL to be used when sending Heartbeat messages

tuint16_t features
    Features that trigger Heartbeat messages when changed

tuint16_t net_idx
    Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
    Status Code for the request message

uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Remaining Period for processing Heartbeat messages

uint8_t count
    Number of Heartbeat messages received

uint8_t min_hops
    Minimum hops when receiving Heartbeat messages

uint8_t max_hops
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count
    Number of transmissions for each Network PDU originating from the node
\textbf{uint8_t \texttt{net\_trans\_step}}

Maximum hops when receiving Heartbeat messages

\textbf{struct esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t}

Parameters of Config SIG/Vendor Subscription List

\textbf{Public Members}

\textbf{uint8_t \texttt{status}}

Status Code for the request message

\textbf{uint16_t \texttt{element\_addr}}

Address of the element

\textbf{uint16_t \texttt{company\_id}}

Company ID

\textbf{uint16_t \texttt{model\_id}}

Model ID

\textbf{struct net\_buf\_simple *\texttt{sub\_addr}}

A block of all addresses from the Subscription List

\textbf{struct esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t}

Parameter of Config NetKey List

\textbf{Public Members}

\textbf{struct net\_buf\_simple *\texttt{net\_idx}}

A list of NetKey Indexes known to the node

\textbf{struct esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t}

Parameters of Config AppKey List

\textbf{Public Members}

\textbf{uint8_t \texttt{status}}

Status Code for the request message

\textbf{uint16_t \texttt{net\_idx}}

NetKey Index of the NetKey that the AppKeys are bound to

\textbf{struct net\_buf\_simple *\texttt{app\_idx}}

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIdx

\textbf{struct esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t}

Parameters of Config Node Identity Status

\textbf{Public Members}

\textbf{uint8_t \texttt{status}}

Status Code for the request message

\textbf{uint16_t \texttt{net\_idx}}

Index of the NetKey
uint8_t identity
    Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status

Public Members

uint8_t status
    Status Code for the request message

uint16_t net_idx
    Index of the NetKey

uint8_t phase
    Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
    Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
    The unicast address of the Low Power node

int32_t poll_timeout
    The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
    Configuration Client Model callback parameters

Public Members

int error_code
    Appropriate error code
esp_ble_mesh_client_common_param_t *params
The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index

bool cred_flag
Friendship Credential Flag

uint8_t pub_ttl
Publish TTL

uint8_t pub_period
Publish Period

uint8_t pub_retransmit
Publish Retransmit

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_mod_model_pub_set_t
Parameters of Config Model Subscription Add

Public Members

uint16_t element_addr
Element Address

uint16_t sub_addr
Subscription Address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete

2.1. Bluetooth API
Public Members

uint16_t `element_addr`
   Element Address

uint16_t `sub_addr`
   Subscription Address

uint16_t `company_id`
   Company ID

uint16_t `model_id`
   Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
   Parameters of Config NetKey Add

Public Members

uint16_t `net_idx`
   NetKey Index

uint8_t `net_key`[16]
   NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
   Parameters of Config NetKey Update

Public Members

uint16_t `net_idx`
   NetKey Index

uint8_t `net_key`[16]
   NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
   Parameter of Config NetKey Delete

Public Members

uint16_t `net_idx`
   NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
   Parameters of Config AppKey Add

Public Members

uint16_t `net_idx`
   NetKey Index

uint16_t `app_idx`
   AppKey Index

uint8_t `app_key`[16]
   AppKey
struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

  uint16_t net_idx
    NetKey Index

  uint16_t app_idx
    AppKey Index

  uint8_t app_key[16]
    AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

  uint16_t net_idx
    NetKey Index

  uint16_t app_idx
    AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

  uint16_t element_addr
    Element Address

  uint16_t app_idx
    AppKey Index

  uint16_t company_id
    Company ID

  uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

  uint16_t element_addr
    Element Address

  uint16_t app_idx
    AppKey Index

  uint16_t company_id
    Company ID

2.1. Bluetooth API
uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
    NetKey Index

uint8_t kr_phase
    New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
    Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
    Pointer to the server model structure

esp_ble_mesh_msg_ctx_t *ctx
    Context of the received message

esp_ble_mesh_cfg_server_cb_value_t value
    Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
    Define a new Config Server Model.

    Note The Config Server Model can only be included by a Primary Element.
    Return New Config Server Model instance.
    Parameters
    • srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
    Define a new Config Client Model.

    Note The Config Client Model can only be included by a Primary Element.
    Return New Config Client Model instance.
    Parameters
    • cli_data: Pointer to a unique struct esp_ble_mesh_client_t.
Type Definitions

typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
    Configuration Server Model context

typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                              esp_ble_mesh_cfg_client_cb_param_t *param)

    Bluetooth Mesh Config Client and Server Model functions.
    Configuration Client Model callback function type

    Parameters
    • event: Event type
    • param: Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                             esp_ble_mesh_cfg_server_cb_param_t *param)

    Configuration Server Model callback function type.

    Parameters
    • event: Event type
    • param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_cfg_client_cb_event_t
    This enum value is the event of Configuration Client Model
    Values:
    ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
    ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
    ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
    ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
    ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

enum esp_ble_mesh_cfg_server_cb_event_t
    This enum value is the event of Configuration Server model
    Values:
    ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
    ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File

• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h
Functions

**esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)**

Register BLE Mesh Generic Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **callback**: Pointer to the callback function.

**esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_generic_client_get_state_t *get_state)**

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **params**: Pointer to BLE Mesh common client parameters.
- **get_state**: Pointer to generic get message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_generic_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_generic_client_set_state_t *set_state)**

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **params**: Pointer to BLE Mesh common client parameters.
- **set_state**: Pointer to generic set message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_register_generic_server_callback (esp_ble_mesh_generic_server_cb_t callback)**

Register BLE Mesh Generic Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **callback**: Pointer to the callback function.

Time to complete state transition (optional)

\texttt{uint8\_t delay}

Indicate message execution delay (C.1)

\texttt{struct esp_ble_mesh_gen_delta_set_t}

Parameters of Generic Delta Set.
Public Members

bool op_en
    Indicate if optional parameters are included
int32_t level
    Delta change of Generic Level state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
Parameters of Generic Move Set.

Public Members

bool op_en
    Indicate if optional parameters are included
int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time
    The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set.

Public Members

uint8_t onpowerup
    The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t
Parameters of Generic Power Level Set.
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
Parameter of Generic Power Default Set.

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_BLE_mesh_gen_power_range_set_t
Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.
**Public Members**

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
Raw value for the Admin Property
```
struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t present_onoff
Current value of Generic OnOff state

uint8_t target_onoff
Target value of Generic OnOff state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
Parameters of Generic Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

int16_t present_level
Current value of Generic Level state

2.1. Bluetooth API
int16_t target_level
    Target value of the Generic Level state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
    Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
    The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

Public Members

uint8_t onpowerup
    The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
    Parameters of Generic Power Level Status.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_power
    Current value of Generic Power Actual state

uint16_t target_power
    Target value of Generic Power Actual state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
    Parameter of Generic Power Last Status.

Public Members

uint16_t power
    The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
    Parameter of Generic Power Default Status.

Public Members

uint16_t power
    The value of the Generic Default Last state
**struct esp_ble_mesh_gen_power_range_status_cb_t**
Parameters of Generic Power Range Status.

**Public Members**

- `uint8_t status_code`
  Status Code for the request message

- `uint16_t range_min`
  Value of Range Min field of Generic Power Range state

- `uint16_t range_max`
  Value of Range Max field of Generic Power Range state

**struct esp_ble_mesh_gen_battery_status_cb_t**
Parameters of Generic Battery Status.

**Public Members**

- `u32_t battery_level`
  Value of Generic Battery Level state

- `u32_t time_to_discharge`
  Value of Generic Battery Time to Discharge state

- `u32_t time_to_charge`
  Value of Generic Battery Time to Charge state

- `u32_t flags`
  Value of Generic Battery Flags state

**struct esp_ble_mesh_gen_loc_global_status_cb_t**
Parameters of Generic Location Global Status.

**Public Members**

- `int32_t global_latitude`
  Global Coordinates (Latitude)

- `int32_t global_longitude`
  Global Coordinates (Longitude)

- `int16_t global_altitude`
  Global Altitude

**struct esp_ble_mesh_gen_loc_local_status_cb_t**
Parameters of Generic Location Local Status.

**Public Members**

- `int16_t local_north`
  Local Coordinates (North)

- `int16_t local_east`
  Local Coordinates (East)
int16_t local_altitude
    Local Altitude

uint8_t floor_number
    Floor Number

uint16_t uncertainty
    Uncertainty

**struct esp_ble_mesh_gen_user_properties_status_cb_t**
Parameter of Generic User Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
    Buffer contains a sequence of N User Property IDs
```

**struct esp_ble_mesh_gen_user_property_status_cb_t**
Parameters of Generic User Property Status.

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property ID identifying a Generic User Property
```

```c
uint8_t user_access
    Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
    Raw value for the User Property (C.1)
```

**struct esp_ble_mesh_gen_admin_properties_status_cb_t**
Parameter of Generic Admin Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
    Buffer contains a sequence of N Admin Property IDs
```

**struct esp_ble_mesh_gen_admin_property_status_cb_t**
Parameters of Generic Admin Property Status.

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
    Enumeration indicating user access (optional)
```
struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t property_id
  Property ID identifying a Generic Manufacturer Property

uint8_t user_access
  Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
Generic Client Model callback parameters

Public Members

int error_code
  Appropriate error code

esp_ble_mesh_client_common_param_t *params
  The client common parameters.

esp_ble_mesh_gen_client_status_cb_t *status_cb
  The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
Parameters of Generic OnOff state

2.1. Bluetooth API
Public Members

`uint8_t onoff`
The present value of the Generic OnOff state

`uint8_t target_onoff`
The target value of the Generic OnOff state

`struct esp_ble_mesh_gen_onoff_srv_t`
User data of Generic OnOff Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic OnOff Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_onoff_state_t *state`
Parameters of the Generic OnOff state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`struct esp_ble_mesh_gen_level_srv_t`
User data of Generic Level Server Model

Public Members

`int16_t level`
The present value of the Generic Level state

`int16_t target_level`
The target value of the Generic Level state

`int16_t last_level`
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

`int32_t last_delta`
The last delta change of the Generic Level state

`bool move_start`
Indicate if the transition of the Generic Level state has been started

`bool positive`
Indicate if the transition is positive or negative

`struct esp_ble_mesh_gen_level_srv_t`
User data of Generic Level Server Model
Public Members

*esp_ble_mesh_model_t* `model`
  Pointer to the Generic Level Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
  Response control of the server model received messages

*esp_ble_mesh_gen_level_state_t* `state`
  Parameters of the Generic Level state

*esp_ble_mesh_last_msg_info_t* `last`
  Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
  Parameters of state transition

`int32_t tt_delta_level`
  Delta change value of level state transition

**struct esp_ble_mesh_gen_def_trans_time_state_t**
  Parameter of Generic Default Transition Time state

Public Members

*uint8_t* `trans_time`
  The value of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_def_trans_time_srv_t**
  User data of Generic Default Transition Time Server Model

Public Members

*esp_ble_mesh_model_t* `model`
  Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
  Response control of the server model received messages

*esp_ble_mesh_gen_def_trans_time_state_t* `state`
  Parameters of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_state_t**
  Parameter of Generic OnPowerUp state

Public Members

*uint8_t* `onpowerup`
  The value of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_srv_t**
  User data of Generic Power OnOff Server Model

2.1. Bluetooth API
Public Members

.esp_ble_mesh_model_t *model
Pointer to the Generic Power OnOff Server Model. Initialized internally.

.esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

.esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model

Public Members

.esp_ble_mesh_model_t *model
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

.esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

.esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t
Parameters of Generic Power Level state

Public Members

uint16_t power_actual
The present value of the Generic Power Actual state

uint16_t target_power_actual
The target value of the Generic Power Actual state

uint16_t power_last
The value of the Generic Power Last state

uint16_t power_default
The value of the Generic Power Default state

uint8_t status_code
The status code of setting Generic Power Range state

uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

.esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.
Read the Docs Template Documentation, Release v4.1-dev-2071-gf91080637

```
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
   Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
   Parameters of state transition

int32_t tt_delta_level
   Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
   User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
   Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_power_level_state_t
   Parameters of Generic Power Level state

Public Members

uint32_t battery_level
   The value of the Generic Battery Level state

uint32_t time_to_discharge
   The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge
   The value of the Generic Battery Time to Charge state

uint32_t battery_flags
   The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_state_t
   User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t state
   Parameters of the Generic Battery state

struct esp_ble_mesh_gen_battery_state_t
   Parameters of Generic Battery state
```

2.1. Bluetooth API
struct esp_ble_mesh_gen_location_state_t
Parameters of Generic Location state

Public Members

int32_t global_latitude
The value of the Global Latitude field

int32_t global_longitude
The value of the Global Longitude field

int16_t global_altitude
The value of the Global Altitude field

int16_t local_north
The value of the Local North field

int16_t local_east
The value of the Local East field

int16_t local_altitude
The value of the Local Altitude field

uint8_t floor_number
The value of the Floor Number field

uint16_t uncertainty
The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
Parameters of Generic Property states
Public Members

uint16_t id
   The value of User/Admin/Manufacturer Property ID

uint8_t user_access
   The value of User Access field

uint8_t admin_access
   The value of Admin Access field

uint8_t manu_access
   The value of Manufacturer Access field

struct net_buf_simple *val
   The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t
   User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

uint8_t property_count
   Generic User Property count

esp_ble_mesh_generic_property_t *properties
   Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
   User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

uint8_t property_count
   Generic Admin Property count

esp_ble_mesh_generic_property_t *properties
   Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
   User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Manufacturer Property Server Model. Initialized internally.
**esp_ble_mesh_server_rsp_ctrl_t** `rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

**esp_ble_mesh_generic_property_t** `*properties`
Parameters of the Generic Manufacturer Property state

**esp_ble_mesh_gen_client_prop_srv_t**
User data of Generic Client Property Server Model

### Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Client Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

**struct esp_ble_mesh_state_change_gen_onoff_set_t**
Parameter of Generic OnOff Set state change event

### Public Members

`uint8_t onoff`
The value of Generic OnOff state

**struct esp_ble_mesh_state_change_gen_level_set_t**
Parameter of Generic Level Set state change event

### Public Members

`int16_t level`
The value of Generic Level state

**struct esp_ble_mesh_state_change_gen_delta_set_t**
Parameter of Generic Delta Set state change event

### Public Members

`int16_t level`
The value of Generic Level state

**struct esp_ble_mesh_state_change_gen_move_set_t**
Parameter of Generic Move Set state change event
Public Members

```c
int16_t level
   The value of Generic Level state
```

```c
struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set state change event
```

Public Members

```c
uint8_t trans_time
   The value of Generic Default Transition Time state
```

```c
struct esp_ble_mesh_state_change_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set state change event
```

Public Members

```c
uint8_t onpowerup
   The value of Generic OnPowerUp state
```

```c
struct esp_ble_mesh_state_change_gen_power_level_set_t
   Parameter of Generic Power Level Set state change event
```

Public Members

```c
uint16_t power
   The value of Generic Power Actual state
```

```c
struct esp_ble_mesh_state_change_gen_power_default_set_t
   Parameter of Generic Power Default Set state change event
```

Public Members

```c
uint16_t power
   The value of Generic Power Default state
```

```c
struct esp_ble_mesh_state_change_gen_power_range_set_t
   Parameters of Generic Power Range Set state change event
```

Public Members

```c
uint16_t range_min
   The minimum value of Generic Power Range state
```

```c
uint16_t range_max
   The maximum value of Generic Power Range state
```

```c
struct esp_ble_mesh_state_change_gen_loc_global_set_t
   Parameters of Generic Location Global Set state change event
```
Public Members

int32_t latitude
The Global Latitude value of Generic Location state

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state

uint8_t floor_number
The Floor Number value of Generic Location state

uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event
Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID
```c
uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
    Context of the received Generic Level Set message

Public Members
ool op_en
    Indicate if optional parameters are included

int16_t level
    Target value of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
    Context of the received Generic Delta Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int32_t delta_level
    Delta change of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
    Context of the received Generic Move Set message

Public Members

bool op_en
    Indicate if optional parameters are included

int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
    Transaction ID
```
uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
Context of the received Generic Default Transition Time Set message

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
Context of the received Generic Power Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
Context of the received Generic Power Default Set message

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message

2.1. Bluetooth API
Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_recv_gen_loc_global_set_t
Context of the received Generic Location Global Set message

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property

struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
**Public Members**

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`uint8_t user_access`
Enumeration indicating user access

`struct net_buf_simple *property_value`
Raw value for the Admin Property

**struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t**
Context of the received Generic Manufacturer Property Set message

**Public Members**

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
Enumeration indicating user access

**struct esp_ble_mesh_generic_server_cb_param_t**
Generic Server Model callback parameters

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t value`
Value of the received Generic Messages

**Macros**

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI**(cli_pub, cli_data)
Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

**Parameters**

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI**(cli_pub, cli_data)
Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.
Return New Generic Level Client Model instance.

Parameters
- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI` (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

Return New Generic Default Transition Time Client Model instance.

Parameters
- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI` (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

Return New Generic Power OnOff Client Model instance.

Parameters
- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI` (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Return New Generic Power Level Client Model instance.

Parameters
- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI` (cli_pub, cli_data)
Define a new Generic Battery Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Return New Generic Battery Client Model instance.

Parameters
- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`. 
**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)
Define a new Generic Location Client Model.

*Note*  This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

*Return*  New Generic Location Client Model instance.

*Parameters*
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)
Define a new Generic Property Client Model.

*Note*  This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

*Return*  New Generic Location Client Model instance.

*Parameters*
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.
Define a new Generic OnOff Server Model.

*Note*  1. The Generic OnOff Server Model is a root model.
   1. This model shall support model publication and model subscription.

*Return*  New Generic OnOff Server Model instance.

*Parameters*
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

*Note*  1. The Generic Level Server Model is a root model.
   1. This model shall support model publication and model subscription.

*Return*  New Generic Level Server Model instance.

*Parameters*
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

2.1. Bluetooth API
Note 1. The Generic Default Transition Time Server Model is a root model.
   1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_def_trans_time_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
   2. This model shall support model publication and model subscription.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

   1. This model shall support model subscription.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_srv_t.
ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

Note 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the
Generic Power OnOff Setup Server model.
1. This model shall support model subscription.
Return New Generic Power Level Setup Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.
Return New Generic Battery Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_battery_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)
Define a new Generic Location Server Model.

Note 1. The Generic Location Server model is a root model. When this model is present on an Element, the
 corresponding Generic Location Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that knows its location (global or local).
Return New Generic Location Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note 1. The Generic Location Setup Server model extends the Generic Location Server model.
1. This model shall support model subscription.
Return New Generic Location Setup Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_setup_srv_t.
ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note 1. The Generic User Property Server model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic User Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_user_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note 1. The Generic Admin Property Server model extends the Generic User Property Server model.
1. This model shall support model publication and model subscription.

Return New Generic Admin Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_admin_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

Note 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
1. This model shall support model publication and model subscription.

Return New Generic Manufacturer Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_manu_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic Client Property Server Model.

Note 1. The Generic Client Property Server model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Client Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_client_prop_srv_t.
Type Definitions

typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event, esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event, esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_generic_client_cb_event_t
This enum value is the event of Generic Client Model

Values:

ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t
This enum value is the access value of Generic User Property

Values:

ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property

Values:

ESP_BLE_MESH GEN_ADMIN NOT_USER_PROP
**ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

**ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

**ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

**enum esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

**Values:**

- **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**
- **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

**enum esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

**Values:**

- **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.

2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

- **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

- **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

### Generic Client/Server Models

**Header File**

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h`

**Functions**

**esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)**

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **callback**: Pointer to the callback function.

**esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)**

Register BLE Mesh Health Server Model callback.
Return ESP_OK on success or error code otherwise.

Parameters

- callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                            esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- params: Pointer to BLE Mesh common client parameters.
- get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                               esp_ble_mesh_health_client_set_state_t *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- params: Pointer to BLE Mesh common client parameters.
- set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters

- element: The element to which the Health Server Model belongs.

Unions

```c
union esp_ble_mesh_health_client_get_state_t
#define esp_ble_mesh_health_client_get_state_t
```

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET

the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.
Public Members

```
esp_ble_mesh_health_fault_get_t fault_get
```
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

```
union esp_ble_mesh_health_client_set_state_t
```
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

```
esp_ble_mesh_health_attention_set_t attention_set
```
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

```
esp_ble_mesh_health_period_set_t period_set
```
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

```
esp_ble_mesh_health_fault_test_t fault_test
```
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

```
esp_ble_mesh_health_fault_clear_t fault_clear
```
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

```
union esp_ble_mesh_health_client_common_cb_param_t
```
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

```
esp_ble_mesh_health_current_status_cb_t current_status
```
The health current status value

```
esp_ble_mesh_health_fault_status_cb_t fault_status
```
The health fault status value

```
esp_ble_mesh_health_period_status_cb_t period_status
```
The health period status value

```
esp_ble_mesh_health_attention_status_cb_t attention_status
```
The health attention status value

```
union esp_ble_mesh_health_server_cb_param_t
```
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.

  Array of registered faults

\texttt{struct esp\_ble\_mesh\_health\_srv\_t}
  ESP BLE Mesh Health Server Model Context

\textbf{Public Members}

\textit{esp\_ble\_mesh\_model\_t *} \texttt{model}
  Pointer to Health Server Model

\section*{2.1. Bluetooth API}
**esp_ble_mesh_health_srv_cb_t** \textit{health\_cb}
Health callback struct

**struct k\_delayed\_work** \textit{attention\_timer}
Attention Timer state

**bool** \textit{attention\_timer\_start}
Attention Timer start flag

**esp_ble_mesh_health_test_t** \textit{health\_test}
Health Server fault test

**struct esp_ble_mesh_health_fault_get_t**
Parameter of Health Fault Get

**Public Members**

\texttt{uint16\_t company\_id}
Bluetooth assigned 16-bit Company ID

**struct esp_ble_mesh_health_attention_set_t**
Parameter of Health Attention Set

**Public Members**

\texttt{uint8\_t attention}
Value of the Attention Timer state

**struct esp_ble_mesh_health_period_set_t**
Parameter of Health Period Set

**Public Members**

\texttt{uint8\_t fast\_period\_divisor}
Divider for the Publish Period

**struct esp_ble_mesh_health_fault_test_t**
Parameter of Health Fault Test

**Public Members**

\texttt{uint16\_t company\_id}
Bluetooth assigned 16-bit Company ID

\texttt{uint8\_t test\_id}
ID of a specific test to be performed

**struct esp_ble_mesh_health_fault_clear_t**
Parameter of Health Fault Clear

**Public Members**

\texttt{uint16\_t company\_id}
Bluetooth assigned 16-bit Company ID
struct esp_ble_mesh_health_current_status_cb_t
Parameters of Health Current Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
Parameters of Health Fault Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

2.1. Bluetooth API
esp_ble_mesh_health_client_common_cb_param_t status_cb
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int error_code
The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint8_t test_id
ID of a specific test to be performed

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint8_t time
Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
Parameter of Health Attention Off event
**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to the Health Server Model

**Macros**

`ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)`

Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**

- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

`ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)`

Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**

- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)`

A helper to define a health publication context

**Parameters**

- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

`ESP_BLE_MESH_HEALTH_STANDARD_TEST`

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

`ESP_BLE_MESH_NO_FAULT`

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(
    esp_ble_mesh_health_client_cb_event_t event,
    esp_ble_mesh_health_client_cb_param_t *param
)

Bluetooth Mesh Health Client and Server Model function.
Health Client Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(
    esp_ble_mesh_health_server_cb_event_t event,
    esp_ble_mesh_health_server_cb_param_t *param
)

Health Server Model callback function type.

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

defined esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX
enum esp_ble_mesh_health_server_cb_event_t
    This enum value is the event of Health Server Model
    Values:
        ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
        ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
        ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
        ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
        ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
        ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t esp_ble_mesh_register_light_client_callback(esp_ble_mesh_light_client_cb_t
        callback)
    Register BLE Mesh Light Client Model callback.
    
    Return  ESP_OK on success or error code otherwise.
    
    Parameters
        • callback: pointer to the callback function.

esp_err_t esp_ble_mesh_light_client_get_state(esp_ble_mesh_client_common_param_t
        *params, esp_ble_mesh_light_client_get_state_t
        *get_state)
    Get the value of Light Server Model states using the Light Client Model get messages.
    
    Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
    esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
    
    Return  ESP_OK on success or error code otherwise.
    
    Parameters
        • params: Pointer to BLE Mesh common client parameters.
        • get_state: Pointer of light get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t
        *params, esp_ble_mesh_light_client_set_state_t
        *set_state)
    Set the value of Light Server Model states using the Light Client Model set messages.
    
    Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
    esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters

- `params`: Pointer to BLE Mesh common client parameters.
- `set_state`: Pointer of light set message value. Shall not be set to NULL.

```c
/MeshLightingServerCallback
```

Register BLE Mesh Lighting Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- `callback`: Pointer to the callback function.

**Structures**

Struct esp_ble_mesh_light_lightness_set_t

Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

Parameters of Light Lightness Set

**Public Members**

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t lightness
```
Target value of light lightness actual state

```c
uint8_t tid
```
Transaction ID

```c
uint8_t trans_time
```
Time to complete state transition (optional)
**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lightness_linear_set_t**
Parameters of Light Lightness Linear Set

**Public Members**

**bool op_en**
Indicate if optional parameters are included

**uint16_t lightness**
Target value of light lightness linear state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lightness_default_set_t**
Parameter of Light Lightness Default Set

**Public Members**

**uint16_t lightness**
The value of the Light Lightness Default state

**struct esp_ble_mesh_light_lightness_range_set_t**
Parameters of Light Lightness Range Set

**Public Members**

**uint16_t range_min**
Value of range min field of light lightness range state

**uint16_t range_max**
Value of range max field of light lightness range state

**struct esp_ble_mesh_light_ctl_set_t**
Parameters of Light CTL Set

**Public Members**

**bool op_en**
Indicate if optional parameters are included

**uint16_t ctl_lightness**
Target value of light ctl lightness state

**uint16_t ctl_temperature**
Target value of light ctl temperature state
struct esp_ble_mesh_light_ctl_temperature_set_t
Parameters of Light CTL Temperature Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t ctl_temperaturue
Target value of light ctl temperature state

int16_t ctl_delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_lightCtl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set

Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state
struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

Public Members

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

structure esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

structure esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

structure esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

2.1. Bluetooth API
Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
Parameters of Light LC Property Set

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
Parameters of Light Lightness Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness actual state

uint16_t target_lightness
Target value of light lightness actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
Parameters of Light Lightness Linear Status
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness linear state

uint16_t target_lightness
Target value of light lightness linear state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state
### Public Members

#### uint16_t target_ctl_lightness
- Target value of light ctl lightness state (optional)

#### uint16_t target_ctl_temperature
- Target value of light ctl temperature state (C.1)

#### uint8_t remain_time
- Time to complete state transition (C.1)

### struct esp_ble_mesh_light_ctl_temperature_status_cb_t
- Parameters of Light CTL Temperature Status

#### Public Members

- bool op_en
  - Indicate if optional parameters are included

#### uint16_t present_ctl_temperature
- Current value of light ctl temperature state

#### uint16_t present_ctl_delta_uv
- Current value of light ctl delta UV state

#### uint16_t target_ctl_temperature
- Target value of light ctl temperature state (optional)

#### uint16_t target_ctl_delta_uv
- Target value of light ctl delta UV state (C.1)

#### uint8_t remain_time
- Time to complete state transition (C.1)

### struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
- Parameters of Light CTL Temperature Range Status

#### Public Members

- uint8_t status_code
  - Status code for the request message

#### uint16_t range_min
- Value of temperature range min field of light ctl temperature range state

#### uint16_t range_max
- Value of temperature range max field of light ctl temperature range state

### struct esp_ble_mesh_light_ctl_default_status_cb_t
- Parameters of Light CTL Default Status

#### Public Members

- uint16_t lightness
  - Value of light lightness default state

- uint16_t temperature
  - Value of light temperature default state

- int16_t delta_uv
  - Value of light delta UV default state
struct esp_ble_mesh_light_hsl_status_cb_t
Parameters of Light HSL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Current value of light hsl lightness state

uint16_t hsl_hue
Current value of light hsl hue state

uint16_t hsl_saturation
Current value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
Parameters of Light HSL Target Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness_target
Target value of light hsl lightness state

uint16_t hsl_hue_target
Target value of light hsl hue state

uint16_t hsl_saturation_target
Target value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_hue
Current value of light hsl hue state

uint16_t target_hue
Target value of light hsl hue state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

2.1. Bluetooth API
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_saturation
   Current value of light hsl saturation state

uint16_t target_saturation
   Target value of light hsl saturation state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
   Parameters of Light HSL Default Status

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state

uint16_t saturation
   Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
   Parameters of Light HSL Range Status

Public Members

uint8_t status_code
   Status code for the request message

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
   Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
   Parameters of Light xyL Status

Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The present value of the Light xyL Lightness state
uint16_t _xyl_x
    The present value of the Light xyL x state

uint16_t _xyl_y
    The present value of the Light xyL y state

uint8_t _remain_time
    Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
    Parameters of Light xyL Target Status

Public Members

bool _op_en
    Indicate whether optional parameters included

uint16_t _target_xyl_lightness
    The target value of the Light xyL Lightness state

uint16_t _target_xyl_x
    The target value of the Light xyL x state

uint16_t _target_xyl_y
    The target value of the Light xyL y state

uint8_t _remain_time
    Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
    Parameters of Light xyL Default Status

Public Members

uint16_t _lightness
    The value of the Light Lightness Default state

uint16_t _xyl_x
    The value of the Light xyL x Default state

uint16_t _xyl_y
    The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
    Parameters of Light xyL Range Status

Public Members

uint8_t _status_code
    Status Code for the requesting message

uint16_t _xyl_x_range_min
    The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t _xyl_x_range_max
    The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t _xyl_y_range_min
    The value of the xyL y Range Min field of the Light xyL y Range state

2.1. Bluetooth API
uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t mode
The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t mode
The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t present_light_onoff
The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters

Public Members

int error_code
Appropriate error code
esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
    The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
    Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
    The present value of Light Lightness Linear state

uint16_t target_lightness_linear
    The target value of Light Lightness Linear state

uint16_t lightness_actual
    The present value of Light Lightness Actual state

uint16_t target_lightness_actual
    The target value of Light Lightness Actual state

uint16_t lightness_last
    The value of Light Lightness Last state

uint16_t lightness_default
    The value of Light Lightness Default state

uint8_t status_code
    The status code of setting Light Lightness Range state

uint16_t lightness_range_min
    The minimum value of Light Lightness Range state

uint16_t lightness_range_max
    The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
    User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
    Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
    Parameters of state transition
int32_t *tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t *tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
The present value of Light CTL Lightness state

uint16_t target_lightness
The target value of Light CTL Lightness state

uint16_t temperature
The present value of Light CTL Temperature state

uint16_t target_temperature
The target value of Light CTL Temperature state

int16_t delta_uv
The present value of Light CTL Delta UV state

int16_t target_delta_uv
The target value of Light CTL Delta UV state

uint8_t status_code
The statue code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t temperature_default
The value of Light CTL Temperature Default state

int16_t delta_uv_default
The value of Light CTL Delta UV Default state
struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_temperature
Delta change value of temperature state transition

int32_t tt_delta_delta_uv
Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
**esp_ble_mesh_state_transition_t**

Parameters of state transition

- `int32_t tt_delta_temperature`
  Delta change value of temperature state transition

- `int32_t tt_delta_delta_uv`
  Delta change value of delta uv state transition

**struct esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

### Public Members

- `uint16_t lightness`
  The present value of Light HSL Lightness state

- `uint16_t target_lightness`
  The target value of Light HSL Lightness state

- `uint16_t hue`
  The present value of Light HSL Hue state

- `uint16_t target_hue`
  The target value of Light HSL Hue state

- `uint16_t saturation`
  The present value of Light HSL Saturation state

- `uint16_t target_saturation`
  The target value of Light HSL Saturation state

- `uint16_t lightness_default`
  The value of Light Lightness Default state

- `uint16_t hue_default`
  The value of Light HSL Hue Default state

- `uint16_t saturation_default`
  The value of Light HSL Saturation Default state

- `uint8_t status_code`
  The status code of setting Light HSL Hue & Saturation Range state

- `uint16_t hue_range_min`
  The minimum value of Light HSL Hue Range state

- `uint16_t hue_range_max`
  The maximum value of Light HSL Hue Range state

- `uint16_t saturation_range_min`
  The minimum value of Light HSL Saturation state

- `uint16_t saturation_range_max`
  The maximum value of Light HSL Saturation state

**struct esp_ble_mesh_light_hsl_srv_t**

User data of Light HSL Server Model
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the Lighting HSL Server Model. Initialized internally.

Parameters of state transition
**int32_t tt_delta_hue**

Delta change value of hue state transition

**struct esp_ble_mesh_light_hsl_sat_srv_t**

User data of Light HSL Saturation Server Model

### Public Members

**esp_ble_mesh_model_t *model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**

Response control of the server model received messages

**esp_ble_mesh_light_hsl_state_t *state**

Parameters of the Light HSL state

**esp_ble_mesh_last_msg_info_t last**

Parameters of the last received set message

**esp_ble_mesh_state_transition_t transition**

Parameters of state transition

**int32_t tt_delta_saturation**

Delta change value of saturation state transition

**struct esp_ble_mesh_light_xyl_state_t**

Parameters of Light xyL state

### Public Members

**uint16_t lightness**

The present value of Light xyL Lightness state

**uint16_t target_lightness**

The target value of Light xyL Lightness state

**uint16_t x**

The present value of Light xyL x state

**uint16_t target_x**

The target value of Light xyL x state

**uint16_t y**

The present value of Light xyL y state

**uint16_t target_y**

The target value of Light xyL y state

**uint16_t lightness_default**

The value of Light Lightness Default state

**uint16_t x_default**

The value of Light xyL x Default state

**uint16_t y_default**

The value of Light xyL y Default state

**uint8_t status_code**

The status code of setting Light xyL x & y Range state
uint16_t x_range_min
   The minimum value of Light xyL x Range state

uint16_t x_range_max
   The maximum value of Light xyL x Range state

uint16_t y_range_min
   The minimum value of Light xyL y Range state

uint16_t y_range_max
   The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
   Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
   Parameters of state transition

int32_t tt_delta_lightness
   Delta change value of lightness state transition

int32_t tt_delta_x
   Delta change value of x state transition

int32_t tt_delta_y
   Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
   Parameters of the Light xyL state

struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states

2.1. Bluetooth API
Public Members

```c
uint32_t mode
0b0 The controller is turned off.
    • The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
    • The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t occupancy_mode
The value of Light LC Occupancy Mode state

uint32_t light_onoff
The present value of Light LC Light OnOff state

uint32_t target_light_onoff
The target value of Light LC Light OnOff state

uint32_t occupancy
The value of Light LC Occupancy state

uint32_t ambient_luxlevel
The value of Light LC Ambient LuxLevel state

uint16_t linear_output
1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state
```

```c
struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state
```
uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is
greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

\texttt{int8_t \_regulator\_accuracy}

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

\texttt{uint32_t \_set\_occupancy\_to\_1\_delay}

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value.

\texttt{struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t}

Parameters of Light LC state machine

**Public Members**

\texttt{uint8_t \_fade\_on}

The value of transition time of Light LC Time Fade On

\texttt{uint8_t \_fade}

The value of transition time of Light LC Time Fade

\texttt{uint8_t \_fade\_standby\_auto}

The value of transition time of Light LC Time Fade Standby Auto

\texttt{uint8_t \_fade\_standby\_manual}

The value of transition time of Light LC Time Fade Standby Manual

\texttt{struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t::[anonymous]\_trans\_time}

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

\texttt{esp\_ble\_mesh\_lc\_state\_t \_state}

The value of Light LC state machine state

\texttt{struct k\_delayed\_work \_timer}

Timer of Light LC state machine

\texttt{struct esp\_ble\_mesh\_light\_control\_t}

Parameters of Light Lightness controller

**Public Members**

\texttt{esp\_ble\_mesh\_light\_lc\_state\_t \_state}

Parameters of Light LC state

\texttt{esp\_ble\_mesh\_light\_lc\_property\_state\_t\_prop\_state}

Parameters of Light LC Property state

\texttt{esp\_ble\_mesh\_light\_lc\_state\_machine\_t\_state\_machine}

Parameters of Light LC state machine

\texttt{struct esp\_ble\_mesh\_light\_lc\_srv\_t}

User data of Light LC Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting LC Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`
Parameters of the Light controller

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`struct esp_ble_mesh_light_lc_setup_srv_t`
User data of Light LC Setup Server Model

---

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting LC Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`
Parameters of the Light controller

`struct esp_ble_mesh_state_change_light_lightness_set_t`
Parameter of Light Lightness Actual state change event

---

Public Members

`uint16_t lightness`
The value of Light Lightness Actual state

`struct esp_ble_mesh_state_change_light_lightness_linear_set_t`
Parameter of Light Lightness Linear state change event

---

Public Members

`uint16_t lightness`
The value of Light Lightness Default state

`struct esp_ble_mesh_state_change_light_lightness_default_set_t`
Parameter of Light Lightness Default state change event

---

Public Members

`uint16_t lightness`
The value of Light Lightness Range state change event

`struct esp_ble_mesh_state_change_light_lightness_range_set_t`
Parameters of Light Lightness Range state change event
Public Members

uint16_t range_min
The minimum value of Light Lightness Range state

uint16_t range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event

Public Members

uint16_t lightness
The value of Light CTL Lightness state

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state
### struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

**Public Members**

- **uint16_t** lightness
  The value of Light HSL Lightness state

- **uint16_t** hue
  The value of Light HSL Hue state

- **uint16_t** saturation
  The value of Light HSL Saturation state

### struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

**Public Members**

- **uint16_t** hue
  The value of Light HSL Hue state

### struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

**Public Members**

- **uint16_t** saturation
  The value of Light HSL Saturation state

### struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

**Public Members**

- **uint16_t** lightness
  The value of Light HSL Lightness Default state

- **uint16_t** hue
  The value of Light HSL Hue Default state

- **uint16_t** saturation
  The value of Light HSL Saturation Default state

### struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event

**Public Members**

- **uint16_t** hue_range_min
  The minimum hue value of Light HSL Range state

- **uint16_t** hue_range_max
  The maximum hue value of Light HSL Range state

```
uint16_t saturation_range_min
    The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max
    The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
    Parameters of Light xyL state change event

Public Members

uint16_t lightness
    The value of Light xyL Lightness state

uint16_t x
    The value of Light xyL x state

uint16_t y
    The value of Light xyL y state

struct esp_ble_mesh_state_change_light_xyl_default_set_t
    Parameters of Light xyL Default state change event

Public Members

uint16_t lightness
    The value of Light xyL Lightness Default state

uint16_t x
    The value of Light xyL x Default state

uint16_t y
    The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
    Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
    The minimum value of Light xyL x Range state

uint16_t x_range_max
    The maximum value of Light xyL x Range state

uint16_t y_range_min
    The minimum value of Light xyL y Range state

uint16_t y_range_max
    The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
    Parameter of Light LC Mode state change event
```
Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message
Public Members

uint16_t **property_id**
Property ID identifying a Light LC Property

**struct esp_ble_mesh_server_recv_light_lightness_set_t**
Context of the received Light Lightness Set message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **lightness**
Target value of light lightness actual state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_lightness_linear_set_t**
Context of the received Light Lightness Linear Set message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **lightness**
Target value of light lightness linear state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_lightness_default_set_t**
Context of the received Light Lightness Default Set message

Public Members

uint16_t **lightness**
The value of the Light Lightness Default state

**struct esp_ble_mesh_server_recv_light_lightness_range_set_t**
Context of the received Light Lightness Range Set message
Public Members

```c
uint16_t range_min
Value of range min field of light lightness range state
```

```c
uint16_t range_max
Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_set_t
Context of the received Light CTL Set message
```

Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t lightness
Target value of light ctl lightness state
```

```c
uint16_t temperature
Target value of light ctl temperature state
```

```c
int16_t delta_uv
Target value of light ctl delta UV state
```

```c
uint8_t tid
Transaction ID
```

```c
uint8_t trans_time
Time to complete state transition (optional)
```

```c
uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
Context of the received Light CTL Temperature Set message
```

Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t temperature
Target value of light ctl temperature state
```

```c
int16_t delta_uv
Target value of light ctl delta UV state
```

```c
uint8_t tid
Transaction ID
```

```c
uint8_t trans_time
Time to complete state transition (optional)
```

```c
uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message
```

2.1. Bluetooth API
Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_recv_light_ctl_default_set_t
Context of the received Light CTL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light hsl lightness state

uint16_t hue
Target value of light hsl hue state

uint16_t saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
Context of the received Light HSL Hue Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hue
Target value of light hsl hue state
uint8_t *tid
   Transaction ID

uint8_t *trans_time
   Time to complete state transition (optional)

uint8_t *delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
   Context of the received Light HSL Saturation Set message

Public Members

bool *op_en
   Indicate if optional parameters are included

uint16_t *saturation
   Target value of light hsl hue state

uint8_t *tid
   Transaction ID

uint8_t *trans_time
   Time to complete state transition (optional)

uint8_t *delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
   Context of the received Light HSL Default Set message

Public Members

uint16_t *lightness
   Value of light lightness default state

uint16_t *hue
   Value of light hue default state

uint16_t *saturation
   Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
   Context of the received Light HSL Range Set message

Public Members

uint16_t *hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t *hue_range_max
   Value of hue range max field of light hsl hue range state

uint16_t *saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t *saturation_range_max
   Value of saturation range max field of light hsl saturation range state
struct esp_ble_mesh_server_recv_light_xyl_set_t

Context of the received Light xyL Set message

**Public Members**

bool op_en

Indicate whether optional parameters included

uint16_t lightness

The target value of the Light xyL Lightness state

uint16_t x

The target value of the Light xyL x state

uint16_t y

The target value of the Light xyL y state

uint8_t tid

Transaction Identifier

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t

Context of the received Light xyL Default Set message

**Public Members**

uint16_t lightness

The value of the Light Lightness Default state

uint16_t x

The value of the Light xyL x Default state

uint16_t y

The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t

Context of the received Light xyL Range Set message

**Public Members**

uint16_t x_range_min

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t y_range_min

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max

The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t

Context of the received Light LC Mode Set message
Public Members

uint8_t \_\_\_mode
The target value of the Light LC Mode state

struct esp\_ble\_mesh\_server\_recv\_light\_lc\_om\_set\_t
Context of the received Light OM Set message

Public Members

uint8_t \_\_\_mode
The target value of the Light LC Occupancy Mode state

struct esp\_ble\_mesh\_server\_recv\_light\_lc\_light\_onoff\_set\_t
Context of the received Light LC Light OnOff Set message

Public Members

bool \_\_\_op\_en
Indicate whether optional parameters included

uint8_t \_\_\_light\_onoff
The target value of the Light LC Light OnOff state

uint8_t \_\_\_tid
Transaction Identifier

uint8_t \_\_\_trans\_time
Time to complete state transition (optional)

uint8_t \_\_\_delay
Indicate message execution delay (C.1)

struct esp\_ble\_mesh\_server\_recv\_light\_lc\_property\_set\_t
Context of the received Light LC Property Set message

Public Members

uint16_t \_\_\_property\_id
Property ID identifying a Light LC Property

struct net\_buf\_simple *\_\_\_property\_value
Raw value for the Light LC Property

struct esp\_ble\_mesh\_server\_recv\_sensor\_status\_t
Context of the received Sensor Status message

Public Members

struct net\_buf\_simple *\_\_\_data
Value of sensor data state (optional)

struct esp\_ble\_mesh\_lighting\_server\_cb\_param\_t
Lighting Server Model callback parameters

2.1. Bluetooth API
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Lighting Server Models

`esp_ble_mesh_msg_ctx_t *ctx`
Context of the received messages

`esp_ble_mesh_lighting_server_cb_value_t *value`
Value of the received Lighting Messages

Macros

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI** (cli_pub, cli_data)
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI** (cli_pub, cli_data)
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.
Return  New Light xyL Client Model instance.

Parameters

-(cli_pub): Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
-(cli_data): Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)

Define a new Light LC Client Model.

Note This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Return  New Light LC Client Model instance.

Parameters

-(cli_pub): Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
-(cli_data): Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

Note 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return  New Light Lightness Server Model instance.

Parameters

- (srv_pub): Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- (srv_data): Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

Note 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

Return  New Light Lightness Setup Server Model instance.

Parameters

- (srv_pub): Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- (srv_data): Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

Note 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Return New Light CTL Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV` (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

Note 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light CTL Setup Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV` (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

Note 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

Return New Light CTL Temperature Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV` (srv_pub, srv_data)
Define a new Light HSL Server Model.

Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.
Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV** *(srv_pub, srv_data)*

Define a new Light HSL Setup Server Model.

**Note** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
   1. This model shall support model subscription.

**Return** New Light HSL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV** *(srv_pub, srv_data)*

Define a new Light HSL Hue Server Model.

**Note** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   1. This model shall support model publication and model subscription.

**Return** New Light HSL Hue Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** *(srv_pub, srv_data)*

Define a new Light HSL Saturation Server Model.

**Note** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   1. This model shall support model publication and model subscription.

**Return** New Light HSL Saturation Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** *(srv_pub, srv_data)*

Define a new Light xYL Server Model.

**Note** 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

**Return** New Light xYL Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

### ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xyL Setup Server Model.

**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
2. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

### ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)
Define a new Light LC Server Model.

**Note** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

### ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)
Define a new Light LC Setup Server Model.

**Note** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
2. This model shall support model publication and model subscription.

**Return** New Light LC Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters

• **event**: Event type
• **param**: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Parameters

• **event**: Event type
• **param**: Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
This enum value is the event of Lighting Client Model

Values:

ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:

ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
```

```
enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:

ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
```
1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to
   the application layer when Lighting Get messages are received.

2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to
   the application layer when Lighting Set/Set Unack messages are received.

**ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to
the application layer when Lighting Get messages are received.

**ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the
application layer when Lighting Set/Set Unack messages are received.

**ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to
the application layer when Sensor Status message is received.

**ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

### Time and Scenes Client/Server Models

#### Header File

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

#### Functions

**esp_err_t esp_ble_mesh_register_sensor_client_callback** *(esp_ble_mesh_sensor_client_cb_t callback)*

Register BLE Mesh Sensor Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.

**esp_err_t esp_ble_mesh_sensor_client_get_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)*

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
`esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `params`: Pointer to BLE Mesh common client parameters.
- `get_state`: Pointer to sensor get message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_sensor_client_set_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)*

Set the value of Sensor Server Model states using the Sensor Client Model set messages.
**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `params`: Pointer to BLE Mesh common client parameters.
- `set_state`: Pointer to sensor set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)
```

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `callback`: Pointer to the callback function.

**Unions**

```c
union esp_ble_mesh_sensor_client_get_state_t
#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.
```

**Public Members**

```c
esp_ble_mesh_sensor_descriptor_get_t descriptor_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_DESCRIPTOR_GET
```

```c
esp_ble_mesh_sensor_cadence_get_t cadence_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_GET
```

```c
esp_ble_mesh_sensor_settings_get_t settings_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_SETTINGS_GET
```

```c
esp_ble_mesh_sensor_setting_get_t setting_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_SETTING_GET
```

```c
esp_ble_mesh_sensor_column_get_t column_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_COLUMN_GET
```

```c
esp_ble_mesh_sensor_series_get_t series_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_SERIES_GET
```

```c
union esp_ble_mesh_sensor_client_set_state_t
#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model set message union.
```

**Public Members**

```c
esp_ble_mesh_sensor_cadence_set_t cadence_set
For ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_SET & ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_SET_UNACK
```

```c
esp_ble_mesh_sensor_setting_set_t setting_set
For ESP_BLE_MESH_MODEL_OP_SENSOR_SETTING_SET & ESP_BLE_MESH_MODEL_OP_SENSOR_SETTING_SET_UNACK
```

2.1. Bluetooth API

Structures

struct esp_ble_mesh_sensor_descriptor_get_t
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
Parameters of Sensor Descriptor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_sensor_cadence_get_t
Parameter of Sensor Cadence Get

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_cadence_set_t
Parameters of Sensor Cadence Set

2.1. Bluetooth API
Public Members

```c
uint16_t property_id
    Property ID for the sensor

uint8_t fast_cadence_period_divisor
    Divisor for the publish period

uint8_t status_trigger_type
    The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message

uint8_t status_min_interval
    Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range
```

struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get

Public Members

```c
uint16_t sensor_property_id
    Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
    Parameters of Sensor Setting Get
```

Public Members

```c
uint16_t sensor_property_id
    Property ID of a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
    Parameters of Sensor Setting Set
```

Public Members

```c
uint16_t sensor_property_id
    Property ID identifying a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
    Raw value for the setting
```
struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

**Public Members**

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

**Public Members**

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple * **raw_value_x**
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

**Public Members**

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple * **raw_value_x1**
Raw value identifying a starting column (optional)

struct net_buf_simple * **raw_value_x2**
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

**Public Members**

struct net_buf_simple * **descriptor**
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status
Public Members

uint16_t **property_id**  
Property for the sensor

```c
struct net_buf_simple *sensor_cadence_value
```
Value of sensor cadence state

```c
struct esp_ble_mesh_sensor_settings_status_cb_t
```
Parameters of Sensor Settings Status

Public Members

uint16_t **sensor_property_id**  
Property ID identifying a sensor

```c
struct net_buf_simple *sensor_setting_property_ids
```
A sequence of N sensor setting property IDs (optional)

```c
struct esp_ble_mesh_sensor_setting_status_cb_t
```
Parameters of Sensor Setting Status

Public Members

bool **op_en**  
Indicate id optional parameters are included

```c
uint16_t **sensor_property_id**
```
Property ID identifying a sensor

```c
uint16_t **sensor_setting_property_id**
```
Setting ID identifying a setting within a sensor

```c
uint8_t **sensor_setting_access**
```
Read/Write access rights for the setting (optional)

```c
struct net_buf_simple *sensor_setting_raw
```
Raw value for the setting

```c
struct esp_ble_mesh_sensor_status_cb_t
```
Parameter of Sensor Status

Public Members

```c
struct net_buf_simple *marshalled_sensor_data
```
Value of sensor data state (optional)

```c
struct esp_ble_mesh_sensor_column_status_cb_t
```
Parameters of Sensor Column Status

Public Members

```c
uint16_t **property_id**
```
Property identifying a sensor and the Y axis

```c
struct net_buf_simple *sensor_column_value
```
Left values of sensor column status
struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters

Public Members

int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance
The value of Sensor Positive Tolerance field

uint32_t negative_tolerance
The value of Sensor Negative Tolerance field

uint32_t sampling_function
The value of Sensor Sampling Function field

uint8_t measure_period
The value of Sensor Measurement Period field

uint8_t update_interval
The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state

Public Members

uint16_t property_id
The value of Sensor Setting Property ID field

uint8_t access
The value of Sensor Setting Access field

2.1. Bluetooth API
struct net_buf_simple *raw
   The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state

Public Members

uint8_t period_divisor
   The value of Fast Cadence Period Divisor field

uint8_t trigger_type
   The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
   Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *trigger_delta_up
   The value of Status Trigger Delta Up field

uint8_t min_interval
   The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
   The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
   The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format
   Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
   Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127).
   The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length
   The value of the Sensor Data length

struct net_buf_simple *raw_value
   The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
   The value of Sensor Raw Value X field

struct net_buf_simple *column_width
   The value of Sensor Column Width field
struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t sensor_property_id
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state

const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t *cadence
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t sensor_data
Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t *series_column
Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Sensor Setup Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint8_t period_divisor
The value of Fast Cadence Period Divisor state

uint8_t trigger_type
The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state

uint8_t min_interval
The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t property_id
   Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
   Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
   Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
   Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
   Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
   Context of the received Sensor Setting Get message

Public Members

uint16_t property_id
   Property ID of a sensor

uint16_t setting_property_id
   Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
   Context of the received Sensor Get message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
   Context of the received Sensor Column Get message

Public Members

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x
   Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
   Context of the received Sensor Series Get message

Public Members

uint16_t property_id
   Property identifying a sensor

2.1. Bluetooth API
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value
Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI(cli_pub, cli_data)
Define a new Sensor Client Model.
Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return New Sensor Client Model instance.

Parameters
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_SENSOR_SRV (`srv_pub`, `srv_data`)  
Sensor Server Models related context.

Define a new Sensor Server Model.

Note 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Sensor Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (`srv_pub`, `srv_data`)  
Define a new Sensor Setup Server Model.

Note 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

Return New Sensor Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID  
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN  
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN  
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE  
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE  
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD  
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL  
Not applicable Sensor Update Interval

2.1. Bluetooth API
ESP_BLE_MESH_INVALID_SENSOR_SETTINGPROPERTY_ID
Invalid Sensor Setting Property ID
ESP_BLE_MESH_SENSOR_SETTINGPROPERTY_ID_LEN
Length of Sensor Setting Property ID
ESP_BLE_MESH_SENSOR_SETTINGACCESS_LEN
Length of Sensor Setting Access
ESP_BLE_MESH SENSOR_SETTINGACCESS_READ
Sensor Setting Access - Read
ESP_BLE_MESH SENSOR_SETTINGACCESS_READ_WRITE
Sensor Setting Access - Read & Write
ESP_BLE_MESH SENSOR_DIVISOR_TRIGGERTYPE_LEN
Length of Sensor Divisor Trigger Type
ESP_BLE_MESH SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval
ESP_BLE_MESH SENSOR_PERIODDIVISOR_MAXVALUE
Maximum value of Sensor Period Divisor
ESP_BLE_MESH SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval
ESP_BLE_MESH SENSOR_STATUS_TRIGGERTYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references
ESP_BLE_MESH SENSOR_STATUS_TRIGGERTYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”
ESP_BLE_MESH SENSOR_DATAFORMAT_A
Sensor Data Format A
ESP_BLE_MESH SENSOR_DATAFORMAT_B
Sensor Data Format B
ESP_BLE_MESH SENSOR_DATAFORMAT_A_MPID_LEN
MPID length of Sensor Data Format A
ESP_BLE_MESH SENSOR_DATAFORMAT_B_MPID_LEN
MPID length of Sensor Data Format B
ESP_BLE_MESH SENSOR_DATAZERO_LEN
Zero length of Sensor Data.
  Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.
Sensor Client Model callback function type

Parameters

  • event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.
Sensor Server Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model
Values:
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function
Values:
ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t
This enum value is the event of Sensor Server Model
Values:
ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.

2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.
**ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT**
When `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

**ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**
When `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

**Lighting Client/Server Models**

**Header File**

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

**Functions**

```c
esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)
```

Register BLE Mesh Time Scene Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_time_scene_client_get_state_t *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `params`: Pointer to BLE Mesh common client parameters.
- `get_state`: Pointer to time scene get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                   esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• **params**: Pointer to BLE Mesh common client parameters.
• **set_state**: Pointer to time scene set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)`

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• **callback**: Pointer to the callback function.

**Unions**

```c
union esp_ble_mesh_time_scene_client_get_state_t
#include <esp_ble_mesh_time_scene_model_api.h> // Time Scene Client Model get message union.
```

**Public Members**

```c

```

2.1. Bluetooth API
Structures

```c
struct esp_ble_mesh_time_set_t
    Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

    Parameters of Time Set

    Public Members

    uint8_t tai_seconds[5]
        The current TAI time in seconds

    uint8_t sub_second
        The sub-second time in units of 1/256 second

    uint8_t uncertainty
        The estimated uncertainty in 10-millisecond steps

    uint16_t time_authority
        0 = No Time Authority, 1 = Time Authority

    uint16_t tai_utc_delta
        Current difference between TAI and UTC in seconds

    uint8_t time_zone_offset
        The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_set_t
    Parameters of Time Zone Set

    Public Members

    uint8_t time_zone_offset_new
        Upcoming local time zone offset

    uint8_t tai_zone_change[5]
        TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_set_t
    Parameters of TAI-UTC Delta Set

    Public Members

    uint16_t tai_utc_delta_new
        Upcoming difference between TAI and UTC in seconds

    uint16_t padding
        Always 0b0. Other values are Prohibited.

    uint8_t tai_delta_change[5]
        TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set
**Public Members**

`uint8_t time_role`
- The Time Role for the element

**struct esp_ble_mesh_scene_store_t**
- Parameter of Scene Store

**Public Members**

`uint16_t scene_number`
- The number of scenes to be stored

**struct esp_ble_mesh_scene_recall_t**
- Parameters of Scene Recall

**Public Members**

`bool op_en`
- Indicate if optional parameters are included

`uint16_t scene_number`
- The number of scenes to be recalled

`uint8_t tid`
- Transaction ID

`uint8_t trans_time`
- Time to complete state transition (optional)

`uint8_t delay`
- Indicate message execution delay (C.1)

**struct esp_ble_mesh_scene_delete_t**
- Parameter of Scene Delete

**Public Members**

`uint16_t scene_number`
- The number of scenes to be deleted

**struct esp_ble_mesh_scheduler_act_get_t**
- Parameter of Scheduler Action Get

**Public Members**

`uint8_t index`
- Index of the Schedule Register entry to get

**struct esp_ble_mesh_scheduler_act_set_t**
- Parameters of Scheduler Action Set
Public Members

uint64_t index
   Index of the Schedule Register entry to set

uint64_t year
   Scheduled year for the action

uint64_t month
   Scheduled month for the action

uint64_t day
   Scheduled day of the month for the action

uint64_t hour
   Scheduled hour for the action

uint64_t minute
   Scheduled minute for the action

uint64_t second
   Scheduled second for the action

uint64_t day_of_week
   Schedule days of the week for the action

uint64_t action
   Action to be performed at the scheduled time

uint64_t trans_time
   Transition time for this action

uint16_t scene_number
   Transition time for this action

struct esp_ble_mesh_time_status_cb_t
   Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
   The current TAI time in seconds

uint8_t sub_second
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
   Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
   Parameters of Time Zone Status
Public Members

- **uint8_t time_zone_offset_curr**
  - Current local time zone offset

- **uint8_t time_zone_offset_new**
  - Upcoming local time zone offset

- **uint8_t tai_zone_change[5]**
  - TAI Seconds time of the upcoming Time Zone Offset change

```c
struct esp_ble_mesh_tai_utc_delta_status_cb_t
```
- Parameters of TAI-UTC Delta Status

Public Members

- **uint16_t tai_utc_delta_curr**
  - Current difference between TAI and UTC in seconds

- **uint16_t padding_1**
  - Always 0b0. Other values are Prohibited.

- **uint16_t tai_utc_delta_new**
  - Upcoming difference between TAI and UTC in seconds

- **uint16_t padding_2**
  - Always 0b0. Other values are Prohibited.

- **uint8_t tai_delta_change[5]**
  - TAI Seconds time of the upcoming TAI-UTC Delta change

```c
struct esp_ble_mesh_time_role_status_cb_t
```
- Parameter of Time Role Status

Public Members

- **uint8_t time_role**
  - The Time Role for the element

```c
struct esp_ble_mesh_scene_status_cb_t
```
- Parameters of Scene Status

Public Members

- **bool op_en**
  - Indicate if optional parameters are included

- **uint8_t status_code**
  - Status code of the last operation

- **uint16_t current_scene**
  - Scene Number of the current scene

- **uint16_t target_scene**
  - Scene Number of the target scene (optional)

- **uint8_t remain_time**
  - Time to complete state transition (C.1)
struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status

Public Members

uint8_t status_code
Status code for the previous operation

uint16_t current_scene
Scene Number of the current scene

struct net_buf_simple *scenes
A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status

Public Members

uint16_t schedules
Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index
Enumerates (selects) a Schedule Register entry

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action

uint64_t hour
Scheduled hour for the action

uint64_t minute
Scheduled minute for the action

uint64_t second
Scheduled second for the action

uint64_t day_of_week
Schedule days of the week for the action

uint64_t action
Action to be performed at the scheduled time

uint64_t trans_time
Transition time for this action

uint16_t scene_number
Transition time for this action
struct esp_ble_mesh_time_scene_client_cb_param_t
  Time Scene Client Model callback parameters

Public Members

int error_code
  Appropriate error code

esp_ble_mesh_client_common_param_t *params
  The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
  The scene status message callback values

struct esp_ble_mesh_time_state_t
  Parameters of Time state

Public Members

uint8_t tai_seconds[5]
  The value of the TAI Seconds state

uint8_t subsecond
  The value of the Subsecond field

uint8_t uncertainty
  The value of the Uncertainty field

uint8_t time_zone_offset_curr
  The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
  The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
  The value of the TAI of Zone Change field

uint16_t time_authority
  The value of the Time Authority bit

uint16_t tai_utc_delta_curr
  The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new
  The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
  The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
  Parameters of the Time state

uint8_t time_role
  The value of the Time Role state

struct esp_ble_mesh_time_srv_t
  User data of Time Server Model

2.1. Bluetooth API
Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Time Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_time_state_t *state
Parameters of the Time state
```

```c
struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Time Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_time_state_t *state
Parameters of the Time state
```

```c
struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model
```

Public Members

```c
uint16_t scene_number
The value of the Scene Number
```

```c
uint8_t scene_type
The value of the Scene Type
```

```c
struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which
can be stored in a scene. The value of the Scene Value
```

```c
struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.
```

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states
of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a
maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container
associated with it, are determined by a model.
The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

**Public Members**

```c
const uint16_t scene_count
   The Scenes state’s scene count

esp_ble_mesh_scene_register_t *scenes
   Parameters of the Scenes state

uint16_t current_scene
   The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

   When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

   When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

   When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

   When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene
   The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

   When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

   When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

   When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code
   The status code of the last scene operation

bool in_progress
   Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t
   User data of Scene Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
   Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
   Response control of the server model received messages
```
esp_ble_mesh_scenes_state_t *state
Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t
User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_scenes_state_t *state
Parameters of the Scenes state

struct esp_ble_mesh_schedule_register_t
Parameters of Scheduler Register state

Public Members

bool in_use
Indicate if the registered schedule is in use

uint64_t year
The value of Scheduled year for the action

uint64_t month
The value of Scheduled month for the action

uint64_t day
The value of Scheduled day of the month for the action

uint64_t hour
The value of Scheduled hour for the action

uint64_t minute
The value of Scheduled minute for the action

uint64_t second
The value of Scheduled second for the action

uint64_t day_of_week
The value of Schedule days of the week for the action

uint64_t action
The value of Action to be performed at the scheduled time

uint64_t trans_time
The value of Transition time for this action

uint16_t scene_number
The value of Scene Number to be used for some actions
struct esp_ble_mesh_scheduler_state_t
Parameters of Scheduler state

Public Members

cst uint8_t schedule_count
Scheduler count

esp_ble_mesh_schedule_register_t *schedules
Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t
User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

2.1. Bluetooth API
uint16_t \texttt{tai\_utc\_delta\_curr}
Current difference between TAI and UTC in seconds

uint8_t \texttt{time\_zone\_offset\_curr}
The local time zone offset in 15-minute increments

\begin{verbatim}
struct esp\_ble\_mesh\_state\_change\_time\_status\_t
Parameters of Time Status state change event

Public Members

uint8_t \texttt{tai\_seconds}[5]
The current TAI time in seconds

uint8_t \texttt{subsecond}
The sub-second time in units of 1/256 second

uint8_t \texttt{uncertainty}
The estimated uncertainty in 10-millisecond steps

uint16_t \texttt{time\_authority}
0 = No Time Authority, 1 = Time Authority

uint16_t \texttt{tai\_utc\_delta\_curr}
Current difference between TAI and UTC in seconds

uint8_t \texttt{time\_zone\_offset\_curr}
The local time zone offset in 15-minute increments
\end{verbatim}

\begin{verbatim}
struct esp\_ble\_mesh\_state\_change\_time\_zone\_set\_t
Parameters of Time Zone Set state change event

Public Members

uint8_t \texttt{time\_zone\_offset\_new}
Upcoming local time zone offset

uint8_t \texttt{tai\_zone\_change}[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t \texttt{tai\_utc\_delta\_new}
Upcoming difference between TAI and UTC in seconds

uint8_t \texttt{tai\_delta\_change}[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp\_ble\_mesh\_state\_change\_time\_role\_set\_t
Parameter of Time Role Set state change event
\end{verbatim}
Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
Parameter of Scene Store state change event

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
Parameter of Scene Delete state change event

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
Parameter of Scheduler Action Set state change event

Public Members

uint64_t index
Index of the Schedule Register entry to set

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action

uint64_t hour
Scheduled hour for the action

uint64_t minute
Scheduled minute for the action

uint64_t second
Scheduled second for the action

uint64_t day_of_week
Schedule days of the week for the action
uint64_t action
Action to be performed at the scheduled time

uint64_t trans_time
Transition time for this action

uint16_t scene_number
Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
Context of the received Time Set message

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message

Public Members
Public Members

uint16_t `tai_utc_delta_new`
Upcoming difference between TAI and UTC in seconds

uint16_t `padding`
Always 0b0. Other values are Prohibited.

uint8_t `tai_delta_change[5]`
TAI Seconds time of the upcoming TAI-UTC Delta change

struct `esp_ble_mesh_server_recv_time_role_set_t`
Context of the received Time Role Set message

Public Members

uint8_t `time_role`
The Time Role for the element

struct `esp_ble_mesh_server_recv_scene_store_t`
Context of the received Scene Store message

Public Members

uint16_t `scene_number`
The number of scenes to be stored

struct `esp_ble_mesh_server_recv_scene_recall_t`
Context of the received Scene Recall message

Public Members

bool `op_en`
Indicate if optional parameters are included

uint16_t `scene_number`
The number of scenes to be recalled

uint8_t `tid`
Transaction ID

uint8_t `trans_time`
Time to complete state transition (optional)

uint8_t `delay`
Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_recv_scene_delete_t`
Context of the received Scene Delete message

Public Members

uint16_t `scene_number`
The number of scenes to be deleted

struct `esp_ble_mesh_server_recv_scheduler_act_set_t`
Context of the received Scheduler Action Set message
Public Members

```c
uint64_t index
    Index of the Schedule Register entry to set

uint64_t year
    Scheduled year for the action

uint64_t month
    Scheduled month for the action

uint64_t day
    Scheduled day of the month for the action

uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Schedule days of the week for the action

uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions
```

`struct esp_ble_mesh_server_recv_time_status_t`
Context of the received Time Status message

Public Members

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

`struct esp_ble_mesh_time_scene_server_cb_param_t`
Time Scene Server Model callback parameters
Public Members

\texttt{esp\_ble\_mesh\_model\_t *model}

Pointer to Time and Scenes Server Models

\texttt{esp\_ble\_mesh\_msg\_ctx\_t ctx}

Context of the received messages

\texttt{esp\_ble\_mesh\_time\_scene\_server\_cb\_value\_t value}

Value of the received Time and Scenes Messages

Macros

\texttt{ESP\_BLE\_MESH\_MODEL\_TIME\_CLI (cli\_pub, cli\_data)}

Define a new Time Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Time Client Model.

\textbf{Return} New Time Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI (cli\_pub, cli\_data)}

Define a new Scene Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Scene Client Model.

\textbf{Return} New Scene Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI (cli\_pub, cli\_data)}

Define a new Scheduler Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

\textbf{Return} New Scheduler Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\texttt{ESP\_BLE\_MESH\_MODEL\_TIME\_SRV (srv\_pub, srv\_data)}

Time Scene Server Models related context.

Define a new Time Server Model.

\textbf{Note} 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV(srv_data)
Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

2. This model does not support subscribing nor publishing.

Parameters

- srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV(srv_pub, srv_data)
Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_scene_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV(srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scene Setup Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_scene_setup_srv_t.
ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.
   3. The model requires the Time Server model shall be present on the element.

Return New Scheduler Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_scheduler_srv_t.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

Note 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   1. This model shall support model subscription.
   2. The model may be present only on the Primary element of a node.

Return New Scheduler Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_scheduler_setup_srv_t.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELAT_MAX_VALUE
Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELAT_CHANGE_LEN
Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay
**ESP_BLE_MESH_TIME_CLINET**
Time Role - Mesh Time Client

**ESP_BLE_MESH.Scene.SUCCESS**
Scene operation - Success

**ESP_BLE_MESH_SCENE_REG_FULL**
Scene operation - Scene Register Full

**ESP_BLE_MESH_SCENE_NOT_FOUND**
Scene operation - Scene Not Found

### Type Definitions

```c
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.
Time Scene Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.
Time Scene Server Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

### Enumerations

```c
enum esp_ble_mesh_time_scene_client_cb_event_t
```
This enum value is the event of Time Scene Client Model

**Values:**
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_time_scene_server_cb_event_t
```
This enum value is the event of Time Scene Server Model

2.1. Bluetooth API

---

537
Values:

ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when TIime Status message is received.

ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice: * For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used. * For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:
- ESP32 Bluetooth Architecture (PDF) [English]
- ESP32 Bluetooth Architecture (PDF) []

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:
- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi
Introduction

The WiFi libraries provide support for configuring and monitoring the ESP32 WiFi networking functionality. This includes configuration for:

- Station mode (aka STA mode or WiFi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Combined AP-STA mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 WiFi packets.

Application Examples

The wifi directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the wifi directory of ESP-IDF examples.

In addition, there is a simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

- esp_wifi/include/esp_wifi.h

Functions

\[ \text{esp_wifi_init}(\text{const wifi_init_config_t} *\text{config}) \]

Init WiFi Alloc resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc, this WiFi also start WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to init the config to default values, this can guarantee all the fields got correct value when more fields are added into \text{wifi_init_config_t} in future release. If you want to set your owner initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT, please be notified that the field ‘magic’ of \text{wifi_init_config_t} should always be WIFI_INIT_CONFIG_MAGIC!

Return

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

Parameters

- config: pointer to WiFi init configuration structure; can point to a temporary variable.

2.2. Networking APIs 539
**esp_err_t esp_wifi_deinit** (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_mode** (wifi_mode_t mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

**Parameters**

- mode: WiFi operating mode

**esp_err_t esp_wifi_get_mode** (wifi_mode_t* mode)

Get current operating mode of WiFi.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- mode: store current WiFi mode

**esp_err_t esp_wifi_start** (void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APB, it create soft-AP and station control block and start soft-AP and station.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors
**esp_err_t esp_wifi_stop**(void)

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_restore**(void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
- esp_wifi_get_auto_connect,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_connect**(void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect**(void)

Disconnect the ESP32 WiFi station from the AP.

**Return**
- ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_FAIL: other WiFi internal errors

\texttt{esp_err_t esp_wifi_clear_fast_connect (void)}

Currently this API is just an stub API.

Return

• ESP_OK: succeed
• others: fail

\texttt{esp_err_t esp_wifi_deauth_sta (uint16_t aid)}

deanauthenticate all stations or associated id equals to aid

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters

• \texttt{aid}: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

\texttt{esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)}

Scan all available APs.

\textbf{Attention} If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

\textbf{Attention} The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
• ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
• others: refer to error code in esp_err.h

Parameters

• \texttt{config}: configuration of scanning
• \texttt{block}: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately
esp_err_t esp_wifi_scan_stop (void)
Stop the scan in process.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• number: store number of APIs found in last scan

esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
Get AP list found in last scan.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory

Parameters
• number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
• ap_records: wifi_ap_record_t array to hold the found APs

esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
Get information of AP which the ESP32 station is associated with.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_CONN: The station interface don’t initialized
• ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

Parameters
• **ap_info**: the `wifi_ap_record_t` to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11bphy_11gphy_11nphy_lr in the `wifi_ap_record_t` struct. For example, phy_11b = 1 imply that ap support 802.11b mode

```c
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)
```
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- `type`: power save type

```c
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
```
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- `type`: store current power save type

```c
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
```
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- `ifx`: interfaces
- `protocol_bitmap`: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
• \texttt{ifx}: interface
• \texttt{protocol\_bitmap}: store current WiFi protocol bitmap of interface \texttt{ifx}

\texttt{esp\_err\_t esp\_wifi\_set\_bandwidth (wifi\_interface\_t \texttt{ifx}, wifi\_bandwidth\_t \texttt{bw})}

Set the bandwidth of ESP32 specified interface.

\textbf{Attention} 1. API return false if try to configure an interface that is not enabled
\textbf{Attention} 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

\textbf{Return}

• ESP\_OK: succeed
• ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
• ESP\_ERR\_WIFI\_IF: invalid interface
• ESP\_ERR\_INVALID\_ARG: invalid argument
• others: refer to error codes in esp\_err.h

\textbf{Parameters}

• \texttt{ifx}: interface to be configured
• \texttt{bw}: bandwidth

\texttt{esp\_err\_t esp\_wifi\_get\_bandwidth (wifi\_interface\_t \texttt{ifx}, wifi\_bandwidth\_t *\texttt{bw})}

Get the bandwidth of ESP32 specified interface.

\textbf{Attention} 1. API return false if try to get a interface that is not enable

\textbf{Return}

• ESP\_OK: succeed
• ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
• ESP\_ERR\_WIFI\_IF: invalid interface
• ESP\_ERR\_INVALID\_ARG: invalid argument

\textbf{Parameters}

• \texttt{ifx}: interface to be configured
• \texttt{bw}: store bandwidth of interface \texttt{ifx}

\texttt{esp\_err\_t esp\_wifi\_set\_channel (uint8\_t \texttt{primary}, wifi\_second\_chan\_t \texttt{second})}

Set primary/secondary channel of ESP32.

\textbf{Attention} 1. This API should be called after esp\_wifi\_start()
\textbf{Attention} 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
\textbf{Attention} 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
\textbf{Attention} 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

\textbf{Return}
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
• second: for HT20, second is ignored, for HT40, second is the second channel

```c
esp_err_t esp_wifi_get_channel(uint8_t *primary, wifi_second_chan_t *second)
```
Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• primary: store current primary channel
• second: store current second channel

```c
esp_err_t esp_wifi_set_country(const wifi_country_t *country)
```
configure country info

Attention 1. The default country is {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

Attention 2. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="USA", .schan=1, .nchan=11} and the country info of the AP which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 3. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, always use the configured country info.

Attention 4. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is changed also.

Attention 5. The country configuration is not stored into flash

Attention 6. This API doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
Parameters

- **country**: the configured country info

```c
esp_err_t esp_wifi_get_country(wifi_country_t *country)
```

get the current country info

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- **country**: country info

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention 1.** This API can only be called when the interface is disabled

**Attention 2.** ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention 3.** The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

Parameters

- **ifx**: interface
- **mac**: the MAC address

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
• ifx: interface
• mac: store mac of the interface ifx

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

• cb: callback

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```

Enable the promiscuous mode.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

• en: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```

Get the promiscuous mode.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters

• en: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```

Enable the promiscuous mode packet type filter.

Note The default filter is to filter all packets except WIFI_PKT_MISC

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

• filter: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)
```

Get the promiscuous filter.
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- `filter`: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
```

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- `filter`: the subtype of the control packet filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
```

Get the subtype filter of the control packet in promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- `filter`: store the current status of subtype filter of the control packet in promiscuous mode

```c
esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
• ESP_ERR_WIFI_NVS: WiFi internal NVS error
• others: refer to the erro code in esp_err.h

Parameters
• interface: interface
• conf: station or soft-AP configuration

`esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)`
Get configuration of specified interface.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

Parameters
• interface: interface
• conf: station or soft-AP configuration

`esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)`
Get STAs associated with soft-AP.

Attention  SSC only API

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
• sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11bphy_11gphy_11nphy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

`esp_err_t esp_wifi_set_storage(wifi_storage_t storage)`
Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
**storage**: storage type

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx,
                                   const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xFF) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

**Parameters**

- *enable*: If true, specified IE is enabled. If false, specified IE is removed.
- *type*: Information Element type. Determines the frame type to associate with the IE.
- *idx*: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- *vnd_ie*: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**

- *cb*: Callback function
- *ctx*: Context argument, passed to callback function.

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```

Set maximum WiFi transmitting power.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- *power*: Maximum WiFi transmitting power, unit is 0.25dBm, range is [40, 82] corresponding to 10dBm - 20.5dBm here.

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```

Get maximum WiFi transmitting power.

---

**2.2. Networking APIs**
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- power: Maximum WiFi transmitting power, unit is 0.25dBm.

```
esp_err_t esp_wifi_set_event_mask (uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- mask: WiFi event mask.

```
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```

Get mask of WiFi events.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- mask: WiFi event mask.

```
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Return

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory
Parameters

- **ifx**: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.

- **buffer**: raw ieee80211 buffer

- **len**: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes

- **en_sys_seq**: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.
Each time a CSI data is received, the callback function will be called.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- **cb**: callback
- **ctx**: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- **config**: configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

2.2. Networking APIs
Parameters

• en: true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)`
Set antenna GPIO configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters

• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)`
Get current antenna GPIO configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters

• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`
Set antenna configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters

• config: Antenna configuration.

`esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)`
Get current antenna configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters

• config: Antenna configuration.
Structures

```c
struct wifi_init_config_t
    WiFi stack configuration parameters passed to esp_wifi_init call.
```

Public Members

```c
system_event_handler_t event_handler
    WiFi event handler

wifi_osi_funcs_t *osi_funcs
    WiFi OS functions

wpa_crypto_funcs_t wpa_crypto_funcs
    WiFi station crypto functions when connect

int static_rx_buf_num
    WiFi static RX buffer number

int dynamic_rx_buf_num
    WiFi dynamic RX buffer number

int tx_buf_type
    WiFi TX buffer type

int static_tx_buf_num
    WiFi static TX buffer number

int dynamic_tx_buf_num
    WiFi dynamic TX buffer number

int csi_enable
    WiFi channel state information enable flag

int ampdu_rx_enable
    WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
    WiFi AMPDU TX feature enable flag

int nvs_enable
    WiFi NVS flash enable flag

int nano_enable
    Nano option for printf/scan family enable flag

int tx_ba_win
    WiFi Block Ack TX window size

int rx_ba_win
    WiFi Block Ack RX window size

int wifi_task_core_id
    WiFi Task Core ID

int beacon_max_len
    WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32
```
uint64_t **feature_caps**
   Enables additional WiFi features and capabilities

int **magic**
   WiFi init magic number, it should be the last field

**Macros**

**ESP_ERR_WIFI_NOT_INIT**
   WiFi driver was not installed by esp_wifi_init

**ESP_ERR_WIFI_NOT_STARTED**
   WiFi driver was not started by esp_wifi_start

**ESP_ERR_WIFI_NOT_STOPPED**
   WiFi driver was not stopped by esp_wifi_stop

**ESP_ERR_WIFI_IF**
   WiFi interface error

**ESP_ERR_WIFI_MODE**
   WiFi mode error

**ESP_ERR_WIFI_STATE**
   WiFi internal state error

**ESP_ERR_WIFI_CONN**
   WiFi internal control block of station or soft-AP error

**ESP_ERR_WIFI_NVS**
   WiFi internal NVS module error

**ESP_ERR_WIFI_MAC**
   MAC address is invalid

**ESP_ERR_WIFI_SSID**
   SSID is invalid

**ESP_ERR_WIFI_PASSWORD**
   Password is invalid

**ESP_ERR_WIFI_TIMEOUT**
   Timeout error

**ESP_ERR_WIFI_WAKE_FAIL**
   WiFi is in sleep state(RF closed) and wakeup fail

**ESP_ERR_WIFI_WOULD_BLOCK**
   The caller would block

**ESP_ERR_WIFI_NOT_CONNECT**
   Station still in disconnect status

**ESP_ERR_WIFI_POST**
   Failed to post the event to WiFi task

**ESP_ERR_WIFI_INIT_STATE**
   Invalid WiFi state when init/deinit is called

**ESP_ERR_WIFI_STOP_STATE**
   Returned when WiFi is stopping
### Type Definitions

**typedef** void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Parameters**

- **buf**: Data received. Type of data in buffer (`wifi_promiscuous_pkt_t` or `wifi_pkt_rx_ctrl_t`) indicated by `type` parameter.
- **type**: promiscuous packet type.

**typedef** void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
                                      const vendor_ie_data_t *vnd_ie, uint8_t rssi)

Function signature for received Vendor-Specific Information Element callback.

**Parameters**

- **ctx**: Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- **type**: Information element type, based on frame type received.
- **sa**: Source 802.11 address.
- **vnd_ie**: Pointer to the vendor specific element data received.
- **rssi**: Received signal strength indication.

**typedef** void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.
Parameters

- **ctx**: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- **data**: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- esp_wifi/include/esp_wifi_types.h

Unions

```c
union wifi_scan_time_t
#include <esp_wifi_types.h> Aggregate of active & passive scan time per channel.
```

**Public Members**

```c
cwifi_active_scan_time_t active
active scan time per channel, units: millisecond.
```

```c
cuint32_t passive
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.
```

```c
union wifi_config_t
#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.
```

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config().

**Public Members**

```c
cwifi_ap_config_t ap
configuration of AP.
```

```c
cwifi_sta_config_t sta
configuration of STA.
```

Structures

```c
struct wifi_country_t
Structure describing WiFi country-based regional restrictions.
```

**Public Members**

```c
char cc[3]
country code string.
```

```c
cuint8_t schan
start channel.
```
uint8_t nchan
    total channel number

int8_t max_tx_power
    This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
    country policy

struct wifi_active_scan_time_t
    Range of active scan times per channel.

**Public Members**

uint32_t min
    minimum active scan time per channel, units: millisecond

uint32_t max
    maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_config_t
    Parameters for an SSID scan.

**Public Members**

uint8_t *ssid
    SSID of AP

uint8_t *bssid
    MAC address of AP

uint8_t channel
    channel, scan the specific channel

bool show_hidden
    enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
    scan type, active or passive

wifi_scan_time_t scan_time
    scan time per channel

struct wifi_ap_record_t
    Description of a WiFi AP.

**Public Members**

uint8_t bssid[6]
    MAC address of AP

uint8_t ssid[33]
    SSID of AP

uint8_t primary
    channel of AP

2.2. Networking APIs
**wifi_second_chan_t**
second channel of AP

**int8_t rssi**
signal strength of AP

**wifi_auth_mode_t authmode**
authmode of AP

**wifi_cipher_type_t pairwise_cipher**
pairwise cipher of AP

**wifi_cipher_type_t group_cipher**
group cipher of AP

**wifi_ant_t ant**
antenna used to receive beacon from AP

**uint32_t phy_11b**
bit: 0 flag to identify if 11b mode is enabled or not

**uint32_t phy_11g**
bit: 1 flag to identify if 11g mode is enabled or not

**uint32_t phy_11n**
bit: 2 flag to identify if 11n mode is enabled or not

**uint32_t phy_lr**
bit: 3 flag to identify if low rate is enabled or not

**uint32_t wps**
bit: 4 flag to identify if WPS is supported or not

**uint32_t reserved**
bit: 5..31 reserved

**wifi_country_t country**
country information of AP

**struct wifi_scan_threshold_t**
Structure describing parameters for a WiFi fast scan.

**Public Members**

**int8_t rssi**
The minimum rssi to accept in the fast scan mode

**wifi_auth_mode_t authmode**
The weakest authmode to accept in the fast scan mode

**struct wifi_pmf_config_t**
Configuration structure for Protected Management Frame

**Public Members**

**bool capable**
Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if other device also advertizes PMF capability.
bool required
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi_ap_config_t**
Soft-AP configuration settings for the ESP32.

**Public Members**

- `uint8_t ssid[32]`
  SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

- `uint8_t password[64]`
  Password of ESP32 soft-AP. Null terminated string.

- `uint8_t ssid_len`
  Optional length of SSID field.

- `uint8_t channel`
  Channel of ESP32 soft-AP

- `wifi_auth_mode_t authmode`
  Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

- `uint8_t ssid_hidden`
  Broadcast SSID or not, default 0, broadcast the SSID

- `uint8_t max_connection`
  Max number of stations allowed to connect in, default 4, max 4

- `uint16_t beacon_interval`
  Beacon interval, 100 ~ 60000 ms, default 100 ms

**struct wifi_sta_config_t**
STA configuration settings for the ESP32.

**Public Members**

- `uint8_t ssid[32]`
  SSID of target AP. Null terminated string.

- `uint8_t password[64]`
  Password of target AP. Null terminated string.

- `wifi_scan_method_t scan_method`
  do all channel scan or fast scan

- `bool bssid_set`
  whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

- `uint8_t bssid[6]`
  MAC address of target AP

- `uint8_t channel`
  channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.
uint16_t listen_interval
    Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
    sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
    When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
    Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

struct wifi_sta_info_t
    Description of STA associated with AP.

    Public Members

    uint8_t mac[6]
        mac address

    int8_t rssi
        current average rssi of sta connected

    uint32_t phy_11b
        bit: 0 flag to identify if 11b mode is enabled or not

    uint32_t phy_11g
        bit: 1 flag to identify if 11g mode is enabled or not

    uint32_t phy_11n
        bit: 2 flag to identify if 11n mode is enabled or not

    uint32_t phy_lr
        bit: 3 flag to identify if low rate is enabled or not

    uint32_t reserved
        bit: 4..31 reserved

struct wifi_sta_list_t
    List of stations associated with the ESP32 Soft-AP.

    Public Members

    wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
        station list

    int num
        number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.
Public Members

- **uint8_t element_id**
  Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

- **uint8_t length**
  Length of all bytes in the element data following this field. Minimum 4.

- **uint8_t vendor_oui[3]**
  Vendor identifier (OUI).

- **uint8_t vendor_oui_type**
  Vendor-specific OUI type.

- **uint8_t payload[0]**
  Payload. Length is equal to value in ‘length’ field, minus 4.

### struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

- **signed rssi**
  Received Signal Strength Indicator (RSSI) of packet. unit: dBm

- **unsigned rate**
  PHY rate encoding of the packet. Only valid for non HT(11bg) packet

- **unsigned __pad0__**
  reserve

- **unsigned sig_mode**
  0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

- **unsigned __pad1__**
  reserve

- **unsigned mcs**
  Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

- **unsigned cwb**
  Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

- **unsigned __pad2__**
  reserve

- **unsigned smoothing**
  reserve

- **unsigned not_sounding**
  reserve

- **unsigned __pad3__**
  reserve

- **unsigned aggregation**
  Aggregation. 0: MPDU packet; 1: AMPDU packet

- **unsigned stbc**
  Space Time Block Code (STBC). 0: non STBC packet; 1: STBC packet

2.2. Networking APIs
unsigned **fec_coding**
Flag is set for 11n packets which are LDPC

unsigned **sgi**
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **ampdu_cnt**
ampdu cnt

unsigned **channel**
primary channel on which this packet is received

unsigned **secondary_channel**
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad4__**
reserve

unsigned **timestamp**
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad5__**
reserve

unsigned **__pad6__**
reserve

unsigned **ant**
an antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig_len**
length of packet including Frame Check Sequence(FCS)

unsigned **__pad7__**
reserve

unsigned **rx_state**
state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**
Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

**Public Members**

**wifi_pkt_rx_ctrl_t rx_ctrl**
metadata header

**uint8_t payload[0]**
Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**
Mask for filtering different packet types in promiscuous mode.

**Public Members**

**uint32_t filter_mask**
OR of one or more filter values WIFI_PROMIS_FILTER_*
struct wifi_csi_config_t
Channel state information(CSI) configuration type.

Public Members

bool lltf_en
   enable to receive legacy long training field(lltf) data. Default enabled

bool htlf_en
   enable to receive HT long training field(htlf) data. Default enabled

bool stbc_hltf2_en
   enable to receive space time block code HT long training field(stbc-hltf2) data. Default enabled

bool ltf_merge_en
   enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool channel_filter_en
   enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
   manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
   manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
   received packet radio metadata header of the CSI data

uint8_t mac[6]
   source MAC address of the CSI data

bool first_word_invalid
   first four bytes of the CSI data is invalid or not

int8_t *buf
   buffer of CSI data

uint16_t len
   length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select
   Whether this GPIO is connected to external antenna switch

2.2. Networking APIs 565
uint8_t gpio_num
The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving

wifi_ant_t rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t enabled_ant0
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_event_sta_scan_done_t
Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
status of scanning APs: 0 — success, 1 - failure

uint8_t number
number of scan results

uint8_t scan_id
scan sequence number, used for block scan

struct wifi_event_sta_connected_t
Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
SSID of connected AP

uint8_t ssid_len
SSID length of connected AP
uint8_t *bssid[6]
BSSID of connected AP

uint8_t *channel
channel of connected AP

wifi_auth_mode_t authmode
authentication mode used by AP

**struct wifi_event_sta_disconnected_t**
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

**Public Members**

uint8_t *ssid[32]
SSID of disconnected AP

uint8_t *ssid_len
SSID length of disconnected AP

uint8_t *bssid[6]
BSSID of disconnected AP

uint8_t *reason
reason of disconnection

**struct wifi_event_sta_authmode_change_t**
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

**Public Members**

wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP

**struct wifi_event_sta_wps_er_pin_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

**Public Members**

uint8_t *pin_code[8]
PIN code of station in enrollee mode

**struct wifi_event_ap_staconnected_t**
Argument structure for WIFI_EVENT_AP_STACONNECTED event

**Public Members**

uint8_t *mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t *aid
the aid that ESP32 soft-AP gives to the station connected to
struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
MAC address of the station disconnects to ESP32 soft-AP
uint8_t aid
the aid that ESP32 soft-AP gave to the station disconnects to

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength
uint8_t mac[6]
MAC address of the station which send probe request

Macros

WIFI_IF_STA
WIFI_IF_AP
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
filter all packets
WIFI_PROMIS_FILTER_MASK_MGMT
filter the packets with type of WIFI_PKT_MGMT
WIFI_PROMIS_FILTER_MASK_CTRL
filter the packets with type of WIFI_PKT_CTRL
WIFI_PROMIS_FILTER_MASK_DATA
filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
filter the MPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
   filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
   filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
   filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
   filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
   filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
   filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
   filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
   filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
   filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
   filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
   filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
   mask all WiFi events

WIFI_EVENT_MASK_NONE
   mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
   mask SYSTEM_EVENT_AP_PROBEREQRECVED event

Type Definitions

typedef esp_interface_t wifi_interface_t

Enumerations

enum wifi_mode_t
   Values:
   WIFI_MODE_NULL = 0
      null mode
   WIFI_MODE_STA
      WiFi station mode
   WIFI_MODE_AP
      WiFi soft-AP mode
**WIFI_MODE_APSTA**
WiFi station + soft-AP mode

**WIFI_MODE_MAX**

e num wifi_country_policy_t

**Values:**

**WIFI_COUNTRY_POLICY_AUTO**
Country policy is auto, use the country info of AP to which the station is connected

**WIFI_COUNTRY_POLICY_MANUAL**
Country policy is manual, always use the configured country info

**enum wifi_auth_mode_t**

**Values:**

**WIFI_AUTH_OPEN = 0**
authenticate mode : open

**WIFI_AUTH_WEP**
authenticate mode : WEP

**WIFI_AUTH_WPA_PSK**
authenticate mode : WPA_PSK

**WIFI_AUTH_WPA2_PSK**
authenticate mode : WPA2_PSK

**WIFI_AUTH_WPA_WPA2_PSK**
authenticate mode : WPA_WPA2_PSK

**WIFI_AUTH_WPA2_ENTERPRISE**
authenticate mode : WPA2_ENTERPRISE

**WIFI_AUTH_WPA3_PSK**
authenticate mode : WPA3_PSK

**WIFI_AUTH_MAX**

e num wifi_err_reason_t

**Values:**

**WIFI_REASON_UNSPECIFIED = 1**

**WIFI_REASON_AUTH_EXPIRE = 2**

**WIFI_REASON_AUTH_LEAVE = 3**

**WIFI_REASON_ASSOC_EXPIRE = 4**

**WIFI_REASON_ASSOC_TOOMANY = 5**

**WIFI_REASON_NOT_AUTHED = 6**

**WIFI_REASON_NOT_ASSOCED = 7**

**WIFI_REASON_ASSOC_LEAVE = 8**

**WIFI_REASON_ASSOC_NOT_AUTHED = 9**

**WIFI_REASON_DISASSOC_PWRCAP_BAD = 10**

**WIFI_REASON_DISASSOC_SUPCHAN_BAD = 11**

**WIFI_REASON_IE_INVALID = 13**
WIFI_REASON_MIC_FAILURE = 14
WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT = 15
WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT = 16
WIFI_REASON_IE_IN_4WAY_DIFFERS = 17
WIFI_REASON_GROUP_CIPHER_INVALID = 18
WIFI_REASON_PAIRWISE_CIPHER_INVALID = 19
WIFI_REASON_AKMP_INVALID = 20
WIFI_REASON_UNSUPP_RSN_IE_VERSION = 21
WIFI_REASON_INVALID_RSN_IE_CAP = 22
WIFI_REASON_802_1X_AUTH_FAILED = 23
WIFI_REASON_CIPHER_SUITE_REJECTED = 24
WIFI_REASON_BEACON_TIMEOUT = 200
WIFI_REASON_NO_AP_FOUND = 201
WIFI_REASON_AUTH_FAIL = 202
WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205

enum wifi_second_chan_t
    Values:

    WIFI_SECOND_CHAN_NONE = 0
        the channel width is HT20

    WIFI_SECOND_CHAN_ABOVE
        the channel width is HT40 and the secondary channel is above the primary channel

    WIFI_SECOND_CHAN_BELOW
        the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
    Values:

    WIFI_SCAN_TYPE_ACTIVE = 0
        active scan

    WIFI_SCAN_TYPE_PASSIVE
        passive scan

enum wifi_cipher_type_t
    Values:

    WIFI_CIPHER_TYPE_NONE = 0
        the cipher type is none

    WIFI_CIPHER_TYPE_WEP40
        the cipher type is WEP40

    WIFI_CIPHER_TYPE_WEP104
        the cipher type is WEP104
WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

nenum wifi_ant_t
WiFi antenna.

Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

nenum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

nnenum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

nnenum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

nnenum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:

WIFI_STORAGE_FLASH  
all configuration will store in both memory and flash

WIFI_STORAGE_RAM  
all configuration will only store in the memory

denum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.

Values:

WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

denum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.

Values:

WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

denum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

WIFI_PKT_MGMT  
Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

WIFI_PKT_CTRL  
Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

WIFI_PKT_DATA  
Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

WIFI_PKT_MISC  
Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

denum wifi_ant_mode_t
WiFi antenna mode.

Values:

WIFI_ANT_MODE_ANT0  
Enable WiFi antenna 0 only
**WIFI_ANT_MODE_ANT1**
Enable WiFi antenna 1 only

**WIFI_ANT_MODE_AUTO**
Enable WiFi antenna 0 and 1, automatically select an antenna

**WIFI_ANT_MODE_MAX**
Invalid WiFi enabled antenna

```c
enum wifi_phy_rate_t
WiFi PHY rate encodings.
Values:
```

- **WIFI_PHY_RATE_1M_L** = 0x00
  1 Mbps with long preamble
- **WIFI_PHY_RATE_2M_L** = 0x01
  2 Mbps with long preamble
- **WIFI_PHY_RATE_5M_L** = 0x02
  5.5 Mbps with long preamble
- **WIFI_PHY_RATE_11M_L** = 0x03
  11 Mbps with long preamble
- **WIFI_PHY_RATE_2M_S** = 0x05
  2 Mbps with short preamble
- **WIFI_PHY_RATE_5M_S** = 0x06
  5.5 Mbps with short preamble
- **WIFI_PHY_RATE_11M_S** = 0x07
  11 Mbps with short preamble
- **WIFI_PHY_RATE_48M** = 0x08
  48 Mbps
- **WIFI_PHY_RATE_24M** = 0x09
  24 Mbps
- **WIFI_PHY_RATE_12M** = 0x0A
  12 Mbps
- **WIFI_PHY_RATE_6M** = 0x0B
  6 Mbps
- **WIFI_PHY_RATE_54M** = 0x0C
  54 Mbps
- **WIFI_PHY_RATE_36M** = 0x0D
  36 Mbps
- **WIFI_PHY_RATE_18M** = 0x0E
  18 Mbps
- **WIFI_PHY_RATE_9M** = 0x0F
  9 Mbps
- **WIFI_PHY_RATE_MCS0_LGI** = 0x10
  MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
- **WIFI_PHY_RATE_MCS1_LGI** = 0x11
  MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz
WIFI_PHY_RATE_MCS2_LGI = 0x12
    MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz
WIFI_PHY_RATE_MCS3_LGI = 0x13
    MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz
WIFI_PHY_RATE_MCS4_LGI = 0x14
    MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz
WIFI_PHY_RATE_MCS5_LGI = 0x15
    MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz
WIFI_PHY_RATE_MCS6_LGI = 0x16
    MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz
WIFI_PHY_RATE_MCS7_LGI = 0x17
    MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS0_SGI = 0x18
    MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

    MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz
WIFI_PHY_RATE_MCS2_SGI = 0x1A
    MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz
WIFI_PHY_RATE_MCS3_SGI = 0x1B
    MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz
WIFI_PHY_RATE_MCS4_SGI = 0x1C
    MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz
WIFI_PHY_RATE_MCS5_SGI = 0x1D
    MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz
WIFI_PHY_RATE_MCS6_SGI = 0x1E
    MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS7_SGI = 0x1F
    MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz
WIFI_PHY_RATE_LORA_250K = 0x29
    250 Kbps
WIFI_PHY_RATE_LORA_500K = 0x2A
    500 Kbps

enum wifi_event_t
WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
    ESP32 WiFi ready
WIFI_EVENT_SCAN_DONE
    ESP32 finish scanning AP
WIFI_EVENT_STA_START
    ESP32 station start

2.2. Networking APIs
enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

- **WPS_FAIL_REASON_NORMAL** = 0
  ESP32 WPS normal fail reason
- **WPS_FAIL_REASON_RECV_M2D**
  ESP32 WPS receive M2D frame
- **WPS_FAIL_REASON_MAX**

SmartConfig

[]
API Reference

Header File

- esp_wifi/include/esp_smartconfig.h

Functions

`const char *esp_smartconfig_get_version(void)`
Get the version of SmartConfig.

Return

- SmartConfig version const char.

`esp_err_t esp_smartconfig_start(const smartconfig_start_config_t *config)`
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return

- ESP_OK: succeed
- others: fail

Parameters

- `config`: pointer to smartconfig start configure structure

`esp_err_t esp_smartconfig_stop(void)`
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return

- ESP_OK: succeed
- others: fail

`esp_err_t esp_esptouch_set_timeout(uint8_t time_s)`
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return

- ESP_OK: succeed
- others: fail

Parameters

- `time_s`: range 15s~255s, offset:45s.
\texttt{esp_err_t esp_smartconfig_set_type(smartconfig_type_t type)}

Set protocol type of SmartConfig.

\textbf{Attention} If users need to set the SmartConfig type, please set it before calling \texttt{esp_smartconfig_start}.

\textbf{Return}

- ESP_OK: succeed
- others: fail

\textbf{Parameters}

- \texttt{type}: Choose from the \texttt{smartconfig_type_t}.

\texttt{esp_err_t esp_smartconfig_fast_mode(bool enable)}

Set mode of SmartConfig. default normal mode.

\textbf{Attention} 1. Please call it before API \texttt{esp_smartconfig_start}.

\textbf{Attention} 2. Fast mode have corresponding APP(phone).

\textbf{Attention} 3. Two mode is compatible.

\textbf{Return}

- ESP_OK: succeed
- others: fail

\textbf{Parameters}

- \texttt{enable}: false-disable(default); true-enable;

\textbf{Structures}

\texttt{struct smartconfig_event_got_ssid_pswd_t}

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

\textbf{Public Members}

\begin{verbatim}
uint8_t ssid[32]
    SSID of the AP. Null terminated string.

uint8_t password[64]
    Password of the AP. Null terminated string.

bool bssid_set
    whether set MAC address of target AP or not.

uint8_t bssid[6]
    MAC address of target AP.

smartconfig_type_t type
    Type of smartconfig(ESPTouch or AirKiss).

uint8_t token
    Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
    IP address of cellphone.
\end{verbatim}
struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start

Public Members

bool enable_log
Enable smartconfig logs.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations

enum smartconfig_type_t
Values:

SC_TYPE_ESPTOUCH = 0
protocol: ESPTouch

SC_TYPE_AIRKISS
protocol: AirKiss

SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

defined

enum smartconfig_event_t
Smartconfig event declarations
Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone

ESP-NOW

[]

Overview

ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.
ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

| MAC Header | Category Code | Organization Identifier | Random Values | Vendor Specific Content | FCS | 24 bytes 1 byte 3 bytes 4 bytes 7~ 255 bytes 4 bytes |

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value field is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

| Element ID | Length | Organization Identifier | Type | Version | Body | 1 byte 1 byte 3 bytes 1 byte 1 byte 0~250 bytes |

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. This method includes the following steps:

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.
Initialization and De-initialization

Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

Add Paired Device

Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data

Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data

Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

API Reference

Header File

- `esp_wifi/include/esp_now.h`

Functions

```
esp_err_t esp_now_init(void)
```

Initialize ESPNOW function.
Return

• ESP_OK : succeed
• ESP.ERR_ESPNOW_INTERNAL : Internal error

```
esp_err_t esp_now_deinit (void)
```
De-initialize ESPNOW function.

Return

• ESP_OK : succeed

```
esp_err_t esp_now_get_version (uint32_t *version)
```
Get the version of ESPNOW.

Return

• ESP_OK : succeed
• ESP.ERR_ESPNOW_ARG : invalid argument

Parameters

• version: ESPNOW version

```
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
```
Register callback function of receiving ESPNOW data.

Return

• ESP_OK : succeed
• ESP.ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP.ERR_ESPNOW_INTERNAL : internal error

Parameters

• cb: callback function of receiving ESPNOW data

```
esp_err_t esp_now_unregister_recv_cb (void)
```
Unregister callback function of receiving ESPNOW data.

Return

• ESP_OK : succeed
• ESP.ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
```
Register callback function of sending ESPNOW data.

Return

• ESP_OK : succeed
• ESP.ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP.ERR_ESPNOW_INTERNAL : internal error

Parameters
- `cb`: callback function of sending ESPNOW data

`esp_err_t esp_now_unregister_send_cb (void)`
Unregister callback function of sending ESPNOW data.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

`esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)`
Send ESPNOW data.

**Attention**
1. If `peer_addr` is not NULL, send data to the peer whose MAC address matches `peer_addr`
2. If `peer_addr` is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by `data` argument does not need to be valid after `esp_now_send` returns

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

**Parameters**
- `peer_addr`: peer MAC address
- `data`: data to send
- `len`: length of data

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`
Add a peer to peer list.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULLSCREEN : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

**Parameters**
- `peer`: peer information
esp_err_t esp_now_del_peer(const uint8_t *peer_addr)
Delete a peer from peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
• peer_addr: peer MAC address

esp_err_t esp_now_mod_peer(const esp_now_peer_info_t *peer)
Modify a peer.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full

Parameters
• peer: peer information

esp_err_t esp_now_get_peer(const uint8_t *peer_addr, esp_now_peer_info_t *peer)
Get a peer whose MAC address matches peer_addr from peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
• peer_addr: peer MAC address
• peer: peer information

esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t *peer)
Fetch a peer from peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
Parameters

- `from_head`: fetch from head of list or not
- `peer`: peer information

```c
bool esp_now_is_peer_exist (const uint8_t *peer_addr)
```
Peer exists or not.

Return

- `true`: peer exists
- `false`: peer not exists

Parameters

- `peer_addr`: peer MAC address

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t *num)
```
Get the number of peers.

Return

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument

Parameters

- `num`: number of peers

```c
esp_err_t esp_now_set_pmk (const uint8_t *pmk)
```
Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Return

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument

Parameters

- `pmk`: primary master key

Structures

```c
struct esp_now_peer_info
```
ESPNOW peer information parameters.

2.2. Networking APIs
Public Members

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
    ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]
    ESPNOW peer local master key that is used to encrypt data

uint8_t channel
    Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel
    which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx
    Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt
    ESPNOW data that this peer sends/receives is encrypted or not

void **priv
    ESPNOW peer private data
```

```c
struct esp_now_peer_num
    Number of ESPNOW peers which exist currently.
```

Public Members

```c
int total_num
    Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num
    Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
```

Macros

```c
ESP_ERR_ESPNOW_BASE
    ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
    ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG
    Invalid argument

ESP_ERR_ESPNOW_NO_MEM
    Out of memory

ESP_ERR_ESPNOW_FULL
    ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
    ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
    Internal error

ESP_ERR_ESPNOW_EXIST
    ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
    Interface error
```
ESP_NOW_ETH_ALEN
Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.

typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.

Parameters
- mac_addr: peer MAC address
- data: received data
- data_len: length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.

Parameters
- mac_addr: peer MAC address
- status: status of sending ESPNOW data (succeed or fail)

Enumerations

define esp_now_send_status_t
Status of sending ESPNOW data.

Values:

ESP_NOW_SEND_SUCCESS = 0
Send ESPNOW data successfully

ESP_NOW_SEND_FAIL
Send ESPNOW data fail

2.2. Networking APIs
ESP-MESH Programming Guide

This is a programming guide for ESP-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-MESH Programming Model
2. Writing an ESP-MESH Application
3. Self Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-MESH protocol, please see the ESP-MESH API Guide. For more information about ESP-MESH Development Framework, please see ESP-MESH Development Framework.

ESP-MESH Programming Model

Software Stack

The ESP-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-MESH software stack.

![ESP-MESH Software Stack Diagram](image)

Fig. 2: ESP-MESH Software Stack

System Events

An application interfaces with ESP-MESH via ESP-MESH Events. Since ESP-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-MESH application.

The `mesh_event_id_t` defines all possible ESP-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-MESH events can be used, the application must register a Mesh Events handler via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream.
respectively. Likewise, \texttt{IP\_EVENT\_STA\_GOT\_IP} and \texttt{IP\_EVENT\_STA\_LOST\_IP} can be used to indicate when the root node can and cannot transmit data to the external IP network.

\begin{warning}
When using ESP-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect(scan etc. \textbf{Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-MESH’s self-organizing behavior}. Therefore, user’s should not call Wi-Fi APIs after \texttt{esp\_mesh\_start()} is called, and before \texttt{esp\_mesh\_stop()} is called.
\end{warning}

\section*{LwIP & ESP-MESH}

The application can access the ESP-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling \texttt{tcpip\_adapter\_init()}. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

\begin{note}
ESP-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address.
\end{note}
Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-MESH Application

The prerequisites for starting ESP-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-MESH itself can be initialized.

```c
#include <lwip/tcpip.h>
#include <esp_mesh_api.h>

void tcpip_adapter_init()
{
    // for mesh
    * stop DHCP server on softAP interface by default
    * stop DHCP client on station interface by default
    ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
    ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

    /* event initialization */
    ESP_ERROR_CHECK(esp_event_loop_create_default());

    /* Wi-Fi initialization */
    wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
    ESP_ERROR_CHECK(esp_wifi_init(&config));

    /* register IP events handler */
    ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
    ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
    ESP_ERROR_CHECK(esp_wifi_start());
}
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-MESH Network**
3. **Start Mesh**

Initialize Mesh

The following code snippet demonstrates how to initialize ESP-MESH

```c
#include <lwip/tcpip.h>
#include <esp_mesh_api.h>

void tcpip_adapter_init()
{
    // for mesh
    * stop DHCP server on softAP interface by default
    * stop DHCP client on station interface by default
    ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
    ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

    /* event initialization */
    ESP_ERROR_CHECK(esp_event_loop_create_default());

    /* Wi-Fi initialization */
    wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
    ESP_ERROR_CHECK(esp_wifi_init(&config));

    /* register IP events handler */
    ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
    ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
    ESP_ERROR_CHECK(esp_wifi_start());
}
```

Configuring an ESP-MESH Network

ESP-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-MESH:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-MESH Network, see mesh_addr_t</td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see mesh_router_t</td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see mesh_ap_cfg_t</td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see mesh_crypto_funcs_t</td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

**Start Mesh**

The following code snippet demonstrates how to start ESP-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-MESH, the application should check for ESP-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self Organized Networking**

Self organized networking is a feature of ESP-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self organized networking is enabled, the ESP-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-MESH.

2.2. Networking APIs
Toggling Self Organized Networking

Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending on the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking

The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking

ESP-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
|               |              | • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
|               |              | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
|               |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API**

There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must**
be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0);  //Don’t select new parent
esp_mesh_connect();  //Manually reconnect to router
```

**Application Examples**

ESP-IDF contains these ESP-MESH example projects:

- **The Internal Communication Example** demonstrates how to set up a ESP-MESH network and have the root node send a data packet to every node within the network.

- **The Manual Networking Example** demonstrates how to use ESP-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

**API Reference**

**Header File**

- `esp_wifi/include/esp_mesh.h`
Functions

\texttt{esp_err_t \textbf{esp_mesh_init} (void)}

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

\textbf{Attention} This API shall be called after Wi-Fi is started.

\textbf{Return}

- ESP_OK
- ESP_FAIL

\texttt{esp_err_t \textbf{esp_mesh_deinit} (void)}

Mesh de-initialization.

- Release resources and stop the mesh

\textbf{Return}

- ESP_OK
- ESP_FAIL

\texttt{esp_err_t \textbf{esp_mesh_start} (void)}

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

\textbf{Attention} This API shall be called after mesh initialization and configuration.

\textbf{Return}

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

\texttt{esp_err_t \textbf{esp_mesh_stop} (void)}

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
• Unregister mesh packets receive callback.
• Delete TX and RX queues.
• Release resources.
• Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.

Return
• ESP_OK
• ESP_FAIL

`esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)`

Send a packet over the mesh network.
• Send a packet to any device in the mesh network.
• Send a packet to external IP network.

Attention This API is not reentrant.

Return
• ESP_OK
• ESP_FAIL
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_DISCONNECTED
• ESP_ERR_MESH_OPT_UNKNOWN
• ESP_ERR_MESH_EXCEED_MTU
• ESP_ERR_MESH_NO_MEMORY
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_NO_ROUTE_FOUND
• ESP_ERR_MESH_DISCARD

Parameters
• to: the address of the final destination of the packet
  – If the packet is to the root, set this parameter to NULL.
  – If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
• data: pointer to a sending mesh packet
  – Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  – Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

• flag: bitmap for data sent
  – Speed up the route search
    • If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    • If the packet is to an internal device, MESH_DATA_P2P should be set.
    • If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    • If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  – Specify whether this API is block or non-block, block by default
    • If needs non-block, MESH_DATA_NONBLOCK should be set.
  – In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

• opt: options
  – In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  – Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

• opt_count: option count
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```
Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

• Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

Parameters
• from: the address of the original source of the packet
• data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• timeout_ms: wait time if a packet isn’t immediately available (0:no wait, portMAX_DELAY:wait forever)
• flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters
• opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address
• opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD

Parameters
• from: the address of the original source of the packet
• to: the address contains remote IP address and port (IPv4:PORT)
• data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• timeout_ms: wait time if a packet isn’t immediately available (0:no wait, portMAX_DELAY:wait forever)
• flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
• opt: options desired to receive
• opt_count: option count desired to receive

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```
Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
Parameters

• config: pointer to mesh stack configuration

`esp_err_t esp_mesh_set_router(const mesh_router_t *router)`

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters

• router: pointer to router configuration

`esp_err_t esp_mesh_get_router(mesh_router_t *router)`

Get router configuration.

**Return**

• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters

• router: pointer to router configuration

`esp_err_t esp_mesh_set_id(const mesh_addr_t *id)`

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**

• ESP_OK
• ESP_ERR_MESH_ARGUMENT: invalid argument

Parameters

• id: pointer to mesh network ID

`esp_err_t esp_mesh_get_id(mesh_addr_t *id)`

Get mesh network ID.

**Return**

• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters

• id: pointer to mesh network ID

`esp_err_t esp_mesh_set_type(mesh_type_t type)`

Designate device type over the mesh network.
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station

Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• type: device type

mesh_type_t esp_mesh_get_type(void)
Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return mesh type

esp_err_t esp_mesh_set_max_layer(int max_layer)
Set network max layer value (max:25, default:25)

• Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• max_layer: max layer value

int esp_mesh_get_max_layer(void)
Get max layer value.

Return max layer value

esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)
Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• pwd: pointer to the password
• len: password length
esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)
Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• authmode: authentication mode

wifi_auth_mode_t esp_mesh_get_ap_authmode(void)
Get mesh softAP authentication mode.

Return authentication mode

esp_err_t esp_mesh_set_ap_connections(int connections)
Set mesh softAP max connection value.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• connections: the number of max connections

int esp_mesh_get_ap_connections(void)
Get mesh softAP max connection configuration.

Return the number of max connections

int esp_mesh_get_layer(void)
Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return layer value

esp_err_t esp_mesh_get_parent_bssid(mesh_addr_t *bssid)
Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return
• ESP_OK
• ESP_FAIL

Parameters
• **bssid**: pointer to parent BSSID

```c
bool esp_mesh_is_root (void)
Return whether the device is the root node of the network.
```

**Return** true/false

```c
esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)
Enable/disable self-organized networking.
```

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- **enable**: enable or disable self-organized networking
- **select_parent**: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

```c
bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.
```

**Return** true/false

```c
esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.
```

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.
Return

- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

Parameters

- vote: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

```c
esp_err_t esp_mesh_set_vote_percentage(float percentage)
```
Set vote percentage threshold for approval of being a root.

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_FAIL

Parameters

- percentage: vote percentage threshold

```c
float esp_mesh_get_vote_percentage(void)
```
Get vote percentage threshold for approval of being a root.

Return percentage threshold

```c
esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)
```
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return

- ESP_OK
- ESP_FAIL

Parameters

- seconds: the expired time
int \texttt{esp\_mesh\_get\_ap\_assoc\_expire} (void)
\hspace*{1em} Get mesh softAP associate expired time.

\textbf{Return} \hspace{1em} seconds

int \texttt{esp\_mesh\_get\_total\_node\_num} (void)
\hspace*{1em} Get total number of devices in current network (including the root)

\textbf{Attention} \hspace{1em} The returned value might be incorrect when the network is changing.
\textbf{Return} \hspace{1em} total number of devices (including the root)

\textbf{Parameters}
\hspace*{1em} \texttt{mac} \hspace*{1em} pointer to routing table
\hspace*{1em} \texttt{len} \hspace*{1em} routing table size (in bytes)
\hspace*{1em} \texttt{size} \hspace*{1em} pointer to the number of devices in routing table (including itself)

\textbf{Return}
\hspace*{1em} ESP_OK
\hspace*{1em} ESP_ERR_MESH_ARGUMENT

\textbf{esp\_err\_t \texttt{esp\_mesh\_get\_routing\_table\_size}} (void)
\hspace{1em} Get the number of devices in this device’s sub-network (including self)

\textbf{Return} \hspace{1em} the number of devices over this device’s sub-network (including self)

\textbf{esp\_err\_t \texttt{esp\_mesh\_get\_routing\_table}} (mesh\_addr\_t *\texttt{mac}, int \texttt{len}, int *\texttt{size})
\hspace{1em} Get routing table of this device’s sub-network (including itself)

\textbf{Return}
\hspace*{1em} ESP_OK
\hspace*{1em} ESP_ERR_MESH_ARGUMENT

\textbf{Parameters}
\hspace*{1em} \texttt{mac} \hspace*{1em} pointer to routing table
\hspace*{1em} \texttt{len} \hspace*{1em} routing table size (in bytes)
\hspace*{1em} \texttt{size} \hspace*{1em} pointer to the number of devices in routing table (including itself)

\textbf{esp\_err\_t \texttt{esp\_mesh\_post\_toDS\_state}} (bool \texttt{reachable})
\hspace{1em} Post the toDS state to the mesh stack.

\textbf{Attention} \hspace{1em} This API is only for the root.

\textbf{Return}
\hspace*{1em} ESP_OK
\hspace*{1em} ESP_FAIL

\textbf{Parameters}
\hspace*{1em} \texttt{reachable} \hspace*{1em} this state represents whether the root is able to access external IP network

\textbf{esp\_err\_t \texttt{esp\_mesh\_get\_tx\_pending}} (mesh\_tx\_pending\_t *\texttt{pending})
\hspace{1em} Return the number of packets pending in the queue waiting to be sent by the mesh stack.

\textbf{Return}
\hspace*{1em} ESP_OK
\hspace*{1em} ESP_FAIL

\textbf{Parameters}
\hspace*{1em} \texttt{pending} \hspace*{1em} pointer to the TX pending
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
    Return the number of packets available in the queue waiting to be received by applications.

    Return
    • ESP_OK
    • ESP_FAIL

    Parameters
    • pending: pointer to the RX pending

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
    Return the number of packets could be accepted from the specified address.

    Return the number of upQ for a certain address

    Parameters
    • addr: self address or an associate children address
    • xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize (int qsize)
    Set the number of queue.

    Attention This API shall be called before mesh is started.

    Return
    • ESP_OK
    • ESP_FAIL

    Parameters
    • qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize (void)
    Get queue size.

    Return the number of queue

esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
    Set whether allow more than one root existing in one network.

    Return
    • ESP_OK
    • ESP_WIFI_ERR_NOT_INIT
    • ESP_WIFI_ERR_NOT_START

    Parameters
    • allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed (void)
    Check whether allow more than one root to exist in one network.
esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
Set group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to new group ID addresses
• num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
Delete group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to deleted group ID address
• num: the number of group ID addresses

int esp_mesh_get_group_num(void)
Get the number of group ID addresses.

Return the number of group ID addresses

esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)
Get group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to group ID addresses
• num: the number of group ID addresses

bool esp_mesh_is_my_group(const mesh_addr_t *addr)
Check whether the specified group address is my group.

Return true/false

esp_err_t esp_mesh_set_capacity_num(int num)
Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.
Return

• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED
• ESP_MESH_ERR_ARGUMENT

Parameters

• num: mesh network capacity

`int esp_mesh_get_capacity_num(void)`
Get mesh network capacity.

Return mesh network capacity

`esp_err_t esp_mesh_set_ie_crypto_funcs(const mesh_crypto_funcs_t *crypto_funcs)`
Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

Return

• ESP_OK

Parameters

• crypto_funcs: crypto functions for mesh IE
  – If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

`esp_err_t esp_mesh_set_ie_crypto_key(const char *key, int len)`
Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters

• key: ASCII crypto key
• len: length in bytes, range:8–64

`esp_err_t esp_mesh_get_ie_crypto_key(char *key, int len)`
Get mesh IE crypto key.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters

• key: ASCII crypto key
• len: length in bytes, range:8–64
esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)
    Set delay time before starting root healing.

    Return
    • ESP_OK

    Parameters
    • delay_ms: delay time in milliseconds

int esp_mesh_get_root_healing_delay (void)
    Get delay time before network starts root healing.

    Return delay time in milliseconds

esp_err_t esp_mesh_fix_root (bool enable)
    Enable network Fixed Root Setting.

    • Enabling fixed root disables automatic election of the root node via voting.
    • All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
    • If Fixed Root is enabled, users should make sure a root node is designated for the network.

    Return
    • ESP_OK

    Parameters
    • enable: enable or not

bool esp_mesh_is_root_fixed (void)
    Check whether network Fixed Root Setting is enabled.

    • Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
    • Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

    Return true/false

esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
    Set a specified parent for the device.

    Attention This API can be called at any time after mesh is configured.

    Return
    • ESP_OK
    • ESP_ERR_ARGUMENT
    • ESP_ERR_MESH_NOT_CONFIG

    Parameters
    • parent: parent configuration, the SSID and the channel of the parent are mandatory.
      − If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the
device will never find this specified parent.
• **parent_mesh_id**: parent mesh ID,
  - If this value is not set, the original mesh ID is used.

• **my_type**: mesh type
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.

• **my_layer**: mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

```c
esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)
```
Get mesh networking IE length of one AP.

**Return**

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG
• ESP_ERR_WIFI_FAIL

**Parameters**

• len: mesh networking IE length

```c
esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)
```
Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Return**

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG
• ESP_ERR_WIFI_FAIL

**Parameters**

• ap_record: pointer to one AP record
• buffer: pointer to the mesh networking IE of this AP

```c
esp_err_t esp_mesh_flush_upstream_packets(void)
```
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**

• ESP_OK
`esp_err_t esp_mesh_get_subnet_nodes_num(const mesh_addr_t *child_mac, int *nodes_num)`

Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `child_mac`: an associated child address of this device
- `nodes_num`: pointer to the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_get_subnet_nodes_list(const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)`

Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `child_mac`: an associated child address of this device
- `nodes`: pointer to nodes in the subnet of a specific child
- `nodes_num`: the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_disconnect(void)`

Disconnect from current parent.

**Return**
- ESP_OK

`esp_err_t esp_mesh_connect(void)`

Connect to current parent.

**Return**
- ESP_OK

`esp_err_t esp_mesh_flush_scan_result(void)`

Flush scan result.

**Return**
- ESP_OK

`esp_err_t esp_mesh_switch_channel(const uint8_t *new_bssid, int csa_newchan, int csa_count)`

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
• Set how many beacons with CSA IE will be sent before changing a new channel
• Enable the channel switch function

Attention This API is only called by the root.

Return
• ESP_OK

Parameters
• new_bssid: the new router BSSID if the router changes
• csa_newchan: the new channel number to which the whole network is moving
• csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

`esp_err_t esp_mesh_get_router_bssid(uint8_t *router_bssid)`
Get the router BSSID.

Return
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG

Parameters
• router_bssid: pointer to the router BSSID

`int64_t esp_mesh_get_tsf_time(void)`
Get the TSF time.

Return the TSF time

Unions

`union mesh_addr_t`
`#include <esp_mesh.h>` Mesh address.

**Public Members**

uint8_t addr[6]
mac address

mip_t mip
mip address

`union mesh_event_info_t`
`#include <esp_mesh.h>` Mesh event information.
Public Members

```
mesh_event_channel_switch_t channel_switch
  channel switch

mesh_event_child_connected_t child_connected
  child connected

mesh_event_child_disconnected_t child_disconnected
  child disconnected

mesh_event_routing_table_change_t routing_table
  routing table change

mesh_event_connected_t connected
  parent connected

mesh_event_disconnected_t disconnected
  parent disconnected

mesh_event_no_parent_found_t no_parent
  no parent found

mesh_event_layer_change_t layer_change
  layer change

mesh_event_toDS_state_t toDS_state
  toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
  vote started

mesh_event_root_address_t root_addr
  root address

mesh_event_root_switch_req_t switch_req
  root switch request

mesh_event_root_conflict_t root_conflict
  other powerful root

mesh_event_root_fixed_t root_fixed
  fixed root

mesh_event_scan_done_t scan_done
  scan done

mesh_event_network_state_t network_state
  network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
  network found that can join

mesh_event_router_switch_t router_switch
  new router information

union mesh_rc_config_t

#include <esp_mesh.h> Vote address configuration.
```
Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()

Structures

struct mip_t
IP address and port.

Public Members

ip4_addr_t ip4
IP address

uint16_t port
port

struct mesh_event_channel_switch_t
Channel switch information.

Public Members

uint8_t channel
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

wifi_event_sta_connected_t connected
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint8_t self_layer
layer

struct mesh_event_no_parent_found_t
No parent found information.

Public Members

int scan_times
scan times being through

struct mesh_event_layer_change_t
Layer change information.
**Public Members**

`uint8_t new_layer`
- new layer

**struct mesh_event_vote_started_t**
- vote started information

**Public Members**

`int reason`
- vote reason, vote could be initiated by children or by the root itself

`int attempts`
- max vote attempts before stopped

`mesh_addr_t rc_addr`
- root address specified by users via API esp_mesh_waive_root()

**struct mesh_event_find_network_t**
- find a mesh network that this device can join

**Public Members**

`uint8_t channel`
- channel number of the new found network

`uint8_t router_bssid[6]`
- router BSSID

**struct mesh_event_root_switch_req_t**
- Root switch request information.

**Public Members**

`int reason`
- root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

`mesh_addr_t rc_addr`
- the address of root switch requester

**struct mesh_event_root_conflict_t**
- Other powerful root address.

**Public Members**

`int8_t rssi`
- rssi with router

`uint16_t capacity`
- the number of devices in current network

`uint8_t addr[6]`
- other powerful root address

**struct mesh_event_routing_table_change_t**
- Routing table change.

---

2.2. Networking APIs
Public Members

uint16_t rt_size_new
   the new value

uint16_t rt_size_change
   the changed value

struct mesh_event_root_fixed_t
   Root fixed.

Public Members

bool is_fixed
   status

struct mesh_event_scan_done_t
   Scan done event information.

Public Members

uint8_t number
   the number of APs scanned

struct mesh_event_network_state_t
   Network state information.

Public Members

bool is_rootless
   whether current mesh network has a root

struct mesh_opt_t
   Mesh option.

Public Members

uint8_t type
   option type

uint16_t len
   option length

uint8_t *val
   option value

struct mesh_data_t
   Mesh data for esp_mesh_send() and esp_mesh_recv()
**Public Members**

- `uint8_t ssid[32]`  
  SSID

- `uint8_t ssid_len`  
  length of SSID

- `uint8_t bssid[6]`  
  BSSID, if this value is specified, users should also specify “allow_router_switch”.

- `uint8_t password[64]`  
  password

- `bool allow_router_switch`  
  if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**

Mesh softAP configuration.

**Public Members**

- `uint8_t password[64]`  
  mesh softAP password

- `uint8_t max_connection`  
  max number of stations allowed to connect in, max 10

**struct mesh_cfg_t**

Mesh initialization configuration.

**Public Members**

- `uint8_t channel`  
  channel, the mesh network on

- `bool allow_channel_switch`  
  if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

- `mesh_addr_t mesh_id`  
  mesh network identification

2.2. Networking APIs
**mesh_router_t**  
router configuration

**mesh_ap_cfg_t**  
(mesh_ap) mesh softAP configuration

**const** mesh_crypto_funcs_t **crypto_funcs**

crypto functions

**struct mesh_vote_t**

Vote.

**Public Members**

float **percentage**  
vote percentage threshold for approval of being a root

bool **is_rc_specified**

if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

**mesh_rc_config_t** **config**

vote address configuration

**struct mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

int **to_parent**

to parent queue

int **to_parent_p2p**

to parent (P2P) queue

int **to_child**

to child queue

int **to_child_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

**struct mesh_rx_pending_t**

The number of packets available in the queue waiting to be received by applications.

**Public Members**

int **toDS**

to external DS

int **toSelf**

to self
Macros

**MESH_ROOT_LAYER**

root layer value

**MESH_MTU**

max transmit unit (in bytes)

**MESH_MPS**

max payload size (in bytes)

**ESP_ERR_MESH_WIFI_NOT_START**

Mesh error code definition.

Wi-Fi isn’t started

**ESP_ERR_MESH_NOT_INIT**

mesh isn’t initialized

**ESP_ERR_MESH_NOT_CONFIG**

mesh isn’t configured

**ESP_ERR_MESH_NOT_START**

mesh isn’t started

**ESP_ERR_MESH_NOT_SUPPORT**

not supported yet

**ESP_ERR_MESH_NOT_ALLOWED**

operation is not allowed

**ESP_ERR_MESH_NO_MEMORY**

out of memory

**ESP_ERR_MESH_ARGUMENT**

illegal argument

**ESP_ERR_MESH_EXCEED_MTU**

packet size exceeds MTU

**ESP_ERR_MESH_TIMEOUT**

timeout

**ESP_ERR_MESH_DISCONNECTED**

disconnected with parent on station interface

**ESP_ERR_MESH_QUEUE_FAIL**

queue fail

**ESP_ERR_MESH_QUEUE_FULL**

queue full

**ESP_ERR_MESH_NO_PARENT_FOUND**

no parent found to join the mesh network

**ESP_ERR_MESH_NO_ROUTE_FOUND**

no route found to forward the packet

**ESP_ERR_MESH_OPTION_NULL**

no option found

**ESP_ERR_MESH_OPTION_UNKNOWN**

unknown option

### 2.2. Networking APIs
ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

MESH_DATA_ENC
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P
point-to-point delivery over the mesh network

MESH_DATA_FROMDS
receive from external IP network

MESH_DATA_TODS
identify this packet is target to external IP network

MESH_DATA_NONBLOCK
esp_mesh_send() non-block

MESH_DATA_DROP
in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
identify this packet is target to a group address

MESH_OPT_SEND_GROUP
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
Flag of mesh networking IE.
vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
fixed root

MESH_INIT_CONFIG_DEFAULT()
Type Definitions

typedef mesh_addr_t mesh_event_root_address_t
   Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
   Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
   Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
   Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
   New router information.

Enumerations

enum mesh_event_id_t
   Enumerated list of mesh event id.

   Values:

   MESH_EVENT_STARTED
      mesh is started

   MESH_EVENT_STOPPED
      mesh is stopped

   MESH_EVENT_CHANNEL_SWITCH
      channel switch

   MESH_EVENT_CHILD_CONNECTED
      a child is connected on softAP interface

   MESH_EVENT_CHILD_DISCONNECTED
      a child is disconnected on softAP interface

   MESH_EVENT_ROUTING_TABLE_ADD
      routing table is changed by adding newly joined children

   MESH_EVENT_ROUTING_TABLE_REMOVE
      routing table is changed by removing leave children

   MESH_EVENT_PARENT_CONNECTED
      parent is connected on station interface

   MESH_EVENT_PARENT_DISCONNECTED
      parent is disconnected on station interface

   MESH_EVENT_NO_PARENT_FOUND
      no parent found

   MESH_EVENT_LAYER_CHANGE
      layer changes over the mesh network

   MESH_EVENT_TODS_STATE
      state represents whether the root is able to access external IP network

   MESH_EVENT_VOTE_STARTED
      the process of voting a new root is started either by children or by the root
MESH_EVENT_VOTE_STOPPED
the process of voting a new root is stopped

MESH_EVENT_ROOT_ADDRESS
the root address is obtained. It is posted by mesh stack automatically.

MESH_EVENT_ROOT_SWITCH_REQ
root switch request sent from a new voted root candidate

MESH_EVENT_ROOT_SWITCH_ACK
root switch acknowledgment responds the above request sent from current root

MESH_EVENT_ROOT_ASKED_YIELD
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is
specified to be a root by users, users should set a new parent for this device. if self organized is enabled,
this device will find a new parent by itself, users could ignore this event.

MESH_EVENT_ROOT_FIXED
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent,
the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as
that setting changes of the root.

MESH_EVENT_SCAN_DONE
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add
the corresponding scan done handler in this event.

MESH_EVENT_NETWORK_STATE
network state, such as whether current mesh network has a root.

MESH_EVENT_STOP_RECONNECTION
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

MESH_EVENT_FIND_NETWORK
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to
find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH
if users specify BSSID of the router in mesh configuration, when the root connects to another router with
the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_MAX

enum mesh_type_t
Device type.

    Values:

    MESH_IDLE
    hasn’t joined the mesh network yet

    MESH_ROOT
    the only sink of the mesh network. Has the ability to access external IP network

    MESH_NODE
    intermediate device. Has the ability to forward packets over the mesh network

    MESH_LEAF
    has no forwarding ability

enum mesh_proto_t
Protocol of transmitted application data.

    Values:
### MESH_PROTO_BIN
binary

### MESH_PROTO_HTTP
HTTP protocol

### MESH_PROTO_JSON
JSON format

### MESH_PROTO_MQTT
MQTT protocol

**enum mesh_tos_t**
For reliable transmission, mesh stack provides three types of services.

*Values:*

- **MESH_TOS_P2P**
  provide P2P (point-to-point) retransmission on mesh stack by default

- **MESH_TOS_E2E**
  provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

- **MESH_TOS_DEF**
  no retransmission on mesh stack

**enum mesh_vote_reason_t**
Vote reason.

*Values:*

- **MESH_VOTE_REASON_ROOT_INITIATED**
  vote is initiated by the root

- **MESH_VOTE_REASON_CHILD_INITIATED**
  vote is initiated by children

**enum mesh_disconnect_reason_t**
Mesh disconnect reason code.

*Values:*

- **MESH_REASON_CYCLIC**
  cyclic is detected

- **MESH_REASON_PARENT_IDLE**
  parent is idle

- **MESH_REASON_LEAF**
  the connected device is changed to a leaf

- **MESH_REASON_DIFF_ID**
  in different mesh ID

- **MESH_REASON_ROOTS**
  root conflict is detected

- **MESH_REASON_PARENT_STOPPED**
  parent has stopped the mesh

- **MESH_REASON_SCAN_FAIL**
  scan fail

- **MESH_REASON_IE_UNKNOWN**
  unknown IE

### 2.2. Networking APIs
**MESH_REASON_WAIVE_ROOT**
waive root

**MESH_REASON_PARENT_WORSE**
parent with very poor RSSI

**MESH_REASON_EMPTY_PASSWORD**
use an empty password to connect to an encrypted parent

**MESH_REASON_PARENT_UNENCRYPTED**
connect to an unencrypted parent/router

```c
enum mesh_event_toDS_state_t
```
The reachability of the root to a DS (distribute system)

*Values:*

**MESH_TODS_UNREACHABLE**
the root isn’t able to access external IP network

**MESH_TODS_REACHABLE**
the root is able to access external IP network

Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples. Code examples for ESP-MESH are provided in the `mesh` directory of ESP-IDF examples.

### 2.2.2 Ethernet

**Ethernet**

[]

**Application Example**

- Ethernet basic example: `ethernet/ethernet`
- Ethernet iperf example: `ethernet/iperf`

**Ethernet Driver Model**

- `esp_eth/include/esp_eth.h`

**Ethernet Common Interface**

- `esp_eth/include/esp_eth_com.h`

**Ethernet MAC Interface**

- `esp_eth/include/esp_eth_mac.h`
Ethernet PHY Interface

- esp_eth/include/esp_eth_phy.h

Ethernet PHY Common Registers

- esp_eth/include/eth_phy_regs_struct.h

API Reference - Driver Model

Header File

- esp_eth/include/esp_eth.h

Functions

`esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)`

Install Ethernet driver.

**Return**

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**

- `config`: configuration of the Ethernet driver
- `out_hdl`: handle of Ethernet driver

`esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)`

Uninstall Ethernet driver.

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**

- `hdl`: handle of Ethernet driver
**esp_err_t esp_eth_start(esp_eth_handle_t hdl)**
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

*Note* This API will start driver state machine and internal software timer (for checking link status).

**Return**
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**Parameters**
- **hdl**: handle of Ethernet driver

**esp_err_t esp_eth_stop(esp_eth_handle_t hdl)**
Stop Ethernet driver.

*Note* This function does the opposite operation of esp_eth_start.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**
- **hdl**: handle of Ethernet driver

**esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)**
Update Ethernet data input path (i.e. specify where to pass the input buffer)

*Note* After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

**Parameters**
- **hdl**: handle of Ethernet driver
- **stack_input**: function pointer, which does the actual process on incoming packets
- **priv**: private resource, which gets passed to stack_input callback without any modification

**esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, uint32_t length)**
General Transmit.
Return

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- buf: buffer of the packet to transfer
- length: length of the buffer to transfer

```c
esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)
```

General Receive.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Return

- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- buf: buffer to preserve the received packet
- length: length of the received packet

```c
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Etherent driver.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- cmd: IO control command
- data: specified data for command

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```

Increase Ethernet driver reference.

2.2. Networking APIs
Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Return**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**

- hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)
```

Decrease Ethernet driver reference.

**Return**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**

- hdl: handle of Ethernet driver

**Structures**

```c
struct esp_eth_config_t
```

Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```

Ethernet MAC object.

```c
esp_eth_phy_t *phy
```

Ethernet PHY object.

```c
uint32_t check_link_period_ms
```

Period time of checking Ethernet link status.

```c
esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)
```

Input frame buffer to user’s stack.

**Return**

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

**Parameters**

- eth_handle: handle of Ethernet driver
- buffer: frame buffer that will get input to upper stack
- length: length of the frame buffer
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
Callback function invoked when lowlevel initialization is finished.

Return
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
- eth_handle: handle of Ethernet driver

esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
Callback function invoked when lowlevel deinitialization is finished.

Return
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
- eth_handle: handle of Ethernet driver

Macros

ETH_DEFAULT_CONFIG (emac, ephy)
Default configuration for Ethernet driver.

Type Definitions

typedef void *esp_eth_handle_t
Handle of Ethernet driver.

API Reference - Common Interface

Header File

- esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, uint32_t *detected_addr)
Detect PHY address.

Return
- ESP_OK: detect phy address successfully
- ESP_OK_INVALID_ARG: invalid parameter
- ESP_OK_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred
Parameters

- eth: mediator of Ethernet driver
- detected_addr: a valid address after detection

Structures

struct esp_eth_mediator_s

Ethernet mediator.

Public Members

\texttt{esp\_err\_t (**phy\_reg\_read**)(esp\_eth\_mediator\_t *\textit{eth}, uint32\_t \textit{phy\_addr}, uint32\_t \textit{phy\_reg}, uint32\_t \textit{reg\_value})}

Read PHY register.

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters

- \textit{eth}: mediator of Ethernet driver
- \textit{phy\_addr}: PHY Chip address (0-31)
- \textit{phy\_reg}: PHY register index code
- \textit{reg\_value}: PHY register value

\texttt{esp\_err\_t (**phy\_reg\_write**)(esp\_eth\_mediator\_t *\textit{eth}, uint32\_t \textit{phy\_addr}, uint32\_t \textit{phy\_reg}, uint32\_t \textit{reg\_value})}

Write PHY register.

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

Parameters

- \textit{eth}: mediator of Ethernet driver
- \textit{phy\_addr}: PHY Chip address (0-31)
- \textit{phy\_reg}: PHY register index code
- \textit{reg\_value}: PHY register value

\texttt{esp\_err\_t (**stack\_input**)(esp\_eth\_mediator\_t *\textit{eth}, uint8\_t *\textit{buffer}, uint32\_t \textit{length})}

Deliver packet to upper stack.

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred
Parameters

- `eth`: mediator of Ethernet driver
- `buffer`: packet buffer
- `length`: length of the packet

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Parameters

- `eth`: mediator of Ethernet driver
- `state`: new state
- `args`: optional argument for the new state

Macros

- **ETH_MAX_PAYLOAD_LEN**
  Maximum Ethernet payload size.

- **ETH_MIN_PAYLOAD_LEN**
  Minimum Ethernet payload size.

- **ETH_HEADER_LEN**
  Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

- **ETH_CRC_LEN**
  Ethernet frame CRC length.

- **ETH_VLAN_TAG_LEN**
  Optional 802.1q VLAN Tag length.

- **ETH_JUMBO_FRAME_PAYLOAD_LEN**
  Jumbo frame payload size.

- **ETH_MAX_PACKET_SIZE**
  Maximum frame size (1522 Bytes)

- **ETH_MIN_PACKET_SIZE**
  Minimum frame size (64 Bytes)

Type Definitions

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t
```

Ethernet mediator.
Enumerations

```
enum esp_eth_state_t
    Ethernet driver state.
    Values:
    ETH_STATE_LLINIT
        Lowlevel init done
    ETH_STATE_DEINIT
        Deinit done
    ETH_STATE_LINK
        Link status changed
    ETH_STATE_SPEED
        Speed updated
    ETH_STATE_DUPLEX
        Duplex updated

enum esp_eth_io_cmd_t
    Command list for ioctl API.
    Values:
    ETH_CMD_G_MAC_ADDR
        Get MAC address
    ETH_CMD_S_MAC_ADDR
        Set MAC address
    ETH_CMD_G_PHY_ADDR
        Get PHY address
    ETH_CMD_S_PHY_ADDR
        Set PHY address
    ETH_CMD_G_SPEED
        Get Speed
    ETH_CMD_S_PROMISCUOUS
        Set promiscuous mode

enum eth_link_t
    Ethernet link status.
    Values:
    ETH_LINK_UP
        Ethernet link is up
    ETH_LINK_DOWN
        Ethernet link is down

enum eth_speed_t
    Ethernet speed.
    Values:
    ETH_SPEED_10M
        Ethernet speed is 10Mbps
```
ETH_SPEED_100M
Ethernet speed is 100Mbps

enum eth_duplex_t
Ethernet duplex mode.

Values:

ETH_DUPLEX_HALF
Ethernet is in half duplex

ETH_DUPLEX_FULL
Ethernet is in full duplex

enum eth_event_t
Ethernet event declarations.

Values:

ETHERNET_EVENT_START
Ethernet driver start

ETHERNET_EVENT_STOP
Ethernet driver stop

ETHERNET_EVENT_CONNECTED
Ethernet got a valid link

ETHERNET_EVENT_DISCONNECTED
Ethernet lost a valid link

API Reference - MAC Interface

Header File

- esp_eth/include/esp_eth_mac.h

Structures

struct esp_eth_mac_s
Ethernet MAC.

Public Members

esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
Set mediator for Ethernet MAC.

Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters

- mac: Ethernet MAC instance
- eth: Ethernet mediator

2.2. Networking APIs
esp_err_t (*init)(esp_eth_mac_t *mac)
Initialize Ethernet MAC.

Return
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters
- mac: Ethernet MAC instance

esp_err_t (*deinit)(esp_eth_mac_t *mac)
Deinitialize Ethernet MAC.

Return
- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

Parameters
- mac: Ethernet MAC instance

esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
Transmit packet from Ethernet MAC.

Return
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

Parameters
- mac: Ethernet MAC instance
- buf: packet buffer to transmit
- length: length of packet

esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Return
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
Esp. ESP_FAIL: receive packet failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• buf: packet buffer which will preserve the received frame
• length: length of the received packet

esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
Read PHY register.

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• phy_addr: PHY chip address (0~31)
• phy_reg: PHY register index code
• reg_value: PHY register value

esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
Write PHY register.

Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• phy_addr: PHY chip address (0~31)
• phy_reg: PHY register index code
• reg_value: PHY register value

esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
Set MAC address.

Return
• ESP_OK: set MAC address successfully

2.2. Networking APIs
• ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
• ESP_FAIL: set MAC address failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• addr: MAC address

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```
Get MAC address.

Return
• ESP_OK: get MAC address successfully
• ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
• ESP_FAIL: get MAC address failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• addr: MAC address

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```
Set speed of MAC.

Return
• ESP_OK: set MAC speed successfully
• ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
• ESP_FAIL: set MAC speed failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• speed: MAC speed

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

Return
• ESP_OK: set MAC duplex mode successfully
• ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
• ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• duplex: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

Return
• ESP_OK: set link status successfully
• ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
• ESP_FAIL: set link status failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• link: Link status

```
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

Return
• ESP_OK: set promiscuous mode successfully
• ESP_FAIL: set promiscuous mode failed because some error occurred

Parameters
• mac: Ethernet MAC instance
• enable: set true to enable promiscuous mode; set false to disable promiscuous mode

```
esp_err_t (*del)(esp_eth_mac_t *mac)
```
Free memory of Ethernet MAC.

Return
• ESP_OK: free Ethernet MAC instance successfully
• ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
• mac: Ethernet MAC instance

```
struct eth_mac_config_t
```
Configuration of Ethernet MAC object.

### Public Members

```
uint32_t sw_reset_timeout_ms
```
Software reset timeout value (Unit: ms)

```
uint32_t rx_task_stack_size
```
Stack size of the receive task

```
uint32_t rx_task_prio
```
Priority of the receive task

```
int smi_mdc_gpio_num
```
SMI MDC GPIO number

```
int smi_mdio_gpio_num
```
SMI MDIO GPIO number

```
uint32_t flags
```
Flags that specify extra capability for mac driver

2.2. Networking APIs
Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled

ETH_MAC_DEFAULT_CONFIG()
Default configuration for Ethernet MAC object.

Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
Ethernet MAC.

API Reference - PHY Interface

Header File

• esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t*esp_eth_phy_new_ip101(const eth_phy_config_t*config)
Create a PHY instance of IP101.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters
• config: configuration of PHY

esp_eth_phy_t*esp_eth_phy_new_rtl8201(const eth_phy_config_t*config)
Create a PHY instance of RTL8201.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters
• config: configuration of PHY

esp_eth_phy_t*esp_eth_phy_new_lan8720(const eth_phy_config_t*config)
Create a PHY instance of LAN8720.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred
Parameters

- `config`: configuration of PHY

```c
esp_eth_phy_t* esp_eth_phy_new_dp83848(const eth_phy_config_t *config)
```

Create a PHY instance of DP83848.

Return

- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

Parameters

- `config`: configuration of PHY

Structures

```c
struct esp_eth_phy_s
```

Ethernet PHY.

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```

Set mediator for PHY.

Return

- `ESP_OK`: set mediator for Ethernet PHY instance successfully
- `ESP_ERR_INVALID_ARG`: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters

- `phy`: Ethernet PHY instance
- `mediator`: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```

Software Reset Ethernet PHY.

Return

- `ESP_OK`: reset Ethernet PHY successfully
- `ESP_FAIL`: reset Ethernet PHY failed because some error occurred

Parameters

- `phy`: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```

Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• phy: Ethernet PHY instance

```
esp_err_t (*init)(esp_eth_phy_t *phy)
```
Initialize Ethernet PHY.

Return
• ESP_OK: initialize Ethernet PHY successfully
• ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters
• phy: Ethernet PHY instance

```
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```
Deinitialize Ethernet PHY.

Return
• ESP_OK: deinitialize Ethernet PHY successfully
• ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters
• phyL: Ethernet PHY instance

```
esp_err_t (*negotiate)(esp_eth_phy_t *phy)
```
Start auto negotiation.

Return
• ESP_OK: restart auto negotiation successfully
• ESP_FAIL: restart auto negotiation failed because some error occurred

Parameters
• phy: Ethernet PHY instance

```
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```
Get Ethernet PHY link status.

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• phy: Ethernet PHY instance

```
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```
Power control of Ethernet PHY.
Return
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters
- phy: Ethernet PHY instance
- enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

```
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```
Set PHY chip address.

Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters
- phy: Ethernet PHY instance
- addr: PHY chip address

```
esp_err_t (*get_addr)(esp_ethphy_t *phy, uint32_t addr)
```
Get PHY chip address.

Return
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
- phy: Ethernet PHY instance
- addr: PHY chip address

```
esp_err_t (*del)(esp_ethphy_t *phy)
```
Free memory of Ethernet PHY instance.

Return
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

Parameters
- phy: Ethernet PHY instance

```
struct eth_phy_config_t
```
Ethernet PHY configuration.
Public Members

int32_t phy_addr
   PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t reset_timeout_ms
   Reset timeout value (Unit: ms)

uint32_t autonego_timeout_ms
   Auto-negotiation timeout value (Unit: ms)

int reset_gpio_num
   Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG()
   Default configuration for Ethernet PHY object.

Type Definitions

typedef struct esp_eth_phy_s esp_eth_phy_t
   Ethernet PHY.

API Reference - Glue for esp_netif

Header File

   • esp_eth/include/esp_eth_netif_glue.h

Functions

void *esp_eth_new_netif_glue (esp_eth_handle_t eth_hdl)
   Create a netif glue for Ethernet driver.

   Note netif glue is used to attach io driver to TCP/IP netif

   Return glue object, which inherits esp_netif_driver_base_t

   Parameters

   • eth_hdl: Ethernet driver handle

esp_err_t esp_eth_del_netif_glue (void *glue)
   Delete netif glue of Ethernet driver.

   Return -ESP_OK: delete netif glue successfully

   Parameters

   • glue: netif glue
\texttt{esp_err_t esp_eth_set_default_handlers} (\texttt{void *} \texttt{esp_netif})

Register default IP layer handlers for Ethernet.

\textbf{Note}: Ethernet handle might not yet properly initialized when setting up these default handlers

\textbf{Return}

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp_netif is NULL)
- ESP\_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp_event handler

\textbf{Parameters}

- \texttt{esp_netif}: esp network interface handle created for Ethernet driver

\texttt{esp_err_t esp_eth_clear_default_handlers} (\texttt{void *} \texttt{esp_netif})

Unregister default IP layer handlers for Ethernet.

\textbf{Return}

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp_netif is NULL)
- ESP\_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp_event handler

\textbf{Parameters}

- \texttt{esp_netif}: esp network interface handle created for Ethernet driver

Code examples for the Ethernet API are provided in the \texttt{ethernet} directory of ESP-IDF examples.

### 2.2.3 IP Network Layer

**ESP-NETIF**

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the \textit{TCP/IP Adapter Migration Guide} section in case existing applications to be ported to use the esp-netif API instead.
ESP-NETIF architecture

```

Data and event flow in the diagram

- . . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<--->-- Data packets going from communication media to TCP/IP stack and back
- ******** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
• IO driver specific options (transmit, free rx buffer functions, IO driver handle)

3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps

4) Configures event handlers
• use default handlers for common interfaces defined in IO drivers; or define a specific handlers for
customised behaviour/new interfaces
• register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
• Getting and setting TCP/IP related parameters (DHCP, IP, etc)
• Receiving IP events (connect/disconnect)
• Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver

Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up ->
turn netif on)

2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
• Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are
passed to the IO driver
• Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter

ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these
two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a
network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its
TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)

2) Input/Output API (for passing data between IO driver and network stack)

3) Event or Action API
• Used for network interface lifecycle management
• ESP-NETIF provides building blocks for designing event handlers

4) Setters and Getters for basic network interface properties

5) Network stack abstraction: enabling user interaction with TCP/IP stack
• Set interface up or down
• DHCP server and client API
• DNS API

6) Driver conversion utilities
D) Network stack

Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**ESP-NETIF programmer’s manual**

Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

**WiFi default initialization**

The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the *esp_netif* handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in *AP+STA* mode, both these interfaces has to be created.

**API Reference**

**Header File**

- `esp_netif/include/esp_netif.h`

**Functions**

```c
esp_err_t esp_netif_init (void)
```

Initialize the underlying TCP/IP stack.

**Return**

- ESP_OK on success
- ESP_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.
`esp_err_t esp_netif_deinit (void)`

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

**Return**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new (const esp_netif_config_t *esp_netif_config)`

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- `esp_netif_config`: pointer esp-netif configuration

`void esp_netif_destroy (esp_netif_t *esp_netif)`

Destroys the esp_netif object.

**Parameters**

- `esp_netif`: pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`

Configures driver related options of esp_netif object.

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**

- `esp_netif`: pointer to the object to be configured
- `driver_config`: pointer esp-netif io driver related configuration

`esp_err_t esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**

- `esp_netif`: pointer to esp_netif object to be attached
• `driver_handle`: pointer to the driver handle

```c
esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
```

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**

• ESP_OK

**Parameters**

• `esp_netif`: Handle to esp-netif instance
• `buffer`: Received data
• `len`: Length of the data frame
• `eb`: Pointer to internal buffer (used in Wi-Fi driver)

```c
void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled, turns the interface on, if DHCPS enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**

• `esp_netif`: Handle to esp-netif instance
• `base`:
• `event_id`:
• `data`:

```c
void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**

• `esp_netif`: Handle to esp-netif instance
• `base`:
• `event_id`:
• `data`:

```c
void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**

• `esp_netif`: Handle to esp-netif instance
• `base`:
void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**
- esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void esp_netif_action_got_ip(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**
- esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
esp_err_t esp_netif_set_mac(esp_netif_t *esp_netif, uint8_t mac[])
```

Set the mac address for the interface instance.

**Return** ESP_OK

**Parameters**
- esp_netif: Handle to esp-netif instance
- mac: Desired mac address for the related network interface

```c
esp_err_t esp_netif_set_hostname(esp_netif_t *esp_netif, const char *hostname)
```

Set the hostname of an interface.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**
- esp_netif: Handle to esp-netif instance
esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)
Get interface hostname.

Return

• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters

• esp_netif: Handle to esp-netif instance
• hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool esp_netif_is_netif_up (esp_netif_t *esp_netif)
Test if supplied interface is up or down.

Return

• true - Interface is up
• false - Interface is down

Parameters

• esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
Get interface’s IP address information.
If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

• esp_netif: Handle to esp-netif instance
• ip_info: If successful, IP information will be returned in this argument.

esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
Get interface’s old IP information.
Returns an “old” IP address previously stored for the interface when the valid IP changed.
If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
• esp_netif: Handle to esp-netif instance
• ip_info: If successful, IP information will be returned in this argument.

```c
esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**

• esp_netif: Handle to esp-netif instance
• ip_info: IP information to set on the specified interface

```c
esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

• esp_netif: Handle to esp-netif instance
• ip_info: Store the old IP information for the specified interface

```c
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note** This index could be used in setsockopt() to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied esp_netif

**Parameters**
• esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP server option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- esp_netif: Handle to esp-netif instance
- opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- opt_id: Option index to get or set, must be one of the supported enum values.
- opt_val: Pointer to the option parameter.
- opt_len: Length of the option parameter.

```c
esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP client option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- esp_netif: Handle to esp-netif instance
- opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- opt_id: Option index to get or set, must be one of the supported enum values.
- opt_val: Pointer to the option parameter.
- opt_len: Length of the option parameter.

```c
esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)
```

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**

- ESP_OK
Read the Docs Template Documentation, Release v4.1-dev-2071-gf91080637

2.2. Networking APIs

- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPSTART_FAILED

Parameters

- esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)
```

Stop DHCP client (only if enabled in interface object)

Note Calling action_netif_stop() will also stop the DHCP Client if it is running.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters

- esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP client status.

Return

- ESP_OK

Parameters

- esp_netif: Handle to esp-netif instance
- status: If successful, the status of DHCP client will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP Server status.

Return

- ESP_OK

Parameters

- esp_netif: Handle to esp-netif instance
- status: If successful, the status of the DHCP server will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_start(esp_netif_t *esp_netif)
```

Start DHCP server (only if enabled in interface object)

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
Parameters
  • esp_netif: Handle to esp-netif instance

\( \text{esp_err_t } \text{esp_netif_dhcps_stop}(\text{esp_netif_t } \ast \text{esp_netif}) \)
Stop DHCP server (only if enabled in interface object)

Return
  • ESP_OK
  • ESP_ERR_ESP_NETIF_INVALID_PARAMS
  • ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
  • ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
  • esp_netif: Handle to esp-netif instance

\( \text{esp_err_t } \text{esp_netif_set_dns_info}(\text{esp_netif_t } \ast \text{esp_netif}, \text{esp_netif_dns_type_t } \ast \text{type}, \text{esp_netif_dns_info_t } \ast \text{dns}) \)
Set DNS Server information.
This function behaves differently if DHCP server or client is enabled
If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.
If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).
  • The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
  • This function can override it by setting server type ESP_NETIF_DNS_MAIN.
  • Other DNS Server types are not supported for the Wi-Fi AP interface.

Return
  • ESP_OK on success
  • ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
  • esp_netif: Handle to esp-netif instance
  • type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
  • dns: DNS Server address to set

\( \text{esp_err_t } \text{esp_netif_get_dns_info}(\text{esp_netif_t } \ast \text{esp_netif}, \text{esp_netif_dns_type_t } \ast \text{type}, \text{esp_netif_dns_info_t } \ast \text{dns}) \)
Get DNS Server information.
Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to \( \text{esp_netif_set_dns_info}() \). If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
• esp_netif: Handle to esp-netif instance
• type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• dns: DNS Server result is written here on success

```c
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```
Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
• esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Return
• ESP_OK
• ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

Parameters
• esp_netif: Handle to esp-netif instance
• if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Return
• ESP_OK
• ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

Parameters
• esp_netif: Handle to esp-netif instance
• if_ip6: IPv6 information will be returned in this argument if successful.

```c
void esp_netif_set_ip4_addr(esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```

Sets IPv4 address to the specified octets.

**Parameters**

- `addr`: IP address to be set
- `a`: the first octet (127 for IP 127.0.0.1)
- `b`:
- `c`:
- `d`:

```c
char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)
```

Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

**Parameters**

- `addr`: ip address in network order to convert
- `buf`: target buffer where the string is stored
- `buflen`: length of buf

```c
uint32_t esp_ip4addr_aton(const char *addr)
```

Ascii internet address interpretation routine The value returned is in network order.

**Return** ip address in network order

**Parameters**

- `addr`: IP address in ascii representation (e.g. “127.0.0.1”)

```c
esp_netif_iodriver_handle esp_netif_get_io_driver(esp_netif_t *esp_netif)
```

Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- `esp_netif`: Handle to esp-netif instance

```c
esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)
```

Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- `if_key`: Textual description of network interface

```c
esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)
```

Returns configured flags for this interface.
Return Configuration flags

Parameters

- esp_netif: Handle to esp-netif instance

const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

Return Textual description of related interface

Parameters

- esp_netif: Handle to esp-netif instance

const char *esp_netif_get_desc (esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

Return Enumerated type of this interface, such as station, AP, ethernet

Parameters

- esp_netif: Handle to esp-netif instance

int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

Return specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

Parameters

- esp_netif: Handle to esp-netif instance
- event_type: (either get or lost IP)

esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise

Parameters

- esp_netif: Handle to esp-netif instance

size_t esp_netif_get_nr_of_ifs (void)

Returns number of registered esp_netif objects.

Return Number of esp_netifs

WiFi default API reference

Header File

- esp_wifi/include/esp_wifi_default.h
Functions

`esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)`
Attaches wifi station interface to supplied netif.

Return

- ESP_OK on success
- ESP_FAIL if attach failed

Parameters

- `esp_netif`: instance to attach the wifi station to

`esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)`
Attaches wifi soft AP interface to supplied netif.

Return

- ESP_OK on success
- ESP_FAIL if attach failed

Parameters

- `esp_netif`: instance to attach the wifi AP to

`esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`
Sets default wifi event handlers for STA interface.

Return

- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`
Sets default wifi event handlers for STA interface.

Return

- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void *esp_netif)`
Clears default wifi event handlers for supplied network interface.

Return

- ESP_OK on success, error returned from esp_event_handler_register if failed

Parameters

- `esp_netif`: instance of corresponding if object

`esp_netif_t *esp_netif_create_default_wifi_ap(void)`
Creates default WIFI AP. In case of any init error this API aborts.

Return

pointer to esp-netif instance

`esp_netif_t *esp_netif_create_default_wifi_sta(void)`
Creates default WIFI STA. In case of any init error this API aborts.
Return pointer to esp-netif instance

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Return ESP_OK on success

Parameters

- `p_netif_sta`: pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap`: pointer where the resultant AP interface is saved (if non NULL)

TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor ESP-NETIF.

Updating network connection code

Network stack initialization

Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the ESP-NETIF initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

Network interface creation

TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the ESP-NETIF to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta()`; or `esp_netif_create_default_wifi_ap()`; after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`

2.2. Networking APIs 659
Replacing other tcpip_adapter API

All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers

Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since `ip4addr_ntoa()` is a LwIP API, the esp-netif provides `esp_ip4addr_ntoa()` as a replacement, but the above method is generally preferred.

IP addresses

It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

Next steps

Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output

As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:
The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls esp_netif_receive() on a new data received event.

### Post attach callback

A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_, handle);
```

It is assumed that the esp_netif_iodriver_handle is a pointer to driver’s object, a struct derived from struct esp_netif_driver_base_s, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*!< base structure reserved as esp-
    ->netif driver */
    driver_impl *h; /*!< handle of driver implementation, */
    
} my_netif_driver_t;
```

with actual values of my_netif_driver_t::base.post_attach and the actual drivers handle my_netif_driver_t::h. So when the esp_netif_attach() gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args) {
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```
Default handlers

I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection

The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File

- esp_netif/include/esp_netif_net_stack.h

Functions

```c
esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)
Returns esp-netif handle.
```

**Return** handle to related esp-netif instance

**Parameters**

- dev: opaque ptr to network interface of specific TCP/IP stack

```c
void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)
Returns network stack specific implementation handle (if supported)
```

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

**Return** handle to related network stack netif handle

**Parameters**

- esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)
Outputs packets from the TCP/IP stack to the media to be transmitted.
This function gets called from network stack to output packets to IO driver.
```
Return  ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

• esp_netif: Handle to esp-netif instance
• data: Data to be transmitted
• len: Length of the data frame

void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

• esp_netif: Handle to esp-netif instance
• buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

2.2.4 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

2.3 Peripherals API

2.3.1 Analog to Digital Converter

Overview

The ESP32 integrates two 12-bit SAR (Successive Approximation Register) ADCs supporting a total of 18 measurement channels (analog enabled pins).

The ADC driver API supports ADC1 (8 channels, attached to GPIOs 32 - 39), and ADC2 (10 channels, attached to GPIOs 0, 2, 4, 12 - 15 and 25 - 27). However, the usage of ADC2 has some restrictions for the application:

1. ADC2 is used by the Wi-Fi driver. Therefore the application can only use ADC2 when the Wi-Fi driver has not started.

2. Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
   • ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
   • ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.
Configuration and Reading ADC

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

**Note:** Since the ADC2 is shared with the WIFI module, which has higher priority, reading operation of `adc2_get_raw()` will fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc2_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section Minimizing Noise.

**Application Examples**

Reading voltage on ADC1 channel 0 (GPIO 36):

```c
#include <driver/adc.h>
...
adc1_config_width(ADC_WIDTH_BIT_12);
adcl_config_channel_atten(ADC1_CHANNEL_0,ADC_ATTEN_DB_0);
int val = adc1_get_raw(ADC1_CHANNEL_0);
```

The input voltage in above example is from 0 to 1.1V (0 dB attenuation). The input range can be extended by setting higher attenuation, see `adc_atten_t`. An example using the ADC driver including calibration (discussed below) is available in esp-idf: `peripherals/adc`

Reading voltage on ADC2 channel 7 (GPIO 27):

```c
#include <driver/adc.h>
...
int read_raw;
adcl_config_channel_atten( ADC2_CHANNEL_7, ADC_ATTEN_0db );
```

(continues on next page)
The reading may fail due to collision with Wi-Fi, should check it. An example using the ADC2 driver to read the output of DAC is available in esp-idf: peripherals/adc2

Reading the internal hall effect sensor:

```c
#include <driver/adc.h>
...
adc1_config_width(ADC_WIDTH_BIT_12);
int val = hall_sensor_read();
```

The value read in both these examples is 12 bits wide (range 0-4095).

**Minimizing Noise**

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

![ADC Noise Comparison](image)

Fig. 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.
ADC Calibration

The esp_adc_cal/include/esp_adc_cal.h API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

![Graph illustrating effect of differing reference voltages on the ADC voltage curve.](image)

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of $y = \text{coeff}_a \times x + \text{coeff}_b$ and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values**

Calibration values are used to generate characteristic curves that account for the unique ADC reference voltage of a particular ESP32. There are currently three sources of calibration values. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150mV and 850mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.

- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.

- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see...
If you would like to purchase chips or modules with calibration, double check with distributor or Espressif directly. If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running `espefuse.py` tool with `adc_info` parameter:

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board’s port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093mV) will be reported as follows:

```
ADC VRef calibration: 1093mV
```

In another example below the **eFuse Vref** is not programmed:

```
ADC VRef calibration: None (1100mV nominal)
```

For a chip with two point calibration the message will look similar to:

```
ADC VRef calibration: 1149mV
ADC readings stored in efuse BLK3:
    ADC1 Low reading (150mV): 306
    ADC1 High reading (850mV): 3153
    ADC2 Low reading (150mV): 389
    ADC2 High reading (850mV): 3206
```

**Application Example**

For a full example see esp-idf: `peripherals/adc`

Characterizing an ADC at a particular attenuation:

---

2.3. Peripherals API 667
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

//Characterize ADC at particular atten
  esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
  esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
  //Check type of calibration value used to characterize ADC
  if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
  } else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
  } else {
    printf("Default");
  }

Reading an ADC then converting the reading to a voltage:

#include "driver/adc.h"
#include "esp_adc_cal.h"
...
  uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
  uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

#include "driver/adc.h"
...
  esp_err_t status = adc2_vref_to_gpio(GPIO_NUM_25);
  if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
  } else {
    printf("failed to route v_ref\n");
  }

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.
  1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0 (36);
  2. ADC1_GPIO32_CHANNEL is the ADC1 channel number of GPIO 32 (ADC1 channel 4).

API Reference

This reference covers three components:

- **ADC driver**
- **ADC Calibration**
• **GPIO Lookup Macros**

**ADC driver**

**Header File**

- driver/include/driver/adc.h

**Functions**

`esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)`

Get the GPIO number of a specific ADC1 channel.

**Return**

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

`esp_err_t adc1_config_width(adc_bits_width_t width_bit)`

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `width_bit`: Bit capture width for ADC1

`esp_err_t adc_set_data_width(adc_unit_t adc_unit, adc_bits_width_t width_bit)`

Configure ADC capture width.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `adc_unit`: ADC unit index
- `width_bit`: Bit capture width for ADC unit.

`esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)`

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.
Note For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

Note This function can be called multiple times to configure multiple ADC channels simultaneously. `adc1_get_raw()` can then be called for any configured channel.

When VDD_A is 3.3 V:

- 0 dB attenuation (ADC_ATTEN_DB_0) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC_ATTEN_DB_2_5) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC_ATTEN_DB_6) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC_ATTEN_DB_11) gives full-scale voltage 3.9 V (see note below)

Due to ADC characteristics, most accurate results are obtained within the following approximate voltage ranges:

Note The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC1 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

Note At 11 dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

- 0 dB attenuation (ADC_ATTEN_DB_0) between 100 and 950 mV
- 2.5 dB attenuation (ADC_ATTEN_DB_2_5) between 100 and 1250 mV
- 6 dB attenuation (ADC_ATTEN_DB_6) between 150 to 1750 mV
- 11 dB attenuation (ADC_ATTEN_DB_11) between 150 to 2450 mV

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- channel: ADC1 channel to configure
- atten: Attenuation level

int adc1_get_raw (adc1_channel_t channel)
Take an ADC1 reading from a single channel.

Note When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

Note Call `adc1_config_width()` before the first time this function is called.

Note For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

Return
- -1: Parameter error
- Other: ADC1 channel reading.
Parameters

- channel: ADC1 channel to read

void adc_power_on(void)
Enable ADC power.

void adc_power_off(void)
Power off SAR ADC This function will force power down for ADC.

esp_err_t adc_gpio_init(adc_unit_t adc_unit, adc_channel_t channel)
Initialize ADC pad.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- adc_unit: ADC unit index
- channel: ADC channel index

esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
Set ADC data invert.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- adc_unit: ADC unit index
- inv_en: whether enable data invert

esp_err_t adc_set_clk_div(uint8_t clk_div)
Set ADC source clock.

Return

- ESP_OK success

Parameters

- clk_div: ADC clock divider, ADC clock is divided from APB clock

esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)
Set I2S data source.

Return

- ESP_OK success

Parameters

- src: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.
esp_err_t adc_i2s_mode_init (adc_unit_t adc_unit, adc_channel_t channel)
Initialize I2S ADC mode.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• adc_unit: ADC unit index
• channel: ADC channel index

void adc1_ulp_enable (void)
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using adc1_get_raw function.

Note that adc1_config_channel_atten, adc1_config_width functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

int hall_sensor_read (void)
Read Hall Sensor.

Note When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

Note The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

Note The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

Return The hall sensor reading.

esp_err_t adc2_pad_get_io_num (adc2_channel_t channel, gpio_num_t *gpio_num)
Get the GPIO number of a specific ADC2 channel.

Return
• ESP_OK if success
• ESP_ERR_INVALID_ARG if channel not valid

Parameters
• channel: Channel to get the GPIO number
• gpio_num: output buffer to hold the GPIO number

esp_err_t adc2_config_channel_atten (adc2_channel_t channel, adc_atten_t atten)
Configure the ADC2 channel, including setting attenuation.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.
**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

When VDD_A is 3.3 V:

- 0 dB attenuation (ADC_ATTEN_0db) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC_ATTEN_2.5db) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC_ATTEN_6db) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC_ATTEN_11db) gives full-scale voltage 3.9 V (see note below)

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC2 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOuT.

**Return**

- ESP_OK if success
- ESP_ERR_TIMEOUT the WIFI is started, using the ADC2

**Parameters**

- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)
```

Output ADC2 reference voltage to GPIO 25 or 26 or 27.

This function utilizes the testing mux exclusive to ADC 2 to route the reference voltage one of ADC2’s channels. Supported GPIOs are GPIOs 25, 26, and 27. This reference voltage can be manually read from the pin and used in the esp_adc_cal component.

**Return**
ESP_OK: v_ref successfully routed to selected GPIO
ESP_ERR_INVALID_ARG: Unsupported GPIO

Parameters
- \texttt{gpio}: GPIO number (GPIOs 25, 26 and 27 are supported)

Macros

\begin{verbatim}
ADC_ATTEN_0db
ADC_ATTEN_2_5db
ADC_ATTEN_6db
ADC_ATTEN_11db
ADC_WIDTH_9Bit
ADC_WIDTH_10Bit
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit
\end{verbatim}

Enumerations

\begin{verbatim}
enum adc1_channel_t
Values:
ADC1_CHANNEL_0 = 0
  ADC1 channel 0 is GPIO36 (ESP32), GPIO1 (ESP32-S2)
ADC1_CHANNEL_1
  ADC1 channel 1 is GPIO37 (ESP32), GPIO2 (ESP32-S2)
ADC1_CHANNEL_2
  ADC1 channel 2 is GPIO38 (ESP32), GPIO3 (ESP32-S2)
ADC1_CHANNEL_3
  ADC1 channel 3 is GPIO39 (ESP32), GPIO4 (ESP32-S2)
ADC1_CHANNEL_4
  ADC1 channel 4 is GPIO32 (ESP32), GPIO5 (ESP32-S2)
ADC1_CHANNEL_5
  ADC1 channel 5 is GPIO33 (ESP32), GPIO6 (ESP32-S2)
ADC1_CHANNEL_6
  ADC1 channel 6 is GPIO34 (ESP32), GPIO7 (ESP32-S2)
ADC1_CHANNEL_7
  ADC1 channel 7 is GPIO35 (ESP32), GPIO8 (ESP32-S2)

enum adc2_channel_t
Values:
ADC2_CHANNEL_0 = 0
  ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
\end{verbatim}
ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)

ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)

ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)

ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)

ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)

ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)

ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

ADC2_CHANNEL_MAX

enum adc_unit_t
Values:
ADC_UNIT_1 = 1
SAR ADC 1
ADC_UNIT_2 = 2
SAR ADC 2, not supported yet
ADC_UNIT_BOTH = 3
SAR ADC 1 and 2, not supported yet
ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode, not supported yet

ADC_UNIT_MAX

enum adc_i2s_encode_t
Values:
ADC_ENCODE_12BIT
ADC to I2S data format, [15:12]-channel [11:0]-12 bits ADC data
ADC_ENCODE_11BIT
ADC to I2S data format, [15] 1 [14:11]-channel [10:0]-11 bits ADC data
ADC_ENCODE_MAX

ADC Calibration

Header File

- esp_adc_cal/include/esp_adc_cal.h

2.3. Peripherals API
Functions

**esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)**
Checks if ADC calibration values are burned into eFuse.
This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

**Return**
- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

**Parameters**
- value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

**esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)**

Characterize an ADC at a particular attenuation.
This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \). Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** Two Point values and eFuse Vref can be enabled/disabled using menuconfig.

**Return**
- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

**Parameters**
- adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- atten: Attenuation to characterize
- bit_width: Bit width configuration of ADC
- default_vref: Default ADC reference voltage in mV (used if eFuse values is not available)
- chars: Pointer to empty structure used to store ADC characteristics

**uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)**
Convert an ADC reading to voltage in mV.
This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**
• `adc_reading`: ADC reading
• `chars`: Pointer to initialized structure containing ADC characteristics

```c
esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return**
- ESP_OK: ADC read and converted to mV
- ESP_ERR_TIMEOUT: Error, timed out attempting to read ADC
- ESP_ERR_INVALID_ARG: Error due to invalid arguments

**Parameters**
- `channel`: ADC Channel to read
- `chars`: Pointer to initialized ADC characteristics structure
- `voltage`: Pointer to store converted voltage

**Structures**

```c
struct esp_adc_cal_characteristics_t
```
Structure storing characteristics of an ADC.

**Note** Call `esp_adc_cal_characterize()` to initialize the structure

**Public Members**

```c
adc_unit_t adc_num
    // ADC number
adc_atten_t atten
    // ADC attenuation
adc_bits_width_t bit_width
    // ADC bit width
uint32_t coeff_a
    // Gradient of ADC-Voltage curve
uint32_t coeff_b
    // Offset of ADC-Voltage curve
uint32_t vref
    // Vref used by lookup table
const uint32_t *low_curve
    // Pointer to low Vref curve of lookup table (NULL if unused)
```
const uint32_t *high_curve
Pointer to high Vref curve of lookup table (NULL if unused)

Enumerations

enum esp_adc_cal_value_t
Type of calibration value used in characterization.

Values:

ESP_ADC_CAL_VAL_EFUSE_VREF = 0
Characterization based on reference voltage stored in eFuse

ESP_ADC_CAL_VAL_EFUSE_TP = 1
Characterization based on Two Point values stored in eFuse

ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
Characterization based on default reference voltage

GPIO Lookup Macros

2.3.2 Controller Area Network (CAN)

Overview

The ESP32’s peripherals contains a CAN Controller that supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID) of the CAN2.0B specification.

Warning: The ESP32 CAN controller is not compatible with CAN FD frames and will interpret such frames as errors.

This programming guide is split into the following sections:

1. Basic CAN Concepts
2. Signals Lines and Transceiver
3. Configuration
4. Driver Operation
5. Examples
Basic CAN Concepts

Note: The following section only covers the basic aspects of CAN. For full details, see the CAN2.0B specification.

The CAN protocol is a multi-master, multi-cast communication protocol with error detection/signalling and inbuilt message prioritization. The CAN protocol is commonly used as a communication bus in automotive applications.

Multi-master: Any node in a CAN bus is allowed to initiate the transfer of data.

Multi-cast: When a node transmits a message, all nodes are able to receive the message (broadcast). However, some nodes can selective choose which messages to accept via the use of acceptance filtering (multi-cast).

Error Detection and Signalling: Every CAN node will constantly monitor the CAN bus. When any node detects an error, it will signal the error by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: If two nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID will win arbitration. All other nodes will become receivers ensuring there is at most one transmitter at any time.

CAN Message Frames

The CAN2.0B specification contains two frame formats known as **Extended Frame** and **Standard Frame** which contain 29-bit IDs and 11-bit IDs respectively. A CAN message consists of the following components:

- 29-bit or 11-bit ID
- Data Length Code (DLC) between 0 to 8
- Up to 8 bytes of data (should match DLC)

Error States and Counters

The CAN2.0B specification implements fault confinement by requiring every CAN node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are used to determine a CAN node’s **error state**, and the counters are incremented and decremented following a set of rules (see CAN2.0B specification). These error states are known as **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active**: A CAN node is Error Active when both TEC and REC are less than 128 and indicates a CAN node is operating normally. Error Active nodes are allowed to participate in CAN bus activities, and will actively signal any error conditions it detects by transmitting an **Active Error Flag** over the CAN bus.

**Error Passive**: A CAN node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in CAN bus activities, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off**: A CAN node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to take part in CAN bus activity and will remain so until it undergoes bus recovery.

Signals Lines and Transceiver

The CAN controller does not contain an internal transceiver and therefore requires an external transceiver to operate. The type of external transceiver will depend on the application’s physical layer specification (e.g. using SN65HVD23X transceivers for ISO 11898-2 compatibility).
The CAN controller’s interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to GPIOs.

**TX and RX:** The TX and RX signal lines are required to interface with an external CAN transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the CAN controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the CAN controller’s source clock (APB Clock).

**Note:** An external transceiver must internally tie the TX input and the RX output such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the CAN controller to interpret differences in logic levels between the two signal lines as a lost in arbitration or a bit error.

### Configuration

#### Operating Modes

The CAN driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the CAN controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another CAN node is required when transmitting message frames.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required when transmitting message frames. This mode is useful when self testing the CAN controller.

**Listen Only Mode:** This mode will prevent the CAN controller from taking part in bus activities. Therefore transmissions of messages/acknowledgement/error frames will be disabled. However the the CAN controller will still be able
to receive messages (without acknowledging). This mode is suited for applications such as CAN bus monitoring.

Alerts

The CAN driver contains an alert feature which is used to notify the application level of certain CAN driver events. Alerts are selectively enabled when the CAN driver is installed, but can be reconfigured during runtime by calling `can_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `can_read_alerts()`. The CAN driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>CAN_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>CAN_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_ACTIVE</td>
<td>CAN controller has become error active</td>
</tr>
<tr>
<td>CAN_ALERT_RECOVERY_IN_PROGRESS</td>
<td>CAN controller is undergoing bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_RECOVERED</td>
<td>CAN controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>CAN_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>CAN_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>CAN_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_PASS</td>
<td>CAN controller has become error passive</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. CAN controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The error warning limit can be used to preemptively warn the application of bus errors before the error passive state is reached. By default the CAN driver sets the error warning limit to 96. The CAN_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The CAN_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the CAN_ALERT_AND_LOG flag can be used to cause the CAN driver to log any raised alerts to UART. The CAN_ALERT_ALL and CAN_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing

The operating bit rate of the CAN controller is configured using the `can_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quanta is determined by a prescaled version of the CAN controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quanta
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quanta by dividing the CAN controller’s source clock (80 MHz APB clock). The brp can be any even number from 2 to 128. If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.
The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their CAN bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used CAN bus bit rates. The following macro initializers are provided by the CAN driver.

- CAN_TIMING_CONFIG_12_5KBITS()
- CAN_TIMING_CONFIG_16KBITS()
- CAN_TIMING_CONFIG_20KBITS()
- CAN_TIMING_CONFIG_25KBITS()
- CAN_TIMING_CONFIG_50KBITS()
- CAN_TIMING_CONFIG_100KBITS()
- CAN_TIMING_CONFIG_125KBITS()
- CAN_TIMING_CONFIG_250KBITS()
- CAN_TIMING_CONFIG_500KBITS()
- CAN_TIMING_CONFIG_800KBITS()
- CAN_TIMING_CONFIG_1MBITS()

**Note:** The macro initializers for 12.5K, 16K, and 20K bit rates are only available for ESP32 revision 2 or later.

**Acceptance Filter**

The CAN controller contains a hardware acceptance filter which can be used to filter CAN messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptances filters can make a node more efficient by filtering out messages sent over the CAN bus that are irrelevant to the CAN node in question. The CAN controller’s acceptance filter is configured using two 32-bit values within `can_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the CAN controller. The acceptance mask is a bit sequence specifying which bits of
the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

![Bit layout of single filter mode](image)

**Fig. 9: Bit layout of single filter mode (Right side MSBit)**

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

![Bit layout of dual filter mode](image)

**Fig. 10: Bit layout of dual filter mode (Right side MSBit)**

**Disabling TX Queue**

The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `can_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the CAN driver.

**Driver Operation**

The CAN driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.
Fig. 11: State transition diagram of the CAN driver (see table below)

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled -&gt; Stopped</td>

<td>128 occurrences of bus-free signal</td>
</tr>
</tbody>
</table>

**Driver States**

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the CAN controller is powered OFF.

**Stopped**: In this state, the CAN controller is powered ON and the CAN driver has been installed. However the CAN controller will be unable to take part in any CAN bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the CAN controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the CAN controller will be able to transmit error frames upon detection of errors on the CAN bus.

**Bus-Off**: The bus-off state is automatically entered when the CAN controller’s Transmit Error Counter becomes greater than or equal to 256 (see CAN2.0B specification regarding error counter rules). The bus-off state indicates the occurrence of severe errors on the CAN bus or in the CAN controller. Whilst in the bus-off state, the CAN controller will be unable to take part in any CAN bus activities. To exit the bus-off state, the CAN controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the CAN driver undergoes bus recovery. The CAN driver/controller will remain in the recovering state until the 128 occurrences of the bus-free signal (see CAN2.0B specification) is observed on the CAN bus.

**Message Flags**

The CAN driver distinguishes different types of CAN messages by using the various bit field members of the `can_message_t` structure. These bit field members help distinguish whether a message is in standard or extended
format, an RTR, and the type of transmission to use when transmitting such a message. These bit field members can also be toggled using the the flags member of can_message_t and the following message flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_MSG_FLAG_EXT</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_RTR</td>
<td>Message is a Remote Transmit Request</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_DLC_NON COMP</td>
<td>Message's Data length code is larger than 8. This will break compliance with CAN2.0B.</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

### Examples

#### Configuration & Installation

The following code snippet demonstrates how to configure, install, and start the CAN driver via the use of the various configuration structures, macro initializers, the can_driver_install() function, and the can_start() function.

```c
#include "driver/gpio.h"
#include "driver/can.h"

void app_main()
{

    //Initialize configuration structures using macro initializers
    can_general_config_t g_config = CAN_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, CAN_MODE_NORMAL);
    can_timing_config_t t_config = CAN_TIMING_CONFIG_500KBITS();
    can_filter_config_t f_config = CAN_FILTER_CONFIG_ACCEPT_ALL();

    //Install CAN driver
    if (can_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }  

    //Start CAN driver
    if (can_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers are not mandatory and each of the configuration structures can be manually.
Message Transmission

The following code snippet demonstrates how to transmit a message via the usage of the `can_message_t` type and `can_transmit()` function.

```c
#include "driver/can.h"
...
//Configure message to transmit
can_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}
//Queue message for transmission
if (can_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

Message Reception

The following code snippet demonstrates how to receive a message via the usage of the `can_message_t` type and `can_receive()` function.

```c
#include "driver/can.h"
...
//Wait for message to be received
can_message_t message;
if (can_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}
//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```
Reconfiguring and Reading Alerts

The following code snippet demonstrates how to reconfigure and read CAN driver alerts via the use of the `can_reconfigure_alerts()` and `can_read_alerts()` functions.

```c
#include "driver/can.h"

... //Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = CAN_ALERT_ERR_PASS | CAN_ALERT_BUS_OFF;
if (can_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
can_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall

The following code demonstrates how to stop and uninstall the CAN driver via the use of the `can_stop()` and `can_driver_uninstall()` functions.

```c
#include "driver/can.h"

... //Stop the CAN driver
if (can_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the CAN driver
if (can_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration

The acceptance mask in `can_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:
Application Examples

Network Example: The CAN Network example demonstrates communication between two ESP32s using the CAN driver API. One CAN node acts as a network master initiate and ceasing the transfer of a data from another CAN node acting as a network slave. The example can be found via peripherals/can/can_network.

Alert and Recovery Example: This example demonstrates how to use the CAN driver’s alert and bus recovery API. The example purposely introduces errors on the CAN bus to put the CAN controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/can/can_alert_and_recovery.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the CAN controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the CAN controller and the external transceiver are working correctly. The example can be found via peripherals/can/can_self_test.

API Reference

Header File

- soc/include/hal/can_types.h

Structures

struct can_message_t
Structure to store a CAN message.

Note
Note The flags member is deprecated

Public Members

uint32_t extd
Extended Frame Format (29bit ID)

uint32_t rtr
Message is a Remote Transmit Request

uint32_t ss
Transmit as a Single Shot Transmission. Unused for received.

uint32_t self
Transmit as a Self Reception Request. Unused for received.
uint32_t dlc_non_comp
    Message’s Data length code is larger than 8. This will break compliance with CAN2.0B.

uint32_t reserved
    Reserved bits

uint32_t flags
    Alternate way to set message flags using message flag macros (see documentation)

uint32_t identifier
    11 or 29 bit identifier

uint8_t data_length_code
    Data length code

uint8_t data[CAN_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)

struct can_timing_config_t
    Structure for bit timing configuration of the CAN driver.

    Note Macro initializers are available for this structure

Public Members

uint32_t brp
    Baudrate prescaler (i.e., APB clock divider) can be any even number from 2 to 128. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
    Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
    Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
    Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
    Enables triple sampling when the CAN controller samples a bit

struct can_filter_config_t
    Structure for acceptance filter configuration of the CAN driver (see documentation)

    Note Macro initializers are available for this structure

Public Members

uint32_t_t acceptance_code
    32-bit acceptance code

uint32_t acceptance_mask
    32-bit acceptance mask

bool single_filter
    Use Single Filter Mode (see documentation)
Macros

CAN_EXTD_ID_MASK
CAN2.0B Constants.
Bit mask for 29 bit Extended Frame Format ID

CAN_STD_ID_MASK
Bit mask for 11 bit Standard Frame Format ID

CAN_FRAME_MAX_DLC
Max data bytes allowed in CAN2.0

CAN_FRAME_EXTD_ID_LEN_BYTES
EFF ID requires 4 bytes (29bit)

CAN_FRAME_STD_ID_LEN_BYTES
SFF ID requires 2 bytes (11bit)

CAN_ERR_PASS_THRESH
Error counter threshold for error passive

Enumerations

enum can_mode_t
CAN Controller operating modes.

Values:

CAN_MODE_NORMAL
Normal operating mode where CAN controller can send/receive/acknowledge messages

CAN_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

CAN_MODE_LISTEN_ONLY
The CAN controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- driver/include/driver/can.h

Functions

esp_err_t can_driver_install(const can_general_config_t *g_config, const can_timing_config_t *t_config, const can_filter_config_t *f_config)
Install CAN driver.
This function installs the CAN driver using three configuration structures. The required memory is allocated and the CAN driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)

Note To reinstall the CAN driver, call can_driver_uninstall() first

Return
• ESP_OK: Successfully installed CAN driver
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_NO_MEM: Insufficient memory
• ESP_ERR_INVALID_STATE: Driver is already installed

Parameters
• g_config: General configuration structure
• t_config: Timing configuration structure
• f_config: Filter configuration structure

`esp_err_t can_driver_uninstall(void)`
Uninstall the CAN driver.

This function uninstalls the CAN driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
• ESP_OK: Successfully uninstalled CAN driver
• ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

`esp_err_t can_start(void)`
Start the CAN driver.

This function starts the CAN driver, putting the CAN driver into the running state. This allows the CAN driver to participate in CAN bus activities such as transmitting/receiving messages. The RX queue is reset in this function, clearing any unread messages. This function can only be called when the CAN driver is in the stopped state.

**Return**
• ESP_OK: CAN driver is now running
• ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t can_stop(void)`
Stop the CAN driver.

This function stops the CAN driver, preventing any further message from being transmitted or received until can_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the CAN driver is in the running state.

**Warning** A message currently being transmitted/received on the CAN bus will be ceased immediately. This may lead to other CAN nodes interpreting the unfinished message as an error.

**Return**
• ESP_OK: CAN driver is now Stopped
• ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed
esp_err_t esp_err_t can_transmit (const can_message_t *message, TickType_t ticks_to_wait)

Transmit a CAN message.

This function queues a CAN message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the CAN driver is in the running state and cannot be called under Listen Only Mode.

Note: This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Return:
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: CAN driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters:
- message: Message to transmit
- ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

esp_err_t esp_err_t can_receive (can_message_t *message, TickType_t ticks_to_wait)

Receive a CAN message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

Warning: The flags field of the received message should be checked to determine if the received message contains any data bytes.

Return:
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters:
- message: Received message
- ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

esp_err_t esp_err_t can_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)

Read CAN driver alerts.

This function will read the alerts raised by the CAN driver. If no alert has been when this function is called, this function will block until an alert occurs or until it times out.
Note Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Return

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

- alerts: Bit field of raised alerts (see documentation for alert flags)
- ticks_to_wait: Number of FreeRTOS ticks to block for alert

```c
esp_err_t can_reconfigure_alerts(uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Return

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

- alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
- current_alerts: Bit field of currently raised alerts. Set to NULL if unused

```c
esp_err_t can_initiate_recovery(void)
```

Start the bus recovery process.

This function initiates the bus recovery process when the CAN driver is in the bus-off state. Once initiated, the CAN driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the CAN bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Return

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: CAN driver is not in the bus-off state, or is not installed

```c
esp_err_t can_get_status_info(can_status_info_t *status_info)
```

Get current status information of the CAN driver.

Return

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed
Parameters

- status_info: Status information

`esp_err_t can_clear_transmit_queue(void)`
Clear the transmit queue.
This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when can_stop() or can_initiate_recovery() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: CAN driver is not installed or TX queue is disabled

`esp_err_t can_clear_receive_queue(void)`
Clear the receive queue.
This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when can_start() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Structures

`struct can_general_config_t`
Structure for general configuration of the CAN driver.

**Note** Macro initializers are available for this structure

Public Members

`can_mode_t mode`
Mode of CAN controller

gpio_num_t tx_io
Transmit GPIO number

gpio_num_t rx_io
Receive GPIO number

gpio_num_t clkout_io
CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io
Bus off indicator GPIO number (optional, set to -1 if unused)

`uint32_t tx_queue_len`
Number of messages TX queue can hold (set to 0 to disable TX Queue)

`uint32_t rx_queue_len`
Number of messages RX queue can hold
uint32_t alerts_enabled
    Bit field of alerts to enable (see documentation)

uint32_t clkout_divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

struct can_status_info_t
    Structure to store status information of CAN driver.

Public Members

can_state_t state
    Current state of CAN controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
    Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred

Macros

CAN_IO_UNUSED
    Marks GPIO as unused in CAN configuration

Enumerations

enum can_state_t
    CAN driver states.

    Values:

    CAN_STATE_STOPPED
        Stopped state. The CAN controller will not participate in any CAN bus activities

    CAN_STATE_RUNNING
        Running state. The CAN controller can transmit and receive messages

    CAN_STATE_BUS_OFF
        Bus-off state. The CAN controller cannot participate in bus activities until it has recovered
2.3.3 Digital To Analog Converter

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO 25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>
...

dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

API Reference

Header File

- driver/include/driver/dac.h

Functions

```c
esp_err_t dac_pad_get_io_num(dac_channel_t channel, gpio_num_t *gpio_num)
```

Get the gpio number of a specific DAC channel.

**Return**

- ESP_OK if success

**Parameters**

- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

```c
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```
Note Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return
• ESP_OK success

Parameters
• channel: DAC channel
• dac_value: DAC output value

`esp_err_t dac_output_enable(dac_channel_t channel)`
DAC pad output enable.

Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

Parameters
• channel: DAC channel

`esp_err_t dac_output_disable(dac_channel_t channel)`
DAC pad output disable.

Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return
• ESP_OK success

Parameters
• channel: DAC channel

`esp_err_t dac_i2s_enable(void)`
Enable DAC output data from I2S.

Return
• ESP_OK success

`esp_err_t dac_i2s_disable(void)`
Disable DAC output data from I2S.

Return
• ESP_OK success

`esp_err_t dac_cw_generator_enable(void)`
Enable cosine wave generator output.

Return
• ESP_OK success

`esp_err_t dac_cw_generator_disable(void)`
Disable cosine wave generator output.

Return
esp_err_t dac_cw_generator_config(dac_cw_config_t *cw)

Config the cosine wave generator function in DAC module.

Return

- ESP_OK success

Parameters

- cw: Configuration.

GPIO Lookup Macros

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC_CHANNEL_1_GPIO_NUM is the GPIO number of channel 1 (25);
2. DAC_GPIO26_CHANNEL is the channel number of GPIO 26 (channel 2).

Header File

- soc/esp32/include/soc/dac_channel.h

Macros

DAC_GPIO25_CHANNEL
DAC_CHANNEL_1_GPIO_NUM
DAC_GPIO26_CHANNEL
DAC_CHANNEL_2_GPIO_NUM

2.3.4 GPIO & RTC GPIO

Overview

The ESP32 chip features 40 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package (refer to technical reference manual). Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO6-11 are usually used for SPI flash.
- GPIO34-39 can only be set as input mode and do not have software pullup or pulldown functions.

There is also separate “RTC GPIO" support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when in deep sleep, when the Ultra Low Power co-processor is running, or when analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: peripherals/gpio.
API Reference - Normal GPIO

Header File

- driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

Configure GPIO’s Mode, pull-up, PullDown, IntrType

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin(gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP_OK.

**Parameters**

- gpio_num: GPIO number.

```c
esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

GPIO set interrupt trigger type.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- gpio_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- intr_type: Interrupt type, select from gpio_int_type_t

```c
esp_err_t gpio_intr_enable(gpio_num_t gpio_num)
```

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• gpio_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_intr_disable (gpio_num_t gpio_num)`

Disables GPIO module interrupt signal.

Return

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• gpio_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

Sets GPIO output level.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO number error

Parameters

• gpio_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  • level: Output level. 0: low ; 1: high

`int gpio_get_level (gpio_num_t gpio_num)`

Gets GPIO input level.

Warning. If the pad is not configured for input (or input and output) the returned value is always 0.

Return

• 0 the GPIO input level is 0
• 1 the GPIO input level is 1

Parameters

• gpio_num: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)`

Sets GPIO direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

Return

• ESP_OK Success

2.3. Peripherals API
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode: GPIO direction

`esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)`
Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG : Parameter error

Parameters
• gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• pull: GPIO pull up/down mode.

`esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`
Enable GPIO wake-up function.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number.
• intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

`esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)`
Disable GPIO wake-up function.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_isr_register(void (*fn)(void *arg), void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.
To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**

- `fn`: Interrupt handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.
- `arg`: Parameter for handler function
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags

```c
esp_err_t gpio_pullup_en(gpio_num_t gpio_num)
```

Enable pull-up on GPIO.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

```c
esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)
```

Disable pull-up on GPIO.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

```c
esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)
```

Enable pull-down on GPIO.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

```c
esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)
```

Disable pull-down on GPIO.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_install_isr_service(int intr_alloc_flags)`
Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM No memory to install this service
• ESP_ERR_INVALID_STATE ISR service already installed.
• ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void `gpio_uninstall_isr_service(void)`
Uninstall the driver’s GPIO ISR service, freeing related resources.

`esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)`
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number
• isr_handler: ISR handler function for the corresponding GPIO number.
• args: parameter for ISR handler.

`esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)`
Remove ISR handler for the corresponding GPIO pin.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

```c
esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)
```

Set GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

```c
esp_err_t gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```

Get GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

```c
esp_err_t gpio_hold_en(gpio_num_t gpio_num)
```

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Return

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters

- gpio_num: GPIO number, only support output-capable GPIOs
### esp_err_t gpio_hold_dis(gpio_num_t gpio_num)
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. E.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**
- gpio_num: GPIO number, only support output-capable GPIOs

### void gpio_deep_sleep_hold_en(void)
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

### void gpio_deep_sleep_hold_dis(void)
Disable all digital gpio pad hold function during Deep-sleep.

### void gpio_iomux_in(uint32_t gpio_num, uint32_t signal_idx)
Set pad input to a peripheral signal through the IOMUX.

**Parameters**
- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

### void gpio_iomux_out(uint8_t gpio_num, int func, bool oen_inv)
Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**
- gpio_num: gpio_num GPIO number of the pad.
- func: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- oen_inv: True if the output enable needs to be inverted, otherwise False.

### Type Definitions

```c
typedef intr_handle_t gpio_isr_handle_t
```

---

706 Chapter 2. API Reference
API Reference - RTC GPIO

Header File

- driver/include/driver/rtc_io.h

Functions

```c
static bool rtc_gpio_is_valid_gpio(gpio_num_t gpio_num)
Determine if the specified GPIO is a valid RTC GPIO.
```

Return true if GPIO is valid for RTC GPIO use. false otherwise.

Parameters

- gpio_num: GPIO number

```c
static int rtc_io_number_get(gpio_num_t gpio_num)
Get RTC IO index number by gpio number.
```

Return >=0: Index of rtcio. -1 : The gpio is not rtcio.

Parameters

- gpio_num: GPIO number

```c
esp_err_t rtc_gpio_init(gpio_num_t gpio_num)
Init a GPIO as RTC GPIO.
```

This function must be called when initializing a pad for an analog function.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_deinit(gpio_num_t gpio_num)
Init a GPIO as digital GPIO.
```

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
uint32_t rtc_gpio_get_level(gpio_num_t gpio_num)
Get the RTC IO input level.
```

Return

- 1 High level
• 0 Low level
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

\texttt{esp_err_t} \texttt{rtc_gpio_set_level}(gpio_num_t gpio_num, uint32_t level)
Set the RTC IO output level.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• level: output level

\texttt{esp_err_t} \texttt{rtc_gpio_set_direction}(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RTC GPIO set direction.
Configure RTC GPIO direction, such as output only, input only, output and input.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

\texttt{esp_err_t} \texttt{rtc_gpio_set_direction_in_sleep}(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO
needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT ONLY, OUTPUT ONLY, INPUT_OUTPUT mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

\texttt{esp_err_t} \texttt{rtc_gpio_pullup_en}(gpio_num_t gpio_num)
RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs
and RTC IOs.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)`

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)`

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)`

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)`

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

2.3. Peripherals API 709
Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)`
Disable hold function on an RTC IO pad.
Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)`
Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

Return

• ESP_OK on success
• ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12).

`esp_err_t rtc_gpio_force_hold_all(void)`
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

`esp_err_t rtc_gpio_force_hold_dis_all(void)`
Disable force hold signal for all RTC IOs.

`esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)`
Set RTC GPIO pad drive capability.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `gpio_num`: GPIO number, only support output GPIOs
• `strength`: Drive capability of the pad

```c
esp_err_t rtc_gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```
Get RTC GPIO pad drive capability.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• `gpio_num`: GPIO number, only support output GPIOs
• `strength`: Pointer to accept drive capability of the pad

```c
esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```
Enable wakeup from sleep mode using specific GPIO.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**
• `gpio_num`: GPIO number
• `intr_type`: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

```c
esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)
```
Disable wakeup from sleep mode using specific GPIO.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Parameters**
• `gpio_num`: GPIO number

### Macros

```c
RTC_GPIO_IS_VALID_GPIO(gpio_num)
```

### 2.3.5 I2C Driver
Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on two I2C buses. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

Configuration

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C mode of operation - slave or master from `i2c_mode_t`
- Configure communication pins
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C clock speed
• (Slave only) Configure the following
  – Whether to enable **10 bit address mode**
  – Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see *Customized Configuration*.

**Install Driver**

After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

• Port number, one of the two port numbers from `i2c_port_t`
• Master or slave, selected from `i2c_mode_t`
• (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
• Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in esp32/include/esp_intr_alloc.h)

**Communication as Master**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**

The example below shows how to build a command link for an I2C master to send *n* bytes to a slave.

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.

   Then, populate it with the series of data to be sent to the slave:

   a) **Start bit** - `i2c_master_start()`

   b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.

   c) **Data** - One or more bytes as an argument of `i2c_master_write()`

   d) **Stop bit** - `i2c_master_stop()`
Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

### Master Read

The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

```c
char cmd = i2c_cmd_link_create();
i2c_master_start(cmd);
i2c_master_write_byte(cmd, Address, ACK);
i2c_master_write(Data, n, ACK);
i2c_master_stop(cmd);
i2c_master_cmd_begin(cmd, 0, 0, wait);
i2c_cmd_link_delete(cmd);
```
Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read**

After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave. The information on what the master will actually do is hidden in the least significant bit of the slave’s address. For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. The API provides the following functions for slaves:

- `i2c_slave_read_buffer()`
  
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`
  
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**

During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to the ESP32 Technical Reference Manual for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

---

2.3. Peripherals API 715
Customized Configuration

As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of start signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of stop signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

Error Handling

The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see `Interrupt Handling`.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

Delete Driver

When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.
Application Example

I2C master and slave example: peripherals/i2c.

API Reference

Header File

- driver/include/driver/i2c.h

Functions

```c
esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver install error

**Parameters**

- `i2c_num`: I2C port number
- `mode`: I2C mode (master or slave)
- `slv_rx_buf_len`: receiving buffer size for slave mode
- `slv_tx_buf_len`: sending buffer size for slave mode
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
```

I2C driver delete.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

2.3. Peripherals API
• i2c_num: I2C port number

`esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`
I2C parameter initialization.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• i2c_conf: pointer to I2C parameter settings

`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`
reset I2C tx hardware fifo

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`
reset I2C rx fifo

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_isr_register(i2c_port_t i2c_num, void (*fn)(void *arg), int intr_alloc_flags, intr_handle_t *handle)`
I2C isr handler register.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• fn: isr handler function
• arg: parameter for isr handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: handle return from esp_intr_alloc.
**esp_err_t i2c_isr_free(intr_handle_t handle)**

to delete and free I2C isr.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- handle: handle of isr.

**esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)**

Configure GPIO signal for I2C sck and sda.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C sda signal
- scl_io_num: GPIO number for I2C scl signal
- sda_pullup_en: Whether to enable the internal pullup for sda pin
- scl_pullup_en: Whether to enable the internal pullup for scl pin
- mode: I2C mode

**i2c_cmd_handle_t i2c_cmd_link_create(void)**

Create and init I2C command link.

**Note** Before we build I2C command link, we need to call i2c_cmd_link_create() to create a command link. After we finish sending the commands, we need to call i2c_cmd_link_delete() to release and return the resources.

**Return** i2c command link handler

**void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)**

Free I2C command link.

**Note** Before we build I2C command link, we need to call i2c_cmd_link_create() to create a command link. After we finish sending the commands, we need to call i2c_cmd_link_delete() to release and return the resources.

**Parameters**

- cmd_handle: I2C command handle

**esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)**

Queue command for I2C master to generate a start signal.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link

\texttt{esp_err_t i2c\_master\_write\_byte(i2c\_cmd\_handle\_t cmd\_handle, uint8\_t data, bool ack\_en)}
Queue command for I2C master to write one byte to I2C bus.

\textbf{Note} Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link
• data: I2C one byte command to write to bus
• ack_en: enable ack check for master

\texttt{esp_err_t i2c\_master\_write(i2c\_cmd\_handle\_t cmd\_handle, uint8\_t *data, size\_t data\_len, bool ack\_en)}
Queue command for I2C master to write buffer to I2C bus.

\textbf{Note} Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

\textbf{Note} If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link
• data: data to send

Parameters
• data_len: data length
• ack_en: enable ack check for master

\texttt{esp_err_t i2c\_master\_read\_byte(i2c\_cmd\_handle\_t cmd\_handle, uint8\_t *data, i2c\_ack\_type\_t ack)}
Queue command for I2C master to read one byte from I2C bus.

\textbf{Note} Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

\textbf{Note} If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link
• data: pointer accept the data byte

Parameters
• ack: ack value for read command

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```
Queue command for I2C master to read data from I2C bus.

Note Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

Note If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link
• data: data buffer to accept the data from bus

Parameters
• data_len: read data length
• ack: ack value for read command

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```
Queue command for I2C master to generate a stop signal.

Note Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• cmd_handle: I2C cmd link

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```
I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

Note Only call this function in I2C master mode

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave doesn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number
• cmd_handle: I2C command handler
• ticks_to_wait: maximum wait ticks.

int i2c_slave_write_buffer (i2c_port_t i2c_num, uint8_t *data, int size, TickType_t ticks_to_wait)
I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

Note  Only call this function in I2C slave mode

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes that pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: data pointer to write into internal buffer
• size: data size
• ticks_to_wait: Maximum waiting ticks

int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

Note  Only call this function in I2C slave mode

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes that read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: data pointer to accept data from internal buffer
• max_size: Maximum data size to read
• ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)
set I2C master clock period

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: clock cycle number during SCL is high level, high_period is a 14 bit value
• low_period: clock cycle number during SCL is low level, low_period is a 14 bit value

`esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)`
get I2C master clock period

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

`esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)`
enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or
the rising edge of the SCL clock is very slow, these may cause the master state machine broken. enable hardware
filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow the SCL clock.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• cyc_num: the APB cycles need to be filtered(0<= cyc_num <=7). When the period of a pulse is less
  than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`
disable filter on I2C bus

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`
set I2C master start signal timing
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- `hold_time`: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

```c
esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```
get I2C master start signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```
set I2C master stop signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2c_num`: I2C port number
- `setup_time`: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- `hold_time`: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```
get I2C master stop signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time.
hold_time: pointer to get hold time.

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```

set I2C data signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```

get I2C data signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- sample_time: pointer to get sample time
- hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

set I2C timeout value

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```

get I2C timeout value

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode);
```

set I2C data transfer mode

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode);
```

get I2C data transfer mode

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

**Macros**

- **I2C_APB_CLK_FREQ**
  12C source clock is APB clock, 80MHz

- **I2C_NUM_0**
  I2C port 0

- **I2C_NUM_1**
  I2C port 1

- **I2C_NUM_MAX**
  I2C port max

**Type Definitions**

```c
typedef void *i2c_cmd_handle_t
```

12C command handle
### 2.3.6 I2S

#### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 integrates two I2S controllers, referred to as I2S0 and I2S1, both of which can be used for streaming audio and video digital data.

An I2S bus consists of the following lines:

- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- Dedicated DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see the ESP32 Technical Reference Manual.

**Note:** For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll = TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: $0 < \text{MCLK}/\text{LRCK}/\text{channels/bits_per_sample} < 64$.

#### Functional Overview
Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Configuration example:

```c
static const int i2s_num = 0; // i2s port number
static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0,
    // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};
```

```c
i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

Setting Communication Pins

Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```c
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};
```

```c
i2s_set_pin(i2s_num, &pin_config);
```

Running I2S Communication

To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the I2S DMA Tx buffer, and then the data will be transmitted automatically.
To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the I2S DMA Rx buffer, once the data is received by the I2S controller.

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver**

If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

**Application Example**

A code example for the I2S driver can be found in the directory `peripherals/i2s`. In addition, there are two short configuration examples for the I2S driver.

**I2S configuration**

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = 16,
  .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
  .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
  .intr_alloc_flags = 0, // default interrupt priority
  .dma_buf_count = 8,
  .dma_buf_len = 64,
  .use_apll = false
};

static const i2s_pin_config_t pin_config = {
  .bck_io_num = 26,
  .ws_io_num = 25,
  .data_out_num = 22,
  .data_in_num = I2S_PIN_NO_CHANGE
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); // install and start i2s
i2s_set_pin(i2s_num, &pin_config);
```

(continues on next page)
Configuring I2S to use internal DAC for analog output

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16,   /* the DAC module will only take the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0,   // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL);   //install and start i2s driver

i2s_set_pin(i2s_num, NULL);   //for internal DAC, this will enable both of the internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050);   //set sample rates

i2s_driver_uninstall(i2s_num);   //stop & destroy i2s driver
```

API Reference

Header File

- `driver/include/driver/i2s.h`

Functions

```c
esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)
```

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.
Note The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

Parameters
- \texttt{i2s\_num}: I2S\_NUM\_0 or I2S\_NUM\_1
- \texttt{pin}: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

Note if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call \texttt{i2s\_set\_dac\_mode} instead.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL IO error

\texttt{esp\_err\_t \texttt{i2s\_set\_dac\_mode}(i2s\_dac\_mode\_t \texttt{dac\_mode})}
Set I2S dac mode, I2S built-in DAC is disabled by default.

Note Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

Parameters
- \texttt{dac\_mode}: DAC mode configurations - see i2s\_dac\_mode\_t

\texttt{esp\_err\_t \texttt{i2s\_driver\_install}(i2s\_port\_t i2s\_num, \textbf{const} i2s\_config\_t *i2s\_config, int queue\_size, \textbf{void} *i2s\_queue)}
Install and start I2S driver.
This function must be called before any I2S driver read/write operations.

Parameters
- \texttt{i2s\_num}: I2S\_NUM\_0, I2S\_NUM\_1
- \texttt{i2s\_config}: I2S configurations - see i2s\_config\_t struct
- \texttt{queue\_size}: I2S event queue size/depth.
- \texttt{i2s\_queue}: I2S event queue handle, if set NULL, driver will not use an event queue.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

\texttt{esp\_err\_t \texttt{i2s\_driver\_uninstall}(i2s\_port\_t i2s\_num)}
Uninstall I2S driver.

2.3. Peripherals API
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2s_num: I2S_NUM_0, I2S_NUM_1
- src: Source address to write from
- size: Size of data in bytes
- bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).

Parameters

- i2s_num: I2S_NUM_0, I2S_NUM_1
- src: Source address to write from
- size: Size of data in bytes
- src_bits: Source audio bit
- aim_bits: Bit wanted, no more than 32, and must be greater than src_bits
- bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```
Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call i2s_adc_start and i2s_adc_stop around the whole reading process, to prevent the data getting corrupted.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• `i2s_num`: I2S_NUM_0, I2S_NUM_1
• `dest`: Destination address to read into
• `size`: Size of data in bytes
• `bytes_read`: Number of bytes read, if timeout, bytes read will be less than the size passed in.
• `ticks_to_wait`: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```
Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

```c
bit_clock = rate * (number of channels) * bits_per_sample
```

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

**Parameters**
• `i2s_num`: I2S_NUM_0, I2S_NUM_1
• `rate`: I2S sample rate (ex: 8000, 44100...)

```c
esp_err_t i2s_stop(i2s_port_t i2s_num)
```
Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

**Return**
• ESP_OK Success

### 2.3. Peripherals API

733
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2s_num`: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_start (i2s_port_t i2s_num)
```

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2s_num`: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
```

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2s_num`: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, i2s_bits_per_sample_t bits, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- `i2s_num`: I2S_NUM_0, I2S_NUM_1
- `rate`: I2S sample rate (ex: 8000, 44100…)
- `bits`: I2S bit width (I2S_BITS_PER_SAMPLE_16BIT, I2S_BITS_PER_SAMPLE_24BIT, I2S_BITS_PER_SAMPLE_32BIT)
- `ch`: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO)

```c
float i2s_get_clk (i2s_port_t i2s_num)
```

get clock set on particular port number.
Return

- actual clock set by i2s driver

Parameters

- \texttt{i2s\_num}: I2S\_NUM\_0, I2S\_NUM\_1

\texttt{esp\_err\_t i2s\_set\_adc\_mode(adc\_unit\_t adc\_unit, adc\_channel\_t adc\_channel)}

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

Parameters

- \texttt{adc\_unit}: SAR ADC unit index
- \texttt{adc\_channel}: ADC channel index

\texttt{esp\_err\_t i2s\_adc\_enable(i2s\_port\_t i2s\_num)}

Start to use I2S built-in ADC mode.

Note This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver state error

Parameters

- \texttt{i2s\_num}: i2s port index

\texttt{esp\_err\_t i2s\_adc\_disable(i2s\_port\_t i2s\_num)}

Stop to use I2S built-in ADC mode.

Note This function would release the lock of ADC so that other tasks can use ADC.

Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver state error

Parameters

- \texttt{i2s\_num}: i2s port index

Type Definitions

\texttt{typedef intr\_handle\_t i2s\_isr\_handle\_t}
2.3.7 LED Control

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes as well. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

A half of LEDC’s channels operate in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other half of channels operate in low speed mode, where the moment of change depends on the application software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Getting LEDC to work on a specific channel in either high or low speed mode is done in three steps:

1. Configure Timer by specifying the PWM signal’s frequency and duty cycle resolution.
2. Configure Channel by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on the fade end.

![Fig. 14: Key Settings of LED PWM Controller’s API](image-url)
Configure Timer

Setting the timer is done by calling the function `ledc_timer_config()` and passing to it a data structure `ledc_timer_config_t` that contains the following configuration settings:

- Timer number `ledc_timer_t`
- Speed mode `ledc_mode_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower duty resolution is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

Configure Channel

When the timer is set up, configure a selected channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal

Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

Change PWM Duty Cycle Using Software

To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Configure Channel.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to $(2^{\text{duty_resolution}}) - 1$. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.
Change PWM Duty Cycle using Hardware

The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

Change PWM Frequency

The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

More Control Over PWM

There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

Use Interrupts

When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

LEDC High and Low Speed Mode

Of the total 8 timers and 16 channels available in the LED PWM Controller, half of them are dedicated to operation in high speed mode and the other half in low speed mode. Selection of a low or high speed timer or channel is done with the parameter `ledc_mode_t` that can be found in applicable function calls.
The advantage of high speed mode is glitch-free changeover of the timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, refer to ESP32 Technical Reference Manual (PDF). Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a wide resolution for PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. It means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try
    reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try
    increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: `peripherals/ledc`.

**API Reference**

**Header File**

- `driver/include/driver/ledc.h`

**Functions**

```c
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.
Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`
LEDCC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

Parameters

• `timer_conf`: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`
LEDCC update channel parameters.

Note Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
• `channel`: LEDC channel (0-7), select from ledc_channel_t

`esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)`
LEDCC stop. Disable LEDC output, and set idle level.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
• `channel`: LEDC channel (0-7), select from ledc_channel_t
• `idle_level`: Set output idle level after LEDC stops.
```c
esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
LEDCC set channel frequency (Hz)

Return
• ESP_OK Success
• ESP.ERR_INVALID_ARG Parameter error
• ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current
duty_resolution.

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_num: LEDC timer index (0-3), select from ledc_timer_t
• freq_hz: Set the LEDC frequency
```

```c
uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)
LEDCC get channel frequency (Hz)

Return
• 0 error
• Others Current LEDC frequency

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_num: LEDC timer index (0-3), select from ledc_timer_t
```

```c
esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
LEDCC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these
functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is
ledc_set_duty_and_update

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.
Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_OK Success
• ESP.ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel (0-7), select from ledc_channel_t
• duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
• hpoint: Set the LEDC hpoint value(max: 0xfffff)
```

```c
int ledc_get_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel)
LEDCC get hpoint value, the counter value when the output is set high level.
```

2.3. Peripherals API 741
Return

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t

```
esp_err_t ledc_set_duty(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty. This function do not change the hpoint value of this channel. if needed, please call
ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note**

ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these
functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is
ledc_set_duty_and_update.

**Note**

If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.
Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

```
uint32_t ledc_get_duty(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty.

Return

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t

```
esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
                        ledc_duty_direction_t fade_direction, uint32_t step_num,
                        uint32_t duty_cycle_num, uint32_t duty_scale)
```

LEDC set gradient. Set LEDC gradient. After the function calls the ledc_update_duty function, the function can
take effect.

**Note**

If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.
Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel (0-7), select from ledc_channel_t
• duty: Set the start of the gradient duty, the range of duty setting is \([0, (2^{\text{duty_resolution}})]\)
• fade_direction: Set the direction of the gradient
• step_num: Set the number of the gradient
• duty_cycle_num: Set how many LEDC tick each time the gradient lasts
• duty_scale: Set gradient change amplitude

declared

esp_err_t ledc_isr_register (void (*fn) (void **), void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle)
Register LEDC interrupt handler, the handler is an
ISR. The handler will be attached to the same CPU core that this function is running on.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error.

Parameters
• fn: Interrupt handler function.
• arg: User-supplied argument passed to the handler function.
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred)
ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

declared

esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
uint32_t duty_resolution, ledc_clk_src_t clk_src)
Configure LEDC settings.

Return
• (-1) Parameter error
• Other Current LEDC duty

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_sel: Timer index (0-3), there are 4 timers in LEDC module
• clock_divider: Timer clock divide value, the timer clock is divided from the selected clock
source
• duty_resolution: Resolution of duty setting in number of bits. The range of duty values is \([0, (2^{\text{duty_resolution}})]\)
• clk_src: Select LEDC source clock.

declared

esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
Reset LEDC timer.
Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_timer_pause(ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Pause LEDC timer counter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_timer_resume(ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Resume LEDC timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`

Bind LEDC channel with the selected timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel index (0-7), select from ledc_channel_t
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`

Set LEDC fade function.
Note Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading \([0, (2^{\text{duty_resolution}} - 1)]\)
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

Note Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading \((0 - (2^{\text{duty_resolution}} - 1)))\)
- `max_fade_time_ms`: The maximum time of the fading (ms).
esp_err_t  **ledc_fade_func_install** (int *intr_alloc_flags*)  
Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**  
- ESP_OK Success  
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**  
- *intr_alloc_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void  **ledc_fade_func_uninstall** (void)  
Uninstall LEDC fade function.

esp_err_t  **ledc_fade_start** (ledc_mode_t *speed_mode*,  
lede_channel_t *channel*,  
lede_fade_mode_t *fade_mode*)  
Start LEDC fading.

**Note** Call *ledc_fade_func_install()* once before calling this function. Call this API right after *ledc_set_fade_with_time* or *ledc_set_fade_with_step* before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**  
- ESP_OK Success  
- ESP_ERR_INVALID_STATE Fade function not installed.  
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**  
- *speed_mode*: Select the LEDC speed_mode, high-speed mode and low-speed mode  
- *channel*: LEDC channel number  
- *fade_mode*: Whether to block until fading done.

esp_err_t  **ledc_set_duty_and_update** (ledc_mode_t *speed_mode*,  
lede_channel_t *channel*,  
uint32_t *duty*,  
uint32_t *hpoint*)  
A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**  
- *speed_mode*: Select the LEDC speed_mode, high-speed mode and low-speed mode  
- *channel*: LEDC channel (0-7), select from *lede_channel_t*  
- *duty*: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]  
- *hpoint*: Set the LEDC hpoint value(max: 0xfffff)

esp_err_t  **ledc_set_fade_time_and_start** (ledc_mode_t *speed_mode*,  
lede_channel_t *channel*,  
uint32_t *target_duty*,  
uint32_t *max_fade_time_ms*,  
lede_fade_mode_t *fade_mode*)  
A thread-safe API to set and start LEDC fade function, with a limited time.
**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from ledc_channel_t
- `target_duty`: Target duty of fading. \(0 - (2^{**duty\_resolution} - 1)\)
- `max_fade_time_ms`: The maximum time of the fading (ms).
- `fade_mode`: choose blocking or non-blocking mode

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from ledc_channel_t
- `target_duty`: Target duty of fading \([0, (2^{*duty\_resolution}) - 1]\)
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: Increase or decrease the duty every `cycle_num` cycles
- `fade_mode`: choose blocking or non-blocking mode

**Macros**

- `LEDC_APB_CLK_HZ`
- `LEDC_REF_CLK_HZ`

2.3. Peripherals API
LEDC_ERR_DUTY
LEDC_ERR_VAL

Type Definitions

typedef intr_handle_t ledc_isr_handle_t

2.3.8 MCPWM

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

![MCPWM Overview](image)

Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture, Carrier and Interrupts.

Contents

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Capture** external signals to provide additional control over the outputs
- Use Fault Handler to detect and manage faults
Fig. 16: MCPWM Block Diagram
• Add a higher frequency Carrier, if output signals are passed through an isolation transformer
• Configuration and handling of Interrupts.

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

![Fig. 17: Example of Brushed DC Motor Control with MCPWM](image)

Configuration covers the following steps:

1. Selection of a MPWn unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in mcpwm_unit_t.

2. Initialization of two GPIOs as output signals within selected unit by calling mcpwm_gpio_init(). The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in mcpwm_io_signals_t. To set more than a single pin at a time, use function mcpwm_set_pin() together with mcpwm_pin_config_t.

3. Selection of a timer. There are three timers available within the unit. The timers are listed in mcpwm_timer_t.

4. Setting of the timer frequency and initial duty within mcpwm_config_t structure.

5. Calling of mcpwm_init() with the above parameters to make the configuration effective.

Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is
There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

### Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_enable()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_enable()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated please refer to ESP32 Technical Reference Manual.
Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

Fig. 18: Example of Brushless DC Motor Control with MCPWM

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.

2. Enabling of the functionality itself by invoking `mcpwm_capture_enable()`, selecting desired signal input from `mcpwm_capture_signal_t`, setting the signal edge with `mcpwm_capture_on_edge_t` and the signal count prescaler.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable()`.

Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:
• lock current state of the output
• set the output low
• set the output high
• toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   • State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   • The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

**Carrier**

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then alerted at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details please refer to “PWM Carrier Submodule” section of the ESP32 Technical Reference Manual.

To disable carrier functionality call `mcpwm_carrier_disable()`.

**Interrupts**

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`.
Application Example

Examples of using MCPWM for motor control: peripherals/mcpwm:

- Demonstration how to use each submodule of the MCPWM - peripherals/mcpwm/mcpwm_basic_config
- Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_bldc_control
- Brushed DC motor control - peripherals/mcpwm/mcpwm_brushed_dc_control
- Servo motor control - peripherals/mcpwm/mcpwm_servo_control

API Reference

Header File

- soc/include/hal/mcpwm_types.h

Enumerations

enum mcpwm_intr_t
Interrupts for MCPWM.

Values:

MCPWM_LL_INTR_CAP0 = BIT(27)
Capture 0 happened.

MCPWM_LL_INTR_CAP1 = BIT(28)
Capture 1 happened.

MCPWM_LL_INTR_CAP2 = BIT(29)
Capture 2 happened.

enum mcpwm_counter_type_t
Select type of MCPWM counter.

Values:

MCPWM_UP_COUNTER = 1
For asymmetric MCPWM

MCPWM_DOWN_COUNTER
For asymmetric MCPWM

MCPWM_UP_DOWN_COUNTER
For symmetric MCPWM, frequency is half of MCPWM frequency set

MCPWM_COUNTER_MAX
Maximum counter mode

enum mcpwm_duty_type_t
Select type of MCPWM duty cycle mode.

Values:

MCPWM_DUTY_MODE_0 = 0
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM
MCPWM_DUTY_MODE_1
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH

MCPWM_DUTY_MODE_MAX
Num of duty cycle modes

enum mcpwm_output_action_t
MCPWM select action to be taken on the output when event happens.
Values:

MCPWM_ACTION_NO_CHANGE = 0
No change in the output

MCPWM_ACTION_FORCE_LOW
Make output low

MCPWM_ACTION_FORCE_HIGH
Make output high

MCPWM_ACTION_TOGGLE
Make output toggle

enum mcpwm_deadtime_type_t
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.
Values:

MCPWM_DEADTIME_BYPASS = 0
Bypass the deadtime

MCPWM_BYPASS_RED
MCPWMXA = no change, MCPWMXB = falling edge delay

MCPWM_BYPASS_FED
MCPWMXA = rising edge delay, MCPWMXB = no change

MCPWM_ACTIVE_HIGH_MODE
MCPWMXA = rising edge delay, MCPWMXB = falling edge delay

MCPWM_ACTIVE_LOW_MODE
MCPWMXA = compliment of rising edge delay, MCPWMXB = compliment of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
MCPWMXA = rising edge delay, MCPWMXB = compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
MCPWMXA = compliment of rising edge delay, MCPWMXB = falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA
MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCP-WMXA

MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCP-WMXB

MCPWM_DEADTIME_TYPE_MAX

2.3. Peripherals API
enum mcpwm_sync_signal_t
    MCPWM select sync signal input.
    Values:
    MCPWM_SELECT_SYNC0 = 4
        Select SYNC0 as input
    MCPWM_SELECT_SYNC1
        Select SYNC1 as input
    MCPWM_SELECT_SYNC2
        Select SYNC2 as input

enum mcpwm_capture_on_edge_t
    MCPWM select capture starts from which edge.
    Values:
    MCPWM_NEG_EDGE = BIT(0)
        Capture the negative edge
    MCPWM_POS_EDGE = BIT(1)
        Capture the positive edge

esp_err_t mcpwm_gpio_init (mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)

This function initializes each gpio signal for MCPWM.

Note This function initializes one gpio at a time.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16
**esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)**

Initialize MCPWM gpio structure.

**Note** This function can be used to initialize more than one gpio at a time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- mcpwm_pin: MCPWM pin structure

**esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)**

Initialize MCPWM parameters.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm_conf: configure structure mcpwm_config_t

**esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)**

Set frequency(in Hz) of MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

**esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)**

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator (MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- `duty`: set duty cycle in % (i.e., for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)
```

Set duty cycle of each operator (MCPWMXA/MCPWMXB) in us.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator (MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- `duty_in_us`: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```

Set duty either active high or active low (out of phase/inverted)

**Note** Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator (MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- `duty_type`: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Get frequency of timer.

**Return**
- Frequency of timer

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
float `mcpwm_get_duty`(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)

Get duty cycle of each operator.

**Return**
- duty cycle in % of each operator(56.7 means duty is 56.7%)

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

`esp_err_t mcpwm_set_signal_high`(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)

Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

`esp_err_t mcpwm_set_signal_low`(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

`esp_err_t mcpwm_start`(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Start MCPWM signal on timer ‘x’.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)

Initialize carrier configuration.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_conf: configure structure mcpwm_carrier_config_t

esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Enable MCPWM carrier submodule, for respective timer.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable MCPWM carrier submodule, for respective timer.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)

Set period of carrier.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_period: set the carrier period of each timer, carrier period = (carrier_period + 1) * 800ns (carrier_period <= 15)

esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)

Set duty_cycle of carrier.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_duty: set duty_cycle of carrier, carrier duty cycle = carrier_duty * 12.5% (chop_duty <= 7)

esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)

Enable and set width of first pulse in carrier oneshot mode.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• pulse_width: set pulse width of first pulse in oneshot mode, width = (carrier period) * (pulse_width + 1) (pulse_width <= 15)

esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable oneshot mode, width of first pulse = carrier period.

Return

• ESP_OK Success
```

2.3. Peripherals API 761
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_carrier_output_invert (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)

Enable or disable carrier output inversion.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_ivt_mode: enable or disable carrier output inversion

esp_err_t mcpwm_deadtime_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)

Enable and initialize deadtime for each MCPWM timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• dt_mode: set deadtime mode
• red: set rising edge delay = red*100ns
• fed: set rising edge delay = fed*100ns

esp_err_t mcpwm_deadtime_disable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable deadtime on MCPWM timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)

Initialize fault submodule, currently low level triggering is not supported.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- input_level: set fault signal level, which will cause fault to occur
- fault_sig: set the fault pin, which needs to be enabled

esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)

Set oneshot mode on fault detection, once fault occurs in oneshot mode reset is required to resume MCPWM signals.

Note currently low level triggering is not supported

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for oneshot mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)

Set cycle-by-cycle mode on fault detection, once fault occurs in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

Note currently low level triggering is not supported

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• fault_sig: set the fault pin, which needs to be enabled for cyc mode
• action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
• action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- mcpwm_num: set MCPWM unit(0-1)
- fault_sig: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig,
                                mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```

Initialize capture submodule.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- mcpwm_num: set MCPWM unit(0-1)
- cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- cap_sig: capture pin, which needs to be enabled
- num_of_pulse: count time between rising/falling edge between 2 *(pulses mentioned), counter uses APB_CLK

```c
esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Disable capture signal.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin, which needs to be disabled

```c
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Get capture value.
Return  Captured value

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture pin on which value is to be measured

uint32_t mcpwm_capture_signal_get_edge (mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Get edge of capture signal.

Return  Capture signal edge: 1 - positive edge, 2 - negative edge

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture pin of whose edge is to be determined

esp_err_t mcpwm_sync_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)

Initialize sync submodule.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• sync_sig: set the synchronization pin, which needs to be enabled
• phase_val: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

esp_err_t mcpwm_sync_disable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable sync submodule on given timer.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_isr_register (mcpwm_unit_t mcpwm_num, void (*fn) (void *arg), void *arg, int intr_alloc_flags, intr_handle_t *handle)

Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error.

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• fn: interrupt handler function.
• arg: user-supplied argument passed to the handler function.
• intr_alloc_flags: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see esp_intr_alloc.h for more info.
• handle: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Structures

```c
struct mcpwm_pin_config_t
    MCPWM pin number for.
```

Public Members

    CAP2 in pin

struct mcpwm_config_t
    MCPWM config structure.

Public Members

uint32_t frequency
    Set frequency of MCPWM in Hz

float cmpr_a
    Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3

float cmpr_b
    Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t duty_mode
    Set type of duty cycle

mcpwm_counter_type_t counter_mode
    Set type of MCPWM counter

struct mcpwm_carrier_config_t
    MCPWM config carrier structure.

Public Members

uint8_t carrier_period
    Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

uint8_t carrier_duty
    Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)  

uint8_t pulse_width_in_os
    Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less then 16

mcpwm_carrier_os_t carrier_os_mode
    Enable or disable carrier oneshot mode

mcpwm_carrier_out_ivt_t carrier_ivt_mode
    Invert output of carrier

Enumerations

enum mcpwm_io_signals_t
IO signals for the MCPWM.

• 6 MCPWM output pins that generate PWM signals
• 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
• 3 MCPWM sync input pins to synchronize MCPWM outputs signals
• 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A  = 0
    PWM0A output pin
MCPWM0B
    PWM0B output pin
MCPWM1A
    PWM1A output pin
MCPWM1B
    PWM1B output pin
MCPWM2A
    PWM2A output pin
MCPWM2B
    PWM2B output pin
MCPWM_SYNC_0
    SYNC0 input pin
MCPWM_SYNC_1
    SYNC1 input pin
MCPWM_SYNC_2
    SYNC2 input pin
MCPWM_FAULT_0
FAULT0 input pin

MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

MCPWM_UNIT_0 = 0
MCPWM unit0 selected

MCPWM_UNIT_1
MCPWM unit1 selected

MCPWM_UNIT_MAX
Num of MCPWM units on ESP32

enum mcpwm_timer_t
Select MCPWM timer.

Values:

MCPWM_TIMER_0 = 0
Select MCPWM timer0

MCPWM_TIMER_1
Select MCPWM timer1

MCPWM_TIMER_2
Select MCPWM timer2

MCPWM_TIMER_MAX
Num of MCPWM timers on ESP32

enum mcpwm_generator_t
Select MCPWM operator.

Values:

MCPWM_GEN_A = 0
Select MCPWMXA, where ‘X’ is operator number

MCPWM_GEN_B
Select MCPWMXB, where ‘X’ is operator number

MCPWM_GEN_MAX
Num of generators to each operator of MCPWM
enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.
Values:

MCPWM_ONESHOT_MODE_DIS = 0
Enable oneshot mode
MCPWM_ONESHOT_MODE_EN
Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.
Values:

MCPWM_CARRIER_OUT_IVT_DIS = 0
Enable carrier output inversion
MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion

enum mcpwm_fault_signal_t
MCPWM select fault signal input.
Values:

MCPWM_SELECT_F0 = 0
Select F0 as input
MCPWM_SELECT_F1
Select F1 as input
MCPWM_SELECT_F2
Select F2 as input

enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.
Values:

MCPWM_LOW_LEVEL_TGR = 0
Fault condition occurs when fault input signal goes from high to low, currently not supported
MCPWM_HIGH_LEVEL_TGR
Fault condition occurs when fault input signal goes low to high

enum mcpwm_capture_signal_t
MCPWM select capture signal input.
Values:

MCPWM_SELECT_CAP0 = 0
Select CAP0 as input
MCPWM_SELECT_CAP1
Select CAP1 as input
MCPWM_SELECT_CAP2
Select CAP2 as input
2.3.9 Pulse Counter

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has eight independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.
**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

**Filtering Pulses**

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in Configuration
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

Pulse counter with control signal and event interrupt example: `peripherals/pcnt`.

**API Reference**

**Header File**

- `driver/include/driver/pcnt.h`

**Functions**

`esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)`

Configure Pulse Counter unit.

**Note** This function will disable three events: `PCNT_EVT_L_LIM`, `PCNT_EVT_H_LIM`, `PCNT_EVT_ZERO`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- pcnt_config: Pointer of Pulse Counter unit configure parameter

`esp_err_t pcnt_get_counter_value (pcnt_unit_t pcnt_unit, int16_t *count)`

Get pulse counter value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- pcnt_unit: Pulse Counter unit number
- count: Pointer to accept counter value

`esp_err_t pcnt_counter_pause (pcnt_unit_t pcnt_unit)`

Pause PCNT counter of PCNT unit.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- pcnt_unit: PCNT unit number

`esp_err_t pcnt_counter_resume (pcnt_unit_t pcnt_unit)`

Resume counting for PCNT counter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

`esp_err_t pcnt_counter_clear (pcnt_unit_t pcnt_unit)`

Clear and reset PCNT counter value to zero.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number, select from pcnt_unit_t

\textbf{esp_err_t pcnt_intr_enable (pcnt_unit_t pcnt_unit)}

Enable PCNT interrupt for PCNT unit.

\textbf{Note} Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with pcnt_event_enable() and pcnt_event_disable()

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number

\textbf{esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)}

Disable PCNT interrupt for PCNT unit.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number

\textbf{esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)}

Enable PCNT event of PCNT unit.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\textbf{esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)}

Disable PCNT event of PCNT unit.

Return
• ESP_OK Success
ESP_ERR_INVALID_STATE pcnt driver has not been initialized
ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\( \text{esp_err_t pcnt_set_event_value} \) (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)
Set PCNT event value of PCNT unit.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Counter value for PCNT event

\( \text{esp_err_t pcnt_get_event_value} \) (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)
Get PCNT event value of PCNT unit.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Pointer to accept counter value for PCNT event

\( \text{esp_err_t pcnt_isr_register} \) (void (*fn) void *, void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)
Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

Return
- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

2.3. Peripherals API
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling esp_intr_free to unregister this ISR service if needed, but only if the handle is not NULL.

```c
esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)
```
Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• unit: PCNT unit number
• channel: PCNT channel number
• pulse_io: Pulse signal input GPIO
• ctrl_io: Control signal input GPIO

```c
esp_err_t pcnt_filter_enable (pcnt_unit_t unit)
```
Enable PCNT input filter.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• unit: PCNT unit number

```c
esp_err_t pcnt_filter_disable (pcnt_unit_t unit)
```
Disable PCNT input filter.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• unit: PCNT unit number

```c
esp_err_t pcnt_set_filter_value (pcnt_unit_t unit, uint16_t filter_val)
```
Set PCNT filter value.
Note filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value(pcnt_unit_t unit, uint16_t *filter_val)
```
Get PCNT filter value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- filter_val: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode(pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode,
    pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```
Set PCNT counter mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- channel: PCNT channel number
- pos_mode: Counter mode when detecting positive edge
- neg_mode: Counter mode when detecting negative edge
- hctrl_mode: Counter mode when control signal is high level
- lctrl_mode: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add(pcnt_unit_t unit, void (*isr_handler)(void *, void *args))
```
Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.
The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- isr_handler: Interrupt handler function.
- args: Parameter for handler function

```c
esp_err_t pcnt_isr_service_install(int intr_alloc_flags)
```

Install PCNT ISR service.

Note We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

Parameters

- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void pcnt_isr_service_uninstall(void)
```

Uninstall PCNT ISR service, freeing related resources.

```c
esp_err_t pcnt_isr_handler_remove(pcnt_unit_t unit)
```

Delete ISR handler for specified unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
Type Definitions

typedef intr_handle_t pcnt_isr_handle_t

2.3.10 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

Fig. 19: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

Fig. 20: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. *Use Interrupts*

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

**Configure Driver**

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

**Common Parameters**

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many **memory blocks** will be used by the channel, set with `mem_block_num`.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in *Transmit Mode* or *Receive Mode*:

**Transmit Mode**

When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`

**Receive Mode**

In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
• A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].

• A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.

Finalize Configuration

Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in `Use Interrupts`.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`, see `soc/esp32/include/soc/rmt_caps.h`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Fig. 21: Structure of RMT items (L - signal level)](image)

For a simple example how to define a block of items see `peripherals/rmt/morse_code`.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.
Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to send is restricted by the size of memory blocks allocated in the RMT controller's internal memory, see `rmt_set_mem_block_num()`.

**Receive Data**

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels. In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

**Change Operation Parameters**

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

**Receive Mode Parameters**

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
• Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

Note: When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

• The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
• The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
• The number of events the transmitter has sent matches a threshold value - `rmt_set_tx_thr_intr_en()`
• Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as RMT.int_clr.val.chN_event_name and defined as a volatile struct in `soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, 7] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

• A simple RMT TX example: `peripherals/rmt/morse_code`.
• Another RMT TX example, specific to drive a common RGB LED strip: `peripherals/rmt/led_strip`.
• NEC remote control TX and RX example: `peripherals/rmt/ir_protocols`.

API Reference

Header File

• `driver/include/driver/rmt.h`
**Functions**

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`
Set RMT clock divider, channel clock is divided from source clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- div_cnt: RMT counter clock divider

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)`
Get RMT clock divider, channel clock is divided from source clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- div_cnt: pointer to accept RMT counter divider

`esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)`
Set RMT RX idle threshold value.
In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

`esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t *thresh)`
Get RMT idle threshold value.
In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
• channel: RMT channel
• thresh: pointer to accept RMT RX idle threshold value

```c
esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)
```
Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * n, and end_addr_chn = RMT base address + 0x800 + 64 * n + 64 * RMT_MEM_SIZE_CHn mod 512 * 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

```c
esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t *rmt_mem_num)
```
Get RMT memory block number.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• rmt_mem_num: Pointer to accept RMT RX memory block number

```c
esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)
```
Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• carrier_en: Whether to enable output carrier.
• high_level: High level duration of carrier
• low_level: Low level duration of carrier.
• carrier_level: Configure the way carrier wave is modulated for channel.
  – 1'b1: transmit on low output level
  – 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)
```
Set RMT memory in low power mode.
Reduce power consumed by memory. 1: memory is in low power state.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • pd_en: RMT memory low power enable.

```c
esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)
```
Get RMT memory low power mode.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • pd_en: Pointer to accept RMT memory low power mode.

```c
esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)
```
Set RMT start sending data from memory.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

```c
esp_err_t rmt_tx_stop(rmt_channel_t channel)
```
Set RMT stop sending.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• channel: RMT channel

`esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)`
Set RMT start receiving data.

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• channel: RMT channel
• rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

`esp_err_t rmt_rx_stop(rmt_channel_t channel)`
Set RMT stop receiving data.

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• channel: RMT channel

`esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)`
Reset RMT TX/RX memory index.

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• channel: RMT channel

`esp_err_t rmt_set_memory_owner(rmt_channel_t channel, rmt_mem_owner_t owner)`
Set RMT memory owner.

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• channel: RMT channel
• owner: To set when the transmitter or receiver can process the memory of channel.
**esp_err_t rmt_get_memory_owner** (rmt_channel_t channel, rmt_mem_owner_t *owner)

Get RMT memory owner.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- channel: RMT channel
- owner: Pointer to get memory owner.

**esp_err_t rmt_set_tx_loop_mode** (rmt_channel_t channel, bool loop_en)

Set RMT tx loop mode.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- channel: RMT channel
- loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

**esp_err_t rmt_get_tx_loop_mode** (rmt_channel_t channel, bool *loop_en)

Get RMT tx loop mode.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- channel: RMT channel
- loop_en: Pointer to accept RMT transmitter loop sending mode.

**esp_err_t rmt_set_rx_filter** (rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- channel: RMT channel
- rx_filter_en: To enable RMT receiver filter.
- thresh: Threshold of pulse width for receiver.
`esp_err_t rmt_set_source_clk (rmt_channel_t channel, rmt_source_clk_t base_clk)`

Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- base_clk: To choose source clock for RMT module.

`esp_err_t rmt_get_source_clk (rmt_channel_t channel, rmt_source_clk_t *src_clk)`

Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- src_clk: Pointer to accept source clock for RMT module.

`esp_err_t rmt_set_idle_level (rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)`

Set RMT idle output level for transmitter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- idle_out_en: To enable idle level output.
- level: To set the output signal’s level for channel in idle state.

`esp_err_t rmt_get_idle_level (rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)`

Get RMT idle output level for transmitter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• idle_out_en: Pointer to accept value of enable idle.
• level: Pointer to accept value of output signal’s level in idle state for specified channel.

\texttt{esp_err_t \texttt{rmt\_get\_status} (rmt\_channel\_t channel, uint32\_t *status)}
Get RMT status.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• status: Pointer to accept channel status. Please refer to RMT\_CHnSTATUS\_REG(n=0~7) in rmt\_reg.h for more details of each field.

\texttt{void \texttt{rmt\_set\_intr\_enable\_mask} (uint32\_t mask)}
Set mask value to RMT interrupt enable register.

Parameters
• mask: Bit mask to set to the register

\texttt{void \texttt{rmt\_clear\_intr\_enable\_mask} (uint32\_t mask)}
Clear mask value to RMT interrupt enable register.

Parameters
• mask: Bit mask to clear the register

\texttt{esp_err_t \texttt{rmt\_set\_rx\_intr\_en} (rmt\_channel\_t channel, bool en)}
Set RMT RX interrupt enable.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• en: enable or disable RX interrupt.

\texttt{esp_err_t \texttt{rmt\_set\_err\_intr\_en} (rmt\_channel\_t channel, bool en)}
Set RMT RX error interrupt enable.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
Parameters

- `channel`: RMT channel
- `en`: enable or disable RX err interrupt.

**esp_err_t rmt_set_tx_intr_en**(rmt_channel_t channel, bool en)
Set RMT TX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `en`: enable or disable TX interrupt.

**esp_err_t rmt_set_tx_thr_intr_en**(rmt_channel_t channel, bool en, uint16_t evt_thresh)
Set RMT TX threshold event interrupt enable.
An interrupt will be triggered when the number of transmitted items reaches the threshold value

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `en`: enable or disable TX event interrupt.
- `evt_thresh`: RMT event interrupt threshold value

**esp_err_t rmt_set_pin**(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)
Set RMT pin.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `mode`: TX or RX mode for RMT
- `gpio_num`: GPIO number to transmit or receive the signal.

**esp_err_t rmt_config**(const rmt_config_t *rmt_param)
Configure RMT parameters.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Parameters

- `rmt_param`: RMT parameter struct

```c
esp_err_t rmt_isr_register (void (*fn) (void *), void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
```

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

Parameters

- `fn`: Interrupt handler function.
- `arg`: Parameter for the handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: If non-zero, a handle to later clean up the ISR gets stored here.

```c
esp_err_t rmt_isr_deregister (rmt_isr_handle_t handle)
```

Deregister previously registered RMT interrupt handler.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

Parameters

- `handle`: Handle obtained from `rmt_isr_register`

```c
esp_err_t rmt_fill_tx_items (rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)
```

Fill memory data of channel with given RMT items.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `item`: Pointer of items.
- `item_num`: RMT sending items number.
- `mem_offset`: Index offset of memory.
** esp_err_t rmt_driver_install (rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags) 
Initialize RMT driver.

** Return **

- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

** Parameters **

- channel: RMT channel
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

** esp_err_t rmt_driver_uninstall (rmt_channel_t channel) 
Uninstall RMT driver.

** Return **

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

** Parameters **

- channel: RMT channel

** esp_err_t rmt_get_channel_status (rmt_channel_status_result_t *channel_status) 
Get the current status of eight channels.

** Note **

Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

** Return **

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

** Parameters **

- channel_status: store the current status of each channel

** esp_err_t rmt_get_counter_clock (rmt_channel_t channel, uint32_t *clock_hz) 
Get speed of channel’s internal counter clock.

** Return **

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

** Parameters **

- channel: RMT channel
- clock_hz: counter clock speed, in hz
esp_err_t rmt_write_items (rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)
RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

Note This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
  • item_num: RMT data item number.
  • wait_tx_done:
    – If set 1, it will block the task and wait for sending done.
    – If set 0, it will not wait and return immediately.

esp_err_t rmt_wait_tx_done (rmt_channel_t channel, TickType_t wait_time)
Wait RMT TX finished.

Return
  • ESP_OK RMT Tx done successfully
  • ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_FAIL Driver not installed

Parameters
  • channel: RMT channel
  • wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

esp_err_t rmt_get_ringbuf_handle (rmt_channel_t channel, RingbufHandle_t *buf_handle)
Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
• channel: RMT channel
• buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

`esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)`

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return

• ESP_FAIL Init fail.
• ESP_OK Init success.

Parameters

• channel: RMT channel.
• fn: Point to the data conversion function.

`esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)`

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

Return

• ESP_FAIL Send fail
• ESP_OK Send success

Parameters

• channel: RMT channel.
• src: Pointer to the raw data.
• src_size: The size of the raw data.
• wait_tx_done: Set true to wait all data send done.

`rmt_tx_end_callback_t rmt_register_tx_end_callback(rmt_tx_end_fn_t function, void *arg)`

Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

Note Requires rmt_driver_install to install the default ISR handler.

Return the previous callback settings (members will be set to NULL if there was none)

Parameters

• function: Function to be called from the default interrupt handler or NULL.
• arg: Argument which will be provided to the callback when it is called.

Structures

`struct rmt_tx_config_t`  
Data struct of RMT TX configure parameters.
Public Members

uint32_t carrier_freq_hz
    RMT carrier frequency

rmt_carrier_level_t carrier_level
    Level of the RMT output, when the carrier is applied

rmt_idle_level_t idle_level
    RMT idle level

uint8_t carrier_duty_percent
    RMT carrier duty (%)

bool carrier_en
    RMT carrier enable

bool loop_en
    Enable sending RMT items in a loop

bool idle_output_en
    RMT idle level output enable

struct rmt_rx_config_t
    Data struct of RMT RX configure parameters.

Public Members

uint16_t idle_threshold
    RMT RX idle threshold

uint8_t filter_ticks_thresh
    RMT filter tick number

bool filter_en
    RMT receiver filter enable

struct rmt_config_t
    Data struct of RMT configure parameters.

Public Members

rmt_mode_t rmt_mode
    RMT mode: transmitter or receiver

rmt_channel_t channel
    RMT channel

gpio_num_t gpio_num
    RMT GPIO number

uint8_t clk_div
    RMT channel counter divider

uint8_t mem_block_num
    RMT memory block number

rmt_tx_config_t tx_config
    RMT TX parameter
struct rmt_rx_config_t rx_config
RMT RX parameter

struct rmt_tx_end_callback_t
Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t function
Function which is called on RMT TX end

void *arg
Optional argument passed to function

Macros

RMT_MEM_ITEM_NUM
Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)
Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)
Default configuration for RX channel.

Type Definitions

typedef intr_handle_t rmt_isr_handle_t
RMT interrupt handle.

typedef void (*rmt_tx_end_fn_t) (rmt_channel_t channel, void *arg)
Type of RMT Tx End callback function.

typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

Note In fact, item_num should be a multiple of translated_size, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters

• src: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
• dest: Pointer to the buffer storing the rmt format data.
• src_size: The raw data size.
• wanted_num: The number of rmt format data that wanted to get.
• translated_size: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
• item_num: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. it should return 0 if no data was converted.
2.3.11 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

- Overview of compatibility between the default pull states on pins of Espressif’s products and the states required by the SD bus
- Solutions - ideas on how to resolve compatibility issues
- Related information - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip
- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Modules

No Pull-ups
Conflicts Between Bootstrap and SDIO on DAT2
• ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  No Pull-ups
• ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  No Pull-ups
  Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

• ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  No Pull-ups
  Conflicts Between Bootstrap and SDIO on DAT2
  Download Mode Not Working (minor issue)
• ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  No Pull-ups
  Conflicts Between Bootstrap and SDIO on DAT2
  Download Mode Not Working (minor issue)
• ESP-WROVER-KIT
  Required pull-ups are provided
  Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  Download Mode Not Working (minor issue) (v2, v1)
You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
  ESP32-WROVER-B on v4.1
  ESP32-WROVER on v3
  ESP32-WROOM-32 on v1 and v2
• ESP32-LyraTD-MSC
  Required pull-ups are provided
  Conflicts Between Bootstrap and SDIO on DAT2
• ESP32-LyraT
  Required pull-ups are provided
  Pull-up Conflicts on GPIO13

Non-Espressif Hosts

Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

2.3. Peripherals API
Solutions

No Pull-ups

If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13

If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode

- Perform one of the following actions on the GPIO13 pin:
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2

There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   Warning: Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on http://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
```

(continues on next page)
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH. This is an irreversible operation. Type 'BURN' (all capitals) to continue.

BURN

VDD_SDIO setting complete.

To check the status of the eFuses, run:
```
components/esptool_py/esptool/espefuse.py summary
```

If running from an automated flashing script, espefuse.py has an option --do-not-confirm. For more details, see the ESP32 Technical Reference Manual (PDF).

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12**

Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)**

When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:
   - For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
   - For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
     - LEDs would not affect operation in most cases.
     - Pull-down resistors can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin**

MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.
All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see *Overview of Compatibility*.

### Internal Pull-ups and Strapping Requirements

Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### 2.3.12 SDMMC Host Driver

#### Overview

ESP32’s SDMMC host peripheral has two slots:

- Slot 0 (*SDMMC_HOST_SLOT_0*) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (*SDMMC_HOST_SLOT_1*) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

**Speed modes not supported at present:**

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`

<table>

## Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (*SDMMC_HOST_DEFAULT* and *SDMMC_SLOT_CONFIG_DEFAULT*), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

## See also

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

## API Reference

### Header File

- `driver/include/driver/sdmmc_host.h`

### Functions

- `esp_err_t sdmmc_host_init (void)`
  
  Initialize SDMMC host peripheral.

  **Note** This function is not thread safe

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
  - ESP_ERR_NO_MEM if memory can not be allocated

- `esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)`

  Initialize given slot of SDMMC peripheral.

  On the ESP32, SDMMC peripheral has two slots:

  - Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
  - Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX
Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- slot_config: additional configuration for the slot

```c
size_t sdmmc_host_get_slot_width (int slot)
```

Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

```c
esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)
```

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- width: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

```c
esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)
```

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- freq_khz: card clock frequency, in kHz
```c
esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)
Enable or disable DDR mode of SD interface.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• ddr_enabled: enable or disable DDR mode

esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)
Send command to the card and get response.
This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

Attention Data buffer passed in cmdinfo->data must be in DMA capable memory

Return
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
• ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
• ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• cmdinfo: pointer to structure describing command and data to transfer

esp_err_t sdmmc_host_io_int_enable (int slot)
Enable IO interrupts.
This function configures the host to accept SDIO interrupts.

Return returns ESP_OK, other errors possible in the future

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)
Block until an SDIO interrupt is received, or timeout occurs.

Return
• ESP_OK on success (interrupt received)
• ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks
```
Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks: number of RTOS ticks to wait for the interrupt

```c
esp_err_t sdmmc_host_deinit (void)
```
Disable SDMMC host and release allocated resources.

**Note**
This function is not thread safe

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

```c
esp_err_t sdmmc_host_pullup_en (int slot, int width)
```
Enable the pull-ups of sd pins.

**Note**
You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**

- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**

- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.

**Structures**

```c
struct sdmmc_slot_config_t
```
Extra configuration for SDMMC peripheral slot

**Public Members**

- `gpio_num_t gpio_cd`
  GPIO number of card detect signal.
- `gpio_num_t gpio_wp`
  GPIO number of write protect signal.
- `uint8_t width`
  Bus width used by the slot (might be less than the max width supported)
- `uint32_t flags`
  Features used by this slot.
Macros

**SDMMC_HOST_SLOT_0**
SDMMC slot 0.

**SDMMC_HOST_SLOT_1**
SDMMC slot 1.

**SDMMC_HOST_DEFAULT()**
Default `sdmmc_host_t` structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

**SDMMC_SLOT_FLAG_INTERNAL_PULLUP**
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC_SLOT_NO_CD**
indicates that card detect line is not used

**SDMMC_SLOT_NO_WP**
indicates that write protect line is not used

**SDMMC_SLOT_WIDTH_DEFAULT**
use the default width for the slot (8 for slot 0, 4 for slot 1)

**SDMMC_SLOT_CONFIG_DEFAULT()**
Macro defining default configuration of SDMMC host slot

2.3.13 SD SPI Host Driver

Overview

The SD SPI host driver allows using the SPI2 (HSPI) or SPI3 (VSPI) controller for communication with SD cards. This driver’s naming pattern was adopted from the *SDMMC Host* driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

The SD SPI host driver has the following modes:

- **SPI mode**: offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin.
- **1-bit SD mode**: offers higher throughput but requires routing the signals through their dedicated IO_MUX pins only.

The SD SPI driver uses software-controlled CS signal.

Currently, the SD SPI driver cannot handle multi-threaded environments as does not support time-division multiplexing on the same SPI bus. It means that if your application needs to communicate with an SD card and other devices on the same SPI bus, the application itself must ensure that its different tasks do not try to access the SPI slaves at the same time.

How to Use

The state and configurations of the SD SPI host driver are stored in a `sdmmc_host_t` structure. This structure can be initialized using the `SDSPI_HOST_DEFAULT` macro.
The state and configurations of the SD slot are stored in a `sdmmc_slot_config_t` structure. Use the macro `SDSPI_SLOT_CONFIG_DEFAULT` to initialize the structure and to fill in the default pin mappings (SD mode pin mappings).

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_slot()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

### API Reference

#### Header File

- `driver/include/driver/sdspi_host.h`

#### Functions

`esp_err_t sdspi_host_init(void)`

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_slot(int slot, const sdspi_slot_config_t *slot_config)`

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**Parameters**

- `slot`: SPI controller to use (HSPI_HOST or VSPI_HOST)
- `slot_config`: pointer to slot configuration structure
esp_err_t sdspi_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note  This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

Return
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

Parameters
• slot: SPI controller (HSPI_HOST or VSPI_HOST)
• cmdinfo: pointer to structure describing command and data to transfer

esp_err_t sdspi_host_set_card_clk(int slot, uint32_t freq_khz)
Set card clock frequency.
Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note  This function is not thread safe

Return
• ESP_OK on success
• other error codes may be returned in the future

Parameters
• slot: SPI controller (HSPI_HOST or VSPI_HOST)
• freq_khz: card clock frequency, in kHz

esp_err_t sdspi_host_deinit(void)
Release resources allocated using sdspi_host_init.

Note  This function is not thread safe

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t sdspi_host_io_int_enable(int slot)
Enable SDIO interrupt.

Return
• ESP_OK on success

Parameters
• slot: SPI controller to use (HSPI_HOST or VSPI_HOST)

```c
esp_err_t sdspi_host_io_int_wait (int slot, TickType_t timeout_ticks)
Wait for SDIO interrupt until timeout.
```

Return

• ESP_OK on success

Parameters

• slot: SPI controller to use (HSPI_HOST or VSPI_HOST)
• timeout_ticks: Ticks to wait before timeout.

Structures

```c
struct sdspi_slot_config_t
Extra configuration for SPI host
```

Public Members

```c
gpio_num_t gpio_miso
  GPIO number of MISO signal.

gpio_num_t gpio_mosi
  GPIO number of MOSI signal.

gpio_num_t gpio_sck
  GPIO number of SCK signal.

gpio_num_t gpio_cs
  GPIO number of CS signal.

gpio_num_t gpio_cd
  GPIO number of card detect signal.

gpio_num_t gpio_wp
  GPIO number of write protect signal.

gpio_num_t gpio_int
  GPIO number of interrupt line (input) for SDIO card.

int dma_channel
  DMA channel to be used by SPI driver (1 or 2)
```

Macros

```c
SDSPI_HOST_DEFAULT ()
Default sdmmc_host_t structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slot’ can be set to one of HSPI_HOST, VSPI_HOST.
```

```c
SDSPI_SLOT_NO_CD
indicates that card detect line is not used
```
SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_SLOT_CONFIG_DEFAULT()
Macro defining default configuration of SPI host

2.3.14 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied
by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only
runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the
hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit
or SPI mode.

Connections

<table>
<thead>
<tr>
<th>Pin Name</th>

<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

Note: Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This
should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you
are using official development boards, check Overview of Compatibility to see whether your development boards have
such pullups.

Note: Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32
module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time.
See Overview of Compatibility to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:
- Modules: ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and
ESP32-WROVER-IB

812 Chapter 2. API Reference
**Kits:** ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to **SD Pull-up Requirements** for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

### Terminology

The SDIO slave driver uses the following terms:

- **Transfer:** a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending:** slave to host transfers.
- **Receiving:** host to slave transfers.

**Note:** Register names in ESP Technical Reference Manual are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO:** specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: $\text{requested length} = 0x1F800 - \text{address}$.
- **Ownership:** When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length:** The length requested in one transfer determined by the FIFO address.
- **Transfer length:** The length requested in one transfer determined by the CMD53 byte/block count field.

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- **Receiving buffer size:** The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the `recv_buffer_size` member of `sdio_slave_config_t`.

2.3. Peripherals API
• Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in Interrupts.
• Registers: specific address in Function 1 access by CMD52 or CMD53.

Communication with ESP SDIO Slave

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO slave initialization.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to ESP SDIO slave protocol. There is also a component ESP Serial Slave Link for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

Communication with ESP SDIO Slave

ESP SDIO slave initialization

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification). In this specification and below, the SDIO slave is also called an (SD)IO card. All the initialization CMD52 and CMD53 are sent to Func 0 (CIA region). Here is an brief example on how to do this:

1. SDIO reset CMD52 (Write 0x6=0x8)
2. SD reset CMD0
3. Check whether IO card (optional) CMD8
4. Send SDIO op cond and wait for card ready CMD5 arg = 0x00000000
   CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
   Example: Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFF00.
   Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
5. Set address CMD3
6. Select card CMD7 (arg address according to CMD3 response)
   Example: Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. Select 4-bit mode (optional) CMD52 (Write 0x07=0x02)
8. Enable func1 CMD52 (Write 0x02=0x02)
9. Enable SDIO interrupt (required if interrupt line (DAT1) is used) CMD52 (Write 0x04=0x03)
10. Set Func0 blocksize (optional, default value is 512 (0x200)) CMD52/53 (Read 0x10~0x11)
    CMD52/53 (Write 0x10=0x00)
    CMD52/53 (Write 0x11=0x02)
    CMD52/53 (Read 0x10=0x11, read to check the final value)
11. Set Func1 blocksize (optional, default value is 512 (0x200)) CMD52/53 (Read 0x110~0x111)
    CMD52/53 (Write 0x110=0x00)
    CMD52/53 (Write 0x111=0x02)
CMD52/53 (Read 0x110~0x111, read to check the final value)

ESP SDIO slave protocol

The protocol is based on Function 1 access by CMD52 and CMD53, offering 3 services: (1) sending and receiving FIFO, (2) 52 8-bit R/W register shared by host and slave, (3) 8 general purpose interrupt sources from host to slave and 8 in the opposite direction.

There is a component `esp_serial_slave_link` implementing the logic of this protocol for ESP32 master to communicate with the ESP32 slave. See `ESP Serial Slave Link`.

The host should access the registers below as described to communicate with slave.

**Slave register table**

**32-bit**

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the receiving buffer number.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated length (by byte) to be sent from slave to host.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

**8-bit**

Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)**

0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from/write to the slave in a single transfer:

\[
\text{requested length} = 0x1F800-\text{address}
\]

The slave will respond with the length according to the length field in CMD53, with the data longer than `requested length` filled with 0 (sending) or discard (receiving).

**Note:** This includes both the block and the byte mode of CMD53.

The function number should be set to 1, OP Code should be set to 1 (for CMD53).
It is allowed to use CMD53 mode combination of block+byte to get higher efficiency when accessing the FIFO by arbitrary length. E.g. The block size is set to 512 by default, you can write/get 1031 bytes of data to/from the FIFO by:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

Interrupts

For the host interrupts, the slave raise the interrupt by pulling DAT1 line down at a proper time (level sensitive). The host detect this and read the INT_ST register to see the source. Then the host can clear it by writing the INT_CLR register and do something with the interrupt. The host can also mask unneeded sources by clearing the bits in INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

\texttt{sdio\_slave\_hostint\_t (SDIO Card Slave Driver)} shows the bit definition corresponding to host interrupt sources.

For the slave interrupts, the host send transfers to write the SLAVE_INT register. Once a bit is written from 0 to 1, the slave hardware and driver will detect it and inform the app.

Receiving FIFO

To write the receiving FIFO in the slave, host should work in the following steps:

1. Read the TOKEN1 field (bits 27-16) of TOKEN_RDATA (0x044) register. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (\texttt{recv\_buffer\_size * buffer\_num} is greater than data to write, \texttt{recv\_buffer\_size} is pre-defined between the host and the slave before the communication starts). Or go back to step 1 until the buffer is enough.
3. Write to the FIFO address with CMD53. Note that the \texttt{requested\_length} should not be larger than calculated in step 2, and the FIFO address is related to \texttt{requested\_length}.
4. Calculate used buffers, note that non-full buffer at the tail should be seen as one that is used.

Sending FIFO

To read the sending FIFO in the slave, host should work in the following steps:

1. Wait for the interrupt line to be active (optional, low by default).
2. Read (poll) the interrupt bits in INT_ST register to see whether new packets exists.
3. If new packets are ready, reads the PKT_LEN reg. The data length to read from slave is PKT_LEN minuses the length that has been read from the host. If the PKT_LEN is not larger than used, wait and poll until the slave is ready and update the PKT_LEN.
4. Read from the FIFO with CMD53. Note that the \texttt{requested\_length} should not be larger than calculated in step3, and the FIFO address is related to \texttt{requested\_length}.
5. Recorded read length.
Interrupts

There are interrupts from host to slave, and from slave to host to help communicating conveniently.

Slave Interrupts

The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.

Note: The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call sdio_slave_wait_int to wait for an interrupt within a certain time, or call sdio_slave_clear_int to clear interrupts from host. The callback function can work with the wait functions perfectly.

Host Interrupts

The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see sdio_slave_hostint_t for more information.

Shared Registers

There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by sdio_slave_read_reg and sdio_slave_write_reg. The host can access (R/W) the register by CMD52 or CMD53.

Receiving FIFO

When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling sdio_slave_recv_register_buf, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware.
2. Load buffers onto the driver by passing the buffer handle to sdio_slave_recv_load_buf.
3. Call sdio_slave_recv to get the received data. If non-blocking call is needed, set wait=0.
4. Pass the handle of processed buffer back to the driver by sdio_recv_load_buf again.

Note: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.
Sending FIFO

Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode**: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.

- **Packet Mode**: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note**: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.

2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.

2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t* buffer;
    size_t size;
    int     id;
}s dio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3,    //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
```
3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256] = {1, 2, 3, 4, 5, 6, 7, 8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

// ... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see `peripherals/sdio`.

### Application Example

Slave/master communication: `peripherals/sdio`.

### API Reference

#### Header File

- `soc/include/hal/sdio_slave_types.h`

#### Enumerations

```c
enum sdio_slave_hostint_t
{
    SDIO_SLAVE_HOSTINT_BIT0 = BIT(0),
    SDIO_SLAVE_HOSTINT_BIT1 = BIT(1),
    SDIO_SLAVE_HOSTINT_BIT2 = BIT(2),
    SDIO_SLAVE_HOSTINT_BIT3 = BIT(3),
    SDIO_SLAVE_HOSTINT_BIT4 = BIT(4),
    SDIO_SLAVE_HOSTINT_BIT5 = BIT(5),
    SDIO_SLAVE_HOSTINT_BIT6 = BIT(6),
    SDIO_SLAVE_HOSTINT_BIT7 = BIT(7),
}
```
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = BIT(23)
    New packet available.

enum sdio_slave_timing_t
    Timing of SDIO slave.
    Values:
        SDIO_SLAVE_TIMING_PSEND_PSAMPLE = 0
            Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using
            this to work in DS mode.
        SDIO_SLAVE_TIMING_NSEND_PSAMPLE
            Send at negedge, and sample at posedge. Default value for DS mode and below.
        SDIO_SLAVE_TIMING_PSEND_NSAMPLE
            Send at posedge, and sample at negedge.
        SDIO_SLAVE_TIMING_NSEND_NSAMPLE
            Send at negedge, and sample at negedge.

enum sdio_slave_sending_mode_t
    Configuration of SDIO slave mode.
    Values:
        SDIO_SLAVE_SEND_STREAM = 0
            Stream mode, all packets to send will be combined as one if possible.
        SDIO_SLAVE_SEND_PACKET = 1
            Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

Header File

- driver/include/driver/sdio_slave.h

Functions

esp_err_t sdio_slave_initialize(sdio_slave_config_t *config)
    Initialize the sdio slave driver

Return

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

Parameters

- config: Configuration of the sdio slave driver.

void sdio_slave_deinit(void)
    De-initialize the sdio slave driver to release the resources.

esp_err_t sdio_slave_start(void)
    Start hardware for sending and receiving, as well as set the IOREADY1 to 1.
Note The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.

Return
- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

void sdio_slave_stop (void)
Stop hardware from sending and receiving, also set IOREADY1 to 0.

Note this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call sdio_slave_reset to do that.

esp_err_t sdio_slave_reset (void)
Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

Return always return ESP_OK.

sdio_slave_buf_handle_t sdio_slave_recv_register_buf (uint8_t *start)
Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

Note The driver will use and only use the amount of space specified in the recv_buffer_size member set in the sdio_slave_config_t. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

Return The buffer handle if success, otherwise NULL.

Parameters
- start: The start address of the buffer.

esp_err_t sdio_slave_recv_unregister_buf (sdio_slave_buf_handle_t handle)
Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

Return ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

Parameters
- handle: Handle to the buffer to release.

esp_err_t sdio_slave_recv_load_buf (sdio_slave_buf_handle_t handle)
Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Return
- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returnened by sdio_slave_recv can you load it again.
- ESP_OK if success

Parameters
- handle: Handle to the buffer ready to receive data.
esp_err_t sdio_slave_recv(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)
Get received data if exist. The driver returns the ownership of the buffer to the app.

Note Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

Return
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

Parameters
- handle_ret: Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- out_addr: Output of the start address, set to NULL if not needed.
- out_len: Actual length of the data in the buffer, set to NULL if not needed.
- wait: Time to wait before data received.

uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)
Retrieve the buffer corresponding to a handle.

Return buffer address if success, otherwise NULL.

Parameters
- handle: Handle to get the buffer.
- len_o: Output of buffer length

esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TickType_t wait)
Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

Return
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

Parameters
- addr: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- len: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- arg: Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- wait: Time to wait if the buffer is full.

esp_err_t sdio_slave_send_get_finished(void **out_arg, TickType_t wait)
Return the ownership of a finished transaction.

Return ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.
Parameters

- `out_arg`: Argument of the finished transaction. Set to NULL if unused.
- `wait`: Time to wait if there’s no finished sending transaction.

```c
esp_err_t sdio_slave_transmit(uint8_t *addr, size_t len)
```

Start a new sending transfer, and wait for it (blocked) to be finished.

Return

- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

Parameters

- `addr`: Start address of the buffer to send
- `len`: Length of buffer to send.

```c
uint8_t sdio_slave_read_reg(int pos)
```

Read the spi slave register shared with host.

**Note** register 28 to 31 are reserved for interrupt vector.

Return value of the register.

Parameters

- `pos`: register address, 0-27 or 32-63.

```c
esp_err_t sdio_slave_write_reg(int pos, uint8_t reg)
```

Write the spi slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.

Return ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

Parameters

- `pos`: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- `reg`: the value to write.

```c
sdio_slave_hostint_t sdio_slave_get_host_intena(void)
```

Get the interrupt enable for host.

Return the interrupt mask.

```c
void sdio_slave_set_host_intena(sdio_slave_hostint_t mask)
```

Set the interrupt enable for host.

Parameters

- `mask`: Enable mask for host interrupt.

```c
esp_err_t sdio_slave_send_host_int(uint8_t pos)
```

Interrupt the host by general purpose interrupt.
Return
• ESP_ERR_INVALID_ARG if interrupt num error
• ESP_OK otherwise

Parameters
• pos: Interrupt num, 0-7.

void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
Clear general purpose interrupt to host.

Parameters
• mask: Interrupt bits to clear, by bit mask.

esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)
Wait for general purpose interrupt from host.

Note  this clears the interrupt at the same time.

Return  ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

Parameters
• pos: Interrupt source number to wait for. is set.
• wait: Time to wait before interrupt triggered.

Structures

struct sdio_slave_config_t
Configuration of SDIO slave.

Public Members

sdio_slave_timing_t timing
 timing of sdio_slave. see sdio_slave_timing_t.

sdio_slave_sending_mode_t sending_mode
 mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible;
 SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

int send_queue_size
 max buffers that can be queued before sending.

size_t recv_buffer_size
 If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is too
large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are
easily run out. Should be set according to length of data really transferred. All data that do not fully fill
a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer.
Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given
to the driver should be larger than this.

sdio_event_cb_t event_cb
 when the host interrupts slave, this callback will be called with interrupt number (0-7).
```c
uint32_t flags

Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_*.

Macros

SDIO_SLAVE_RECV_MAX_BUFFER

SDIO_SLAVE_FLAG_DAT2_DISABLED

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_HOST_INTR_DISABLED

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

Type Definitions

typedef void (*sdio_event_cb_t)(uint8_t event)

typedef void *sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

2.3.15 Sigma-delta Modulation

Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are eight independent sigma-delta modulation channels identified with sigmadelta_channel_t. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in sigmadelta_config_t and then applying this configuration with sigmadelta_config().

Another option is to call individual functions, that will configure all required parameters one by one:

- Prescaler of the sigma-delta generator - sigmadelta_set_prescale()
- Duty of the output signal - sigmadelta_set_duty()
- GPIO pin to output modulated signal - sigmadelta_set_pin()
The range of the ‘duty’ input parameter of \texttt{sigmadelta_set_duty()} is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of \texttt{sigmadelta_set_duty()}.

**Application Example**

Sigma-delta Modulation example: \texttt{peripherals/sigmadelta}.

**API Reference**

**Header File**

- driver/include/driver/sigmadelta.h

**Functions**

\texttt{esp_err_t sigmadelta_config(const sigmadelta_config_t *config)}

Configure Sigma-delta channel.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- \texttt{config}: Pointer of Sigma-delta channel configuration struct

\texttt{esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)}

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{VDDIO}{256} \times \text{duty} + \frac{VDDIO}{2} \), where \( VDDIO \) is the power supply voltage.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- \texttt{channel}: Sigma-delta channel number
- \texttt{duty}: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

\texttt{esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)}

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / \texttt{prescale}.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- channel: Sigma-delta channel number
- prescale: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)`
Set Sigma-delta signal output pin.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- channel: Sigma-delta channel number
- gpio_num: GPIO number of output pin.

### 2.3.16 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

#### Overview of ESP32’s SPI peripherals

ESP32 integrates four SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory and thus are currently not open to users. They share one signal bus via an arbiter.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. Each bus has three CS lines to drive up to three SPI slaves.

#### Terminology

The terms used in relation to the SPI master driver are given in the table below.

</tbody>
</table>

**Driver Features**

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
• Automatic time-division multiplexing of data coming from different Devices on the same signal bus

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

• Refactor your application so that each SPI peripheral is only accessed by a single task at a time.

• Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `tx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device.*
Interrupt Transactions

Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions

Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction intervals. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

Command and Address Phases

During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

Write and Read Phases

Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If external PSRAM is enabled, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.
Note: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see Known Issues.

Bus Acquiring

Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the peripherals/spi_master directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits

When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`. 

2.3. Peripherals API
Transactions with Integers Other Than uint8_t

An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device

To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.
Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Interval

Transaction interval is the time that software requires to set up SPI peripheral registers and to copy data to FIFOs, or to set up DMA links.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the interval. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction interval timings for one byte of data are given below.

<table>
<thead>
<tr>
<th>DMA</th>
<th>24</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>No DMA</td>
<td>22</td>
<td>7</td>
</tr>
</tbody>
</table>
**SPI Clock Frequency**

Transferring each byte takes eight times the clock period \(8/\text{fspi}\). If the clock frequency is too high, the use of some functions might be limited. See *Timing Considerations*.

**Cache Miss**

The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from the cache miss and will need to wait until the code is read from the flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache miss.

For an interrupt transaction, the overall cost is \(20+8n/F_{spi}[\text{MHz}]/[\text{us}]\) for \(n\) bytes transferred in one transaction. Hence, the transferring speed is: \(n/(20+8n/F_{spi})\). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see *IRAM-Safe Interrupt Handlers*.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, and the setup timing requirement is violated, which results in the failure to perform the reading correctly.
The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33–77% in comparison to the existing `input_delay`. To retain a higher frequency, you have to use the IO_MUX pins or the *dummy bit workaround*. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>–</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver can work even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions
You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time on an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and the excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to the input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table.

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
<tr>
<td>ESP32’s slave device is on a different physical chip.</td>
<td></td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{\text{floor(MISO delay[ns]/12.5) + 1}}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.
<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>

<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:
   ```c
   ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
   ```
      This can prohibit you from transmitting and receiving data longer than 64 bytes.
   3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See [dummy bit speed-up workaround](#).

3. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

**Application Example**

The code example for displaying graphics on an ESP32-WROVER-KIT’s 320x240 LCD screen can be found in the peripherals/spi_master directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- `soc/include/hal/spi_types.h`

**Enumerations**

```c
enum spi_host_device_t

Enum with the three SPI peripherals that are software-accessible in it.

Values:

SPI1_HOST =0
SPI1.

SPI2_HOST =1
SPI2.

SPI3_HOST =2
SPI3.
```

2.3. Peripherals API
Header File

- driver/include/driver/spi_common.h

Functions

```c
esp_err_t spi_bus_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, int dma_chan)
```

Initialize a SPI bus.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral that controls this bus
- `bus_config`: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma_chan`: Either channel 1 or 2, or 0 in the case when no DMA is required. Selecting a DMA channel for a SPI bus allows transfers on the bus to have sizes only limited by the amount of internal memory. Selecting no DMA channel (by passing the value 0) limits the amount of bytes transferred to a maximum of 64. Set to 0 if only the SPI flash uses this bus.

```c
esp_err_t spi_bus_free(spi_host_device_t host)
```

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral to free

Structures

```c
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.
You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

- `int mosi_io_num`
  GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.
- `int miso_io_num`
  GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.
- `int sclk_io_num`
  GPIO pin for Spi Clock signal, or -1 if not used.
- `int quadwp_io_num`
  GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.
- `int quadhd_io_num`
  GPIO pin for HD (Hold) signal which is used as D3 in 4-bit communication modes, or -1 if not used.
- `int max_transfer_sz`
  Maximum transfer size, in bytes. Defaults to 4094 if 0.
- `uint32_t flags`
  Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.
- `int intr_flags`
  Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

### Macros

- `SPI_MAX_DMA_LEN`  
- `SPI_SWAP_DATA_TX(DATA, LEN)`  
  Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
  
  E.g. to send 9 bits of data, you can:
  ```c
  uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
  ```
  
  Then points tx_buffer to `&data`.

### Parameters

- **DATA**: Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN**: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.
SPI_SWAP_DATA_RX (DATA, LEN)
Transform received data of length \leq 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

API Reference - SPI Master

Header File

- driver/include/driver/spi_master.h

Functions

```
esp_err_t spi_bus_add_device (spi_host_device_t host, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.
Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- host: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

```c
esp_err_t spi_bus_remove_device (spi_device_handle_t handle)
```
Remove a device from the SPI bus.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

Parameters
- handle: Device handle to free

```c
esp_err_t spi_device_queue_trans (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

Parameters
- handle: Device handle obtained using `spi_host_add_dev`
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by spi_device_queue_trans.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

Parameters

- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by spi_device_get_trans_result.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_queue_trans() followed by spi_device_get_trans_result(). Do not use this when there is still a transaction separately queued (started) from spi_device_queue_trans() or polling_start/transmit that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute

esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

Parameters
• handle: Device handle obtained using spi_host_add_dev
• trans_desc: Description of transaction to execute
• ticks_to_wait: Ticks to wait until there’s room in the queue; currently only portMAX_DELAY is supported.

`esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)`
Poll until the polling transaction ends.
This routine will not return until the transaction to the given device has successfully completed. The task is not
blocked, but actively busy-spins for the transaction to be completed.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
• ESP_OK on success

Parameters
• handle: Device handle obtained using spi_host_add_dev
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

`esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)`
Send a polling transaction, wait for it to complete, and return the result.
This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot
start (queue) polling and interrupt transactions simultaneously.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters
• handle: Device handle obtained using spi_host_add_dev
• trans_desc: Description of transaction to execute

`esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)`
Occupy the SPI bus for a device to do continuous transactions.
Transactions to all other devices will be put off until spi_device_release_bus is called.

Note The function will wait until all the existing transactions have been sent.

Return
• ESP_ERR_INVALID_ARG: `wait` is not set to `portMAX_DELAY`.
• ESP_OK: Success.

Parameters
• device: The device to occupy the bus.
• wait: Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```
Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters
• dev: The device to release the bus.

```c
int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```
Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters
• fapb: The frequency of apb clock, should be `APB_CLK_FREQ`.
• hz: Desired working frequency
• duty_cycle: Duty cycle of the spi clock
• reg_o: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```
Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters
• fapb: The frequency of apb clock, should be `APB_CLK_FREQ`.
• hz: Desired working frequency
• duty_cycle: Duty cycle of the spi clock

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```
Calculate the timing settings of specified frequency and settings.

Note If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters
• gpio_is_used: True if using GPIO matrix, or False if iomux pins are used.
• input_delay_ns: Input delay from SCLK launch edge to MISO data valid.
• eff_clk: Effective clock frequency (in Hz) from `spi_cal_clock`.
• dummy_o: Address of dummy bits used output. Set to NULL if not needed.
• cycles_remain_o: Address of cycles remaining (after dummy bits are used) output.
- If too many cycles remaining, suggest to compensate half a clock.
- 0 If no remaining cycles or dummy bits are not used.
- positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**

- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

- `uint8_t command_bits`: Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.
- `uint8_t address_bits`: Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.
- `uint8_t dummy_bits`: Amount of dummy bits to insert between address and data phase.
- `uint8_t mode`: SPI mode (0-3)
- `uint16_t duty_cycle_pos`: Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.
- `uint16_t cs_ena_pretrans`: Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.
- `uint8_t cs_ena_posttrans`: Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)
- `int clock_speed_hz`: Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.
- `int input_delay_ns`: Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.
int **spics_io_num**
    CS GPIO pin for this device, or -1 if not used.

uint32_t **flags**
    Bitwise OR of SPI_DEVICE_* flags.

int **queue_size**
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

**transaction Callback pre_cb**
    Callback to be called before a transmission is started.

    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**transaction Callback post_cb**
    Callback to be called after a transmission has completed.

    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**struct spi_transaction_t**
    This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

uint32_t **flags**
    Bitwise OR of SPI_TRANS_* flags.

uint16_t **cmd**
    Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

    NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

    Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t **addr**
    Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

    NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

    Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t **length**
    Total data length, in bits.

size_t **rxlength**
    Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void **user**
    User-defined variable. Can be used to store eg transaction ID.

const void **tx_buffer**
    Pointer to transmit buffer, or NULL for no MOSI phase.
uint8_t tx_data[4]
    If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
    If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
    This struct is for SPI transactions which may change their address and command length. Please do set the flags
    in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
    Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
    The command length in this transaction, in bits.

uint8_t address_bits
    The address length in this transaction, in bits.

uint8_t dummy_bits
    The dummy length in this transaction, in bits.

Macros

SPI_DEVICE_TXBIT_LSBFIRST
    Transmit command/address/data LSB first instead of the default MSB first.
    SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be
    free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
    8MHz

SPI_DEVICE_RXBIT_LSBFIRST
    Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
    Transmit and receive LSB first.

SPI_DEVICE_3WIRE
    Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS
    Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALF Duplex
    Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS
    Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY
    There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used,
    valid time after slave sees the clock).
    • In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing
    issue. Set this flag to disable this feature.

2.3. Peripherals API
• In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_TRANS_MODE_DIO
  Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO
  Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA
  Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA
  Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR
  Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD
  Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
  Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
  Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_SET_CD
  Set the CD pin.

Type Definitions

typedef struct spi_transaction_t spi_transaction_t

typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
  Handle for a device on a SPI bus.

2.3.17 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

• SPI2, sometimes referred to as HSPI

• SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.
Terminology

The terms used in relation to the SPI slave driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device, in this case the SPI2 and SPI3 controllers. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>• MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>• MOSI</td>
<td>Master In, Slave Out, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>• SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>• CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>• QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI slave driver allows using the SPI2 and/or SPI3 peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some
known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the `bus_config`. Set the unused signals to -1. If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.
Warning: The ESP32 DMA hardware has a limit to the number of bytes sent by a Host and received by a Device. The transaction length must be longer than 8 bytes and a multiple of 4 bytes; otherwise, the SPI hardware might fail to receive the last 1 to 7 bytes.

GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2 GPIO Number</th>
<th>SPI3 GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

Speed and Timing Considerations

Transaction Interval

The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`. 
SCLK Frequency Requirements

The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.

- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th></th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

**Note:**

1. If the frequency is equal to the limitation, it can lead to random errors.
2. The clock uncertainty between Host and Device (12.5ns) is included.
3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge than expected, or configurable latching time.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

   If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.
Application Example

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

API Reference

Header File

- `driver/include/driver/spi_slave.h`

Functions

```c
esp_err_t spi_slave_initialize (spi_host_device_t host, const spi_bus_config_t *bus_config,
                                 const spi_slave_interface_config_t *slave_config, int dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning**  
For now, only supports HSPI and VSPI.

**Warning**  
If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning**  
The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral to use as a SPI slave interface
- `bus_config`: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `slave_config`: Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- `dma_chan`: Either 1 or 2. A SPI bus used by this driver must have a DMA channel associated with it. The SPI hardware has two DMA channels to share. This parameter indicates which one to use.

```c
esp_err_t spi_slave_free (spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral to free

---

2.3. Peripherals API 853
```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- host: SPI peripheral that is acting as a slave
- trans_desc: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

**Return**

- ESP_ERRINVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- host: SPI peripheral to that is acting as a slave
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.

**Return**
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• host: SPI peripheral to that is acting as a slave
• trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Structures

struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

int spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
SPI mode (0-3)

slave_transaction_cb_t post_setup_cb
Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb
Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.
const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user
    User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
    Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
    Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
    Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.18 ESP32-S2 Temperature Sensor

Overview

The ESP32-S2 has a built-in temperature sensor. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC. The conversion relationship is the first columns of the table below. Among them, offset = 0 is the main measurement option, and other values are extended measurement options.

<table>
<thead>
<tr>
<th>offset</th>
<th>measure range(Celsius)</th>
<th>measure error(Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>50 ~ 125</td>
<td>&lt; 3</td>
</tr>
<tr>
<td>-1</td>
<td>20 ~ 100</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>0</td>
<td>-10 ~ 80</td>
<td>&lt; 1</td>
</tr>
<tr>
<td>1</td>
<td>-30 ~ 50</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>2</td>
<td>-40 ~ 20</td>
<td>&lt; 3</td>
</tr>
</tbody>
</table>

Application Example

Temperature sensor reading example: peripherals/temp_sensor.

API Reference - Normal Temp Sensor

Header File

- driver/esp32s2/include/temp_sensor.h
Functions

```
esp_err_t temp_sensor_set_config (temp_sensor_config_t tsens)
Set parameter of temperature sensor.

Return
  • ESP_OK Success

Parameters
  • tsens:

esp_err_t temp_sensor_get_config (temp_sensor_config_t *tsens)
Get parameter of temperature sensor.

Return
  • ESP_OK Success

Parameters
  • tsens:

esp_err_t temp_sensor_start (void)
Start temperature sensor measure.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG

esp_err_t temp_sensor_stop (void)
Stop temperature sensor measure.

Return
  • ESP_OK Success

esp_err_t temp_sensor_read_raw (uint32_t *tsens_out)
Read temperature sensor raw data.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG tsens_out is NULL
  • ESP_ERR_INVALID_STATE temperature sensor dont start

Parameters
  • tsens_out: Pointer to raw data, Range: 0 ~ 255

esp_err_t temp_sensor_read_celsius (float *celsius)
Read temperature sensor data that is converted to degrees Celsius.

Note Should not be called from interrupt.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG ARG is NULL.
• ESP_ERR_INVALID_STATE The ambient temperature is out of range.

Parameters
• celsius: The measure output value.

Structures

struct temp_sensor_config_t
Configuration for temperature sensor reading.

Public Members

temp_sensor_dac_offset_t dac_offset
The temperature measurement range is configured with a built-in temperature offset DAC.

uint8_t clk_div
Default: 6

Macros

TSENS_CONFIG_DEFAULT()

Enumerations

enum temp_sensor_dac_offset_t
Values:

TSENS_DAC_L0 = 0
offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

TSENS_DAC_L1
offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

TSENS_DAC_L2
offset = 0, measure range:-10°C ~ 80°C, error < 1°C.

TSENS_DAC_L3
offset = 1, measure range:-30°C ~ 50°C, error < 2°C.

TSENS_DAC_L4
offset = 2, measure range:-40°C ~ 20°C, error < 3°C.

TSENS_DAC_MAX
TSENS_DAC_DEFAULT = TSENS_DAC_L2

2.3.19 Timer

[]
Introduction

The ESP32 chip contains two hardware timer groups. Each group has two general-purpose hardware timers. They are all 64-bit generic timers based on 16-bit prescalers and 64-bit up / down counters which are capable of being auto-reloaded.

Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- **Timer Initialization** - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- **Timer Control** - describes how to read a timer’s value, pause or start a timer, and change how it operates.
- **Alarms** - shows how to set and use alarms.
- **Interrupts** - explains how to enable and use interrupts.

Timer Initialization

The two ESP32 timer groups, with two timers in each, provide the total of four individual timers for use. An ESP32 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Divider**: Sets how quickly the timer’s counter is “ticking”. The setting `divider` is used as a divisor of the incoming 80 MHz APB_CLK clock.
- **Mode**: Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable**: If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable**: Can be set using `alarm_en`.
- **Auto Reload**: Sets if the counter should `auto_reload` the initial counter value on the timer’s alarm or continue incrementing or decrementing.
- **Interrupt Type**: Select which interrupt type should be triggered on the timer’s alarm. Set the value defined in `timer_intr_mode_t`.

To get the current values of the timer’s settings, use the function `timer_get_config()`.

Timer Control

Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to true, or call `timer_start()`. You can specify the timer’s initial counter value by calling `timer_set_counter_value()`. To check the timer’s current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.
To reconfigure the timer, you can call `timer_init()`. This function is described in Section *Timer Initialization*.

You can also reconfigure the timer by using dedicated functions to change individual settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Dedicated Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divider</td>
<td><code>timer_set_divider()</code></td>
<td>Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.</td>
</tr>
<tr>
<td>Mode</td>
<td><code>timer_set_counter_mode()</code></td>
<td>Set if the counter should be incrementing or decrementing</td>
</tr>
<tr>
<td>Auto Reload</td>
<td><code>timer_set_auto_reload()</code></td>
<td>Set if the initial counter value should be reloaded on the timer’s alarm</td>
</tr>
</tbody>
</table>

### Alarms

To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section *Interrupts* on how to configure interrupts.
- When `auto_reload` is enabled, the timer’s counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

**Note:**
- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
- Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.

To check the specified alarm value, call `timer_get_alarm_value()`.

### Interrupts

Registration of the interrupt handler for a specific timer or a timer group can be done by calling `timer_isr_register()`.

To enable interrupts for a timer group, call `timer_group_intr_enable()`, for a specific timer call `timer_enable_intr()`. To disable interrupts for a timer group, call `timer_group_intr_disable()`, for a specified timer, call `timer_disable_intr()`.

When handling an interrupt within an interrupt service routine (ISR), the interrupt status bit needs to be explicitly cleared. To do that, set the TIMERGN.int_clr_timers.tM structure, defined in `soc/esp32/include/soc/timer_group_struct.h`. In this structure, N is the timer group number [0, 1], M is the timer number [0, 1]. For example, to clear an interrupt status bit for the timer 1 in the timer group 0, call the following:

```
TIMERG0.int_clr_timers.t1 = 1
```

For more information on how to use interrupts, please see the application example below.
Application Example

The 64-bit hardware timer example: peripherals/timer_group.

API Reference

Header File

- driver/include/driver/timer.h

Functions

**esp_err_t timer_get_counter_value** (timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)

Read the counter value of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- timer_val: Pointer to accept timer counter value.

**esp_err_t timer_get_counter_time_sec** (timer_group_t group_num, timer_idx_t timer_num, double *time)

Read the counter value of hardware timer, in unit of a given scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- time: Pointer, type of double*, to accept timer counter value, in seconds.

**esp_err_t timer_set_counter_value** (timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)

Set counter value to hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
**timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

**load_val**: Counter value to write to the hardware timer.

`esp_err_t timer_start (timer_group_t group_num, timer_idx_t timer_num)`

Start the counter of hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_pause (timer_group_t group_num, timer_idx_t timer_num)`

Pause the counter of hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_set_counter_mode (timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)`

Set counting mode for hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir**: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload (timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)`

Enable or disable counter reload function when alarm event occurs.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• reload: Counter reload mode.

`esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)`
Set hardware timer source clock divider. Timer groups clock are divider from APB clock.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• divider: Timer clock divider value. The divider’s range is from 2 to 65536.

`esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)`
Set timer alarm value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: A 64-bit value to set the alarm value.

`esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)`
Get timer alarm value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: Pointer of A 64-bit value to accept the alarm value.

`esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)`
Enable or disable generation of timer alarm events.

Return
• ESP_OK Success
ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number
- timer_num: Timer index of timer group
- isr_handler: Interrupt handler function, it is a callback function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\[ \text{esp_err_t} \ \text{timer_isr_callback_remove}(\text{timer_group_t group_num, timer_idx_t timer_num}) \]
Remove ISR handle callback for the corresponding timer.

Parameters
- group_num: Timer group number
- timer_num: Timer index of timer group

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\[ \text{esp_err_t} \ \text{timer_isr_register}(\text{timer_group_t group_num, timer_idx_t timer_num, void (*fn)(void *arg, int intr_alloc_flags)} \]
Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

Note If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call timer_spinlock_take(…) before your handling, and call timer_spinlock_give(…) after your handling.
Parameters

- **group_num**: Timer group number
- **timer_num**: Timer index of timer group
- **fn**: Interrupt handler function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_init(timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)
```

Initializes and configure the timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **config**: Pointer to timer initialization parameters.

```c
esp_err_t timer_deinit(timer_group_t group_num, timer_idx_t timer_num)
```

Deinitializes the timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_get_config(timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)
```

Get timer configure value.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• config: Pointer of struct to accept timer parameters.

```
esp_err_t timer_group_intr_enable (timer_group_t group_num, timer_intr_t intr_mask)
```
Enable timer group interrupt, by enable mask.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• intr_mask: Timer interrupt enable mask.
  – TIMER_INTR_T0: t0 interrupt
  – TIMER_INTR_T1: t1 interrupt
  – TIMER_INTR_WDT: watchdog interrupt

```
esp_err_t timer_group_intr_disable (timer_group_t group_num, timer_intr_t intr_mask)
```
Disable timer group interrupt, by disable mask.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• intr_mask: Timer interrupt disable mask.
  – TIMER_INTR_T0: t0 interrupt
  – TIMER_INTR_T1: t1 interrupt
  – TIMER_INTR_WDT: watchdog interrupt

```
esp_err_t timer_enable_intr (timer_group_t group_num, timer_idx_t timer_num)
```
Enable timer interrupt.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

```
esp_err_t timer_disable_intr (timer_group_t group_num, timer_idx_t timer_num)
```
Disable timer interrupt.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_intr_clr_in_isr (timer_group_t group_num, timer_idx_t timer_num)
Clear timer interrupt status, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_clr_intr_status_in_isr (timer_group_t group_num, timer_idx_t timer_num)
Clear timer interrupt status, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_enable_alarm_in_isr (timer_group_t group_num, timer_idx_t timer_num)
Enable alarm interrupt, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

uint64_t timer_group_get_counter_value_in_isr (timer_group_t group_num, timer_idx_t timer_num)
Get the current counter value, just used in ISR.

Return
• Counter value

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
void **timer_group_set_alarm_value_in_isr** (timer_group_t *group_num, timer_idx_t *timer_num, uint64_t *alarm_val)

Set the alarm threshold for the timer, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
• alarm_val: Alarm threshold.

void **timer_group_set_counter_enable_in_isr** (timer_group_t *group_num, timer_idx_t *timer_num, timer_start_t *counter_en)

Enable/disable a counter, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
• counter_en: Enable/disable.

timer_intr_t **timer_group_intr_get_in_isr** (timer_group_t *group_num)

Get the masked interrupt status, just used in ISR.

Return

• Interrupt status

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

uint32_t **timer_group_get_intr_status_in_isr** (timer_group_t *group_num)

Get interrupt status, just used in ISR.

Return

• Interrupt status

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

void **timer_group_clr_intr_sta_in_isr** (timer_group_t *group_num, timer_intr_t *intr_mask)

Clear the masked interrupt status, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• intr_mask: Masked interrupt.

bool timer_group_get_auto_reload_in_isr(timer_group_t group_num, timer_idx_t timer_num)
Get auto reload enable status, just used in ISR.

Return
• True Auto reload enabled
• False Auto reload disabled

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index

esp_err_t timer_spinlock_take(timer_group_t group_num)
Take timer spinlock to enter critical protect.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

esp_err_t timer_spinlock_give(timer_group_t group_num)
Give timer spinlock to exit critical protect.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Macros
TIMER_BASE_CLK
Frequency of the clock on the input of the timer groups

Type Definitions
typedef void (*timer_isr_t)(void *)
typedef intr_handle_t timer_isr_handle_t
Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

2.3.20 Touch Sensor
Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

ESP32 can handle up to 10 capacitive touch pads / GPIOs. The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

Design, operation, and control registers of a touch sensor are discussed in ESP32 Technical Reference Manual (PDF). Please refer to this manual for additional details on how this subsystem works.

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note. If you want to test touch sensors in various configurations without building them on your own, check the Guide for ESP32-Sense Development Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization

Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several .._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration

Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.
Touch State Measurements

The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section *Filtering of Measurements*.

For the demonstration of how to use both read functions, check the application example `peripherals/touch_pad_read`.

Optimization of Measurements

A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding 'set' functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`

- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

The last chart *Output* represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

Filtering of Measurements

If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.
Touch Detection

Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_pad_interrupt.

Touch Triggered Interrupts

Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`
When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

---

**Wakeup from Sleep Mode**

If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

**Application Examples**

- Touch sensor read example: `peripherals/touch_pad_read`
- Touch sensor interrupt example: `peripherals/touch_pad_interrupt`

**API Reference**

**Header File**

- `driver/include/driver/touch_pad.h`

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

**Header File**

- `soc/esp32/include/soc/touch_sensor_channel.h`

**Macros**

- `TOUCH_PAD_GPIO4_CHANNEL`
- `TOUCH_PAD_NUM0_GPIO_NUM`
- `TOUCH_PAD_GPIO0_CHANNEL`
TOUCH_PAD_NUM1_GPIO_NUM
TOUCH_PAD_GPIO2_CHANNEL
TOUCH_PAD_NUM2_GPIO_NUM
TOUCH_PAD_GPIO15_CHANNEL
TOUCH_PAD_NUM3_GPIO_NUM
TOUCH_PAD_GPIO13_CHANNEL
TOUCH_PAD_NUM4_GPIO_NUM
TOUCH_PAD_GPIO12_CHANNEL
TOUCH_PAD_NUM5_GPIO_NUM
TOUCH_PAD_GPIO14_CHANNEL
TOUCH_PAD_NUM6_GPIO_NUM
TOUCH_PAD_GPIO27_CHANNEL
TOUCH_PAD_NUM7_GPIO_NUM
TOUCH_PAD_GPIO33_CHANNEL
TOUCH_PAD_NUM8_GPIO_NUM
TOUCH_PAD_GPIO32_CHANNEL
TOUCH_PAD_NUM9_GPIO_NUM

Header File

- soc/include/hal/touch_sensor_types.h

Macros

TOUCH_PAD_SLOPE_DEFAULT
TOUCH_PAD_TIE_OPT_DEFAULT
TOUCH_PAD_BIT_MASK_MAX
TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD
TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
TOUCH_PAD_INACTIVE_CONNECT_DEFAULT
TOUCH_PAD_THRESHOLD_MAX
    If set touch threshold max value, The touch sensor can’t be in touched status

Enumerations

enum touch_pad_t

Values:
**TOUCH_PAD_NUM0** = 0
    Touch pad channel 0 is GPIO4(ESP32)

**TOUCH_PAD_NUM1**
    Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

**TOUCH_PAD_NUM2**
    Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

**TOUCH_PAD_NUM3**
    Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

**TOUCH_PAD_NUM4**
    Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

**TOUCH_PAD_NUM5**
    Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

**TOUCH_PAD_NUM6**
    Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

**TOUCH_PAD_NUM7**
    Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

**TOUCH_PAD_NUM8**
    Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

**TOUCH_PAD_NUM9**
    Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

**TOUCH_PAD_MAX**

```c
enum touch_high_volt_t

Values:

**TOUCH_HVOLT_KEEP** = -1
    Touch sensor high reference voltage, no change

**TOUCH_HVOLT_2V4** = 0
    Touch sensor high reference voltage, 2.4V

**TOUCH_HVOLT_2V5**
    Touch sensor high reference voltage, 2.5V

**TOUCH_HVOLT_2V6**
    Touch sensor high reference voltage, 2.6V

**TOUCH_HVOLT_2V7**
    Touch sensor high reference voltage, 2.7V

**TOUCH_HVOLT_MAX**

enum touch_low_volt_t

Values:

**TOUCH_LVOLT_KEEP** = -1
    Touch sensor low reference voltage, no change

**TOUCH_LVOLT_0V5** = 0
    Touch sensor low reference voltage, 0.5V

**TOUCH_LVOLT_0V6**
    Touch sensor low reference voltage, 0.6V
```
TOUCH_LVOLT_0V7
   Touch sensor low reference voltage, 0.7V

TOUCH_LVOLT_0V8
   Touch sensor low reference voltage, 0.8V

TOUCH_LVOLT_MAX

enum touch_volt_atten_t
   Values:

   TOUCH_HVOLT_ATTEN_KEEP = -1
      Touch sensor high reference voltage attenuation, no change

   TOUCH_HVOLT_ATTEN_1V5 = 0
      Touch sensor high reference voltage attenuation, 1.5V attenuation

   TOUCH_HVOLT_ATTEN_1V
      Touch sensor high reference voltage attenuation, 1.0V attenuation

   TOUCH_HVOLT_ATTEN_0V5
      Touch sensor high reference voltage attenuation, 0.5V attenuation

   TOUCH_HVOLT_ATTEN_0V
      Touch sensor high reference voltage attenuation, 0V attenuation

   TOUCH_HVOLT_ATTEN_MAX

enum touch_cnt_slope_t
   Values:

   TOUCH_PAD_SLOPE_0 = 0
      Touch sensor charge / discharge speed, always zero

   TOUCH_PAD_SLOPE_1 = 1
      Touch sensor charge / discharge speed, slowest

   TOUCH_PAD_SLOPE_2 = 2
      Touch sensor charge / discharge speed

   TOUCH_PAD_SLOPE_3 = 3
      Touch sensor charge / discharge speed

   TOUCH_PAD_SLOPE_4 = 4
      Touch sensor charge / discharge speed

   TOUCH_PAD_SLOPE_5 = 5
      Touch sensor charge / discharge speed

   TOUCH_PAD_SLOPE_6 = 6
      Touch sensor charge / discharge speed

   TOUCH_PAD_SLOPE_7 = 7
      Touch sensor charge / discharge speed, fast

   TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
   Values:

   TOUCH_PAD_TIE_OPT_LOW = 0
      Initial level of charging voltage, low level

   TOUCH_PAD_TIE_OPT_HIGH = 1
      Initial level of charging voltage, high level
enum touch_fsm_mode_t

Values:

TOUCH_FSM_MODE_TIMER = 0
To start touch FSM by timer

TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t

Values:

TOUCH_TRIGGER_BELOW = 0
Touch interrupt will happen if counter value is less than threshold.

TOUCH_TRIGGER_ABOVE = 1
Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t

Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

2.3.21 UART

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e.,
timing requirements and data framing) using widely-adapted asynchronous serial communication interfaces, such as
RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex
data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2) that feature an identical set of registers
for ease of programming and flexibility. Each UART controller is independently configurable with parameters such
as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with
UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using
the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken
down into the sections provided below:

1. Setting Communication Parameters - Setting baud rate, data bits, stop bits, etc.

2. Setting Communication Pins - Assigning pins for connection to a device.

3. Driver Installation - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data

5. **Using Interrupts** - Triggering interrupts on specific communication events

6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the three UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

### Setting Communication Parameters

UART communication parameters can be configured all in a single step or individually in multiple steps.

#### Single Step

Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const int uart_num = UART_NUM_2;
uart_config_t uart_config = {
  .baud_rate = 115200,
  .data_bits = UART_DATA_8_BITS,
  .parity = UART_PARITY_DISABLE,
  .stop_bits = UART_STOP_BITS_1,
  .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
  .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

#### Multiple Steps

Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.
Setting Communication Pins

After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`. The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO16 (UART2 default), RX: IO17 (UART2 default), RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE, 18, 19));
```

Driver Installation

Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required ESP32 resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication

Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.
Transmitting

After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const int uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS ticks
```

Receiving

Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const int uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control

If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.
Communication Mode Selection

The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts

There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual (PDF). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`
Macros

The API also defines several macros. For example, UART_FIFO_LEN defines the length of hardware FIFO buffers; UART_BITRATE_MAX gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver

If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. To find more information on a specific option bit, open Register Summary in the ESP32 Technical Reference Manual (PDF), use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32’s UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the –RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options

This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.
Note:

- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

### Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the ESP32 hardware when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver
This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>

### API Reference

#### Header File

- `driver/include/driver/uart.h`
### Functions

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

```c
esp_err_t uart_driver_delete(uart_port_t uart_num)
```

Uninstall UART driver.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
bool uart_is_driver_installed(uart_port_t uart_num)
```

Checks whether the driver is installed or not.

**Return**

- true driver is installed
- false driver is not installed

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
```

Set UART data bits.
Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: UART data bits

```c
esp_err_t uart_get_word_length (uart_port_t uart_num, uart_word_length_t *data_bit)
```

Get the UART data bit configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: Pointer to accept value of UART data bits.

```c
esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)
```

Set UART stop bits.

Return

- ESP_OK Success
- ESP_FAIL Fail

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits

```c
esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)
```

Get the UART stop bit configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: Pointer to accept value of UART stop bits.

```c
esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)
```

Set UART parity mode.

Return

- ESP_FAIL Parameter error
- ESP_OK Success
Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

```c
esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)
```
Get the UART parity mode configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: Pointer to accept value of UART parity mode.

```c
esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
```
Set UART baud rate.

Return

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: UART baud rate.

```c
esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)
```
Get the UART baud rate configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: Pointer to accept value of UART baud rate

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```
Set UART line inverse mode.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of uart_signal_inv_t

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```

Set software flow control.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```

Get the UART hardware flow control configuration.

**Return**

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl`: Option for different flow control mode.

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```

Clear UART interrupt status.

**Return**

- ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• clr_mask: Bit mask of the interrupt status to be cleared.

\texttt{esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)}
Set UART interrupt enable.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable_mask: Bit mask of the enable bits.

\texttt{esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)}
Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• disable_mask: Bit mask of the disable bits.

\texttt{esp_err_t uart_enable_rx_intr(uart_port_t uart_num)}
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

\texttt{esp_err_t uart_disable_rx_intr(uart_port_t uart_num)}
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
esp_err_t uart_disable_tx_intr (uart_port_t uart_num)
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number

esp_err_t uart_enable_tx_intr (uart_port_t uart_num, int enable, int thresh)
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable: 1: enable; 0: disable
• thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

esp_err_t uart_isr_register (uart_port_t uart_num, void (* fn) void *, void *arg, int intr_alloc_flags, uart_isr_handle_t *handle)
Register UART interrupt handler (ISR).

Note UART ISR handler will be attached to the same CPU core that this function is running on.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• fn: Interrupt handler function.
• arg: parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

esp_err_t uart_isr_free (uart_port_t uart_num)
Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Set UART pin number.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Note** Instead of GPIO number a macro ‘UART_PIN_NO_CHANGE’ may be provided to keep the currently allocated pin.

**Return**

• ESP_OK Success
• ESP_FAIL Parameter error

**Parameters**

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• tx_io_num: UART TX pin GPIO number.
• rx_io_num: UART RX pin GPIO number.
• rts_io_num: UART RTS pin GPIO number.
• cts_io_num: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**

• ESP_OK Success
• ESP_FAIL Parameter error

**Parameters**

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: RTS output low (active); 0: RTS output high (block)

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```

Manually set the UART DTR pin level.

**Return**

• ESP_OK Success
• ESP_FAIL Parameter error

**Parameters**

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: DTR output low; 0: DTR output high

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```

Set UART idle interval after tx FIFO is empty.

**Return**

2.3. Peripherals API 891
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• idle_num: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
Set UART configuration parameters.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• uart_config: UART parameter settings

esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait: Timeout, count in RTOS ticks

int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.
Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- buffer: data buffer address
- len: data length to send

int uart_write_bytes (uart_port_t uart_num, const char *src, size_t size)
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- src: data buffer address
- size: data length to send

int uart_write_bytes_with_break (uart_port_t uart_num, const char *src, size_t size, int brk_len)
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- src: data buffer address
- size: data length to send
- brk_len: break signal duration(unit: the time it takes to send one bit at current baudrate)

int uart_read_bytes (uart_port_t uart_num, uint8_t *buf, uint32_t length, TickType_t ticks_to_wait)
UART read bytes from UART buffer.

2.3. Peripherals API
• (-1) Error
• OTHERS (>=0) The number of bytes read from UART FIFO

Parameters
• `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
• `buf`: pointer to the buffer.
• `length`: data length
• `ticks_to_wait`: sTimeout, count in RTOS ticks

```c
esp_err_t uart_flush(uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uartFlush_input(uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Return**
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
• `size`: Pointer of size_t to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)
```

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.
Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number.
- pattern_chr: character of the pattern.
- chr_num: number of the character, 8bit value.
- chr_tout: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- post_idle: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- pre_idle: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
int uart_pattern_get_pos(uart_port_t uart_num)

    Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

    The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

    Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

    • (-1) No pattern found for current index or parameter error
    • others the pattern position in rx buffer.

Parameters

    • uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)

    Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return

    • ESP_ERR_NO_MEM No enough memory
    • ESP_ERR_INVALID_STATE Driver not installed
    • ESP_FAIL Parameter error
    • ESP_OK Success

Parameters

    • uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
    • queue_length: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)

    UART set communication mode.

    Note This function must be executed after uart_driver_install(), when the driver object is initialized.

Return

    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

Parameters

    • uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
    • mode: UART UART mode to set

esp_err_t uart_set_rx_full_threshold(uart_port_t uart_num, int threshold)

    Set uart threshold value for RX fifo full.
Note If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- threshold: Threshold value above which RX fifo full interrupt is generated

\[
\text{esp_err_t uart_set_tx_empty_threshold} \text{(uart_port_t uart_num, int threshold)}
\]
Set uart threshold values for TX fifo empty.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- threshold: Threshold value below which TX fifo empty interrupt is generated

\[
\text{esp_err_t uart_set_rx_timeout} \text{(uart_port_t uart_num, const uint8_t tout_thresh)}
\]
UART set threshold timeout for TOUT feature.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_threash = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_threash == 0, the TOUT feature is disabled.

\[
\text{esp_err_t uart_get_collision_flag} \text{(uart_port_t uart_num, bool *collision_flag)}
\]
Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters

• `uart_num`: Uart number to configure the max port number is (UART_NUM_MAX -1).
• `collision_flag`: Pointer to variable of type bool to return collision flag.

`esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)`

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting `use_ref_tick` field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Return

• `ESP_OK` on success
• `ESP_ERR_INVALID_ARG` if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

Parameters

• `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
• `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

`esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)`

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Return

• `ESP_OK` on success
• `ESP_ERR_INVALID_ARG` if `out_wakeup_threshold` is NULL

Parameters

• `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
• `out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

`esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)`

Wait until UART tx memory empty and the last char send ok (polling mode).

• Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters

- **uart_num**: UART number

```c
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters

- **uart_num**: UART number
- **loop_back_en**: Set true to enable the loop back function, else set it false.

Structures

```c
struct uart_intr_config_t
```

UART interrupt configuration parameters for uart_intr_config function.

**Public Members**

```c
uint32_t intr_enable_mask
```

UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

```c
uint8_t rx_timeout_thresh
```

UART timeout interrupt threshold (unit: time of sending one byte)

```c
uint8_t txfifo_empty_intr_thresh
```

UART TX empty interrupt threshold.

```c
uint8_t rxfifo_full_thresh
```

UART RX full interrupt threshold.

```c
struct uart_event_t
```

Event structure used in UART event queue.

**Public Members**

```c
uart_event_type_t type
```

UART event type

```c
size_t size
```

UART data size for UART_DATA event
Macros

UART_NUM_0
    UART port 0

UART_NUM_1
    UART port 1

UART_NUM_MAX
    UART port max

UART_PIN_NO_CHANGE
    Constant for uart_set_pin function which indicates that UART pin should not be changed

Type Definitions

typedef intr_handle_t uart_isr_handle_t

Enumerations

enum uart_event_type_t
    UART event types used in the ring buffer.
    Values:
    UART_DATA
        UART data event
    UART_BREAK
        UART break event
    UART_BUFFER_FULL
        UART RX buffer full event
    UART_FIFO_OVF
        UART FIFO overflow event
    UART_FRAME_ERR
        UART RX frame error event
    UART_PARITY_ERR
        UART RX parity event
    UART_DATA_BREAK
        UART TX data and break event
    UART_PATTERN_DET
        UART pattern detected
    UART_EVENT_MAX
        UART event max index

GPIO Lookup Macros

The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning
IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- soc/esp32/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO22_DIRECT_CHANNEL
- UART_NUM_0_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO1_DIRECT_CHANNEL
- UART_RXD_GPIO3_DIRECT_CHANNEL
- UART_CTS_GPIO19_DIRECT_CHANNEL
- UART_RTS_GPIO22_DIRECT_CHANNEL
- UART_GPIO10_DIRECT_CHANNEL
- UART_NUM_1_TXD_DIRECT_GPIO_NUM
- UART_GPIO9_DIRECT_CHANNEL
- UART_NUM_1_RXD_DIRECT_GPIO_NUM
- UART_GPIO6_DIRECT_CHANNEL
- UART_NUM_1_CTS_DIRECT_GPIO_NUM
- UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UARTCTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UARTCTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.4 Application Protocols

[]

2.4.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation

Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

Supported features

ESP platform port currently supports only network asynchronous socket operations; does not support serial port and ssl. Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
• TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio protocols/asio:
• protocols/asio/udp_echo_server
• protocols/asio/tcp_echo_server
• protocols/asio/chat_client
• protocols/asio/chat_server

Please refer to the specific example README.md for details

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

• Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
• Easy to setup with URI
• Multiple instances (Multiple clients in one application)
• Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

• protocols/mqtt/tcp: MQTT over tcp, default port 1883
• protocols/mqtt/ssl: MQTT over tcp, default port 8883
• protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
• protocols/mqtt/ws: MQTT over Websocket, default port 80
• protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

• Currently support mqtt, mqtts, ws, wss schemes
• MQTT over TCP samples:
  – mqtt://mqtt.eclipse.org: MQTT over TCP, default port 1883
  – mqtt://mqtt.eclipse.org:1884 MQTT over TCP, port 1884
- `mqtt://username:password@mqtt.eclipse.org:1884` MQTT over TCP, port 1884, with username and password

- **MQTT over SSL samples:**
  - `mqtts://mqtt.eclipse.org`: MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipse.org:8884`: MQTT over SSL, port 8884

- **MQTT over Websocket samples:**
  - `ws://mqtt.eclipse.org:80/mqtt`

- **MQTT over Websocket Secure samples:**
  - `wss://mqtt.eclipse.org:443/mqtt`

- **Minimal configurations:**

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipse.org",
    // .user_context = (void *)your_context
};

esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, client);
esp_mqtt_client_start(client);
```

- **Note:** By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

### SSL

- **Get certificate from server, example:**
  
  ```bash
  mqtt.eclipse.org openssl s_client -showcerts -connect mqtt.eclipse.org:8883 <dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem
  ```

- **Check the sample application:** `examples/mqtt_ssl`

- **Configuration:**

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipse.org:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org.pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- **use_global_ca_store**: use the global certificate store to verify server certificate, see esp-tls.h for more information

- **client_cert_pem**: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

- **client_cert_len**: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.

- **client_key_pem**: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

- **client_key_len**: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
• **psk_hint_key**: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
• **alpn_protos**: NULL-terminated list of protocols to be used for ALPN.

### Last Will and Testament

MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

• **lwt_topic**: pointer to the LWT message topic
• **lwt_msg**: pointer to the LWT message
• **lwt_msg_len**: length of the LWT message, required if `lwt_msg` is not null-terminated
• **lwt_qos**: quality of service for the LWT message
• **lwt_retain**: specifies the retain flag of the LWT message

### Other Configuration Parameters

• **disable_clean_session**: determines the clean session flag for the connect message, defaults to a clean session
• **keepalive**: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
• **disable_auto_reconnect**: enable to stop the client from reconnecting to server after errors or disconnects
• **user_context**: custom context that will be passed to the event handler
• **task_prio**: MQTT task priority, defaults to 5
• **task_stack**: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menuconfig
• **buffer_size**: size of MQTT send/receive buffer, default is 1024 bytes
• **username**: pointer to the username used for connecting to the broker
• **password**: pointer to the password used for connecting to the broker
• **client_id**: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
• **host**: MQTT broker domain (ipv4 as string), setting the uri will override this
• **port**: MQTT broker port, specifying the port in the uri will override this
• **transport**: sets the transport protocol, setting the uri will override this
• **refresh_connection_after_ms**: refresh connection after this value (in milliseconds)
• **event_handle**: handle for MQTT events as a callback in legacy mode
• **event_loop_handle**: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

---

### 2.4. Application Protocols
Change settings in Project Configuration Menu

The settings for MQTT can be found using idf.py menuconfig, under Component config -> ESP-MQTT Configuration

The following settings are available:

- **CONFIG_MQTT_PROTOCOL_311**: Enables 3.1.1 version of MQTT protocol
- **CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET**: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- **CONFIG_MQTT_CUSTOM_OUTBOX**: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
- **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
- **MQTT_EVENT_ERROR**: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

API Reference

Header File

- mqtt/esp-mqtt/include/mqtt_client.h

Functions

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates mqtt client handle based on the configuration.
Return mqtt_client_handle if successfully created, NULL on error

Parameters

• config: mqtt configuration structure

```c
esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)
```

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Return ESP_FAIL if URI parse error, ESP_OK on success

Parameters

• client: mqtt client handle
• uri:

```c
esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)
```

Starts mqtt client with already created client handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

Parameters

• client: mqtt client handle

```c
esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

Return ESP_OK on success ESP_FAIL if client is in invalid state

Parameters

• client: mqtt client handle

```c
esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)
```

Stops mqtt client tasks.

Return ESP_OK on success ESP_FAIL if client is in invalid state

Parameters

• client: mqtt client handle

```c
int esp_mqtt_client_subscribe (esp_mqtt_client_handle_t client, const char *topic, int qos)
```

Subscribe the client to defined topic with defined qos.

Notes:

• Client must be connected to send subscribe message
• This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters

• client: mqtt client handle
• topic:
• qos:
int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char *topic)
Unsubscribe the client from defined topic.

Notes:
• Client must be connected to send unsubscribe message
• It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the subscribe message on success -1 on failure

Parameters
• client: mqtt client handle
• topic:

int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
Client to send a publish message to the broker.

Notes:
• Client doesn’t have to be connected to send publish message (although it would drop all qos=0 messages, qos>1 messages would be enqueued)
• It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

Parameters
• client: mqtt client handle
• topic: topic string
• data: payload string (set to NULL, sending empty payload message)
• len: data length, if set to 0, length is calculated from payload string
• qos: qos of publish message
• retain: retain flag

esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)
Destroys the client handle.

Return ESP_OK

Parameters
• client: mqtt client handle

esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t config)
Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success

Parameters
• client: mqtt client handle
• config: mqtt configuration structure
esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)

Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success

Parameters

- client: mqtt client handle
- event: event type
- event_handler: handler callback
- event_handler_arg: handlers context

Structures

struct esp_mqtt_error_codes
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_ESP_TLS | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags | Error reported from esp-tls |
| MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

Public Members

esp_err_t esp_tls_last_esp_err
last esp_err code reported from esp-tls component

int esp_tls_stack_err
tls specific error code reported from underlying tls stack

int esp_tls_cert_verify_flags
tls flags reported from underlying tls stack during certificate verification

error_type_t esp_mqtt_error_type_t
error type referring to the source of the error

esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code
connection refused error code reported from MQTT broker on connection

struct esp_mqtt_event_t
MQTT event configuration structure

Public Members

esp_mqtt_event_id_t event_id
MQTT event type
esp_mqtt_client_handle_t client
    MQTT client handle for this event

void *user_context
    User context passed from MQTT client config

char *data
    Data associated with this event

int data_len
    Length of the data for this event

int total_data_len
    Total length of the data (longer data are supplied with multiple events)

int current_data_offset
    Actual offset for the data associated with this event

char *topic
    Topic associated with this event

int topic_len
    Length of the topic for this event associated with this event

int msg_id
    MQTT message id of message

int session_present
    MQTT session_present flag for connection event

esp_mqtt_error_codes_t *error_handle
    esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

struct esp_mqtt_client_config_t
    MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
    handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
    handle for MQTT event loop library

const char *host
    MQTT server domain (ipv4 as string)

const char *uri
    Complete MQTT broker URI

uint32_t port
    MQTT server port

const char *client_id
    default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
    MQTT username

const char *password
    MQTT password
const char *lwt_topic
    LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
    LWT message (NULL by default)

int lwt_qos
    LWT message qos

int lwt_retain
    LWT retained message flag

int lwt_msg_len
    LWT message length

int disable_clean_session
    mqtt clean session, default clean_session is true

int keepalive
    mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
    this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
    pass user context to this option, then can receive that context in event->user_context

int task_prio
    MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
    MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
    size of MQTT send/receive buffer, default is 1024

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem
esp_mqtt_transport_t transport
overrides URI transport

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

int reconnect_timeout_ms
Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled

const char **alpn_protos
NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
Client key decryption password string

int clientkey_password_len
String length of the password pointed to by clientkey_password

### Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_ESP_TLS</td>
<td>esp_tls_last_error, esp_tls_stack_err, esp_tls_cert_verify_flags</td>
<td>Error reported from esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

### Enumerations

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- user_context - user data from esp_mqtt_client_config_t
- client - mqtt client handle
- various other data depending on event type
Values:

**MQTT_EVENT_ERROR** = 0
on error event, additional context: connection return code, error handle from *esp_tls* (if supported)

**MQTT_EVENT_CONNECTED**
connected event, additional context: session_present flag

**MQTT_EVENT_DISCONNECTED**
disconnected event

**MQTT_EVENT_SUBSCRIBED**
subscribed event, additional context: msg_id

**MQTT_EVENT_UNSUBSCRIBED**
unsubscribed event

**MQTT_EVENT_PUBLISHED**
published event, additional context: msg_id

**MQTT_EVENT_DATA**
data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT_EVENT_BEFORE_CONNECT**
The event occurs before connecting

**enum esp_mqtt_connect_return_code_t**
MQTT connection error codes propagated via ERROR event

Values:

**MQTT_CONNECTION_ACCEPTED** = 0
Connection accepted

**MQTT_CONNECTION_REFUSE_PROTOCOL**
MQTT connection refused reason: Wrong protocol

**MQTT_CONNECTION_REFUSE_ID_REJECTED**
MQTT connection refused reason: ID rejected

**MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**
MQTT connection refused reason: Server unavailable

**MQTT_CONNECTION_REFUSE_BAD_USERNAME**
MQTT connection refused reason: Wrong username

**MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
MQTT connection refused reason: Wrong username or password

2.4. Application Protocols
enum esp_mqtt_error_type_t
    MQTT connection error codes propagated via ERROR event
    Values:
    MQTT_ERROR_TYPE_NONE = 0
    MQTT_ERROR_TYPE_ESP_TLS
    MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
    Values:
    MQTT_TRANSPORT_UNKNOWN = 0x0
    MQTT_TRANSPORT_OVER_TCP
        MQTT over TCP, using scheme: mqtt

    MQTT_TRANSPORT_OVER_WSS
        MQTT over Websocket Secure, using scheme: wss

2.4.3 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It
supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among
others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communica-
tion can be conducted using the following APIs:

• esp_tls_conn_new(): for opening a new TLS connection.
• esp_tls_conn_read(): for reading from the connection.
• esp_tls_conn_write(): for writing into the connection.
• esp_tls_conn_delete(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
  esp_tls.c
  esp_tls.h
  esp_tls_mbedtls.c
  esp_tls_wolfssl.c
  private_include
```
The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:

```bash
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

   - Download wolfssl with:

     ```bash
git clone https://github.com/espressif/esp-wolfssl.git
```

   - Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```bash
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)
## API Reference

### Header File

- esp-tls/esp_tls.h

### Functions

**esp_tls_t**\*\* esp_tls_init (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Return**

tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

**esp_tls_t**\*\* esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_tls_conn_new_sync (and its asynchronous version esp_tls_conn_new_async)

**Return**

pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**

- hostname: Hostname of the host.
- hostlen: Length of hostname.
- port: Port number of the host.
- cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

**esp_tls_conn_new_sync** (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Return**

-1 If connection establishment fails.

---

### Note

These values are subject to change with change in configuration options and version of respective libraries.
• 1 If connection establishment is successful.
• 0 If connection state is in progress.

Parameters

• hostname: Hostname of the host.
• hostlen: Length of hostname.
• port: Port number of the host.
• cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
• tls: Pointer to esp-tls as esp-tls handle.

esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)
Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

• url: url of host.
• cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Parameters

• hostname: Hostname of the host.
• hostlen: Length of hostname.
• port: Port number of the host.
• cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
• tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Return

• -1 If connection establishment fails.
• 0 If connection establishment is in progress.
• 1 If connection establishment is successful.

Parameters

• hostname: Hostname of the host.
• hostlen: Length of hostname.
• port: Port number of the host.
• cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
• tls: pointer to esp-tls as esp-tls handle.
Return

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

Parameters
- url: url of host.
- cfg: TLS configuration as esp_tls_cfg_t.
- tls: pointer to esp-tls as esp-tls handle.

static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
Write from buffer ‘data’ into specified tls connection.

Return

>0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
0 if write operation was not successful. The underlying connection was closed.
<0 if write operation was not successful, because either an error occured or an action must be taken by the calling process.

Parameters
- tls: pointer to esp-tls as esp-tls handle.
- data: Buffer from which data will be written.
- datalen: Length of data buffer.

static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
Read from specified tls connection into the buffer ‘data’.

Return

>0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
0 if read operation was not successful. The underlying connection was closed.
<0 if read operation was not successful, because either an error occured or an action must be taken by the calling process.

Parameters
- tls: pointer to esp-tls as esp-tls handle.
- data: Buffer to hold read data.
- datalen: Length of data buffer.

void esp_tls_conn_delete(esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Parameters
• tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's mbedtls_ssl_get_bytes_avail() API.

Return
• -1 in case of invalid arg
• bytes available in the application data record read buffer

Parameters
• tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)

Returns the connection socket file descriptor from esp_tls session.

Return - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
• ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
• tls: handle to esp_tls context
• sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store(void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return
• ESP_OK if creating global CA store was successful.
• ESP_ERR_NO_MEM if an error occured when allocating the mbedTLS resources.

esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Return
• ESP_OK if adding certificates was successful.
• Other if an error occured or an action must be taken by the calling process.

Parameters
• cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
• cacert_pem_bytes: Length of the buffer.

void esp_tls_free_global_ca_store (void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
• ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK (0) if no error occurred
• specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
• h: esp-tls error handle.
• esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
• esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

Structures

struct esp_tls_last_error
Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t last_error
ero code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

int esp_tls_error_code
esp_tls error code from last esp_tls failed api

int esp_tls_flags
last certification verification flags

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key
const char *hint
    hint in PSK authentication mode in string format

struct esp_tls_cfg
    ESP-TLS configuration parameters.

Note Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
    Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };
    • where ‘h2’ is the protocol name

const unsigned char *cacert_buf
    Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support
    This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
    CA certificate buffer legacy name

unsigned int cacert_bytes
    Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
    Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
    Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support
    This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
    Client certificate legacy name

unsigned int clientcert_bytes
    Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
    Size of client certificate legacy name

const unsigned char *clientkey_buf
    Client key in a buffer Format may be PEM or DER, depending on mbedtls-support
    This buffer should be NULL terminated in case of PEM

2.4. Application Protocols
const unsigned char *clientkey_pem_buf
    Client key legacy name

unsigned int clientkey_bytes
    Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
    Size of client key legacy name

const unsigned char *clientkey_password
    Client key decryption password string

unsigned int clientkey_password_len
    String length of the password pointed to by clientkey_password

bool non_block
    Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

int timeout_ms
    Network timeout in milliseconds

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

collections psk_hint_key_t *psk_hint_key
    Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

struct esp_tls
    ESP-TLS Connection Handle.

Public Members

int sockfd
    Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
    Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
    Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t conn_state
    ESP-TLS Connection state

fd_set rset
    read file descriptors

fd_set wset
    write file descriptors

bool is_tls
    indicates connection type (TLS or NON-TLS)
esp_tls_role_t role
esp-tls role
  • ESP_TLS_CLIENT
  • ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
handle to error descriptor

Macros

ESP_ERR_ESP_TLS_BASE
Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
failed to set socket option

ESP_ERR_MBEDTLS_CERT_PARTLY_OK
mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_own_CERT_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
mbedtls api returned failed

2.4. Application Protocols
ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
  mbedtls api returned failed

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
  new connection in esp_tls_low_level_conn connection timeouted

Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t
  Error structure containing relevant errors in case tls error occurred.

typedef enum esp_tls_conn_state esp_tls_conn_state_t
  ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
  ESP-TLS preshared key and hint structure.

typedef struct esp_tls_cfg esp_tls_cfg_t
  ESP-TLS configuration parameters.

Note
  Note about format of certificates:
  • This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  • Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  • Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t
  ESP-TLS Connection Handle.

Enumerations

enum esp_tls_conn_state
  ESP-TLS Connection State.

  Values:

  ESP_TLS_INIT = 0
  ESP_TLS_CONNECTING
  ESP_TLS_HANDSHAKE
  ESP_TLS_FAIL
  ESP_TLS_DONE

enum esp_tls_role
  Values:
ESP_TLS_CLIENT = 0
ESP_TLS_SERVER

2.4.4 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- **esp_http_client_init()**: To use the HTTP client, the first thing we must do is create an esp_http_client by pass into this function with the esp_http_client_config_t configurations. Which configuration values we do not define, the library will use default.
- **esp_http_client_perform()**: The esp_http_client argument created from the init function is needed. This function performs all operations of the esp_http_client, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event_handle (defined by esp_http_client_config_t). This function performs its job and blocks the current task until it’s done
- **esp_http_client_cleanup()**: After completing our esp_http_client’s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

Application Example

```c
esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
    case HTTP_EVENT_ERROR:
        ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
        break;
    case HTTP_EVENT_ON_CONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
        break;
    case HTTP_EVENT_HEADER_SENT:
        ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
        break;
    case HTTP_EVENT_ON_HEADER:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
        printf("%.*s", evt->data_len, (char*)evt->data);
        break;
    case HTTP_EVENT_ON_DATA:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
        if(!esp_http_client_is_chunked_response(evt->client)) {
            printf("%.*s", evt->data_len, (char*)evt->data);
        }
        break;
    case HTTP_EVENT_ON_FINISH:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
}
```

(continues on next page)
return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example

```c
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
```

```c
esp_http_client_handle_t client = esp_http_client_init(&config);
```

```c
// first request
err = esp_http_client_perform(client);
```

```c
// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_Method_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);
```

```c
esp_http_client_cleanup(client);
```

HTTPS

The HTTP client supports SSL connections using `mbedtls`, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via :ref:`CONFIG_ENABLE_HTTPS` (enabled by default).

**Note:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert.pem` in
esp_http_client_config_t

HTTPS example

```c
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
                esp_http_client_get_status_code(client),
                esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. The HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` alway to called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_` or `esp_http_client_delete_`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader

Check the example function `http_perform_as_stream_reader` at `protocols/esp_http_client`. 2.4. Application Protocols
HTTP Authentication

The HTTP client supports both Basic and Digest Authentication. By providing usernames and passwords in url or in the username, password of config entry. And with auth_type = HTTP_AUTH_TYPE_BASIC, the HTTP client takes only 1 perform to pass the authentication process. If auth_type = HTTP_AUTH_TYPE_NONE, but there are username and password in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: protocols/esp_http_client.

API Reference

Header File

- esp_http_client/include/esp_http_client.h

Functions

```c
esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)
```

Start a HTTP session This function must be the first function to call, and it returns a esp_http_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_http_client_cleanup when the operation is complete.

Return

- esp_http_client_handle_t
- NULL if any errors

Parameters

- config: The configurations, see http_client_config_t
esp_err_t esp_http_client_perform(esp_http_client_handle_t client)
Invoke this function after esp_http_client_init and all the options calls are made, and will perform
the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as
the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking
or non-blocking manner. By default, the API performs request in a blocking manner and returns when done,
or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is
encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times
unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(),
is_async member of esp_http_client_config_t must be set while making a call to esp_http_client_init() API.
You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t.
The underlying connection may be kept open if the server allows it. If you intend to transfer more than one
file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for
the following transfers, thus making the operations faster, less CPU intense and using less network resources.
Just note that you will have to use esp_http_client_set_* between the invokes to set options for the
following esp_http_client_perform.

Note You must never call this function simultaneously from two places using the same client handle.
Let the function return first before invoking it another time. If you want parallel transfers, you
must use several esp_http_client_handle_t. This function include esp_http_client_open
-> esp_http_client_write -> esp_http_client_fetch_headers ->
esp_http_client_read (and option) esp_http_client_close.

Return
• ESP_OK on successful
• ESP_FAIL on error

Parameters
• client: The esp_http_client handle

esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)
Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Return
• ESP_OK
• ESP_FAIL

Parameters
• client: The esp_http_client handle
• url: The url

esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data,
int len)
Set post data, this function must be called before esp_http_client_perform. Note: The data parameter
passed to this function is a pointer and this function will not copy the data.

Return
• ESP_OK
• ESP_FAIL

Parameters
• client: The esp_http_client handle
- data: post data pointer
- len: post length

```c
int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)
```

Get current post field information.

**Return**
Size of post data

**Parameters**
- client: The client
- data: Point to post data pointer

```c
esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)
```

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- client: The `esp_http_client` handle
- key: The header key
- value: The header value

```c
esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
```

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- client: The `esp_http_client` handle
- key: The header key
- value: The header value

```c
esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
```

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
• **client**: The esp_http_client handle
  
• **value**: The username value

```c
esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
```

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**

• ESP_OK
  
• ESP_ERR_INVALID_ARG

**Parameters**

• **client**: The esp_http_client handle
  
• **username**: The username value

```c
esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
```

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**

• ESP_OK
  
• ESP_ERR_INVALID_ARG

**Parameters**

• **client**: The esp_http_client handle
  
• **value**: The password value

```c
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

• ESP_OK
  
• ESP_ERR_INVALID_ARG

**Parameters**

• **client**: The esp_http_client handle
  
• **password**: The password value

```c
esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
```

Set http request auth_type.

**Return**

• ESP_OK
  
• ESP_ERR_INVALID_ARG

**Parameters**
- **client**: The esp_http_client handle
- **auth_type**: The esp_http_client auth type

\[
\text{esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)}
\]

Set http request method.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**

- **client**: The esp_http_client handle
- **method**: The method

\[
\text{esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)}
\]

Delete http request header.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- **client**: The esp_http_client handle
- **key**: The key

\[
\text{esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)}
\]

This function will be open the connection, write all header strings and return.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- **client**: The esp_http_client handle
- **write_len**: HTTP Content length need to write to the server

\[
\text{int esp_http_client_write(esp_http_client_handle_t client, const char *buffer, int len)}
\]

This function will write data to the HTTP connection previously opened by esp_http_client_open().

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- **client**: The esp_http_client handle
- **buffer**: The buffer
• length: This value must not be larger than the write_len parameter provided to esp_http_client_open()

```c
int esp_http_client_fetch_headers (esp_http_client_handle_t client)
```

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- client: The esp_http_client handle

```c
bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)
```

Check response data is chunked.

**Return** true or false

**Parameters**

- client: The esp_http_client handle

```c
int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)
```

Read data from http stream.

**Return**

- (-1) if any errors
- Length of data was read

**Parameters**

- client: The esp_http_client handle
- buffer: The buffer
- len: The length

```c
int esp_http_client_get_status_code (esp_http_client_handle_t client)
```

Get http response status code, the valid value if this function invoke after esp_http_client_perform

**Return** Status code

**Parameters**

- client: The esp_http_client handle

```c
int esp_http_client_get_content_length (esp_http_client_handle_t client)
```

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

**Return**

- (-1) Chunked transfer
- Content-Length value as bytes

---

2.4. Application Protocols 933
Parameters
- **client**: The esp_http_client handle

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)
```
Close http connection, still kept all http request resources.

Return
- ESP_OK
- ESP_FAIL

Parameters
- **client**: The esp_http_client handle

```c
esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)
```
This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
- ESP_OK
- ESP_FAIL

Parameters
- **client**: The esp_http_client handle

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)
```
Get transport type.

Return
- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

Parameters
- **client**: The esp_http_client handle

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)
```
Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return
- ESP_OK
- ESP_FAIL

Parameters
- **client**: The esp_http_client handle
void `esp_http_client_add_auth` *(esp_http_client_handle_t client)*

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

- `client`: The esp_http_client handle

bool `esp_http_client_is_complete_data_received` *(esp_http_client_handle_t client)*

Checks if entire data in the response has been read without any error.

**Return**

- `true`
- `false`

**Parameters**

- `client`: The esp_http_client handle

**Structures**

`struct esp_http_client_event`

HTTP Client events data.

**Public Members**

- `esp_http_client_event_id_t event_id`
  - event_id, to know the cause of the event
- `esp_http_client_handle_t client`
  - esp_http_client_handle_t context
- `void *data`
  - data of the event
- `int data_len`
  - data length of data
- `void *user_data`
  - user_data context, from esp_http_client_config_t user_data
- `char *header_key`
  - For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key
- `char *header_value`
  - For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

`struct esp_http_client_config_t`

HTTP configuration.

2.4. Application Protocols

**Public Members**

```c
const char *url
   HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
   Domain or IP as string

int port
   Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
   Using for Http authentication

const char *password
   Using for Http authentication

esp_http_client_auth_type_t auth_type
   Http authentication type, see esp_http_client_auth_type_t

const char *path
   HTTP Path, if not set, default is /

const char *query
   HTTP query

const char *cert_pem
   SSL server certification, PEM format as string, if the client requires to verify server

const char *client_cert_pem
   SSL client certification, PEM format as string, if the server requires to verify client

const char *client_key_pem
   SSL client key, PEM format as string, if the server requires to verify client

esp_http_client_method_t method
   HTTP Method

int timeout_ms
   Network timeout in milliseconds

bool disable_auto_redirect
   Disable HTTP automatic redirects

int max_redirection_count
   Max redirection number, using default value if zero

http_event_handle_cb event_handler
   HTTP Event Handle

esp_http_client_transport_t transport_type
   HTTP transport type, see esp_http_client_transport_t

int buffer_size
   HTTP receive buffer size

int buffer_size_tx
   HTTP transmit buffer size

void *user_data
   HTTP user_data context

bool is_async
   Set asynchronous mode, only supported with HTTPS for now
```
bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
   Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
   Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
   There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
   HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
   Mapping of errno EAGAIN to esp_err_t

Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
   HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations

gen esp_http_client_event_id_t
   HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
   This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
   Once the HTTP has been connected to the server, no data exchange has been performed
HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

enum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.

Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method
## HTTP OPTIONS Method

### HTTP METHOD OPTIONS

HTTP OPTIONS Method

### HTTP METHOD_MAX

e num esp_http_client_auth_type_t

HTTP Authentication type.

*Values:*

- **HTTP_AUTH_TYPE_NONE** = 0
  
  No authention
- **HTTP_AUTH_TYPE_BASIC**
  
  HTTP Basic authentication
- **HTTP_AUTH_TYPE_DIGEST**
  
  HTTP Digest authentication

### HttpStatus_Code

Enum for the HTTP status codes.

*Values:*

- **HttpStatus_MovedPermanently** = 301
- **HttpStatus_Found** = 302
- **HttpStatus_TemporaryRedirect** = 307
- **HttpStatus_Unauthorized** = 401

### 2.4.5 HTTP Server

[]

#### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.
APPLICATION EXAMPLE

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
       * httpd_req_recv() accepts char* only, but content could
       * as well be any binary data (needs type casting).
       * In case of string data, null termination will be absent, and
       * content length would give length of string */
    char[100] content;

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
               * httpd_req_recv(), but to keep it simple, here we
               * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
           * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
};

(continues on next page)
Simple HTTP server example

Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```c
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}
```
esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ............
    ............
    ............
    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

**API Reference**

**Header File**

- esp_http_server/include/esp_http_server.h

**Functions**

*esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)*

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t * req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (...) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}
```

(continues on next page)
// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note  URI handlers can be registered in real time as long as the server handle is valid.

Return

• ESP_OK : On successfully registering the handler
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
• ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

Parameters

• handle: handle to HTTPD server instance
• uri_handler: pointer to handler that needs to be registered

esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)
Unregister a URI handler.

Return

• ESP_OK : On successfully deregistering the handler
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

Parameters

• handle: handle to HTTPD server instance
• uri: URI string
• method: HTTP method

esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)
Unregister all URI handlers with the specified uri string.

Return

• ESP_OK : On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG : Null arguments
ESP_ERR_NOT_FOUND: No handler registered with specified uri string

Parameters
- handle: handle to HTTPD server instance
- uri: uri string specifying all handlers that need to be deregistered

```c
esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)
```
Override web server’s receive function (by session FD)
This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

Parameters
- hd: HTTPD instance handle
- sockfd: Session socket FD
- recv_func: The receive function to be set for this session

```c
esp_err_t httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
```
Override web server’s send function (by session FD)
This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

Note This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

Parameters
- hd: HTTPD instance handle
- sockfd: Session socket FD
- send_func: The send function to be set for this session

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```
Override web server’s pending function (by session FD)
This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd`

**Return**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- `hd`: HTTPD instance handle
- `sockfd`: Session socket FD
- `pending_func`: The receive function to be set for this session

```c
int httpd_req_to_sockfd(httpd_req_t *r)
```
Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Return**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**
- `r`: The request whose socket descriptor should be found

```c
int httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)
```
API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes : Number of bytes read into the buffer successfully
• 0 : Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

Parameters
• r: The request being responded to
• buf: Pointer to a buffer that the data will be read into
• buf_len: Length of the buffer

size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char *field)
Search for a field in request headers and return the string length of it's value.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• Length : If field is found in the request URL
• Zero : Field not found / Invalid request / Null arguments

Parameters
• r: The request being responded to
• field: The header field to be searched in the request

esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)
Get the value string of a field from the request headers.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Use httpd_req_get_hdr_value_len() to know the right buffer length

Return
• ESP_OK : Field found in the request header and value string copied
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
Parameters

- **r**: The request being responded to
- **field**: The field to be searched in the header
- **val**: Pointer to the buffer into which the value will be copied if the field is found
- **val_size**: Size of the user buffer “val”

```c
size_t httpd_req_get_url_query_len(httpd_req_t *r)
```

Get Query string length from the request URL.

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

**Return**

- **Length**: Query is found in the request URL
- **Zero**: Query not found / Null arguments / Invalid request

Parameters

- **r**: The request being responded to

```c
esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char *buf, size_t buf_len)
```

Get Query string from the request URL.

**Note**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**

- **ESP_OK**: Query is found in the request URL and copied to buffer
- **ESP_ERR_NOT_FOUND**: Query not found
- **ESP_ERR_INVALID_ARG**: Null arguments
- **ESP_ERR_HTTPD_INVALID_REQ**: Invalid HTTP request pointer
- **ESP_ERR_HTTPD_RESULT_TRUNC**: Query string truncated

Parameters

- **r**: The request being responded to
- **buf**: Pointer to the buffer into which the query string will be copied (if found)
- **buf_len**: Length of output buffer
Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**Note**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

**Return**

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

**Parameters**

- `qry`: Pointer to query string
- `key`: The key to be searched in the query string
- `val`: Pointer to the buffer into which the value will be copied if the key is found
- `val_size`: Size of the user buffer "val"

Test if a URI matches the given wildcard template.

**Return** true if a match was found

**Parameters**

- `uri_template`: URI template (pattern)
- `uri_to_match`: URI to be matched
- `match_upto`: how many characters of the URI buffer to test (there may be trailing query string etc.)

API to send a complete HTTP response.
This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:
httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
- r: The request being responded to
- buf: Buffer from where the content is to be fetched
- buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:
httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet chunk
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• r : The request being responded to
• buf : Pointer to a buffer that stores the data
• buf_len : Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)
API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• r : The request being responded to
• str : String to be sent as response body

static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)
API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• r : The request being responded to
• str : String to be sent as response body (NULL to finish response packet)
**esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)**

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- *r: The request being responded to
- status: The HTTP status code of this response

**esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)**

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- *r: The request being responded to
- type: The Content Type of the response

**esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)**

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Return
• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• r: The request being responded to
• field: The field name of the HTTP header
• value: The value of this HTTP header

esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)
For sending out error code in response to HTTP request.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• req: Pointer to the HTTP request for which the response needs to be sent
• error: Error type to send
• msg: Error message string (pass NULL for default message)

static esp_err_t httpd_resp_send_404(httpd_req_t *r)
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.
Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- `r` : The request being responded to

`static esp_err_t httpd_resp_send_408(httpd_req_t *r)`

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- `r` : The request being responded to

`static esp_err_t httpd_resp_send_500(httpd_req_t *r)`

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Read the Docs Template Documentation, Release v4.1-dev-2071-gf91080637

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- \( r \): The request being responded to

\[ \text{int } \text{httpd_send}(\text{httpd_req_t } *r, \text{const char *} \text{buf}, \text{size_t } \text{buf_len}) \]

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()

Return
- Bytes: Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
- \( r \): The request being responded to
- \( \text{buf} \): Buffer from where the fully constructed packet is to be read
- \( \text{buf_len} \): Length of the buffer

\[ \text{esp_err_t } \text{httpd_register_err_handler}(\text{httpd_handle_t } \text{handle}, \text{httpd_err_code_t } \text{error}, \text{httpd_err_handler_func_t } \text{handler_fn}) \]

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

Return
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

Parameters
- \( \text{handle} \): HTTP server handle
• error: Error type
• handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

\[
\text{esp_err_t} \text{httpd_start} (\text{httpd_handle_t *handle, const httpd_config_t *config})
\]

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    // If server failed to start, handle will be NULL
    return server;
}
```

Return

• ESP_OK : Instance created successfully
• ESP_ERR_INVALID_ARG : Null argument(s)
• ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters

• config: Configuration for new instance of the server
• handle: Handle to newly created instance of the server. NULL on error

\[
\text{esp_err_t} \text{httpd_stop} (\text{httpd_handle_t handle})
\]

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
    }
}
```

(continues on next page)
Return

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

Parameters

- handle: Handle to server returned by httpd_start

void * esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- handle: Handle to server returned by httpd_start
- work: Pointer to the function to be executed in the HTTPD’s context
- arg: Pointer to the arguments that should be passed to this function

void * httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

Parameters

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

Parameters

• **handle**: Handle to server returned by httpd_start
• **sockfd**: The socket descriptor for which the context should be extracted.
• **ctx**: Context object to assign to the session
• **free_fn**: Function that should be called to free the context

```c
void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
```
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See** httpd_sess_get_ctx()

**Return**

• void*: Pointer to the transport context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

**Parameters**

• **handle**: Handle to server returned by httpd_start
• **sockfd**: The socket descriptor for which the context should be extracted.

```c
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx,
httpd_free_ctx_fn_t free_fn)
```
Set session ‘transport’ context by socket descriptor.

**See** httpd_sess_set_ctx()

**Parameters**

• **handle**: Handle to server returned by httpd_start
• **sockfd**: The socket descriptor for which the context should be extracted.
• **ctx**: Transport context object to assign to the session
• **free_fn**: Function that should be called to free the transport context

```c
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```
Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

**Parameters**

• **handle**: Handle to server returned by httpd_start

```c
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```
Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

**Parameters**

• **handle**: Handle to server returned by httpd_start

```c
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```
Trigger an httpd session close externally.

### 2.4. Application Protocols
Note Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Return

- ESP_OK : On successfully initiating closure
- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor of the session to be closed

```
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note Calling this API is only necessary if the LRU Purge Enable option is enabled.

Return

- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor of the session for which LRU counter is to be updated

Structures

```
struct httpd_config
```

HTTP Server Configuration Structure.

Note Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

```
unsigned task_priority
```

Priority of FreeRTOS task which runs the server
size_t stack_size
    The maximum stack size allowed for the server task

BaseType_t core_id
    The core the HTTP server task will run on

uint16_t server_port
    TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port
    UDP Port number for asynchronously exchanging control signals between various components of the
    server

uint16_t max_open_sockets
    Max number of sockets/clients connected at any time

uint16_t max_uri_handlers
    Maximum allowed uri handlers

uint16_t max_resp_headers
    Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
    Number of backlog connections

bool lru_purge_enable
    Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
    Timeout for recv function (in seconds)

uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.
    This field can be used to store arbitrary user data within the server context. The value can be retrieved
    using the server handle, available e.g. in the httpd_req_t struct.
    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If
    you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.
    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
    will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

httpd_open_func_t open_fn
    Custom session opening callback.
    Called on a new session socket just after accept(), but before reading any data.
    This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
    session overrides.

2.4. Application Protocols
If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`.

Returning a value other than ESP_OK will immediately close the new socket.

### `httpd_close_func_t close_fn`

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

### `httpd_uri_match_func_t uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`.

Available options are: 1) NULL : Internally do basic matching using `strncpy()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher.

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype).

### `struct httpd_req`

HTTP Request Data Structure.

#### Public Members

- `httpd_handle_t handle`
  Handle to server instance

- `int method`
  The type of HTTP request, -1 if unsupported method

- `const char uri[HTTPD_MAX_URI_LEN + 1]`
  The URI of this request (1 byte extra for null termination)

- `size_t content_len`
  Length of the request body

- `void *aux`
  Internally used members

- `void *user_ctx`
  User context pointer passed during URI registration.

- `void *sess_ctx`
  Session Context Pointer

  A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

  By default, this is NULL. URI Handlers can set this to any meaningful value.

  If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.
httpd_free_ctx_fn_t free_ctx

    Pointer to free context hook

    Function to free session context

    If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.
    If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes

    Flag indicating if Session Context changes should be ignored

    By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri

    Structure for URI handler.

    Public Members

const char *uri

    The URI to handle

httpd_method_t method

    Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)

    Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void *user_ctx

    Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT
HTTPD_200
    HTTP Response 200
HTTPD_204
    HTTP Response 204
HTTPD_207
    HTTP Response 207
HTTPD_400
    HTTP Response 400
HTTPD_404
    HTTP Response 404

2.4. Application Protocols
HTTPD_408
HTTP Response 408

HTTPD_500
HTTP Response 500

HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML

HTTPD_TYPE_OCTET
HTTP Content type octext-stream

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len,
int flags)
Prototype for HTTPDs low-level send function.

*Note* User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function.
Return

- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters

- hd: server instance
- sockfd: session socket file descriptor
- buf: buffer with bytes to send
- buf_len: data size
- flags: flags for the send() function

```c
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```
Prototype for HTTPDs low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Return

- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters

- hd: server instance
- sockfd: session socket file descriptor
- buf: buffer with bytes to send
- buf_len: data size
- flags: flags for the send() function

```c
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```
Prototype for HTTPDs low-level “get pending bytes” function.

Note User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return

- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
• HTTPD SOCK ERR FAIL : Unrecoverable error while calling socket pending()

Parameters

• hd: server instance
• sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t) (httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note

• If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
• When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
• The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD 500 INTERNAL SERVER ERROR and the socket closed anyway.

Return

• ESP_OK : error handled successful
• ESP_FAIL : failure indicates that the underlying socket needs to be closed

Parameters

• req: HTTP request for which the error needs to be handled
• error: Error type

typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t) (void *ctx)
Prototype for freeing context data (if any)

Parameters

• ctx: object to free

typedef esp_err_t (*httpd_open_func_t) (httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Return
• ESP_OK : On success
  • Any value other than ESP_OK will signal the server to close the socket immediately

Parameters
  • hd: server instance
  • sockfd: session socket file descriptor

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.

Note It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Parameters
  • hd: server instance
  • sockfd: session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.

Return true on match

Parameters
  • reference_uri: URI/template with respect to which the other URI is matched
  • uri_to_match: URI/template being matched to the reference URI/template
  • match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.

Note Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

Parameters
  • arg: The arguments for this work function

Enumerations

denum httpd_err_code_t
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

HTTPD_500_INTERNAL_SERVER_ERROR = 0
HTTPD_501_METHOD_NOT_IMPLEMENTED
HTTPD_505_VERSION_NOT_SUPPORTED
HTTPD_400_BAD_REQUEST
HTTPD_404_NOT_FOUND
HTTPD_405_METHOD_NOT_ALLOWED
HTTPD_408_REQ_TIMEOUT
HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
HTTPD_ERR_CODE_MAX

2.4.6 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config_t.global_transport_ctx
  - httpd_config_t.global_transport_ctx_free_fn
  - httpd_config_t.open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.
The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

**Performance**

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

**API Reference**

**Header File**

- `esp_https_server/include/esp_https_server.h`

**Functions**

```c
esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)
```

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

**Parameters**

- `config`: - server config, must not be const. Does not have to stay valid after calling this function.
- `handle`: - storage for the server handle, must be a valid pointer

```c
void httpd_ssl_stop(httpd_handle_t handle)
```

Stop the server. Blocks until the server is shut down.

**Parameters**

- `handle`: 

**Structures**

```c
struct httpd_ssl_config
```

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

**Public Members**

```c
httpd_config_t httpd
```

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```c
const uint8_t *cacert_pem
```

CA certificate

```c
size_t cacert_len
```

CA certificate byte length

2.4. Application Protocols
const uint8_t *prvtkey_pem
Private key

size_t prvtkey_len
Private key byte length

httpd_ssl_transport_mode_t transport_mode
Transport Mode (default secure)

uint16_t port_secure
Port used when transport mode is secure (default 443)

uint16_t port_insecure
Port used when transport mode is insecure (default 80)

Macros

HTTPD_SSL_CONFIG_DEFAULT()
Default config struct init

(http_server default config had to be copied for customization)

Notes:
• port is set when starting the server, according to 'transport_mode'
• one socket uses ~40kB RAM with SSL, we reduce the default socket count to 4
• SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
• Stack size may need adjustments depending on the user application

Type Definitions

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations

enum httpd_ssl_transport_mode_t
Values:

HTTPD_SSL_TRANSPORT_SECURE
HTTPD_SSL_TRANSPORT_INSECURE

2.4.7 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).
It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

### Create a new ping session

To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}
```

(continues on next page)
```c
void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res) == 0);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

eesp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_
    esp_ping_new_session(&ping_config, &cbs, &ping);
}
```

### Start and Stop ping session

You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

### Delete a ping session

If a ping session won’t be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

### Get runtime statistics

As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.
Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- lwip/include/apps/ping/ping_sock.h

Functions

```
esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)
```

Create a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

**Parameters**

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

```
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
```

Delete a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

**Parameters**

- `hdl`: handle of ping session

```
esp_err_t esp_ping_start(esp_ping_handle_t hdl)
```

Start the ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

**Parameters**

- `hdl`: handle of ping session
**esp_err_t esp_ping_stop (esp_ping_handle_t hdl)**

Stop the ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

**Parameters**
- hdl: handle of ping session

**esp_err_t esp_ping_get_profile (espPingHandle_t hdl, espPingProfile_t profile, void *data, uint32_t size)**

Get runtime profile of ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**
- hdl: handle of ping session
- profile: type of profile
- data: profile data
- size: profile data size

**Structures**

**struct esp_ping_callbacks_t**

Type of “ping” callback functions.

**Public Members**

- void *cb_args
  - arguments for callback functions

  void (*on_ping_success) (esp_ping_handle_t hdl, void *args)
  - Invoked by internal ping thread when received ICMP echo reply packet.

  void (*on_ping_timeout) (esp_ping_handle_t hdl, void *args)
  - Invoked by internal ping thread when receive ICMP echo reply packet timeout.

  void (*on_ping_end) (esp_ping_handle_t hdl, void *args)
  - Invoked by internal ping thread when a ping session is finished.

**struct esp_ping_config_t**

Type of “ping” configuration.
Public Members

uint32_t count
    A “ping” session contains count procedures

uint32_t interval_ms
    Milliseconds between each ping procedure

uint32_t timeout_ms
    Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
    Size of the data next to ICMP packet header

uint8_t tos
    Type of Service, a field specified in the IP header

ip_addr_t target_addr
    Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
    Stack size of internal ping task

uint32_t task_prio
    Priority of internal ping task

Macros

ESP_PING_DEFAULT_CONFIG()
    Default ping configuration.

ESP_PING_COUNT_INFINITE
    Set ping count to zero will ping target infinitely

Type Definitions

typedef void *esp_ping_handle_t
    Type of “ping” session handle.

Enumerations

enum esp_ping_profile_t
    Profile of ping session.

    Values:
    
    ESP_PING_PROF_SEQNO
        Sequence number of a ping procedure
    
    ESP_PING_PROF_TTL
        Time to live of a ping procedure
    
    ESP_PING_PROF_REQUEST
        Number of request packets sent out
    
    ESP_PING_PROF_REPLY
        Number of reply packets received

2.4. Application Protocols
ESP_PING_PROF_IPADDR
IP address of replied target

ESP_PING_PROF_SIZE
Size of received packet

ESP_PING_PROF_TIMEGAP
Elapsed time between request and reply packet

ESP_PING_PROF_DURATION
Elapsed time of the whole ping session

2.4.8 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .serviceUuid = {
                /* LSB <---------------------------------------
                * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_start →");
```

(continues on next page)
Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
```
Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value.
               * This is essential because the value has to be
               * valid even after this function returns.
               * Alternative is to use dynamic allocation
               * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, const esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        }
        else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl
**Client Side Implementation**

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

**API Reference**

**Header File**

- esp_local_ctrl/include/esp_local_ctrl.h

**Functions**

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
Function for obtaining BLE transport mode.

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
Start local control service.

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• config: Pointer to configuration structure

```
esp_err_t esp_local_ctrl_stop (void)
Stop local control service.
```

```
esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
Add a new property.
This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• prop: Property description structure
```

```
esp_err_t esp_local_ctrl_remove_property (const char *name)
Remove a property.
This finds a property by name, and releases the internal resources which are associated with it.

Return
• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Failure

Parameters
• name: Name of the property to remove
```

```
const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
Get property description structure by name.
This API may be used to get a property's context structure esp_local_ctrl_prop_t when its name is known

Return
• Pointer to property
• NULL if not found

Parameters
• name: Name of the property to find
```

```
esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler,
void *user_ctx)
Register protocomm handler for a custom endpoint.
This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.
```
Note In case of BLE transport the names and uids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- ep_name: Name of the endpoint
- handler: Endpoint handler function
- user_ctx: User data

Unions

union esp_local_ctrl_transport_config_t

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop

Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

2.4. Application Protocols
uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
Pointer to memory holding property value

size_t size
Size of property value

void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
                           esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for retrieving current values of properties.

Note If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

Parameters

- props_count: Total elements in the props array
- props: Array of properties, the current values for which have been requested by the client
prop_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

\texttt{esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)}

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_PROTO : InvalidProto
- All other error codes : InternalError

**Parameters**

- props_count: Total elements in the props array
- props: Array of properties, the values for which the client requests to change
- prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

\texttt{void *usr_ctx}

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

\texttt{void (*usr_ctx_free_fn)(void *usr_ctx)}

Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

**struct esp_local_ctrl_config**

Configuration structure to pass to esp_local_ctrl_start()
Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE
ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
Property description data structure, which is to be populated and passed to the
esp_local_ctrl_add_property() function.
Once a property is added, its structure is available for read-only access inside get_prop_values() and
set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
Transport mode (BLE / HTTPD) over which the service will be provided.
This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
Configuration for transport mode BLE.
This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
Configuration for transport mode HTTPD.
This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h.

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
Configuration structure to pass to esp_local_ctrl_start()

2.4.9 mDNS Service

[]

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.
mDNS Properties

- hostname: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32 will resolve to my-esp32.local

- default_instance: friendly name for your device, like Jhon’s ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

mDNS Services

mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- instance_name: friendly name for your service, like Jhon's ESP32 Web Server. If not defined, default_instance will be used.

- service_type: (required) service type, prepended with underscore. Some common types can be found here.

- proto: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp

- port: (required) network port that the service runs on

- txt: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32"},
        {"u", "user"},
        {"p", "password"}
    }
}
```
mDNS Query

mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses. Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char *host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if (err){
        if (err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char *if_str[] = {"STA", "AP", "ETH", "MAX");
static const char *ip_protocol_str[] = {"V4", "V6", "MAX");

void mdns_print_results(mdns_result_t *results)
{
    mdns_result_t *r = results;
    mdns_ip_addr_t *a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
```

(continues on next page)
void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if (err)
    {
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if (!results)
    {
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

Example of using the methods above:

void my_app_some_method()
{
    //search for esp32-mdns.local
    resolve_mdns_host("esp32-mdns");

    //search for HTTP servers
    find_mdns_service("_http", "_tcp");
    //or file servers
    find_mdns_service("_smb", "_tcp"); //windows sharing
    find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
    find_mdns_service("_nfs", "_tcp"); //NFS server
    find_mdns_service("_ftp", "_tcp"); //FTP server
    //or networked printer
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}
Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- mdns/include/mdns.h

Functions

`esp_err_t mdns_init (void)`

Initialize mDNS on given interface.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mdns task

`void mdns_free (void)`

Stop and free mDNS server.

`esp_err_t mdns_hostname_set (const char *hostname)`

Set the hostname for mDNS server required if you want to advertise services.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**

- hostname: Hostname to set

`esp_err_t mdns_instance_name_set (const char *instance_name)`

Set the default instance name for mDNS server.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**

- instance_name: Instance name to set
`esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)`

Add service to mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

**Parameters**
- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `port`: service port
- `txt`: string array of TXT data (eg. `{{"var","val"},{"other","2"}}`)  
- `num_items`: number of items in TXT data

`esp_err_t mdns_service_remove(const char *service_type, const char *proto)`

Remove service from mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)

`esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto, const char *instance_name)`

Set instance name for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
• instance_name: instance name to set

```c
esp_err_t mdns_service_port_set (const char *service_type, const char *proto, uint16_t port)
```

Set service port.

Return

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters

• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• port: service port

```c
esp_err_t mdns_service_txt_set (const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

Return

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters

• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• txt: array of TXT data (eg. {{“var”,”val”},{“other”,”2”}})
• num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set (const char *service_type, const char *proto, const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

Return

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters

• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to add/update
• value: the new value of the key

`esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)`

Remove TXT item for service TXT record.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to remove

`esp_err_t mdns_service_remove_all(void)`

Remove and free all services from mDNS server.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_result_t **results)`

Query mDNS for host or service All following query methods are derived from this one.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG timeout was not given

Parameters
• name: service instance or host name (NULL for PTR queries)
• service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds to wait for answers.
• max_results: maximum results to be collected
• results: pointer to the results of the query results must be freed using mdns_query_results_free below

2.4. Application Protocols
void \texttt{mdns\_query\_results\_free}(\texttt{mdns\_result\_t *results})

Free query results.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{results}: linked list of results to be freed
\end{itemize}

\texttt{esp\_err\_t mdns\_query\_ptr(\texttt{const char *service\_type, const char *proto, uint32\_t timeout, size\_t max\_results, mdns\_result\_t **results})}

Query mDNS for service.

\textbf{Return}

\begin{itemize}
  \item ESP_OK success
  \item ESP_ERR_INVALID\_STATE mDNS is not running
  \item ESP_ERR_NO\_MEM memory error
  \item ESP_ERR_INVALID\_ARG parameter error
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{service\_type}: service type (_http, _arduino, _ftp etc.)
  \item \texttt{proto}: service protocol (_tcp, _udp, etc.)
  \item \texttt{timeout}: time in milliseconds to wait for answer.
  \item \texttt{max\_results}: maximum results to be collected
  \item \texttt{results}: pointer to the results of the query
\end{itemize}

\texttt{esp\_err\_t mdns\_query\_srv(\texttt{const char *instance\_name, const char *service\_type, const char *proto, uint32\_t timeout, mdns\_result\_t **result})}

Query mDNS for SRV record.

\textbf{Return}

\begin{itemize}
  \item ESP_OK success
  \item ESP_ERR_INVALID\_STATE mDNS is not running
  \item ESP_ERR_NO\_MEM memory error
  \item ESP_ERR_INVALID\_ARG parameter error
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{instance\_name}: service instance name
  \item \texttt{service\_type}: service type (_http, _arduino, _ftp etc.)
  \item \texttt{proto}: service protocol (_tcp, _udp, etc.)
  \item \texttt{timeout}: time in milliseconds to wait for answer.
  \item \texttt{result}: pointer to the result of the query
\end{itemize}

\texttt{esp\_err\_t mdns\_query\_txt(\texttt{const char *instance\_name, const char *service\_type, const char *proto, uint32\_t timeout, mdns\_result\_t **result})}

Query mDNS for TXT record.

\textbf{Return}

\begin{itemize}
  \item ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• instance_name: service instance name
• service_type: service type (_http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• result: pointer to the result of the query

```
esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)
```

Query mDNS for A record.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• host_name: host name to look for
• timeout: time in milliseconds to wait for answer.
• addr: pointer to the resulting IP4 address

```
esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)
```

Query mDNS for A record.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• host_name: host name to look for
• timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
• addr: pointer to the resulting IP6 address

```
esp_err_t mdns_handle_system_event (void *ctx, system_event_t *event)
```

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Parameters

2.4. Application Protocols 991
• **ctx**: The system event context
• **event**: The system event

**Structures**

```c
struct mdns_txt_item_t
    mDNS basic text item structure Used in mdns_service_add()
```

**Public Members**

```c
const char *key
    item key name
const char *value
    item value string
```

```c
struct mdns_ip_addr_s
    mDNS query linked list IP item
```

**Public Members**

```c
esp_ip_addr_t addr
    IP address
struct mdns_ip_addr_s *next
    next IP, or NULL for the last IP in the list
```

```c
struct mdns_result_s
    mDNS query result structure
```

**Public Members**

```c
struct mdns_result_s *next
    next result, or NULL for the last result in the list
mdns_if_t tcpip_if
    interface index
mdns_ip_protocol_t ip_protocol
    ip_protocol type of the interface (v4/v6)
char *instance_name
    instance name
char *hostname
    hostname
uint16_t port
    service port
mdns_txt_item_t *txt
    txt record
size_t txt_count
    number of txt items
```
mdns_ip_addr_t *addr
linked list of IP addresses found

Macros

MDNS_TYPE_A
MDNS_TYPE_PTR
MDNS_TYPE_TXT
MDNS_TYPE_AAAA
MDNS_TYPE_SRV
MDNS_TYPE_OPT
MDNS_TYPE_NSEC
MDNS_TYPE_ANY

Type Definitions

typedef struct mdns_ip_addr_s mdns_ip_addr_t
mDNS query linked list IP item
typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
mDNS query result structure

Enumerations

enum mdns_ip_protocol_t
mDNS enum to specify the ip_protocol type

Values:
MDNS_IP_PROTOCOL_V4
MDNS_IP_PROTOCOL_V6
MDNS_IP_PROTOCOL_MAX

enum mdns_if_internal
Values:
MDNS_IF_STA = 0
MDNS_IF_AP = 1
MDNS_IF_ETH = 2
MDNS_IF_MAX
2.4.10 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

- **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon ("":") and trailing newline (CR/LF).

- **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

Modbus common interface API overview

The API functions below provide common functionality to setup Modbus stack for slave and master implementation accordingly. ESP-IDF supports Modbus serial slave and master protocol stacks and provides modbus_controller interface API to interact with user application.

```c
esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
```

Initialize Modbus controller and stack.

**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error

**Parameters**

- handler: handler(pointer) to master data structure
- port_type: type of stack

```c
esp_err_t mbc_master_init (mb_port_type_t port_type, void **handler)
```

Initialize Modbus controller and stack.

**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error

**Parameters**

- handler: handler(pointer) to master data structure
• **port_type**: the type of port

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

```c
esp_err_t mbc_slave_setup (void *comm_info)
```

Set Modbus communication parameters for the controller.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Incorrect parameter data

**Parameters**

• `comm_info`: Communication parameters structure.

```c
esp_err_t mbc_master_setup (void *comm_info)
```

Set Modbus communication parameters for the controller.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Incorrect parameter data

**Parameters**

• `comm_info`: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information.

- `mbc_slave_set_descriptor()`: Initialization of slave descriptor.
- `mbc_master_set_descriptor()`: Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

```c
esp_err_t mbc_slave_start (void)
```

Start Modbus communication stack.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Modbus stack start error

```c
esp_err_t mbc_master_start (void)
```

Start Modbus communication stack.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

```c
esp_err_t mbc_slave_destroy (void)
```

Destroy Modbus controller and stack.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

`esp_err_t mbc_master_destroy (void)`

Destroy Modbus controller and stack.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Selection of Modbus stack support mode” that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

Modbus serial slave interface API overview

The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus_controller interface using `mbc_slave_set_descriptor()` API call before start of communication. The interface API functions below are used for Modbus slave application:

`esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)`

Set Modbus area descriptor.

Return

- ESP_OK: The appropriate descriptor is set
- ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters

- descr_data: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master. See the `mb_register_area_descriptor_t` and example for more information.

`mb_event_group_t mbc_slave_check_event (mb_event_group_t group)`

Wait for specific event on parameter change.

Return

- mb_event_group_t event bits triggered

Parameters

- group: Group event bit mask to wait for change
The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return ESP_OK. See the mb_event_group_t for more information about Modbus event masks.

```c
esp_err_t mbc_slave_get_param_info(mb_param_info_t *reg_info, uint32_t timeout)
Get parameter information.
```

**Return**
- ESP_OK Success
- ESP_ERR_TIMEOUT Can not get data from parameter queue or queue overflow

**Parameters**
- `reg_info`: parameter info structure
- `timeout`: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig ‘CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE’ key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The mb_param_info_t structure contain information about accessed parameter.

**Modbus serial master interface API overview**

The Modbus master implementation requires parameter description table be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to be assigned to the modbus_controller interface using mbc_master_set_descriptor() API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

```c
esp_err_t mbc_master_set_descriptor(const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
Assign parameter description table for Modbus controller interface.
```

**Return**
- esp_err_t ESP_OK - set descriptor successfully
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

**Parameters**
- `descriptor`: pointer to parameter description table
- `num_elements`: number of elements in the table

Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular

```c
esp_err_t mbc_master_send_request(mb_param_request_t *request, void *data_ptr)
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.
```

**Return**
- esp_err_t ESP_OK - request was successful
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

• request: pointer to request structure of type mb_param_request_t
• data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

```c
esp_err_t mbc_master_get_cid_info(uint16_t cid, const mb_parameter_descriptor_t **param_info)
```

Get information about supported characteristic defined as cid. Uses parameter description table to get this information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return

• esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
• esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters

• cid: characteristic id
• param_info: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as cid. It will check if characteristic is supported and returns its description.

```c
esp_err_t mbc_master_get_parameter(uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

Return

• esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
• esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
• esp_err_t ESP_FAIL - slave returned an exception or other failure
Parameters

- **cid**: id of the characteristic for parameter
- **name**: pointer into string name (key) of parameter (null terminated)
- **value**: pointer to data buffer of parameter
- **type**: pointer to parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

```c
esp_err_t mbc_master_set_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return

- `esp_err_t ESP_OK` - request was successful and value was saved in the slave device registers
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave during processing of parameter
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

Parameters

- **cid**: id of the characteristic for parameter
- **name**: pointer into string name (key) of parameter (null terminated)
- **value**: pointer to data buffer of parameter (actual representation of json value field in binary form)
- **type**: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic’s value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

Application Example

The examples below use the FreeModbus library port for serial slave and master implementation accordingly. The selection of stack is performed through KConfig menu “Selection of Modbus stack support mode” and related configuration keys.

```bash
protocols/modbus/serial/mb_slave
protocols/modbus/serial/mb_master
```

Please refer to the specific example README.md for details.
2.4.11 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32

Features

• supports WebSocket over TCP, SSL with mbedtls  
• Easy to setup with URI  
• Multiple instances (Multiple clients in one application)

Configuration

URI

• Supports ws, wss schemes  
• WebSocket samples:  
  - ws://websocket.org: WebSocket over TCP, default port 80  
  - wss://websocket.org: WebSocket over SSL, default port 443  
• Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {  
  .uri = "ws://websocket.org",  
};
```

• If there are any options related to the URI in esp_websocket_client_config_t, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {  
  .uri = "ws://websocket.org:123",  
  .port = 4567,  
};
//WebSocket client will connect to websocket.org using port 4567
```

SSL

• Get certificate from server, example: websocket.org openssl s_client -showcerts -connect websocket.org:443 </dev/null 2>&dev/null openssl x509 -outform PEM >websocket_org.pem  
• Configuration:

```c
const esp_websocket_client_config_t ws_cfg = {  
  .uri = "wss://websocket.org",  
  .cert_pem = (const char *)websocket_org_pem_start,  
};
```

For more options on esp_websocket_client_config_t, please refer to API reference below
Application Example

Simple WebSocket example that uses esp_websocket_client to establish a websocket connection and send/receive data with the websocket.org Server: protocols/websocket.

API Reference

Header File

- esp_websocket_client/include/esp_websocket_client.h

Functions

`esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)`

Start a Websocket session This function must be the first function to call, and it returns a esp_websocket_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_websocket_client_destroy when the operation is complete.

Return

- esp_websocket_client_handle_t
- NULL if any errors

Parameters

- config: The configuration

`esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)`

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

Return esp_err_t

Parameters

- client: The client
- uri: The uri

`esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)`

Open the WebSocket connection.

Return esp_err_t

Parameters

- client: The client

`esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)`

Close the WebSocket connection.

Return esp_err_t

Parameters

- client: The client
esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

Return esp_err_t

Parameters

• client: The client

int esp_websocket_client_send(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)

Generic write data to the WebSocket connection; defaults to binary send.

Return

• Number of data was sent
• (-1) if any errors

Parameters

• client: The client
• data: The data
• len: The length
• timeout: Write data timeout in RTOS ticks

int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Return

• Number of data was sent
• (-1) if any errors

Parameters

• client: The client
• data: The data
• len: The length
• timeout: Write data timeout in RTOS ticks

int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Return

• Number of data was sent
• (-1) if any errors

Parameters

• client: The client
• data: The data
• len: The length
• timeout: Write data timeout in RTOS ticks

bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
Check the WebSocket connection status.

Return
• true
• false

Parameters
• client: The client handle

esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client, esp_websocket_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
Register the Websocket Events.

Return esp_err_t

Parameters
• client: The client handle
• event: The event id
• event_handler: The callback function
• event_handler_arg: User context

Structures

struct esp_websocket_event_data_t
Websocket event data.

Public Members

const char *data_ptr
Data pointer

int data_len
Data length

uint8_t op_code
Received opcode

esp_websocket_client_handle_t client
esp_websocket_client_handle_t context

void *user_context
user_data context, from esp_websocket_client_config_t user_data

int payload_len
Total payload length, payloads exceeding buffer will be posted through multiple events

2.4. Application Protocols
int payload_offset
   Actual offset for the data associated with this event

struct esp_websocket_client_config_t
   Websocket client setup configuration.

Public Members

c const char *uri
   Websocket URI, the information on the URI can be overrides the other fields below, if any

c const char *host
   Domain or IP as string

int port
   Port to connect, default depend on esp_websocket_transport_t (80 or 443)

c const char *username
   Using for Http authentication - Not supported for now

c const char *password
   Using for Http authentication - Not supported for now

c const char *path
   HTTP Path, if not set, default is /

bool disable_auto_reconnect
   Disable the automatic reconnect function when disconnected

void *user_context
   HTTP user data context

int task_prio
   Websocket task priority

int task_stack
   Websocket task stack

int buffer_size
   Websocket buffer size

c const char *cert_pem
   SSL Certification, PEM format as string, if the client requires to verify server

esp_websocket_transport_t transport
   Websocket transport type, see *esp_websocket_transport_t

char *subprotocol
   Websocket subprotocol

char *user_agent
   Websocket user-agent

char *headers
   Websocket additional headers

Type Definitions

typedef struct esp_websocket_client *esp_websocket_client_handle_t
Enumerations

```c
typenum esp_websocket_event_id_t

Websocket Client events id.

Values:

WEB_SOCKET_EVENT_ANY = -1

WEB_SOCKET_EVENT_ERROR = 0
  This event occurs when there are any errors during execution

WEB_SOCKET_EVENT_CONNECTED
  Once the Websocket has been connected to the server, no data exchange has been performed

WEB_SOCKET_EVENT_DISCONNECTED
  The connection has been disconnected

WEB_SOCKET_EVENT_DATA
  When receiving data from the server, possibly multiple portions of the packet

WEB_SOCKET_EVENT_MAX
```

datatype enum esp_websocket_transport_t

Websocket Client transport.

Values:

WEB_SOCKET_TRANSPORT_UNKNOWN = 0x0
  Transport unknown

WEB_SOCKET_TRANSPORT_OVER_TCP
  Transport over tcp

WEB_SOCKET_TRANSPORT_OVER_SSL
  Transport over ssl

2.4.12 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

For more details about ESP32 SDIO slave protocol, see document *Communication with ESP SDIO Slave*.

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the `esp_serial_slave_link` component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
• ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.

• ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.

• Bus: The bus over which the master and the slave communicate with each other.

• Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.

• TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.

• RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line.

2. Frhost Interrupts: The master can inform the slave about certain events.

3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.

   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.

4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.

   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.

5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

**Initialization of ESP SDIO Slave Link**

The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.

2. Call `sdmmc_card_init()` to initialize the card.

3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.

5. Call `essl_wait_for_ready()` to wait for the slave to be ready.
APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Interrupts**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.
5. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)**

Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.
API Reference

Header File

- esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

`esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)`

Initialize the slave.

Return ESP_OK if success, or other value returned from lower layer init.

Parameters

- handle: Handle of a essl device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)`

Wait for interrupt of a ESP32 slave device.

Return

- ESP_OK if success
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of a essl device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`

Get buffer num for the host to send data to the slave. The buffers are size of buffer_size.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of a essl device.
- out_tx_num: Output of buffer num that host can send data to ESP32 slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)`

Get amount of data the ESP32 slave preparing to send to host.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters
• handle: Handle of a essl device.
• out_rx_size: Output of data size to read from slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_reset_cnt (essl_handle_t handle)
```
Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

Parameters

• handle: Handle of a essl device.

```c
esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)
```
Send a packet to the ESP32 slave. The slave receive the packet into buffers whose size is buffer_size (configured during initialization).

Return

• ESP_OK Success
• ESP_ERR_TIMEOUT No buffer to use, or error from SDMMC host controller
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of a essl device.
• start: Start address of the packet to send
• length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)
```
Get a packet from ESP32 slave.

Return

• ESP_OK Success, all the data are read from the slave.
• ESP_ERR_NOT_FINISHED Read success, while there’re data remaining.
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of a essl device.
• out_data: Data output address
• size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
• out_length: Output of length the data actually received from slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint32_t wait_ms)
```
Write general purpose R/W registers (8-bit) of ESP32 slave.
Note  sdio 28-31 are reserved, the lower API helps to skip.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Address not valid.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of a essl device.
- addr: Address of register to write. Valid address: 0-59.
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_read_reg(essl_handle_t handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)
```

Read general purpose R/W registers (8-bit) of ESP32 slave.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Address not valid.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of a essl device.
- add: Address of register to read. Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read).
- value_o: Output value read from the register.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

Return

- ESP_ERR_NOT_SUPPORTED Currently our driver does not support SDIO with SPI interface.
- ESP_OK If interrupt triggered.
- ESP_ERR_TIMEOUT No interrupts before timeout.

Parameters

- handle: Handle of a essl device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESP32 slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Return
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of a essl device.
- intr_mask: Mask of interrupt bits to clear.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```
Get interrupt bits of ESP32 slave.

**Return**
- ESP_OK Success
- ESP_INVALID_ARG if both intr_raw and intr_st are NULL.
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of a essl device.
- intr_raw: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- intr_st: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```
Set interrupt enable bits of ESP32 slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of a essl device.
- ena_mask: Mask of the interrupt bits to enable.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)
```
Get interrupt enable bits of ESP32 slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of a essl device.
- ena_mask_o: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_send_slave_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of a essl device.
- intr_mask: Mask of interrupt bits to send to slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Macros**

```c
ESP_ERR_NOT_FINISHED
```

There is still remaining data.

**Type Definitions**

```c
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

```c
esp_err_t essl_sdio_init_dev(essl_handle_t *out_handle, const essl_sdio_config_t *config)
```

Initialize the ESSL SDIO device and get its handle.

**Return**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**Parameters**
- out_handle: Output of the handle.
- config: Configuration for the ESSL SDIO device.

```c
esp_err_t essl_sdio_deinit_dev(essl_handle_t handle)
```

Deinitialize and free the space used by the ESSL SDIO device.

**Return**
- ESP_OK: on success
• ESP_ERR_INVALID_ARG: wrong handle passed

Parameters

• handle: Handle of the ESSL SDIO device to deinit.

Structures

struct essl_sdio_config_t
Configuration for the essl SDIO device.

Public Members

sdmmc_card_t *card
The initialized sdmmc card pointer of the slave.

int recv_buffer_size
The pre-negotiated recv buffer size used by both the host and the slave.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.4.13 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.5 Provisioning API

[]

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:

• Communication security at application level -
  – protocomm_security0 (no security)
  – protocomm_security1 (curve25519 key exchange + AES-CTR encryption)

• Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).
Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

**Transport Example (SoftAP + HTTP) with Security 1**

For complete example see provisioning/softap_prov

```c
/* Endpoint handler to be registered with protocomm. */
* This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                           const uint8_t *inbuf, ssize_t inlen,
                           uint8_t **outbuf, ssize_t *outlen,
                           void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen; /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid */
    /* throughout the scope of protocomm endpoint. This need not be static, */
    /* ie. could be dynamically allocated and freed at the time of endpoint */
    /* removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for */
* request handlers, setting security creates an endpoint and registers
* the handler provided by protocomm_security1. One can similarly use
* protocomm_security0. Only one type of security can be set for a
* protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1, &pop_obj);

/* Private data passed to the endpoint must be valid throughout the scope
* of protocomm endpoint. This need not be static, ie. could be
* dynamically
* allocated and freed at the time of endpoint removal */
static uint32_t
priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a unique
* name
* and register a handler function along with private data to be passed
* at the
* time of handler execution. Multiple endpoints can be added as long as
* they
* are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);
return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

Transport Example (BLE) with Security 0

For complete example see provisioning/ble_prov

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };
}
/* Config for protocomm_ble_start() */
protocomm_ble_config_t config = {
  .service_uuid = {
    /* LSB <---------------------------------------
       * ---------------------------------------> MSB */
    0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
    0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
  },
  .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
  .nu_lookup = nu_lookup_table
};

/* Start protocomm layer on top of BLE */
protocomm_ble_start(pc, &config);

/* For protocomm_security0, Proof of Possession is not used, and can be kept NULL */
protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
return pc;

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
  protocomm_remove_endpoint(pc, "echo_req_endpoint");
  protocomm_unset_security(pc, "security_endpoint");

  /* Stop BLE protocomm service */
  protocomm_ble_stop(pc);
  protocomm_delete(pc);
}

API Reference

Header File

- protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new (void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Return

- protocomm_t*: On success
• NULL : No memory for allocating new instance

```c
void protocomm_delete (protocomm_t *pc)
```

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

**Parameters**

- **pc**: Pointer to the protocomm instance to be deleted

```c
esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, proto-
comm_reg_handler_t h, void *priv_data)
```

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

**Return**

- **ESP_OK** : Success
- **ESP_FAIL** : Error adding endpoint / Endpoint with this name already exists
- **ESP_ERR_NO_MEM** : Error allocating endpoint resource
- **ESP_ERR_INVALID_ARG** : Null instance/name/handler arguments

**Parameters**

- **pc**: Pointer to the protocomm instance
- **ep_name**: Endpoint identifier(name) string
- **h**: Endpoint handler function
- **priv_data**: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

**Return**

- **ESP_OK** : Success
- **ESP_ERR_NOT_FOUND** : Endpoint with specified name doesn’t exist
- **ESP_ERR_INVALID_ARG** : Null instance/name arguments

**Parameters**
• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```
Allocates internal resources for new transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- pc: Pointer to the protocomm instance
- session_id: Unique ID for a communication session

```c
esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)
```
Frees internal resources used by a transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- pc: Pointer to the protocomm instance
- session_id: Unique ID for a communication session

```c
esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id,
                               const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```
Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments
Parameters

- **pc**: Pointer to the protocomm instance
- **ep_name**: Endpoint identifier(name) string
- **session_id**: Unique ID for a communication session
- **inbuf**: Input buffer contains input request data which is to be processed by the registered handler
- **inlen**: Length of the input buffer
- **outbuf**: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen**: Buffer length of the allocated output buffer

```c
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- **ESP_OK**: Success
- **ESP_FAIL**: Error adding endpoint / Endpoint with this name already exists
- **ESP_ERR_INVALID_STATE**: Security endpoint already set
- **ESP_ERR_NO_MEM**: Error allocating endpoint resource
- **ESP_ERR_INVALID_ARG**: Null instance/name/handler arguments

**Parameters**

- **pc**: Pointer to the protocomm instance
- **ep_name**: Endpoint identifier(name) string
- **sec**: Pointer to endpoint security instance
- **pop**: Pointer to proof of possession for authenticating a client

```c
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**

- **ESP_OK**: Success
- **ESP_ERR_NOT_FOUND**: Endpoint with specified name doesn’t exist
- **ESP_ERR_INVALID_ARG**: Null instance/name arguments

**Parameters**
• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string

```c
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```
Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note
• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

Return
• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP.ERR.INVALID_STATE : Version endpoint already set
• ESP.ERR.NO_MEM : Error allocating endpoint resource
• ESP.ERR.INVALID_ARG : Null instance/name/handler arguments

Parameters
• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string
• version: Version identifier(name) string

```c
esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)
```
Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return
• ESP_OK : Success
• ESP.ERR.NOT_FOUND : Endpoint with specified name doesn’t exist
• ESP.ERR.INVALID_ARG : Null instance/name arguments

Parameters
• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string

Type Definitions

```c
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```
Function prototype for protocomm endpoint handler.

```c
typedef struct protocomm protocomm_t
```
This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.
Note Structure of the protocomm object is kept private

Header File

- protocomm/include/security/protocomm_security.h

Structures

struct protocomm_security_pop
Proof Of Possession for authenticating a secure session.

Public Members

const uint8_t *data
Pointer to buffer containing the proof of possession data

uint16_t len
Length (in bytes) of the proof of possession data

struct protocomm_security
Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
Function which implements the decryption algorithm

2.5. Provisioning API
Type Definitions

typedef struct "protocomm_security_pop" protocomm_security_pop_t
    Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct "protocomm_security" protocomm_security_t
    Protocomm security object structure.
    The member functions are used for implementing secure protocomm sessions.
    
    Note This structure should not have any dynamic members to allow re-entrancy

Header File

- protocomm/include/security/protocomm_security0.h

Header File

- protocomm/include/security/protocomm_security1.h

Header File

- protocomm/include/transports/protocomm_httpd.h

Functions

```
esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
```
    Start HTTPD protocomm transport.
    
    This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.
    
    Note This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

    Return
    
    - ESP_OK : Success
    - ESP_ERR_INVALID_ARG : Null arguments
    - ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
    - ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
    - ESP_ERR_NO_MEM : Memory allocation for server resource failed
    - ESP_ERR_HTTPD_* : HTTP server error on start

    Parameters
    
    - pc: Protocomm instance pointer obtained from protocomm_new()
    - config: Pointer to config structure for initializing HTTP server
esp_err_t protocomm_httpd_stop (protocomm_t *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

Return

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Parameters

- pc: Same protocomm instance that was passed to protocomm_httpd_start()

Unions

union protocomm_httpd_config_data_t
#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

Public Members

void *handle
HTTP Server Handle, if ext_handle_provided is set to true

protocomm_httpd_config_t config
HTTP Server Configuration, if a server is not already active

Structures

struct protocomm_http_server_config_t
Config parameters for protocomm HTTP server.

Public Members

uint16_t port
Port on which the HTTP server will listen

size_t stack_size
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate of an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data
Macros

`PROTOCOMM_HTTPD_DEFAULT_CONFIG()`

Header File

- `protocomm/include/transports/protocomm_ble.h`

Functions

`esp_err_t protocomm_ble_start(protocomm_t *pc, const protocomm_ble_config_t *config)`

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE start error
- ESP_ERR_NO_MEM : Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE : Error in ble config
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- `pc`: Protocomm instance pointer obtained from `protocomm_new()`
- `config`: Pointer to config structure for initializing BLE

`esp_err_t protocomm_ble_stop(protocomm_t *pc)`

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning.

Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters

- `pc`: Same protocomm instance that was passed to `protocomm_ble_start()`

Structures

`struct name_uuid`

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
**Public Members**

```c
const char *name
Name of the handler, which is passed to protocomm layer
```

```c
uint16_t uuid
UUID to be assigned to the BLE characteristic which is mapped to the handler
```

```c
struct protocomm_ble_config
Config parameters for protocomm BLE service.
```

**Public Members**

```c
char device_name[MAX_BLE_DEVNAME_LEN]
BLE device name being broadcast at the time of provisioning
```

```c
uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service
```

```c
ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table
```

```c
protocomm_ble_name_uuid_t *nu_lookup
Pointer to the Name-UUID lookup table
```

**Macros**

```c
MAX_BLE_DEVNAME_LEN
BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes
```

```c
BLE_UUID128_VAL_LENGTH
```

**Type Definitions**

```c
typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
```

```c
typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.
```

---

## 2.5.2 Unified Provisioning

**Overview**

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.
1. **Extensible Protocol**: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. **Transport Flexibility**: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. **Security Scheme Flexibility**: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. **Compact Data Representation**: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.

4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

#### Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.
2.5. Provisioning API

1. Transport specific discovery and connection

Some form of beaconing

Client connects

2. Session Establishment =

Get Version Request

Get Version Response

Session Setup Request

Session Setup Response

One or multiple steps as per protocol

3. Configuration

App specific Set Config (optional)

Set Config Response (optional)

Wi-Fi SetConfig(SSID, Passphrase...)

Wi-Fi SetConfig response

Wi-Fi ApplyConfig cmd

Wi-Fi ApplyConfig resp

Wi-Fi GetStatus cmd (repeated)

Wi-Fi GetStatus resp (repeated)

4. Close connection
1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

![Unified Provisioning Architecture](image)

Fig. 24: Unified Provisioning Architecture

It relies on the base layer called Protocol Communication (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.
Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key

b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

**Sample Code**

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Various use case implementations can be found as examples under provisioning.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- Android: esp-idf-provisioning-android
- iOS: esp-idf-provisioning-ios
- Linux/MacOS/Windows: tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

**2.5.3 Wi-Fi Provisioning**

**Overview**

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr_ APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization**

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other wifi_prov_mgr_ APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.
The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`: Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`: Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`: Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE`: Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`'s that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_EVENT:
                ESP_LOGI(TAG, "Provisioning started");
        }
    }
}
```

}
Start Provisioning Service

At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is wifi_prov_scheme_softap
- BLE Device name (service key is ignored) when scheme is wifi_prov_scheme_ble

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (`pop`), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored

See `Provisioning` for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in `Check Provisioning State`.

Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```
The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`'s and call `:cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like:

```
```

Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of posses-
sion for authentication. Any application related version / capabilities will be given by other labels (like my_app in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under protocomm/proto, which define the Protobuf message structures supported by prov-session endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of wifi_config commands, serialized as Protobuf messages (the corresponding .proto files can be found under wifi_provisioning/proto):

- `get_status` - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- `set_config` - For setting the Wi-Fi connection credentials
- `apply_config` - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the wifi_config commands described above. The wifi_scan endpoint supports the following protobuf commands:

- `scan_start` - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished
  - `passive` (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - `group_channels` (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - `period_ms` (input) - Scan parameter specifying how long to wait on each channel
- `scan_status` - Gives the status of scanning process:
  - `scan_finished` (output) - When scan has finished this returns true
  - `result_count` (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- `scan_result` - For fetching scan results. This can be called even if scan is still on going
  - `start_index` (input) - Starting index from where to fetch the entries from the results list
  - `count` (input) - Number of entries to fetch from the starting index
Additional Endpoints

In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

When / How To Stop Provisioning Service?

The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

Application Examples

For complete example implementation see provisioning/manager
API Reference

Header File

- wifi_provisioning/include/wifi_provisioning/manager.h

Functions

**esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)**

Initialize provisioning manager instance.

- Configures the manager and allocates internal resources
- Configuration specifies the provisioning scheme (transport) and event handlers
- Event WIFI_PROV_INIT is emitted right after initialization is complete

**Return**

- ESP_OK : Success
- ESP_FAIL : Fail

**Parameters**

- **config**: Configuration structure

**void wifi_prov_mgr_deinit (void)**

Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished
- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

**esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)**

Checks if device is provisioned.

- This checks if Wi-Fi credentials are present on the NVS
- The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component
- If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

**Parameters**

- **provisioned**: True if provisioned, else false
Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- `wifi_prov_scheme_ble`: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap`: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov._tcp`)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

**Return**

- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

**Parameters**

- `security`: Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- `pop`: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- `service_name`: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- `service_key`: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.
Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
    Wait for provisioning service to finish.
```

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
    Disable auto stopping of provisioning service upon completion.
```

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**

- **ESP_OK** : Success
- **ESP_ERR_INVALID_STATE** : Manager not initialized or provisioning service already started

**Parameters**

- cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

```c
esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char *capabilities, size_t total_capabilites)
    Set application version and capabilities in the JSON data returned by proto-ver endpoint.
```

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**

- **ESP_OK** : Success
- **ESP_ERR_INVALID_STATE** : Manager not initialized or provisioning service already started
- **ESP_ERR_NO_MEM** : Failed to allocate memory for version string
• ESP_ERR_INVALID_ARG : Null argument

Parameters
• **label**: String indicating the application name.
• **version**: String indicating the application version. There is no constraint on format.
• **capabilities**: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
• **total_capabilities**: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)
```

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• **ep_name**: unique name of the endpoint

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
**2.5. Provisioning API**

- **ep_name**: Name of the endpoint
- **handler**: Endpoint handler function
- **user_ctx**: User data

```c
void wifi_prov_mgr_endpoint_unregister(const char *ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters**

- **ep_name**: Name of the endpoint

```c
esp_err_t wifi_prov_mgr_event_handler (void *ctx, system_event_t *event)
```

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events

**Note**: This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

**Return**

- **ESP_OK**: Event handled successfully

**Parameters**

- **ctx**: Event context data
- **event**: Event info

```c
esp_err_t wifi_prov_mgr_get_wifi_state(wifi_prov_sta_state_t *state)
```

Get state of Wi-Fi Station during provisioning.

**Return**

- **ESP_OK**: Successfully retrieved Wi-Fi state
- **ESP_FAIL**: Provisioning app not running

**Parameters**

- **state**: Pointer to wifi_prov_sta_state_t variable to be filled

```c
esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason(wifi_prov_sta_fail_reason_t *reason)
```

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Return**

- **ESP_OK**: Successfully retrieved Wi-Fi disconnect reason
- **ESP_FAIL**: Provisioning app not running

**Parameters**

- **reason**: Pointer to wifi_prov_sta_fail_reason_t variable to be filled
esp_err_t wifi_prov_mgr_configure_sta(wifi_config_t *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Return

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

Parameters

- wifi_cfg: Pointer to Wi-Fi configuration structure

Structures

struct wifi_prov_event_handler_t

Event handler that is used by the manager while provisioning service is active.

Public Members

wifif_prov_cb_func_t event_cb

Callback function to be executed on provisioning events

void *user_data

User context data to pass as parameter to callback function

struct wifi_prov_scheme

Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:

- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

Public Members

esp_err_t (*prov_start)(protocomm_t *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (*prov_stop)(protocomm_t *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
void *(*new_config)(void)
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to 
prov_start() 

void *(*delete_config)(void *config)
Function which is to be called by the manager to delete a configuration generated using new_config() 

esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure 

esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure 

wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning This is set to :
- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport 

struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme
Provisioning scheme to use. Following schemes are already available:
- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

wifi_prov_event_handler_t app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE
Event handler can be set to none if not used.

2.5. Provisioning API
Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t
Structure for specifying the provisioning scheme to be followed by the manager.

Note  Ready to use schemes are available:
• wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

Enumerations

enum wifi_prov_cb_event_t
Events generated by manager.
 These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:
WIFI_PROV_INIT
Emitted when the manager is initialized
WIFI_PROV_START
Indicates that provisioning has started
WIFI_PROV_CRED_RECV
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure
WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t
WIFI_PROV_CRED_SUCCESS
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV
WIFI_PROV_END
Signals that provisioning service has stopped
WIFI_PROV_DEINIT
Signals that manager has been de-initialized

enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm
Values:

**WIFI_PROV_SECURITY_0 = 0**
No security (plain-text communication)

**WIFI_PROV_SECURITY_1**
This secure communication mode consists of X25519 key exchange
  • proof of possession (pop) based authentication
  • AES-CTR encryption

Header File

- wifi_provisioning/include/wifi_provisioning/schema_ble.h

Functions

```c
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data);
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data);
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data);
esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128);
```

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

Return

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Parameters

- `uuid128`: A custom 128 bit UUID

Macros

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`
Header File

- wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions

void wifi_prov_scheme_softap_set_httpd_handle (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note This API should be called before wifi_prov_mgr_start_provisioning()

Parameters
- handle: Handle to HTTPD server instance

Header File

- wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File

- wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions

esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the wifi_config endpoint handler (protocomm protocomm_req_handler_t) using protocomm_add_endpoint()

Structures

struct wifi_prov_sta_conn_info_t

WiFi STA connected status information.

Public Members

char ip_addr[IP4ADDR_STRLEN_MAX]

IP Address received by station

char bssid[6]

BSSID of the AP to which connection was established

char ssid[33]

SSID of the to which connection was established
uint8_t channel
    Channel of the AP
uint8_t auth_mode
    Authorization mode of the AP

struct wifi_prov_config_get_data_t
    WiFi status data to be sent in response to get_status request from master.

Public Members

  wifi_prov_sta_state_t wifi_state
    WiFi state of the station

  wifi_prov_sta_fail_reason_t fail_reason
    Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)

  wifi_prov_sta_conn_info_t conn_info
    Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

struct wifi_prov_config_set_data_t
    WiFi config data received by slave during set_config request from master.

Public Members

  char ssid[33]
    SSID of the AP to which the slave is to be connected

  char password[64]
    Password of the AP

  char bssid[6]
    BSSID of the AP

  uint8_t channel
    Channel of the AP

struct wifi_prov_config_handlers
    Internal handlers for receiving and responding to protocomm requests from master.

  This is to be passed as priv_data for protocomm request handler (refer
  to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

  esp_err_t (*get_status_handler) (wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
    Handler function called when connection status of the slave (in WiFi station mode) is requested

  esp_err_t (*set_config_handler) (const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
    Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave
    (in WiFi station mode) is to be set to user provided values

  esp_err_t (*apply_config_handler) (wifi_prov_ctx_t **ctx)
    Handler function for applying the configuration that was set in set_config_handler. After applying
    the station may get connected to the AP or may fail to connect. The slave must be ready to convey the
    updated connection status information when get_status_handler is invoked again by the master.

2.5. Provisioning API
typedef struct wifi_prov_ctx wifi_prov_ctx_t
   Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.
   This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
   Internal handlers for receiving and responding to protocomm requests from master.
   This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

enum wifi_prov_sta_state_t
   WiFi STA status for conveying back to the provisioning master.
   Values:
   WIFI_PROV_STA_CONNECTING
   WIFI_PROV_STA_CONNECTED
   WIFI_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t
   WiFi STA connection fail reason.
   Values:
   WIFI_PROV_STA_AUTH_ERROR
   WIFI_PROV_STA_AP_NOT_FOUND

Code examples for this API section are provided in the provisioning directory of ESP-IDF examples.

2.6 Storage API

2.6.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.
**Using FatFs with VFS**

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_register()` functions:

1. **Call `esp_vfs_fat_register()` to specify:**
   - Path prefix where to mount the filesystem (e.g. "/sdcard", "/spiflash")
   - FatFs drive number
   - A variable which will receive the pointer to the FATFS structure

2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.

3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see FatFs documentation <http://www.elm-chan.org/fsw/fj/doc/mount.html>.

4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, "/sdcard/hello.txt").

5. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").

6. Close all open files.

7. Call the FatFs function `f_mount` for the same drive number, with NULL FATFS* argument, to unmount the filesystem.

8. Call the FatFs function `ff_diskio_register()` with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.

9. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_sdmmcUnmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

```
esp_err_t esp_vfs_fat_register(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)
```

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

**Note** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**Parameters**

2.6. Storage API
• **base_path**: path prefix where FATFS should be registered
• **fat_drive**: FATFS drive specification; if only one drive is used, can be an empty string
• **max_files**: maximum number of files which can be open at the same time
• **out_fs**: pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

```c
esp_err_t esp_vfs_fat_unregister_path(const char *base_path)
```

Un-register FATFS from VFS.

**Note**  
FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

**Parameters**
• **base_path**: path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

### Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()` and `esp_vfs_fat_sdmmcUnmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmcUnmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config,  
                                 const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
• initializes SDMMC driver or SPI driver with configuration in host_config
• initializes SD card with configuration in slot_config
• mounts FAT partition on SD card using FATFS library, with configuration in mount_config
• registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
• ESP_ERR_NO_MEM if memory can not be allocated
• ESP_FAIL if partition can not be mounted
• other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters

• base_path: path where partition should be registered (e.g. "/sdcard")
• host_config: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
• slot_config: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT. For SPI peripheral, pass a pointer to sdspi_slot_config_t structure initialized using SDSPI_SLOT_CONFIG_DEFAULT.
• mount_config: pointer to structure with extra parameters for mounting FATFS
• out_card: if not NULL, pointer to the card information structure will be returned via this argument

struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_sdmmc_unmount (void)
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

Return

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

Using FatFs with VFS in read-only mode

The header file fatfs/vfs/esp_vfs_fat.h also defines the convenience functions esp_vfs_fat_rawflash_mount() and esp_vfs_fat_rawflash_unmount(). These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions
written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```c
esp_err_t esp_vfs_fat_rawflash_mount(const char *base_path, const char *partition_label,
const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_rawflash_mount was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**

- base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
- partition_label: label of the partition which should be used
- mount_config: pointer to structure with extra parameters for mounting FATFS

```c
esp_err_t esp_vfs_fat_rawflashUnmount (const char *base_path, const char *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

**Parameters**

- base_path: path where partition should be registered (e.g. “/spiflash”)
- partition_label: label of partition to be unmounted

**FatFS disk IO layer**

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`. 
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
    Register or unregister diskio driver for given drive number.

    When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in
disco_impl for given pdrv will be called.

Parameters

    • pdrv: drive number
    • discio_impl: pointer to ff_diskio_impl_t structure with diskio functions or NULL to unregister
and free previously registered drive

struct ff_diskio_impl_t
    Structure of pointers to disk IO driver functions.
    See FatFs documentation for details about these functions

Public Members

DSTATUS (*init)(unsigned char pdrv)
    disk initialization function

DSTATUS (*status)(unsigned char pdrv)
    disk status check function

DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
    sector read function

DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)
    sector write function

DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
    function to get info about disk and do some misc operations

void ff_diskio_register_sdmmc (unsigned char pdrv, sdmmc_card_t *card)
    Register SD/MMC diskio driver

Parameters

    • pdrv: drive number
    • card: pointer to sdmmc_card_t structure describing a card; card should be initialized before calling
f_mount.

esp_err_t ff_diskio_register_wl_partition (unsigned char pdrv, wl_handle_t flash_handle)
    Register spi flash partition

Parameters

    • pdrv: drive number
    • flash_handle: handle of the wear levelling partition.

esp_err_t ff_diskio_register_raw_partition (unsigned char pdrv, const esp_partition_t
    *part_handle)
    Register spi flash partition

Parameters

2.6. Storage API
• pdrv: drive number
• part_handle: pointer to raw flash partition.

2.6.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

• esptool.py
• Flash Download tool (available on Windows only)
• Direct flash programming

Prerequisites

This utility is dependent on esp-idf’s NVS partition utility.

• Operating System requirements:
  – Linux / MacOS / Windows (standard distributions)

• The following packages are needed to use this utility:
  – Python version: 2.7 (minimum) is required. You can find it here: <https://www.python.org/downloads/>

Note:

Before using this utility, please make sure that:

• The path to Python is added to the PATH environment variable.
• You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.

Workflow
CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```
name1,namespace,  <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

**Note:** The first line in this file should always be the `namespace` entry.

Each line should have three parameters: `key,type,encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

**Note:**

Make sure there are no spaces:
- before and after `;`
- at the end of each line in a CSV file

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,...
value1,value2,value3,...
```

**Note:** The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the `value` of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:
value  Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6fceed,,103
```

**Note:** If the `REPEAT` tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the `REPEAT` tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>

Commands:

Run mfg_gen.py {command} -h for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

(continues on next page)
To generate factory images for each device (Default): Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
```

Positional Arguments:

```
+--------------+------------------------------------------------------------------
| Parameter | Description |
+------------+-------------+------------------------------------------------------------------+
| conf       | Path to configuration csv file to parse                          |
| values     | Path to values csv file to parse                                 |
| prefix     | Unique name for each output filename prefix                       |
| size       | Size of NVS partition in bytes (must be multiple of 4096)         |
+------------+------------------------------------------------------------------+
```

Optional Arguments:

```
+---------------------+-----------------------------------------------------------+
| Parameter | Description |
|------------+-------------+-----------------------------------------------------------+
| -h, --help | show this help message and exit                            |
| --fileid FILEID | Unique file identifier(any key in values file) |
++. . . .      | for each filename suffix (Default: numeric value(1,2,3...)) |
| --version {1,2} | Set multipage blob version.                               |
+. . . .      | Version 2 - Multipage blob support enabled.                |
+---------------------+-----------------------------------------------------------+
```

(continues on next page)
You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

**Note:** This newly created file having encryption keys in `keys` directory is compatible with NVS key-partition structure. Refer to `NVS key partition` for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

**To generate only encryption keys:** Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:
You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

**Note:** To provide custom target filename use the --keyfile argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3,.. of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

### 2.6.3 Non-volatile storage library

#### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.
Underlying storage

Currently, NVS uses a portion of main flash memory through `spi_flash_{read|write|erase}` APIs. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open` API function or any other partition by specifying its name using the `nvs_open_from_part` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase_flash` target to erase all contents of the flash chip.

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store largeblobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and values

NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- if the new value is of the same type as the old one, value is updated
- if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces

To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the `nvs_open` or `nvs_open_from_part` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_`, `nvs_set_`, and `nvs_commit` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.
Security, tampering, and robustness

NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

Internals

Log of key-value pairs

NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and entries

NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.

Active Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

| +--------+ | +--------+ | +--------+ | +--------+ |
| | Page 1 | | Page 2 | | Page 3 | | Page 4 |
| | Full | +----> | Full | +----> | Active | | Empty | <- states |
| | #11 | | #12 | | #14 | | | <- sequence numbers |

(continues on next page)
Structure of a page

For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, entry size is 32 bytes. For integer types, entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

Entry and entry state bitmap

Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2'b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).
Written (2'b10)  A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

Erased (2'b00) A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

Structure of entry

For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

```
+--------+----------+----------+----------------+-----------+---------------+---------
| NS (1) | Type (1) | Span (1) | ChunkIndex (1) | CRC32 (4) | Key (16) | Data (8) |
+--------+----------+----------+----------------+-----------+---------------+---------
    +-+----------+----------+
    | Primitive + Data (8) |
    +----------+----------+
    +----------+----------+
    | Fixed length -
    +----------+----------+
    | Types +----------+
    +----------+----------+
    +----------+----------+
    | ChunkStart(1) | Rsv(2) | Data format ---
    +----------+----------+
    +----------+----------+
    | Blob Index +----------+
    +----------+----------+
    +----------+----------+
    | Variable length --> | Size (2) | Rsv (2) | CRC32 (4) |
    +----------+----------+
```

Individual fields in entry structure have the following meanings:

**NS**  Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type**  One byte indicating the value data type. See the ItemType enumeration in nvs_types.h for possible values.

**Span**  Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex**  Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

**CRC32**  Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key**  Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data**  For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
• **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.

• **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

• **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.

• **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

### Namespaces

As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

```
| NS=0 Type=uint8_t Key="wifi" Value=1  |
| NS=1 Type=uint32_t Key="channel" Value=6  |
| NS=0 Type=uint8_t Key="pwm" Value=2    |
| NS=2 Type=uint16_t Key="channel" Value=20 |
```

**Item hash list**

To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

### NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.
NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted. Refer to Partition Tables for more details. The size of the partition should be 4096 bytes (minimum partition size). The structure of this partition is depicted below.

```
+---------------------------+---------------------------+---------------------------+----+
<table>
<thead>
<tr>
<th>XTS encryption key (32)</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------------------</td>
</tr>
<tr>
<td>XTS tweak key (32)</td>
</tr>
<tr>
<td>---------------------------</td>
</tr>
<tr>
<td>CRC32(4)</td>
</tr>
<tr>
<td>---------------------------</td>
</tr>
</tbody>
</table>
```

This partition can be generated using nvs partition generator utility and flashed onto the device. Since the partition is marked encrypted and Flash Encryption is enabled, bootloader will encrypt this partition using flash encryption key on the first boot. Alternatively, the keys can be generated after startup using the nvs_flash_generate_keys API function provided by nvs_flash.h, which will then write those keys onto the key-partition in encrypted form.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

Encrypted Read/Write

The same NVS API functions nvs_get_* or nvs_set_* can be used for reading of, and writing to an encrypted nvs partition as well. However, the API functions for initialising NVS partitions are different: nvs_flash_secure_init and nvs_flash_secure_init_partition instead of nvs_flash_init and nvs_flash_init_partition respectively. The nvs_sec_cfg_t structure required for these API functions can be populated using nvs_flash_generate_keys or nvs_flash_read_securityCfg.

Applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using esp_partition_find* API functions.
2. Populate the nvs_sec_cfg_t struct using the nvs_flash_read_securityCfg or nvs_flash_generate_keys API functions.
3. Initialise NVS flash partition using the nvs_flash_secure_init or nvs_flash_secure_init_partition API functions.
4. Open a namespace using the nvs_open or nvs_open_from_part API functions.
5. Perform NVS read/write operations using nvs_get_* or nvs_set_*.
6. Deinitialise an NVS partition using nvs_flash_deinit.

NVS iterators

Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type. There are the following functions available:

- nvs_entry_find returns an opaque handle, which is used in subsequent calls to the nvs_entry_next and nvs_entry_info functions.
- nvs_entry_next returns iterator to the next key-value pair.
- `nvs_entry_info` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find` and `nvs_entry_next` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator`.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to [NVS Partition Generator Utility](#).

**Application Example**

You can find two code examples in the `storage` directory of ESP-IDF examples:

**storage/nvs_rw_value**

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

**storage/nvs_rw_blob**

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- **value** - tracks the number of the ESP32 module soft and hard restarts.
- **blob** - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

**API Reference**

**Header File**

- `nvs_flash/include/nvs_flash.h`

**Functions**

```c
esp_err_t nvs_flash_init(void)
```

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**
• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
• one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_init_partition(const char *partition_label)
```

Initialize NVS flash storage for the specified partition.

**Return**

• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
• one of the error codes from the underlying flash storage driver

**Parameters**

• `partition_label`: Label of the partition. Must be no longer than 16 characters.

```c
esp_err_t nvs_flash_deinit(void)
```

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Return**

• ESP_OK on success (storage was deinitialized)
• ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```c
esp_err_t nvs_flash_deinit_partition(const char *partition_label)
```

Deinitialize NVS storage for the given NVS partition.

**Return**

• ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

**Parameters**

• `partition_label`: Label of the partition

```c
esp_err_t nvs_flash_erase(void)
```

Erase the default NVS partition.

This function erases all contents of the default NVS partition (one with label “nvs”)

**Return**

• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
### esp_err_t nvs_flash_erase_partition(const char *part_name)

Erase specified NVS partition.

This function erases all contents of specified NVS partition

**Return**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table

**Parameters**

- **part_name**: Name (label) of the partition to be erased

### esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- **cfg**: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

### esp_err_t nvs_flash_secure_init_partition(const char *partition_label, nvs_sec_cfg_t *cfg)

Initialize NVS flash storage for the specified partition.

**Return**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- **partition_label**: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- **cfg**: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

### esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)

Generate and store NVS keys in the provided esp partition.

**Return**

- ESP_OK, if cfg was read successfully; -or error codes from esp_partition_write/erase APIs.
Parameters

- **partition**: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg**: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

```c
esp_err_t esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked ‘encrypted’.

**Return** -ESP_OK, if cfg was read successfully; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from esp_partition_read API.

**Parameters**

- **partition**: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg**: Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Structures**

```c
struct nvs_sec_cfg_t
```

Key for encryption and decryption.

**Public Members**

- `uint8_t eky[NVS_KEY_SIZE]` XTS encryption and decryption key
- `uint8_t tky[NVS_KEY_SIZE]` XTS tweak key

**Macros**

NVS_KEY_SIZE

**Header File**

- `nvs_flash/include/nvs.h`

**Functions**

```c
esp_err_t esp_err_t nvs_set_i8(nvs_handle_t handle, const char *key, int8_t value)
```

set value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.
Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters

- **handle**: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key**: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- **value**: The value to set. For strings, the maximum length (including null character) is 4000 bytes.

```c
esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)
esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)
esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)
esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)
esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)
esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)

esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)
get value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

```c
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still have its default value.
```

Return

- ESP_OK if the value was retrieved successfully
ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters
- handle: Handle obtained from nvs_open function.
- key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)
```

get value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
  size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
  char *server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
  uint8_t mac_addr[6];
  size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Return
• ESP_OK if the value was retrieved successfully
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

• handle: Handle obtained from nvs_open function.
• key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
• out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
• length: A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)
```

```c
esp_err_t nvs_open(const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Return

• ESP_OK if storage handle was opened successfully
• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
• ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
• ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
• ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
• other error codes from the underlying storage driver

Parameters

• name: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
• open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
• out_handle: If successful (return code is zero), handle will be returned in this argument.

```c
esp_err_t nvs_open_from_partition(const char *part_name, const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.
Return

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- other error codes from the underlying storage driver

Parameters

- part_name: Label (name) of the partition of interest for object read/write/erase
- name: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- out_handle: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOTENOUGHSPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVEFAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

Parameters

- handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- key: Key name. Maximal length is 15 characters. Shouldn’t be empty.
- value: The value to set.
- length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.
esp_err_t nvs_erase_key (nvs_handle_t handle, const char *key)
Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

Return

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

Parameters

- handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
- key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.

esp_err_t nvs_erase_all (nvs_handle_t handle)
Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

Return

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

Parameters

- handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

esp_err_t nvs_commit (nvs_handle_t handle)
Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

Return

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

Parameters

- handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
void \texttt{nvs\_close} \texttt{(nvs\_handle\_t handle)}

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with \texttt{nvs\_open} once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using \texttt{nvs\_commit} function. Once this function is called on a handle, the handle should no longer be used.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{handle}: Storage handle to close
\end{itemize}

\texttt{esp\_err\_t nvs\_get\_stats(const char *part\_name, nvs\_stats\_t *nvs\_stats)}

Fill structure \texttt{nvs\_stats\_t}. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

\begin{verbatim}
// Example of nvs_get_stats() to get the number of used entries and free entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
    nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
\end{verbatim}

\textbf{Return}

\begin{itemize}
  \item ESP\_OK if the changes have been written successfully. Return param nvs\_stats will be filled.
  \item ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label “name” is not found. Return param nvs\_stats will be filled 0.
  \item ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param nvs\_stats will be filled 0.
  \item ESP\_ERR\_INVALID\_ARG if nvs\_stats equal to NULL.
  \item ESP\_ERR\_INVALID\_STATE if there is page with the status of INVALID. Return param nvs\_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{part\_name}: Partition name NVS in the partition table. If pass a NULL than will use NVS\_DEFAULT\_PART\_NAME (“nvs”).
  \item \texttt{nvs\_stats}: Returns filled structure nvs\_stats\_t. It provides info about used memory the partition.
\end{itemize}

\texttt{esp\_err\_t nvs\_get\_used\_entry\_count(nvs\_handle\_t handle, size\_t *used\_entries)}

Calculate all entries in a namespace.

Note that to find out the total number of records occupied by the namespace, add one to the returned value used\_entries (if err is equal to ESP\_OK). Because the name space entry takes one entry.

\begin{verbatim}
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if\( (\texttt{nvs\_get\_used\_entry\_count(handle, \&used\_entries)} == \texttt{ESP\_OK})\{
\end{verbatim}
total_entries_namespace = used_entries + 1;

Return

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_INVALID_ARG if used_entries equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

Parameters

- handle: Handle obtained from nvs_open function.
- used_entries: Returns amount of used entries from a namespace.

nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified
//partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
```

Return Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using nvs_release_iterator when not used any more.

Parameters

- part_name: Partition name
- namespace_name: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- type: One of nvs_type_t values.

nvs_iterator_t nvs_entry_next(nvs_iterator_t iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.
Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid `nvs_iterator_t` otherwise.

**Parameters**

- `iterator`: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

```c
void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)
```

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

**Parameters**

- `iterator`: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- `out_info`: Structure to which entry information is copied.

```c
void nvs_release_iterator (nvs_iterator_t iterator)
```

Release iterator.

**Parameters**

- `iterator`: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

### Structures

**struct nvs_entry_info_t**

Information about entry obtained from `nvs_entry_info` function

#### Public Members

- `char namespace_name[16]`
  
  Namespace to which key-value belong

- `char key[16]`
  
  Key of stored key-value pair

- `nvs_type_t type`
  
  Type of stored key-value pair

**struct nvs_stats_t**

Information about storage space NVS.

#### Public Members

- `size_t used_entries`
  
  Amount of used entries.

- `size_t free_entries`
  
  Amount of free entries.

- `size_t total_entries`
  
  Amount all available entries.

- `size_t namespace_count`
  
  Amount name space.

---

2.6. Storage API

---

1077
Macros

ESP_ERR_NVS_BASE
Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED
The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND
Id namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH
The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY
Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE
There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME
Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE
Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
Key name is too long

ESP_ERR_NVS_PAGE_FULL
Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
String or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed
ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

Type Definitions

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations

enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:

NVS_READONLY
Read only

NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.

Values:

NVS_TYPE_U8 = 0x01
Type uint8_t

NVS_TYPE_I8 = 0x11
Type int8_t

NVS_TYPE_U16 = 0x02
Type uint16_t

2.6. Storage API
### 2.6.4 NVS Partition Generator Utility

#### Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

#### Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in `requirements.txt` in the root of the esp-idf directory.

#### CSV file format

Each line of a `.csv` file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i32, string, hex2bin, base64 and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value.</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace is fixed and is not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value    <-- column header
namespace_name,namespace,,  <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**Note:**

Make sure there are no spaces:

- before and after ','
- at the end of each line in a CSV file

**NVS Entry and Namespace association**

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

**Multipage Blob Support**

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of entry*. If you intend to use an older format, the utility provides an option to disable this feature.
Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>

Commands:

```
Run nvs_partition_gen.py {command} -h for additional help
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

To generate NVS partition (Default):

Usage:
You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```bash
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] input output size
```

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```
To generate only encryption keys:

Usage:

```bash
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

```
- - h, -- help  show this help message and exit

- - -- key file KEYFILE | Path to output encryption keys file

- - -- out dir OUTDIR | Output directory to store files created.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store files created.</td>
</tr>
</tbody>
</table>
```

You can run the utility to generate only encryption keys using the command below:

```bash
python nvs_partition_gen.py generate-key
```

To generate encrypted NVS partition:

Usage:

```bash
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
```

Positional Arguments:

```
input | Path to CSV file to parse

output | Path to output NVS binary file

size | Size of NVS partition in bytes (must be multiple of 4096)
```

(continues on next page)
Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```python
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen
  ```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  -0x3000 --keygen --keyfile sample_keys.bin

Note: Encryption key of the following format <outdir>/keys/sample_keys.bin is created.

Note: This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to NVS key partition for more details.

• Encrypt by providing the encryption keys as input binary file:

python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  -0x3000 --inputkey sample_keys.bin

To decrypt encrypted NVS partition:

Usage:

python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output

Positional Arguments:

+---------------------+------------------------------------------------------+
| Parameter | Description |
+---------------------+------------------------------------------------------+
| input | Path to encrypted NVS partition file to parse |
| key | Path to file having keys for decryption |
| output | Path to output decrypted binary file |

Optional Arguments:

+---------------------+------------------------------------------------------+
| Parameter | Description |
+---------------------+------------------------------------------------------+
| -h, --help | show this help message and exit |
| --outdir OUTDIR | Output directory to store files created |

(continues on next page)
You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):**

You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**Multipage Blob Support Enabled (Version 2):**

You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** Minimum NVS Partition Size needed is 0x3000 bytes.

**Note:** When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

### 2.6.5 SD/SDIO/MMC Driver

[]
Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level
driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (driver/include/driver/sdmmc_host.h) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see SDMMC Host API
- SD SPI host, see SD SPI Host API

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card
initialization and data transfer commands.

The protocol layer works with the host via the sdmmc_host_t structure. This structure contains pointers to various
functions of the host.

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the storage/sd_card directory
of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library
APIs. See README.md file in the example directory for more information.

Protocol layer API

The protocol layer is given the sdmmc_host_t structure. This structure describes the SD/MMC host driver, lists
its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information
in the sdmmc_card_t structure. When sending commands to the SD/MMC host driver, the protocol layer uses the
sdmmc_command_t structure to describe the command, arguments, expected return values, and data to transfer if
there is any.

Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., sdmmc_host_init(), sdmmc_host_init_slot().
2. To initialize the card, call sdmmc_card_init() and pass to it the parameters host - the host driver
   information, and card - a pointer to the structure sdmmc_card_t which will be filled with information about
   the card when the function completes.
3. To read and write sectors of the card, use sdmmc_read_sectors() and sdmmc_write_sectors()
   respectively and pass to it the parameter card - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., sdmmc_host_deinit() - to disable the
   host peripheral and free the resources allocated by the driver.
Using API with eMMC chips

From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (sdmmc_card_t, sdmmc_card_init). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards

Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with sdmmc_card_init(), the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling sdmmc_io_write_byte().

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td>sdmmc_io_read_byte()</td>
<td>sdmmc_io_write_byte()</td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td>sdmmc_io_read_bytes()</td>
<td>sdmmc_io_write_bytes()</td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td>sdmmc_io_read_blocks()</td>
<td>sdmmc_io_write_blocks()</td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function sdmmc_io_enable_int(). When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use sdmmc_io_wait_int().

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See ESP Serial Slave Link and example peripherals/sdio/host.

Combo (memory + IO) cards

The driver does not support SD combo cards. Combo cards are treated as IO cards.

Thread safety

Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the sdmmc_card_t structure, or when accessing SDMMC or SD SPI host drivers. Such
locking is usually implemented on a higher layer, e.g., in the filesystem driver.

API Reference

Header File

- `sdmmc/include/sdmmc_cmd.h`

Functions

```c
 esp_err_t sdmmc_card_init (const sdmmc_host_t *host, sdmmc_card_t *out_card)
```

Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Return**

- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**

- `host`: pointer to structure defining host controller
- `out_card`: pointer to structure which will receive information about the card when the function completes

```c
 void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)
```

Print information about the card to a stream.

**Parameters**

- `stream`: stream obtained using fopen or fdopen
- `card`: card information structure initialized using sdmmc_card_init

```c
 esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```

Write given number of sectors to SD/MMC card

**Return**

- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**

- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `src`: pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
Write given number of sectors to SD/MMC card

Return

• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
• dst: pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
• start_sector: sector where to start reading
• sector_count: number of sectors to read

esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Return

• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• reg: byte address within IO function
• out_byte: output, receives the value read from the card

esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Return

• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• reg: byte address within IO function
• in_byte: value to be written
• out_byte: if not NULL, receives new byte value read from the card (read-after-write).

esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)
This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where reading starts
- dst: buffer which receives the data read from card
- size: number of bytes to read

esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)
This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- src: data to be written
- size: number of bytes to write

esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)
This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• addr: byte address within IO function where writing starts
• dst: buffer which receives the data read from card
• size: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**

- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- src: data to be written
- size: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

**Parameters**

- card: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Return**

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

**Parameters**

- card: pointer to card information structure previously initialized using sdmmc_card_init
- timeout_ticks: time to wait for the interrupt, in RTOS ticks
**esp_err_t sdmmc_io_get_cis_data** (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Return**

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc_io_read_bytes

**Parameters**

- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer**: Output buffer of the CIS data
- **buffer_size**: Size of the buffer.
- **inout_cis_size**: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

**esp_err_t sdmmc_io_print_cis_info** (uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of a SDIO card.

**Note** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

**Return**

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

**Parameters**

- **buffer**: Buffer to parse
- **buffer_size**: Size of the buffer.
- **fp**: File pointer to print to, set to NULL to print to stdout.
Header File

- driver/include/driver/sdmmc_types.h

Structures

```c
struct sdmmc_csd_t
Decoded values from SD card Card Specific Data register

Public Members

int csd_ver
    CSD structure format
int mmc_ver
    MMC version (for CID format)
int capacity
    total number of sectors
int sector_size
    sector size in bytes
int read_block_len
    block length for reads
int card_command_class
    Card Command Class for SD
int tr_speed
    Max transfer speed
```

```c
struct sdmmc_cid_t
Decoded values from SD card Card IDentification register

Public Members

int mfg_id
    manufacturer identification number
int oem_id
    OEM/product identification number
char name[8]
    product name (MMC v1 has the longest)
int revision
    product revision
int serial
    product serial number
int date
    manufacturing date
```

```c
struct sdmmc_scr_t
Decoded values from SD Configuration Register
```
Public Members

int sd_spec
    SD Physical layer specification version, reported by card

int bus_width
    bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

struct sdmmc_ext_csd_t
    Decoded values of Extended Card Specific Data

Public Members

uint8_t power_class
    Power class used by the card

struct sdmmc_switch_func_rsp_t
    SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
    response data

struct sdmmc_command_t
    SD/MMC command information

Public Members

uint32_t opcode
    SD or MMC command index

uint32_t arg
    SD/MMC command argument

sdmmc_response_t response
    response buffer

void *data
    buffer to send or read into

size_t datalen
    length of data buffer

size_t blklen
    block length

int flags
    see below

esp_err_t error
    error returned from transfer

int timeout_ms
    response timeout, in milliseconds
**struct sdmmc_host_t**

SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

### Public Members

- `uint32_t flags`
  - flags defining host properties
- `int slot`
  - slot number, to be passed to host functions
- `int max_freq_khz`
  - max frequency supported by the host
- `float io_voltage`
  - I/O voltage used by the controller (voltage switching is not supported)

- `esp_err_t(*init)(void)`
  - Host function to initialize the driver

- `esp_err_t(*set_bus_width)(int slot, size_t width)`
  - host function to set bus width

- `size_t(*get_bus_width)(int slot)`
  - host function to get bus width

- `esp_err_t(*set_bus_ddr_mode)(int slot, bool ddr_enable)`
  - host function to set DDR mode

- `esp_err_t(*set_card_clk)(int slot, uint32_t freq_khz)`
  - host function to set card clock frequency

- `esp_err_t(*do_transaction)(int slot, sdmmc_command_t *cmdinfo)`
  - host function to do a transaction

- `esp_err_t(*deinit)(void)`
  - host function to deinitialize the driver

- `esp_err_t(*io_int_enable)(int slot)`
  - Host function to enable SDIO interrupt line

- `esp_err_t(*io_int_wait)(int slot, TickType_t timeout_ticks)`
  - Host function to wait for SDIO interrupt line to be active

- `int command_timeout_ms`
  - timeout, in milliseconds, of a single command. Set to 0 to use the default value.

**struct sdmmc_card_t**

SD/MMC card information structure

### Public Members

- `sdmmc_host_t host`
  - Host with which the card is associated
- `uint32_t ocr`
  - OCR (Operation Conditions Register) value
\texttt{sdmmc_cid_t\ cid}  
decoded CID (Card IDentification) register value

\texttt{sdmmc_response_t\ raw_cid}  
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

\texttt{sdmmc_csd_t\ csd}  
decoded CSD (Card-Specific Data) register value

\texttt{sdmmc_scr_t\ scr}  
decoded SCR (SD card Configuration Register) value

\texttt{sdmmc_ext_csd_t\ ext_csd}  
decoded EXT_CSD (Extended Card Specific Data) register value

\texttt{uint16_t\ rca}  
RCA (Relative Card Address)

\texttt{uint16_t\ max_freq_khz}  
Maximum frequency, in kHz, supported by the card

\texttt{uint32_t\ is_mem}  
Bit indicates if the card is a memory card

\texttt{uint32_t\ is_sdio}  
Bit indicates if the card is an IO card

\texttt{uint32_t\ is_mmc}  
Bit indicates if the card is MMC

\texttt{uint32_t\ num_io_functions}  
If is_sdio is 1, contains the number of IO functions on the card

\texttt{uint32_t\ log_bus_width}  
\texttt{log2(bus width supported by card)}

\texttt{uint32_t\ is_drr}  
Card supports DDR mode

\texttt{uint32_t\ reserved}  
Reserved for future expansion

\textbf{Macros}

\texttt{SDMMC_HOST_FLAG_1BIT}  
host supports 1-line SD and MMC protocol

\texttt{SDMMC_HOST_FLAG_4BIT}  
host supports 4-line SD and MMC protocol

\texttt{SDMMC_HOST_FLAG_8BIT}  
host supports 8-line MMC protocol

\texttt{SDMMC_HOST_FLAG_SPI}  
host supports SPI protocol

\texttt{SDMMC_HOST_FLAG_DDR}  
host supports DDR mode for SD/MMC

\texttt{SDMMC_FREQ_DEFAULT}  
SD/MMC Default speed (limited by clock divider)
**SDMMC_FREQ_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC_FREQ_PROBING**

SD/MMC probing speed

**SDMMC_FREQ_52M**

MMC 52MHz speed

**SDMMC_FREQ_26M**

MMC 26MHz speed

### Type Definitions

typedef uint32_t sdmmc_response_t[4]

SD/MMC command response buffer

### 2.6.6 SPI Flash API

[]

#### Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The spi_flash component also has higher-level API functions which work with partitions defined in the partition table.

Different from the API before IDF v4.0, the functionality is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flashes chips on not only SPI0/1 but also HSPI/VSPI buses.

**Note:** Flash APIs after IDF v4.0 are no longer atomic. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

Kconfig option CONFIG_SPI_FLASH_USE_LEGACY_IMPL can be used to switch spi_flash_* functions back to the implementation before IDF v4.0. However, the code size may get bigger if you use the new API and the old API the same time.

Encrypted reads and writes use the old implementation, even if CONFIG_SPI_FLASH_USE_LEGACY_IMPL is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips on SPI1 with different CS).

#### Initializing a flash device

To use esp_flash_* APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.

2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the esp_flash_t structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

---

### SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

### Concurrency Constraints for flash on SPI1

Because the SPI1 flash is also used for firmware execution via the instruction & data caches, these caches must be disabled while reading/writing/erasing. This means that both CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur.

If you use the API functions documented here, then these constraints are applied automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the `application memory layout` documentation.

To avoid reading flash cache accidentally, when one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state, and all non-IRAM-safe interrupts are disabled on both CPUs until the flash operation completes.

If one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state to avoid reading flash cache accidentally. All interrupts not safe for IRAM are disabled on both CPUs until the flash operation completes.
IRAM-Safe Interrupt Handlers

If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the ESP_INTR_FLAG_IRAM flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM.

Use the IRAM_ATTR attribute for functions:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

Use the DRAM_ATTR and DRAM_STR attributes for constant data:

```c
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };  
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

Note that knowing which data should be marked with DRAM_ATTR can be hard, the compiler will sometimes recognize that a variable or expression is constant (even if it is not marked const) and optimize it into flash, unless it is marked with DRAM_ATTR.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](https://docs.espressif.com/projects/esp-idf/en/latest/development-reference/partition_table_api.html).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in esp_partition.h:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `spi_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in
flash, based on data stored in a partition table.

**SPI Flash Encryption**

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware. Refer to the *Flash Encryption documentation* for more details.

**Memory mapping API**

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64KB pages. Memory mapping hardware can map up to four megabytes of flash into data address space and up to 16 megabytes of flash into instruction address space. See the technical reference manual for more details about memory mapping hardware.

Note that some 64KB pages are used to map the application itself into memory, so the actual number of available 64KB pages may be less.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in *esp_spi_flash.h* and *esp_partition.h*:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in 64KB blocks, it may be possible to read data outside of the partition provided to `esp_partition_mmap`.

**Implementation**

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provides support of some OS functions (e.g. lock, delay) in different stages (1st/2st boot, or the app).
Host driver

The host driver relies on an interface (spi_flash_host_driver_t) defined in the spi_flash_host_drv.h (in the soc/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However due to the speed limitations of ESP32, the HAL layer can’t provide high-speed implementations to some reading commands (So we didn’t do it at all). The files (memspi_host_driver.h and .c) implement the high-speed version of these commands with the common_command function provided in the HAL, and wrap these functions as spi_flash_host_driver_t for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the spi_flash_host_driver_t are implemented, the esp_flash API can access to the flash regardless of the low-level hardware.

Chip driver

The chip driver, defined in spi_flash_chip_driver.h, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS functions

Currently the OS function layer provides a lock and a delay entries.

The lock is used to resolve the conflicts between the SPI chip access and other functions. E.g. the cache (used for the code and PSRAM data fetch) should be disabled when the flash chip on SPI0/1 is being accessed. Also, some devices which don’t have CS wire, or the wire is controlled by the software (e.g. SD card via SPI interface), requires the bus to be monopolized during a period.

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

- Partition Table documentation
- Over The Air Update (OTA) API provides high-level API for updating app firmware stored in flash.
- Non-Volatile Storage (NVS) API provides a structured API for storing small pieces of data in SPI flash.

Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler
before performing the flash operation. In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

**API Reference - SPI Flash**

**Header File**

- `spi_flash/include/esp_flash_spi_init.h`

**Functions**

```c
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

**Return**

- ESP_ERR_INVALID_ARG: `out_chip` is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

**Parameters**

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

```c
esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)
```

Remove a SPI Flash device from the SPI bus.

**Return**

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

**Parameters**
• chip: The flash device to remove.

Structures

struct esp_flash_spi_device_config_t
Configurations for the SPI Flash to init.

Public Members

    spi_host_device_t host_id
    Bus to use.

    int cs_id
    CS pin (signal) to use.

    int cs_io_num
    GPIO pin to output the CS signal.

    esp_flash_io_mode_t io_mode
    IO mode to read from the Flash.

    esp_flash_speed_t speed
    Speed of the Flash clock.

    int input_delay_ns
    Input delay of the data pins, in ns. Set to 0 if unknown.

Header File

• spi_flash/include/esp_flash.h

Functions

esp_err_t esp_flash_init (esp_flash_t *chip)
Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

Note If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

Return ESP_OK on success, or a flash error code if initialisation fails.

Parameters

• chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

bool esp_flash_chip_driver_initialized (const esp_flash_t *chip)
Check if appropriate chip driver is set.

Return true if set, otherwise false.

Parameters
chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

```c
esp_err_t esp_flash_read_id(esp_flash_t *chip, uint32_t *out_id)
```
Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_id: Pointer to receive ID value.

**Return** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t *out_size)
```
Detect flash size based on flash ID.

**Note** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_size: Detected size in bytes.

```c
esp_err_t esp_flash_erase_chip(esp_flash_t *chip)
```
Erase flash chip contents.

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

```c
esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)
```
Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- start: Address to start erasing flash. Must be sector aligned.
- len: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Return** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```
Read if the entire chip is write protected.
Note  A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return  ESP_OK on success, or a flash error code if operation failed.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- write_protected: Pointer to boolean, set to the value of the write protect flag.

`esp_err_t esp_flash_set_chip_write_protect (esp_flash_t *chip, bool write_protect)`

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note  Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- write_protected: Boolean value for the write protect flag

Return  ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_get_protectable_regions (const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)`

Read the list of individually protectable regions of this SPI flash chip.

Note  Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return  ESP_OK on success, or a flash error code if operation failed.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_regions: Pointer to receive a pointer to the array of protectable regions of the chip.
- out_num_regions: Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

`esp_err_t esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)`

Detect if a region of the SPI flash chip is protected.

Note  It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note  Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return  ESP_OK on success, or a flash error code if operation failed.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **region**: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.  
• **out_protected**: Pointer to a flag which is set based on the protected status for this region.

```
esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• **region**: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.  
• **protect**: Write protection flag to set.

```
esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• **buffer**: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.  
• **address**: Address on flash to read from. Must be less than `chip->size` field.  
• **length**: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Return**

• ESP_OK: success  
• ESP_ERR_NO_MEM: the buffer is not valid, however failed to malloc on the heap.  
• or a flash error code if operation failed.

```
esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• **address**: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
• **buffer**: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
• **length**: Length (in bytes) of data to write.

**Return** ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted (esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size.

**Return**
• ESP_OK: on success
• ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
• ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
• or other flash error code from spi_flash_write_encrypted().

**Parameters**
• **chip**: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
• **address**: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
• **buffer**: Pointer to a buffer with the data to write.
• **length**: Length (in bytes) of data to write. 16 byte aligned.

`esp_err_t esp_flash_read_encrypted (esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Return**
• ESP_OK: on success
• ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
• or other flash error code from spi_flash_read_encrypted().

**Parameters**
• **chip**: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
• **address**: Address on flash to read from.
• **out_buffer**: Pointer to a buffer for the data to read to.
• **length**: Length (in bytes) of data to read.

`static bool esp_flash_is_quad_mode (const esp_flash_t *chip)`

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return** true if flash works in quad mode, otherwise false

**Parameters**
• chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Structures

struct esp_flash_region_t
Structure for describing a region of flash.

Public Members

uint32_t offset
Start address of this region.

uint32_t size
Size of the region.

struct esp_flash_os_functions_t
OS-level integration hooks for accessing flash chips inside a running OS

Public Members

esp_err_t (*start) (void *arg)
Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (*end) (void *arg)
Called after completing any flash operation.

esp_err_t (*region_protected) (void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (*delay_ms) (void *arg, unsigned ms)
Delay for at least ‘ms’ milliseconds. Called in between ‘start’ and ‘end’.

struct esp_flash_t
Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()).

Public Members

spi_flash_host_driver_t *host
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
Configured SPI flash read mode. Set before esp_flash_init is called.
Type Definitions

typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t

Header File

- soc/include/hal/spi_flash_types.h

Structures

struct spi_flash_trans_t
Definition of a common transaction. Also holds the return value.

Public Members

uint8_t command
Command to send, always 8bits.

uint8_t mosi_len
Output data length, in bytes.

uint8_t miso_len
Input data length, in bytes.

uint8_t address_bitlen
Length of address in bits, set to 0 if command does not need an address.

uint32_t address
Address to perform operation on.

const uint8_t *mosi_data
Output data to salve.

uint8_t *miso_data
[out] Input data from slave, little endian

struct spi_flash_host_driver_t
Host driver configuration and context structure.

Public Members

void *driver_data
Configuration and static data used by the specific host driver. The type is determined by the host driver.

esp_err_t (*dev_config)(spi_flash_host_driver_t *driver)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously
esp_err_t (*common_command)(spi_flash_host_driver_t *driver, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_driver_t *driver, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_driver_t *driver)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_driver_t *driver, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_driver_t *driver, bool wp)
Disable write protection.

void (*program_page)(spi_flash_host_driver_t *driver, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_driver_t *driver, const void *p)
Check whether need to allocate new buffer to write

bool (*supports_direct_read)(spi_flash_host_driver_t *driver, const void *p)
Check whether need to allocate new buffer to read

int max_write_bytes
maximum length of program_page

esp_err_t (*read)(spi_flash_host_driver_t *driver, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

int max_read_bytes
maximum length of read

bool (*host_idle)(spi_flash_host_driver_t *driver)
Check whether the host is idle to perform new operations.

esp_err_t (*configure_host_io_mode)(spi_flash_host_driver_t *driver, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*poll_cmd_done)(spi_flash_host_driver_t *driver)
Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_driver_t *driver, uint32_t addr, uint32_t size)
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

Macros

ESP_FLASH_SPEED_MIN
Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_READ_MODE_MIN
Slowest io mode supported by ESP32, currently SlowRd.
Type Definitions

typedef struct spi_flash_host_driver_t spi_flash_host_driver_t

Enumerations

define esp_flash_speed_t
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

ESP_FLASH_5MHZ = 0
The flash runs under 5MHz.

ESP_FLASH_10MHZ
The flash runs under 10MHz.

ESP_FLASH_20MHZ
The flash runs under 20MHz.

ESP_FLASH_26MHZ
The flash runs under 26MHz.

ESP_FLASH_40MHZ
The flash runs under 40MHz.

ESP_FLASH_80MHZ
The flash runs under 80MHz.

ESP_FLASH_SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

define esp_flash_io_mode_t
Mode used for reading from SPI flash.

Values:

SPI_FLASH_SLOWRD = 0
Data read using single I/O, some limits on speed.

SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

SPI_FLASH_DOUT
Data read using dual I/O.

SPI_FLASH_DIO
Both address & data transferred using dual I/O.

SPI_FLASH_QOUT
Data read using quad I/O.

SPI_FLASH_QIO
Both address & data transferred using quad I/O.

SPI_FLASH_READ_MODE_MAX
The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.
API Reference - Partition Table

Header File

- spi_flash/include/esp_partition.h

Functions

\[ \text{esp_partition_iterator_t} \text{ esp_partition_find}(\text{esp_partition_type_t} \text{ type}, \text{esp_partition_subtype_t} \text{ subtype}, \text{const char *} \text{label}) \]

Find partition based on one or more parameters.

**Return** iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

**Parameters**

- **type**: Partition type, one of esp_partition_type_t values
- **subtype**: Partition subtype, one of esp_partition_subtype_t values. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- **label**: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

\[ \text{const esp_partition_t *esp_partition_find_first}(\text{esp_partition_type_t} \text{ type}, \text{esp_partition_subtype_t} \text{ subtype}, \text{const char *} \text{label}) \]

Find first partition based on one or more parameters.

**Return** pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

**Parameters**

- **type**: Partition type, one of esp_partition_type_t values
- **subtype**: Partition subtype, one of esp_partition_subtype_t values. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- **label**: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

\[ \text{const esp_partition_t *} \text{esp_partition_get}(\text{esp_partition_iterator_t} \text{ iterator}) \]

Get esp_partition_t structure for given partition.

**Return** pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

**Parameters**

- **iterator**: Iterator obtained using esp_partition_find. Must be non-NULL.

\[ \text{esp_partition_iterator_t} \text{ esp_partition_next}(\text{esp_partition_iterator_t} \text{ iterator}) \]

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.
Return NULL if no partition was found, valid esp_partition_iterator_t otherwise.

Parameters

• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

void esp_partition_iterator_release(esp_partition_iterator_t iterator)
Release partition iterator.

Parameters

• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)
Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from esp_partition_get(), as a test for equality.

Return

• If partition not found, returns NULL.
• If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for the lifetime of the application.

Parameters

• partition: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
Read data from the partition.

Return ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
• src_offset: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.
Partitions marked with an encryption flag will automatically be written via the `spi_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `spi_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

**Note** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Return** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size`: Size of data to be written, in bytes.

```c
unsigned int
esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.

**Return** ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- `size`: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

```c
unsigned int
esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

**Return** ESP_OK, if successful

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where mapping should start.
- `size`: Size of the area to be mapped.
• **memory**: Memory space where the region should be mapped
• **out_ptr**: Output, pointer to the mapped memory region
• **out_handle**: Output, handle which should be used for spi_flash_munmap call

```c
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

**Parameters**

- **partition**: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256**: Returned SHA-256 digest for a given partition.

```c
bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)
```

Check for the identity of two partitions by SHA-256 digest.

**Return**

- True: In case of the two firmware is equal.
- False: Otherwise

**Parameters**

- **partition_1**: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2**: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

```c
esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

**Return**

- ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters

• flash_chip: Pointer to the structure identifying the flash chip
• offset: Address in bytes, where the partition starts
• size: Size of the partition in bytes
• label: Partition name
• type: One of the partition types (ESP_PARTITION_TYPE_*). Note that applications can not be
  booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*)
• out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t struc-
  ture

\[ \text{esp_err_t} \] \text{esp_partition_deregister_external} (const \text{esp_partition_t *} \text{partition})

Deregister the partition previously registered using esp_partition_register_external.

Return

• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external
  function.

Parameters

• partition: pointer to the partition structure obtained from esp_partition_register_external,

Structures

\textbf{struct esp_partition_t}

partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

Public Members

\textbf{esp_flash_t} * \textbf{flash_chip}

SPI flash chip on which the partition resides

\textbf{esp_partition_type_t} \textbf{type}

partition type (app/data)
`esp_partition_subtype_t subtype`
partition subtype

`uint32_t address`
starting address of the partition in flash

`uint32_t size`
size of the partition, in bytes

`char label[17]`
partition label, zero-terminated ASCII string

`bool encrypted`
flag is set to true if partition is encrypted

Macros

`ESP_PARTITION_SUBTYPE_OTA (i)`
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

Type Definitions

`typedef struct esp_partition_iterator_opaque_*esp_partition_iterator_t`
Opaque partition iterator type.

Enumerations

`enum esp_partition_type_t`
Partition type.

Note Keep this enum in sync with PartitionDefinition class gen_esp32part.py

Values:

`ESP_PARTITION_TYPE_APP = 0x00`
Application partition type.

`ESP_PARTITION_TYPE_DATA = 0x01`
Data partition type.

`enum esp_partition_subtype_t`
Partition subtype.

Note Keep this enum in sync with PartitionDefinition class gen_esp32part.py

Values:

`ESP_PARTITION_SUBTYPE_APP_FACTORY = 0x00`
Factory application partition.

`ESP_PARTITION_SUBTYPE_APP_OTA_MIN = 0x10`
Base for OTA partition subtypes.

`ESP_PARTITION_SUBTYPE_APP_OTA_0 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 0`
OTA partition 0.
ESP_PARTITION_SUBTYPE_APP_OTA_1 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1
OTA partition 1.

ESP_PARTITION_SUBTYPE_APP_OTA_2 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2
OTA partition 2.

ESP_PARTITION_SUBTYPE_APP_OTA_3 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3
OTA partition 3.

ESP_PARTITION_SUBTYPE_APP_OTA_4 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4
OTA partition 4.

ESP_PARTITION_SUBTYPE_APP_OTA_5 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5
OTA partition 5.

ESP_PARTITION_SUBTYPE_APP_OTA_6 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6
OTA partition 6.

ESP_PARTITION_SUBTYPE_APP_OTA_7 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7
OTA partition 7.

ESP_PARTITION_SUBTYPE_APP_OTA_8 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8
OTA partition 8.

ESP_PARTITION_SUBTYPE_APP_OTA_9 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9
OTA partition 9.

ESP_PARTITION_SUBTYPE_APP_OTA_10 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.

ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.
ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
  Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
  Partition for emulate eFuse bits.

ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
  ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
  FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
  SPIFFS partition.

ESP_PARTITION_SUBTYPE_ANY = 0xff
  Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

  • bootloader_support/include/esp_flash_encrypt.h

Functions

static bool esp_flash_encryption_enabled(void)
  Is flash encryption currently enabled in hardware?

  Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

  Return true if flash encryption is enabled.

esp_err_t esp_flash_encrypt_check_and_update(void)

esp_err_t esp_flash_encrypt_region(uint32_t src_addr, size_t data_length)
  Encrypt-in-place a block of flash sectors.

  Note This function resets RTC_WDT between operations with sectors.

  Return ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails,
  ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

  Parameters
    • src_addr: Source offset in flash. Should be multiple of 4096 bytes.
    • data_length: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void esp_flash_write_protect_crypt_cnt(void)
  Write protect FLASH_CRYPT_CNT.

  Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This
  should protect against serial re-flashing of an unauthorised code in absence of secure boot.
**esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)**

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Return**

void **esp_flash_encryption_init_checks (void)**

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

**Note** This function is called automatically during app startup, it doesn’t need to be called from the app.

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

**Enumerations**

```text
enum esp_flash_enc_mode_t

Values:

- ESP_FLASH_ENC_MODE_DISABLED
- ESP_FLASH_ENC_MODE_DEVELOPMENT
- ESP_FLASH_ENC_MODE_RELEASE
```

### 2.6.7 SPIFFS Filesystem

- []

**Overview**

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

**Notes**

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
**Tools**

**spiffsgen.py**

spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```python
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```python
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling `spiffs_create_partition_image`.

Make:

```make
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```cmake
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS dep, ...

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the image_size is required for the standalone invocation, only the partition name is required when using spiffs_create_partition_image – the image size is automatically obtained from the project’s partition table.

Due to the differences in structure between Make and CMake, it is important to note that: - for Make `spiffs_create_partition_image` must be called from the project Makefile - for CMake `spiffs_create_partition_image` must be called from one of the component CMakeLists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash or make flash by specifying FLASH_IN_PROJECT. For example, in Make:

```make
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```
in CMake:

```cpp
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py, parttool.py, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DEPENDS/SPIFFS_IMAGE_DEPENDS to specify targets that should be executed before generating the image.

in Make:

```make
dep:
  ...
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```cpp
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

+For an example, see storage/spiffsgen.

**mkspiffs**

Another tool for creating SPIFFS partition images is mkspiffs. Similar to spiffsgen.py, it can be used to create an image from a given folder and then flash that image using esptool.py.

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000
--spiffs.bin
```

**Notes on which SPIFFS tool to use**

The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use spiffsgen.py in the following cases: 1. If you want to simply generate a SPIFFS image during the build. spiffsgen.py makes it very convenient by providing functions/commands from the build system itself. 2. If the host has no C/C++ compiler available, because spiffsgen.py does not require compilation.
Use `mkspiffs` in the following cases: 1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`. 2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

See also

- `Partition Table documentation`

Application Example

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- `spiffs/include/esp_spiffs.h`

Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```

Register and mount SPIFFS to VFS with given path prefix.

Return

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

Parameters

- `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

```c
esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)
```

Unregister and unmount SPIFFS from VFS

Return

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

Parameters

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.
bool esp_spiffs Mounted(const char *partition_label)
Check if SPIFFS is mounted

Return
• true if mounted
• false if not mounted

Parameters
• partition_label: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

esp_err_t esp_spiffs_format(const char *partition_label)
Format the SPIFFS partition

Return
• ESP_OK if successful
• ESP_FAIL on error

Parameters
• partition_label: Same label as passed to esp_vfs_spiffs_register.

esp_err_t esp_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)
Get information for SPIFFS

Return
• ESP_OK if success
• ESP_ERR_INVALID_STATE if not mounted

Parameters
• partition_label: Same label as passed to esp_vfs_spiffs_register
• total_bytes: Size of the file system
• used_bytes: Current used bytes in the file system

Structures

struct esp_vfs_spiffs_conf_t
Configuration structure for esp_vfs_spiffs_register.

Public Members

const char *base_path
File path prefix associated with the filesystem.

const char *partition_label
Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t max_files
Maximum files that could be open at the same time.
bool format_if_mount_failed
    If true, it will format the file system if it fails to mount.

2.6.8 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like
objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS
driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component
searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read,
write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt
to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream
will also be forwarded to the FAT driver.

FS registration

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with
function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either read, write, etc., or read_p, write_p,
etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void *data, size_t size);
```

// In definition of esp_vfs_t:
 .flags = ESP_VFS_FLAG_DEFAULT,
 .write = &myfs_write,
 // ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):
.utility {myfs_t* fs, int fd, const void * data, size_t size};

// In definition of esp_vfs_t:
   .flags = ESP_VFS_FLAG_CONTEXT_PTR,
   .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));

Synchronous input/output multiplexing

Synchronous input/output multiplexing by select() is supported in the VFS component. The implementation works in the following way.

1. select() is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by start_select() described later on this page. This function represents the driver-specific implementation of select() for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by socket_select() described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals socket_select() to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitiazation of the environment for checking events.
6. The select() call ends and returns the appropriate results.

Non-socket VFS drivers

If you want to use select() with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions start_select() and end_select() similarly to the following example:

// In definition of esp_vfs_t:
   .start_select = &uart_start_select,
   .end_select = &uart_end_select,
// ... other members initialized

start_select() is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

end_select() is called to stop/deinitialize/free the environment which was setup by start_select().
Note: end_select() might be called without a previous start_select() call in some rare circumstances. end_select() should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in vfs/vfs_uart.c and most particularly to the functions esp_vfs_dev_uart_register(), uart_start_select(), and uart_end_select() for more information.

Please check the following examples that demonstrate the use of select() with VFS file descriptors:

• peripherals/uart/uart_select
• system/select

Socket VFS drivers

A socket VFS driver is using its own internal implementation of select() and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
.socket_select = &lwip_select,
.get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
.stop_socket_select = &lwip_stop_socket_select,
.stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

Note: If you use select() for socket file descriptors only then you can enable the CONFIG_LWIP_USE_ONLY_LWIP_SELECT option to reduce the code size and improve performance.

Note: Don’t change the socket driver during an active select() call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.
In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

**File descriptors**

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib’s sys/types.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

**Standard IO streams (stdin, stdout, stderr)**

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var), might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.
VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF ("n") character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions `esp_vfs_dev_uart_set_rx_line_endings` and `esp_vfs_dev_uart_set_tx_line_endings`.

**Standard streams and FreeRTOS tasks**

FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to struct _reent (newlib/include/sys/reent.h#L370-L417). This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin (_stdout, _stderr) before creating the task.

**Application Example**

Instructions

**API Reference**

**Header File**

- `vfs/include/esp_vfs.h`

**Functions**

`ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)`

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)`

`ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)`

`int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)`

`int esp_vfs_close (struct _reent *r, int fd)`

`int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)`

2.6. Storage API
int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)
int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)
int esp_vfs_unlink (struct _reent *r, const char *path)
int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)
int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

Parameters
• base_path: file path prefix associated with the filesystem. Must be a zero-terminated C string, up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”.
• vfs: Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
• ctx: If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

This is a special-purpose function intended for registering LWIP sockets to VFS.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters
• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• min_fd: The smallest file descriptor this VFS will use.
• max_fd: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters
• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• vfs_id: Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.
esp_err_t esp_vfs_unregister(const char *base_path)
Unregister a virtual filesystem for given path prefix

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

Parameters
- base_path: file prefix previously used in esp_vfs_register call

esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)
Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
- vfs_id: VFS identificator returned by esp_vfs_register_with_id.
- fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)
Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
- vfs_id: VFS identificator returned by esp_vfs_register_with_id.
- fd: File descriptor which should be unregistered.

int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Return The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

Parameters
- nfds: Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- readfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- writefds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- errorfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- timeout: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out.

2.6. Storage API 1133
void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
    Notification from a VFS driver about a read/write/error condition.
    
    This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

    Parameters
    • sem: semaphore structure which was passed to the driver by the start_select call

void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
    Notification from a VFS driver about a read/write/error condition (ISR version)
    
    This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

    Parameters
    • sem: semaphore structure which was passed to the driver by the start_select call
    • woken: is set to pdTRUE if the function wakes up a task with higher priority

int esp_vfs_poll(struct pollfd *fds, nfds_t nfds, int timeout)
    Implements the VFS layer for synchronous I/O multiplexing by poll()
    
    The implementation is based on esp_vfs_select. The parameters and return values are compatible with POSIX poll().

    Return A positive return value indicates the number of file descriptors that have been selected. The 0 return value indicates a timed-out poll. -1 is return on failure and errno is set accordingly.

    Parameters
    • fds: Pointer to the array containing file descriptors and events poll() should consider.
    • nfds: Number of items in the array fds.
    • timeout: Poll() should wait at least timeout milliseconds. If the value is 0 then it should return immediately. If the value is -1 then it should wait (block) until the event occurs.

ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
    Implements the VFS layer of POSIX pread()

    Return A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

    Parameters
    • fd: File descriptor used for read
    • dst: Pointer to the buffer where the output will be written
    • size: Number of bytes to be read
    • offset: Starting offset of the read

ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
    Implements the VFS layer of POSIX pwrite()

    Return A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.
Parameters

- `fd`: File descriptor used for write
- `src`: Pointer to the buffer from where the output will be read
- `size`: Number of bytes to write
- `offset`: Starting offset of the write

Structures

```c
struct esp_vfs_select_sem_t
VFS semaphore type for select()
```

Public Members

```c
bool is_sem_local
    type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

void *sem
    semaphore instance
```

```c
struct esp_vfs_t
VFS definition structure.
```

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

```c
int flags
    ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
                           esp_vfs_select_sem_t sem, void **end_select_args)
    start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
    socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select)(void *sem)
    called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
    set only for the socket driver
void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
    stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore)(void)
    end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select
    for the given VFS

esp_err_t *(*end_select)(void *end_select_args)
    get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket
    driver

Macros

MAX_FDS
    Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
    Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
    Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
    Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

typedef int esp_vfs_id_t

Header File

• vfs/include/esp_vfs_dev.h

Functions

void esp_vfs_dev_uart_register (void)
    add /dev/uart virtual filesystem driver

    This function is called from startup code to enable serial output

void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
    Set the line endings expected to be received on UART.

    This specifies the conversion between line endings received on UART and newlines (‘\n’, LF) passed into stdin:

    • ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
    • ESP_LINE_ENDINGS_CR: convert CR to LF
    • ESP_LINE_ENDINGS_LF: no modification

    Note  this function is not thread safe w.r.t. reading from UART

    Parameters

    • mode: line endings expected on UART
void `esp_vfs_dev_uart_set_tx_line_endings` (`esp_line_endings_t mode`)  
Set the line endings to sent to UART.

This specifies the conversion between newlines (‘ ’, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Parameters**

- `mode`: line endings to send to UART

void `esp_vfs_dev_uart_use_nonblocking` (int `uart_num`)  
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- `uart_num`: UART peripheral number

void `esp_vfs_dev_uart_use_driver` (int `uart_num`)  
set VFS to use UART driver for reading and writing

**Note** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

**Parameters**

- `uart_num`: UART peripheral number

**Enumerations**

enum `esp_line_endings_t`  
Line ending settings.

**Values**:

- `ESP_LINE_ENDINGS_CRLF`: CR + LF.
- `ESP_LINE_ENDINGS_CR`: CR.
- `ESP_LINE_ENDINGS_LF`: LF.

### 2.6.9 Wear Levelling API

[]
Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

• **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.

• **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

• `wl_mount` - initializes the wear levelling module and mounts the specified partition
• `wlUnmount` - unmounts the partition and deinitializes the wear levelling module
• `wl_erase_range` - erases a range of addresses in flash
• `wl_write` - writes data to a partition
• `wl_read` - reads data from a partition
• `wl_size` - returns the size of available memory in bytes
• `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

See also

• *FAT Filesystem*
• *Partition Table documentation*
Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the storage/wear_levelling/README.md file for more information.

Functions

```c
esp_err_t esp_vfs_fat_spiflash_mount(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config, wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Return

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

Parameters

- base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
- partition_label: label of the partition which should be used
- mount_config: pointer to structure with extra parameters for mounting FATFS
- wl_handle: wear levelling driver handle

```c
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.
Public Members

bool format_if_mount_failed
   If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
   Max number of open files.

size_t allocation_unit_size
   If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

   Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

   Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_spiflash_unmount (const char *base_path, wl_handle_t wl_handle)
   Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount.

Return
   • ESP_OK on success
   • ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

Parameters
   • base_path: path where partition should be registered (e.g. “/spiflash”)
   • wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount

Mid level API Reference

Header File

   • wear_levelling/include/wear_levelling.h

Functions

esp_err_t wl_mount (const esp_partition_t *partition, wl_handle_t *out_handle)
   Mount WL for defined partition.

Return
   • ESP_OK, if the allocation was successfully;
   • ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
   • ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

Parameters
   • partition: that will be used for access
   • out_handle: handle of the WL instance
esh_err_t \texttt{wl\_unmount} (\texttt{wl\_handle\_t handle})

Unmount WL for defined partition.

\textbf{Return}

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

\textbf{Parameters}

- \texttt{handle}: WL partition handle

\texttt{esp\_err\_t \texttt{wl\_erase\_range} (\texttt{wl\_handle\_t handle}, \texttt{size\_t start\_addr}, \texttt{size\_t size})}

Erase part of the WL storage.

\textbf{Return}

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

\textbf{Parameters}

- \texttt{handle}: WL handle that are related to the partition
- \texttt{start\_addr}: Address where erase operation should start. Must be aligned to the result of function \texttt{wl\_sector\_size(...)}.\n- \texttt{size}: Size of the range which should be erased, in bytes. Must be divisible by result of function \texttt{wl\_sector\_size(...)}.\n
\texttt{esp\_err\_t \texttt{wl\_write} (\texttt{wl\_handle\_t handle}, \texttt{size\_t start\_addr}, \texttt{const void *} \texttt{src}, \texttt{size\_t size})}

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using \texttt{wl\_erase\_range} function.

\textbf{Note} Prior to writing to WL storage, make sure it has been erased with \texttt{wl\_erase\_range} call.

\textbf{Return}

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

\textbf{Parameters}

- \texttt{handle}: WL handle that are related to the partition
- \texttt{dest\_addr}: Address where the data should be written, relative to the beginning of the partition.
- \texttt{src}: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least \texttt{size} bytes long.
- \texttt{size}: Size of data to be written, in bytes.
**esp_err_t** **wl_read**( *wl_handle_t handle*,  *size_t src_addr*,  *void *dest*,  *size_t size*)

Read data from the WL storage.

**Return**

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- **handle**: WL module instance that was initialized before
- **dest**: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_addr**: Address of the data to be read, relative to the beginning of the partition.
- **size**: Size of data to be read, in bytes.

**size_t** **wl_size**( *wl_handle_t handle*)

Get size of the WL storage.

**Return** usable size, in bytes

**Parameters**

- **handle**: WL module handle that was initialized before

**size_t** **wl_sector_size**( *wl_handle_t handle*)

Get sector size of the WL instance.

**Return** sector size, in bytes

**Parameters**

- **handle**: WL module handle that was initialized before

**Macros**

**WL_INVALID_HANDLE**

**Type Definitions**

**typedef** int32_t **wl_handle_t**

wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.
2.7 System API

2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.

2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

   - offset for 0 Segment = `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)`.
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32 image_info build/app.bin
```

You can also see the information on segments in the IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 ( 81120)
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 size=0x00000 ( 0) load
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 size=0x00000 ( 0) load
I (571) esp_image: segment 3: paddr=0x00033d18 vaddr=0x3ff80000 size=0x0028e0 ( 10464) load
I (612) esp_image: segment 4: paddr=0x00036600 vaddr=0x3ffb28e0 size=0x00000 ( 0) load
I (654) esp_image: segment 5: paddr=0x00036608 vaddr=0x40080000 size=0x00400 ( 1024) load
```

(continues on next page)
I (695) esp_image: segment 6: paddr=0x00036a10 vaddr=0x40080400 size=0x09600 (38400)_load
I (737) esp_image: segment 7: paddr=0x000040018 vaddr=0x400d0018 size=0x62e4c (405068)_map
I (847) esp_image: segment 8: paddr=0x000a2e6c vaddr=0x40089a00 size=0x6cec (27884)_load
I (888) esp_image: segment 9: paddr=0x000a9b60 vaddr=0x400c0000 size=0x00000 (0)_load
I (929) esp_image: segment 10: paddr=0x000a9b68 vaddr=0x50000000 size=0x0004 (4)_load
I (971) esp_image: segment 11: paddr=0x000a9b74 vaddr=0x50000004 size=0x00000 (0)_load
I (1012) esp_image: segment 12: paddr=0x000a9b7c vaddr=0x50000004 size=0x00000 (0)_load

For more details on the type of memory segments and their address ranges, see the ESP32 Technical Reference Manual, Section 1.3.2 Embedded Memory.

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT or CONFIG_SECURE_BOOT_ENABLED are enabled then the application image will have additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

Application Description

The DROM segment starts with the esp_app_desc_t structure which carries specific fields describing the application:

- secure_version - see Anti-rollback.
- version - see App version.
- project_name is filled from PROJECT_NAME. *
- time and date - compile time and date.
- idf_ver - version of ESP-IDF.
- app_elf_sha256 - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.
Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

API Reference

Header File

- `bootloader_support/include/esp_app_format.h`

Structures

```c
struct esp_image_header_t
{
    // Main header of binary image.

    // Public Members

    uint8_t magic
    // Magic word ESP_IMAGE_HEADER_MAGIC

    uint8_t segment_count
    // Count of memory segments

    uint8_t spi_mode
    // flash read mode (esp_image_spi_mode_t as uint8_t)

    uint8_t spi_speed
    // flash frequency (esp_image_spi_freq_t as uint8_t)

    uint8_t spi_size
    // flash chip size (esp_image_flash_size_t as uint8_t)

    uint32_t entry_addr
    // Entry address

    uint8_t wp_pin
    // WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

    uint8_t spi_pin_drv[3]
    // Drive settings for the SPI flash pins (read by ROM bootloader)

    // ...

2.7. System API 1145
```
esp_chip_id_t chip_id
Chip identification number

uint8_t min_chip_rev
Minimum chip revision supported by image

uint8_t reserved[8]
Reserved bytes in additional header space, currently unused

uint8_t hash_appended
If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t
Header of binary image segment.

Public Members

uint32_t load_addr
Address of segment

uint32_t data_len
Length of data

struct esp_app_desc_t
Description about application.

Public Members

uint32_t magic_word
Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t secure_version
Secure version

uint32_t reserv1[2]
reserv1

char version[32]
Application version

char project_name[32]
Project name

char time[16]
Compile time

char date[16]
Compile date

char idf_ver[32]
Version IDF

uint8_t app_elf_sha256[32]
sha256 of elf file

uint32_t reserv2[20]
reserv2
Macros

**ESP_IMAGE_HEADER_MAGIC**
The magic word for the `esp_image_header_t` structure.

**ESP_IMAGE_MAX_SEGMENTS**
Max count of segments in the image.

**ESP_APP_DESC_MAGIC_WORD**
The magic word for the `esp_app_desc` structure that is in DROM.

Enumerations

**enum esp_chip_id_t**
ESP chip ID.

  Values:

  **ESP_CHIP_ID_ESP32** = 0x0000
  chip ID: ESP32

  **ESP_CHIP_ID_INVALID** = 0xFFFF
  Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

**enum esp_image_spi_mode_t**
SPI flash mode, used in `esp_image_header_t`.

  Values:

  **ESP_IMAGE_SPI_MODE_QIO**
  SPI mode QIO

  **ESP_IMAGE_SPI_MODE_QOUT**
  SPI mode QOUT

  **ESP_IMAGE_SPI_MODE_DIO**
  SPI mode DIO

  **ESP_IMAGE_SPI_MODE_DOUT**
  SPI mode DOUT

  **ESP_IMAGE_SPI_MODE_FAST_READ**
  SPI mode FAST_READ

  **ESP_IMAGE_SPI_MODE_SLOW_READ**
  SPI mode SLOW_READ

**enum esp_image_spi_freq_t**
SPI flash clock frequency.

  Values:

  **ESP_IMAGE_SPI_SPEED_40M**
  SPI clock frequency 40 MHz

  **ESP_IMAGE_SPI_SPEED_26M**
  SPI clock frequency 26 MHz

  **ESP_IMAGE_SPI_SPEED_20M**
  SPI clock frequency 20 MHz
ESP_IMAGE_SPI_SPEED_80M = 0xF
SPI clock frequency 80 MHz

enum esp_image_flash_size_t
Supported SPI flash sizes.

Values:

ESP_IMAGE_FLASH_SIZE_1MB = 0
SPI flash size 1 MB

ESP_IMAGE_FLASH_SIZE_2MB
SPI flash size 2 MB

ESP_IMAGE_FLASH_SIZE_4MB
SPI flash size 4 MB

ESP_IMAGE_FLASH_SIZE_8MB
SPI flash size 8 MB

ESP_IMAGE_FLASH_SIZE_16MB
SPI flash size 16 MB

ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.7.2 Application Level Tracing

Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- app_trace/include/esp_app_trace.h

Functions

esp_err_t esp_apptrace_init (void)
Initializes application tracing module.

Note Should be called before any esp_apptrace_xxx call.

Return ESP_OK on success, otherwise see esp_err_t
void esp_aptrace_down_buffer_config(uint8_t *buf, uint32_t size)

Configures down buffer.

Note Needs to be called before initiating any data transfer using esp_aptrace_buffer_get and esp_aptrace_write. This function does not protect internal data by lock.

Parameters

• buf: Address of buffer to use for down channel (host to target) data.
• size: Size of the buffer.

uint8_t *esp_aptrace_buffer_get(esp_aptrace_dest_t dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. After data in buffer are ready to be sent off esp_aptrace_buffer_put must be called to indicate it.

Return non-NULL on success, otherwise NULL.

Parameters

• dest: Indicates HW interface to send data.
• size: Size of data to write to trace buffer.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_aptrace_buffer_put(esp_aptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by esp_aptrace_buffer_get.

Return ESP_OK on success, otherwise see esp_err_t

Parameters

• dest: Indicates HW interface to send data. Should be identical to the same parameter in call to esp_aptrace_buffer_get.
• ptr: Address of trace buffer to release. Should be the value returned by call to esp_aptrace_buffer_get.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_aptrace_write(esp_aptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

Return ESP_OK on success, otherwise see esp_err_t

Parameters

• dest: Indicates HW interface to send data.
• data: Address of data to write to trace buffer.
• size: Size of data to write to trace buffer.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

int esp_aptrace_vprintf_to(esp_aptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to sent log messages to host via specified HW interface.

Return Number of bytes written.
Parameters

- `dest`: Indicates HW interface to send data.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- `fmt`: Address of format string.
- `ap`: List of arguments.

```c
int esp_apptrace_vprintf(const char *fmt, va_list ap)
```

vprintf-like function to sent log messages to host.

**Return**
Number of bytes written.

**Parameters**

- `fmt`: Address of format string.
- `ap`: List of arguments.

```c
esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host.

**Return**
`ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

```c
esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)
```

Flushes remaining data in trace buffer to host without locking internal data. This is special version of `esp_apptrace_flush` which should be called from panic handler.

**Return**
`ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `min_sz`: Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

```c
esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)
```

Reads host data from trace buffer.

**Return**
`ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to read the data on.
- `data`: Address of buffer to put data from trace buffer.
- `size`: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
uint8_t *esp_apptrace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)
Retrieves incoming data buffer if any. After data in buffer are processed esp_apptrace_down_buffer_put must
be called to indicate it.

Return non-NULL on success, otherwise NULL.

Parameters

• dest: Indicates HW interface to receive data.
• size: Address to store size of available data in down buffer. Must be initialized with requested value.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by
esp_apptrace_down_buffer_get.

Return ESP_OK on success, otherwise see esp_err_t

Parameters

• dest: Indicates HW interface to receive data. Should be identical to the same parameter in call to
esp_apptrace_down_buffer_get.
• ptr: Address of trace buffer to release. Should be the value returned by call to
esp_apptrace_down_buffer_get.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

bool esp_apptrace_host_is_connected (esp_apptrace_dest_t dest)
Checks whether host is connected.

Return true if host is connected, otherwise false

Parameters

• dest: Indicates HW interface to use.

void *esp_apptrace_fopen (esp_apptrace_dest_t dest, const char *path, const char *mode)
Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

Return non zero file handle on success, otherwise 0

Parameters

• dest: Indicates HW interface to use.
• path: Path to file.
• mode: Mode string. See fopen for details.

int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

Return Zero on success, otherwise non-zero. See fclose for details.

Parameters

• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.
size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writes to file on host. This function has the same semantic as `fwrite` except for the first argument.

**Return**  Number of written items. See `fwrite` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `ptr`: Address of data to write.
- `size`: Size of an item.
- `nmemb`: Number of items to write.
- `stream`: File handle returned by `esp_apptrace_fopen`.

size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as `fread` except for the first argument.

**Return**  Number of read items. See `fread` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `ptr`: Address to store read data.
- `size`: Size of an item.
- `nmemb`: Number of items to read.
- `stream`: File handle returned by `esp_apptrace_fopen`.

int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as `fseek` except for the first argument.

**Return**  Zero on success, otherwise non-zero. See `fseek` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.
- `offset`: Offset. See `fseek` for details.

int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

**Return**  Current position in file. See `ftell` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`. 
int esp_aptrace_fstop(esp_aptrace_dest_t dest)
  Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

  Return  ESP_OK on success, otherwise see esp_err_t

  Parameters
  • dest: Indicates HW interface to use.

void esp_gcov_dump (void)
  Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_aptrace_dest_t
  Application trace data destinations bits.

    Values:

    ESP_APTRACE_DEST_TRAX = 0x1
      JTAG destination.

    ESP_APTRACE_DEST_UART0 = 0x2
      UART destination.

Header File

  • app_trace/include/esp_sysview_trace.h

Functions

static esp_err_t esp_sysview_flush (uint32_t tmo)
  Flushes remaining data in SystemView trace buffer to host.

  Return  ESP_OK.

  Parameters
  • tmo: Timeout for operation (in us). Use ESP_APPTURE_TMO_INFINITE to wait indefinitely.

int esp_sysview_vprintf (const char *format, va_list args)
  vprintf-like function to sent log messages to the host.

  Return  Number of bytes written.

  Parameters
  • format: Address of format string.
  • args: List of arguments.

esp_err_t esp_sysview_heap_trace_start (uint32_t tmo)
  Starts SystemView heap tracing.

  Return  ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.
Parameters

- `tmo`: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

```c
esp_err_t esp_sysview_heap_trace_stop(void)
```

Stops SystemView heap tracing.

Return ESP_OK.

```c
void esp_sysview_heap_trace_alloc(void *addr, uint32_t size, const void *callers)
```

Sends heap allocation event to the host.

Parameters

- `addr`: Address of allocated block.
- `size`: Size of allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be `CONFIG_HEAP_TRACING_STACK_DEPTH`.

```c
void esp_sysview_heap_trace_free(void *addr, const void *callers)
```

Sends heap de-allocation event to the host.

Parameters

- `addr`: Address of de-allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be `CONFIG_HEAP_TRACING_STACK_DEPTH`.

### 2.7.3 eFuse Manager

**Introduction**

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

**Hardware description**

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0). For more details see ESP32 Technical Reference Manual in part 20 eFuse controller. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- **EFUSE_BLK0** is used entirely for system purposes;
- **EFUSE_BLK1** is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- **EFUSE_BLK2** is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- **EFUSE_BLK3** can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.
Each block is divided into 8 32-bits registers.

**eFuse Manager component**

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:
- **common** (`esp_efuse_table.csv`) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse_common_table`). Note that changes in this file can lead to incorrect operation.
- **custom** - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse_custom_table`.

**Description CSV file**

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```plaintext
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

- **field_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table).

- **efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available `EFUSE_BLK0..EFUSE_BLK3`.

- **bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

- **bit_count** The number of bits to use in this field (1..). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for `ESP_EFUSE_SECURE_BOOT_KEY` and `ESP_EFUSE_ENCRYPT_FLASH_KEY` fields). The value `MAX_BLK_LEN` depends on `CONFIG_EFUSE_MAX_BLK_LEN`, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

- **comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:
# Factory MAC address #

<table>
<thead>
<tr>
<th>Field</th>
<th>EFUSE_BLK,</th>
<th>Offset</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY</td>
<td>72, 80</td>
<td>Factory MAC addr [0]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY_CRC</td>
<td>64, 80</td>
<td>Factory MAC addr [1]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY</td>
<td>56, 80</td>
<td>Factory MAC addr [2]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY</td>
<td>48, 80</td>
<td>Factory MAC addr [3]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY</td>
<td>40, 80</td>
<td>Factory MAC addr [4]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY</td>
<td>32, 80</td>
<td>Factory MAC addr [5]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC_FACTORY_CRC</td>
<td>80, 80</td>
<td>CRC8 for factory MAC address</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp Efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse_common_table or:

```python
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp Efuse_table.csv
```

After generation in the folder esp32 create:

- esp Efuse_table.c file.
- In include folder esp Efuse_table.h file.

To generate a custom files, use the following command idf.py efuse custom_table or:

```python
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp Efuse_table.csv PROJECT_PATH/main/esp Efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- esp Efuse custom_table.c file.
- In include folder esp Efuse custom_table.h file.

To use the generated fields, you need to include two files:

```c
#include "esp Efuse.h"
#include "esp Efuse_table.h" or "esp Efuse custom_table.h"
```

**Support coding scheme**

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).
The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and are not used.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p COM4 summary` command.
- from esptool utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. To write some fields in one time need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual use the `esp_efuse_write_...` functions. At the end to burn them, need to call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the efuse blocks and disable the batch recording mode. The batch writing mode blocks `esp_efuse_read_...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

**eFuse API**

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
• `esp_efuse_write_reg()` - writes value to eFuse register.
• `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
• `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
• `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
• `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
• `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
• `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

How add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Used bits in eFuse table:
EFUSE_BLK0
[2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188 191]

EFUSE_BLK1
[0 255]

EFUSE_BLK2
[0 255]

EFUSE_BLK3
[0 55] [96 159] [184 191]
```

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif).

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv ...
Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.

3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

### Debug eFuse & Unit tests

#### Virtual eFuses

The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests.

#### espefuse.py

esptool includes a useful tool for reading/writing ESP32 eFuse bits - espefuse.py.

### Header File

- `efuse/include/esp_efuse.h`

### Functions

**esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)**

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**

- `field`: A pointer to the structure describing the fields of efuse.
- `dst`: A pointer to array that will contain the result of reading.
- `dst_size_bits`: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t *out_cnt)**

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**
• field: A pointer to the structure describing the fields of efuse.
• out_cnt: A pointer that will contain the number of programmed as “1” bits.

**esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)**

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Return**

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

**Parameters**

• field: A pointer to the structure describing the fields of efuse.
• src: A pointer to array that contains the data for writing.
• src_size_bits: The number of bits required to write.

**esp_err_t esp_efuse_write_field_cnt(const esp_efuse_desc_t *field[], size_t cnt)**

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

**Return**

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

**Parameters**

• field: A pointer to the structure describing the fields of efuse.
• cnt: Required number of programmed as “1” bits.

**esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)**

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Return**

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
• ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**Parameters**
• blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

```c
esp_err_t esp_efuse_set_read_protect(esp_efuse_block_t blk)
```

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**Parameters**

- blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

```c
int esp_efuse_get_field_size(const esp_efuse_desc_t *field[])
```

Returns the number of bits used by field.

**Return** Returns the number of bits used by field.

**Parameters**

- field: A pointer to the structure describing the fields of efuse.

```c
uint32_t esp_efuse_read_reg(esp_efuse_block_t blk, unsigned int num_reg)
```

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Return** Value of register

**Parameters**

- blk: Block number of eFuse.
- num_reg: The register number in the block.

```c
esp_err_t esp_efuse_write_reg(esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
```

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**

- blk: Block number of eFuse.
- num_reg: The register number in the block.
- val: Value to write.

```c
esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme(esp_efuse_block_t blk)
```

Return efuse coding scheme for blocks.
Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return** Return efuse coding scheme for blocks

**Parameters**
- `blk`: Block number of eFuse.

```c
esp_err_t esp_efuse_read_block(esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
```

Read key to efuse block starting at the offset and the required size.

**Return**
- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

**Parameters**
- `blk`: Block number of eFuse.
- `dst_key`: A pointer to array that will contain the result of reading.
- `offset_in_bits`: Start bit in block.
- `size_bits`: The number of bits required to read.

```c
esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to efuse block starting at the offset and the required size.

**Return**
- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits

**Parameters**
- `blk`: Block number of eFuse.
- `src_key`: A pointer to array that contains the key for writing.
- `offset_in_bits`: Start bit in block.
- `size_bits`: The number of bits required to write.

```c
uint8_t esp_efuse_get_chip_ver(void)
```

Returns chip version from efuse.

**Return** chip version

```c
uint32_t esp_efuse_get_pkg_ver(void)
```

Returns chip package from efuse.

**Return** chip package
void esp_efuse_burn_new_values (void)
void esp_efuse_reset (void)
void esp_efuse_disable_basic_rom_console (void)
void esp_efuse_write_random_key (uint32_t blk_wdata0_reg)
uint32_t esp_efuse_read_secure_version (void)
bool esp_efuse_check_secure_version (uint32_t secure_version)
esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
void esp_efuse_init (uint32_t offset, uint32_t size)
esp_err_t esp_efuse_batch_write_begin (void)
esp_err_t esp_efuse_batch_write_cancel (void)
esp_err_t esp_efuse_batch_write_commit (void)

Structures

struct esp_efuse_desc_t
  Structure eFuse field.
  
  Public Members

    esp_efuse_block_t efuse_block
    Block of eFuse

    uint8_t bit_start
    Start bit [0..255]

    uint16_t bit_count
    Length of bit field [1..-]

Macros

ESP_ERR_EFUSE
  Base error code for efuse api.

ESP_OK_EFUSE_CNT
  OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL
  Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG
  Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING
  Error while a encoding operation.
2.7.4 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see Error Handling.

For the full list of error codes defined in ESP-IDF, see Error Code Reference.

API Reference

Header File

- esp_common/include/esp_err.h

Functions

const char *esp_err_to_name (esp_err_t code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gentools/esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return string error message

Parameters

- code: esp_err_t error code

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gentools/esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return buf containing the string error message

Parameters

- code: esp_err_t error code
- buf: buffer where the error message should be written
- buflen: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Macros

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure
ESP_ERR_NO_MEM
Out of memory

ESP_ERR_INVALID_ARG
Invalid argument

ESP_ERR_INVALID_STATE
Invalid state

ESP_ERR_INVALID_SIZE
Invalid size

ESP_ERR_NOT_FOUND
Requested resource not found

ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERROR_CHECK(x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

**Type Definitions**

typedef int32_t esp_err_t

**2.7.5 ESP HTTPS OTA**
Overview

`esp_https_ota` provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer to `Secure OTA Updates Without Secure boot`.

API Reference

Header File

- `esp_https_ota/include/esp_https_ota.h`

Functions

`esp_err_t esp_https_ota(const esp_http_client_config_t *config)`

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
• ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters
• config: pointer to esp_http_client_config_t structure.

`esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)`

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then esp_https_ota_perform should be called to continue with the OTA process and there should be a call to esp_https_ota_finish on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of http_config, which is a part of ota_config. In case of error, this API explicitly sets handle to NULL.

Note This API is blocking, so setting is_async member of http_config structure will result in an error.

Return
• ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
• ESP_FAIL: For generic failure.
• ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
• For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

Parameters
• ota_config: pointer to esp_https_ota_config_t structure
• handle: pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

`esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)`

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Return
• ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
• ESP_OK: OTA update was successful
• ESP_FAIL: OTA update failed
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
• ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters

  • https_ota_handle: pointer to esp_https_ota_handle_t structure

bool esp_https_ota_is_complete_data_received (esp_https_ota_handle_t https_ota_handle)
Checks if complete data was received or not.

Note This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

Return

  • false
  • true

Parameters

  • https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_finish (esp_https_ota_handle_t https_ota_handle)
Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

Note If this API returns successfully, esp_restart() must be called to boot from the new firmware image

Return

  • ESP_OK: Clean-up successful
  • ESP_ERR_INVALID_STATE
  • ESP_ERR_INVALID_ARG: Invalid argument
  • ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

Parameters

  • https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_get_img_desc (esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)
Reads app description from image header. The app description provides information like the “Firmware version” of the image.

Note This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

Return

  • ESP_ERR_INVALID_ARG: Invalid arguments
  • ESP_FAIL: Failed to read image descriptor
  • ESP_OK: Successfully read image descriptor

Parameters

  • https_ota_handle: pointer to esp_https_ota_handle_t structure

Chapter 2. API Reference
new_app_info: pointer to an allocated esp_app_desc_t structure

int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)

Structures

struct esp_https_ota_config_t
    ESP HTTPS OTA configuration.

    Public Members

    const esp_http_client_config_t *http_config
    ESP HTTP client configuration

Macros

ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void *esp_https_ota_handle_t

2.7.6 ESP-pthread

Overview

This module offers Espressif specific extensions to the pthread library that can be used to influence the behaviour of pthreads. Currently the following configuration can be tuned:

- Stack size of the pthreads
- Priority of the created pthreads
- Inheriting this configuration across threads
- Thread name
- Core affinity / core pinning.

Example to tune the stack size of the pthread:

```c
void * thread_func(void * p)
{
    printf("In thread_func\n");
    return NULL;
}

void app_main(void)
{
    pthread_t t1;
```
esp_pthread_cfg_t cfg = esp_create_default_pthread_config();
cfg.stack_size = (4 * 1024);
esp_pthread_set_cfg(&cfg);

pthread_create(&t1, NULL, thread_func);
}

The API can also be used for inheriting the settings across threads. For example:

```c
void * my_thread2(void * p)
{
    /* This thread will inherit the stack size of 4K */
    printf("In my_thread2\n");
    return NULL;
}

void * my_thread1(void * p)
{
    printf("In my_thread1\n");
    pthread_t t2;
    pthread_create(&t2, NULL, my_thread2);
    return NULL;
}

void app_main(void)
{
    pthread_t t1;

    esp_pthread_cfg_t cfg = esp_create_default_pthread_config();
cfg.stack_size = (4 * 1024);
cfg.inherit_cfg = true;
esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, my_thread1);
}
```

API Reference

Header File

- pthread/include/esp_pthread.h

Functions

`esp_pthread_cfg_t esp_pthread_get_default_config(void)`

Creates a default pthread configuration based on the values set via menuconfig.

**Return**  A default configuration structure.

`esp_err_t esp_pthread_set_cfg(const esp_pthread_cfg_t *cfg)`

Configure parameters for creating pthread.
This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

Note Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

Return

- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

Parameters

- `cfg`: The pthread config parameters

```c
esp_err_t esp_pthread_get_cfg(esp_pthread_cfg_t *p)
```

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

Return

- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

Parameters

- `p`: Pointer to the pthread config structure that will be updated with the currently configured parameters

Structures

```c
struct esp_pthread_cfg_t
```

pthread configuration structure that influences pthread creation

Public Members

- `stack_size`: The stack size of the pthread.
- `prio`: The thread’s priority.
- `inherit_cfg`: Inherit this configuration further.
- `thread_name`: The thread name.
- `pin_to_core`: The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.
Macros

PTHREAD_STACK_MIN

2.7.7 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers – code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that here.
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data) {
    // Event handler logic
}

void app_main() {
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
    // specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is needed
    // by the other APIs to reference the loop
```

(continues on next page)
// to perform their operations on.
esp_event_loop_args_t loop_args = {
    .queue_size = ..., 
    .task_name = ..., 
    .task_priority = ..., 
    .task_stack_size = ..., 
    .task_core_id = ...
};

esp_event_loop_handle_t loop_handle;

esp_event_loop_create(&loop_args, &loop_handle)

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At some point in time
    // the event loop executes the event handler registered to the posted event, in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}

**Declaring and defining events**

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```
Event base definition:

\[
\text{ESP\_EVENT\_DEFINE\_BASE}(\text{EVENT\_BASE})
\]

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with \_EVENT. For example, the base for wifi events is declared and defined as \text{WIFI\_EVENT}, the ethernet event base \text{ETHERNET\_EVENT}, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros \text{ESP\_EVENT\_DECLARE\_BASE} and \text{ESP\_EVENT\_DEFINE\_BASE}).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

\[
\text{enum}
\{
\quad \text{EVENT\_ID\_1},
\quad \text{EVENT\_ID\_2},
\quad \text{EVENT\_ID\_3},
\quad \ldots
\}
\]

**Default Event Loop**

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{esp_event_loop_create()}</td>
<td>\text{esp_event_loop_create_default()}</td>
</tr>
<tr>
<td>\text{esp_event_loop_delete()}</td>
<td>\text{esp_event_loop_delete_default()}</td>
</tr>
<tr>
<td>\text{esp_event_handler_register_with()}</td>
<td>\text{esp_event_handler_register()}</td>
</tr>
<tr>
<td>\text{esp_event_handler_unregister_with()}</td>
<td>\text{esp_event_handler_unregister()}</td>
</tr>
<tr>
<td>\text{esp_event_post_to()}</td>
<td>\text{esp_event_post()}</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to \text{esp\_event\_handler\_register\_with()}. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier \text{ESP\_EVENT\_ANY\_BASE} and special event ID \text{ESP\_EVENT\_ANY\_ID}. These special identifiers may be passed as the event base and event ID arguments for \text{esp\_event\_handler\_register\_with()}. 

1176 Chapter 2. API Reference
Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order**

The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- NMEA Parser, which will decode the statements received from GPS.
API Reference

Header File

- esp_event/include/esp_event.h

Functions

```c
esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args, esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**Parameters**

- `event_loop_args`: configuration structure for the event loop to create
- `event_loop`: handle to the created event loop

```c
esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)
```

Delete an existing event loop.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- `event_loop`: event loop to delete

```c
esp_err_t esp_event_loop_create_default (void)
```

Create default event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

```c
esp_err_t esp_event_loop_delete_default (void)
```

Delete the default event loop.

**Return**

- ESP_OK: Success
• Others: Fail

\texttt{esp\_err\_t esp\_event\_loop\_run (esp\_event\_loop\_handle\_t event\_loop, TickType\_t ticks\_to\_run)}

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

\textbf{Note} encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

\textbf{Return}

• ESP_OK: Success
• Others: Fail

\textbf{Parameters}

• event_loop: event loop to dispatch posted events from
• ticks_to_run: number of ticks to run the loop

\texttt{esp\_err\_t esp\_event\_handler\_register (esp\_event\_base\_t event\_base, int32\_t event\_id, esp\_event\_handler\_t event\_handler, void *event\_handler\_arg)}

Register an event handler to the system event loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

• specific events: specify exact event_base and event_id
• all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
• all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

\textbf{Note} the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

\textbf{Return}

• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for the handler
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
Parameters

- **event_base**: the base id of the event to register the handler for
- **event_id**: the id of the event to register the handler for
- **event_handler**: the handler function which gets called when the event is dispatched
- **event_handler_arg**: data, aside from event data, that is passed to the handler when it is called

```
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop.

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Return

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

Parameters

- **event_loop**: the event loop to register this handler function to
- **event_base**: the base id of the event to register the handler for
- **event_id**: the id of the event to register the handler for
- **event_handler**: the handler function which gets called when the event is dispatched
- **event_handler_arg**: data, aside from event data, that is passed to the handler when it is called

```
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop.

This function can be used to unregister a handler so that it no longer gets called during dispatch. Handlers can be unregistered for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

This function ignores unregistration of handlers that has not been previously registered.

**Return** ESP_OK success
Return ESP_ERR_INVALID_ARG invalid combination of event base and event id
Return others fail
Parameters
• event_base: the base of the event with which to unregister the handler
• event_id: the id of the event with which to unregister the handler
• event_handler: the handler to unregister

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop.
This function behaves in the same manner as esp_event_handler_unregister, except the additional specification of the event loop to unregister the handler with.

Return
• ESP_OK: Success
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
• Others: Fail
Parameters
• event_loop: the event loop with which to unregister this handler function
• event_base: the base of the event with which to unregister the handler
• event_id: the id of the event with which to unregister the handler
• event_handler: the handler to unregister

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Return
• ESP_OK: Success
• ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
• Others: Fail
Parameters
• event_base: the event base that identifies the event
• event_id: the event id that identifies the event
• event_data: the data, specific to the event occurrence, that gets passed to the handler
• event_data_size: the size of the event data
• ticks_to_wait: number of ticks to block on a full event queue
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Return**

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- event_loop: the event loop to post to
- event_base: the event base that identifies the event
- event_id: the event id that identifies the event
- event_data: the data, specific to the event occurrence, that gets passed to the handler
- event_data_size: the size of the event data
- ticks_to_wait: number of ticks to block on a full event queue

esp_err_t esp_event_dump(FILE *file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
event loop
  handler
  handler
  ...
  event loop
  handler
  handler
  ...

where:

  event loop
    format: address,name rx:total_recieved dr:total_dropped
    where:
      address - memory address of the event loop
      name - name of the event loop, 'none' if no dedicated task
      total_recieved - number of successfully posted events
      total_dropped - number of events unsuccessfully posted due to queue being full

  handler
    format: address ev:base,id inv:total_invoked run:total_runtime
```

(continues on next page)
where:

- `address` - address of the handler function
- `base, id` - the event specified by event base and id this handler executes
- `total_invoked` - number of times this handler has been invoked
- `total_runtime` - total amount of time used for invoking this handler

**Note** this function is a noop when `CONFIG_ESP_EVENT_LOOP_PROFILING` is disabled

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

**Parameters**

- `file`: the file stream to output to

**Structures**

```c
struct esp_event_loop_args_t
    Configuration for creating event loops.
```

**Public Members**

- `int32_t queue_size`
  size of the event loop queue
- `const char *task_name`
  name of the event loop task; if NULL, a dedicated task is not created for event loop
- `UBaseType_t task_priority`
  priority of the event loop task, ignored if task name is NULL
- `uint32_t task_stack_size`
  stack size of the event loop task, ignored if task name is NULL
- `BaseType_t task_core_id`
  core to which the event loop task is pinned to, ignored if task name is NULL

**Header File**

- `esp_event/include/esp_event_base.h`

**Macros**

- `ESP_EVENT_DECLARE_BASE(id)`
- `ESP_EVENT_DEFINE_BASE(id)`
- `ESP_EVENT_ANY_BASE`
  register handler for any event base
ESP_EVENT_ANY_ID
register handler for any event id

Type Definitions

typedef const char *esp_event_base_t
unique pointer to a subsystem that exposes events
typedef void *esp_event_loop_handle_t
a number that identifies an event with respect to a base
typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
function called when an event is posted to the queue

Legacy event loop

API Reference

Header File

- esp_event/include/esp_event_legacy.h

Functions

esp_err_t esp_event_send(system_event_t *event)
Send a event to event task.
Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task
Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Return ESP_OK : succeed
Return others : fail
Parameters
- event: Event to send

esp_err_t esp_event_send_internal(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
Send a event to event task.
Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task
Note This API is used by WiFi Driver only.

Return ESP_OK : succeed
Return others : fail
Parameters
- event_base: the event base that identifies the event
• **event_id**: the event id that identifies the event
• **event_data**: the data, specific to the event occurrence, that gets passed to the handler
• **event_data_size**: the size of the event data
• **ticks_to_wait**: number of ticks to block on a full event queue

### esp_err_t esp_event_process_default (system_event_t *event)
Default event handler for system events.

This function performs default handling of system events. When using esp_event_loop APIs, it is called automatically before invoking the user-provided callback function.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

**Return** ESP_OK if an event was handled successfully

**Parameters**

• **event**: pointer to event to be handled

### void esp_event_set_default_eth_handlers (void)
Install default event handlers for Ethernet interface.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

### void esp_event_set_default_wifi_handlers (void)
Install default event handlers for Wi-Fi interfaces (station and AP)

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

### esp_err_t esp_event_loop_init (system_event_cb_t cb, void *ctx)
Initialize event loop.

Create the event handler and task

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

**Return**

• ESP_OK: succeed
• others: fail

**Parameters**

• **cb**: application specified event callback, it can be modified by call esp_event_set_cb
• **ctx**: reserved for user

### system_event_cb_t esp_event_loop_set_cb (system_event_cb_t cb, void *ctx)
Set application specified event callback function.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

**Attention** 1. If cb is NULL, means application don't need to handle If cb is not NULL, it will be call when an event is received, after the default event callback is completed

**Return** old callback
Parameters

- cb: application callback function
- ctx: argument to be passed to callback

Unions

union system_event_info_t
#include <esp_event_legacy.h> Union of all possible system_event argument structures

Public Members

system_event_stasconnected_t connected
ESP32 station connected to AP

system_event_stadisconnected_t disconnected
ESP32 station disconnected to AP

system_event_stascan_done_t scan_done
ESP32 station scan (APs) done

system_event_stauthmode_change_t auth_change
the auth mode of AP ESP32 station connected to changed

system_event_stagot_ip_t got_ip
ESP32 station got IP, first time got IP or when IP is changed

system_event_stawps_er_pin_t sta_er_pin
ESP32 station WPS enrollee mode PIN code received

system_event_stawps_fail_reason_t sta_er_fail_reason
ESP32 station WPS enrollee mode failed reason code received

system_event_apstaconnected_t sta_connected
a station connected to ESP32 soft-AP

system_event_apstadisconnected_t sta_disconnected
a station disconnected to ESP32 soft-AP

system_event_approbe_req_rx_t ap_probeereceived
ESP32 soft-AP receive probe request packet

system_event_apstaipassigned_t ap_staipassigned
ESP32 soft-AP assign an IP to the station

system_event_got_ip6_t got_ip6
ESP32 station or ap or ethernet ipv6 addr state change to preferred

Structures

struct system_event_t
Event, as a tagged enum
Public Members

`system_event_id_t event_id`
- event ID

`system_event_info_t event_info`
- event information

Macros

`SYSTEM_EVENT_AP_STA_GOT_IP6`

Type Definitions

```c
typedef wifi_event_sta_wps_fail_reason_t system_event_sta_wps_fail_reason_t
    Argument structure of SYSTEM_EVENT_STA_WPS_ER_FAILED event
```

typedef ip_event_got_ip_t system_event_sta_got_ip_t
    Argument structure of event
```

```c
typedef ip_event_got_ip6_t system_event_got_ip6_t
    Argument structure of event
```

```c
typedef esp_err_t (*system_event_handler_t)(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
    Event handler function type
```

```c
typedef esp_err_t (*system_event_cb_t)(void *ctx, system_event_t *event)
    Application specified event callback function.
```

Note: This API is part of the legacy event system. New code should use event library API in esp_event.h
Return

• ESP_OK: succeed
• others: fail

Parameters

• ctx: reserved for user
• event: event type defined in this file

Enumerations

```
enum system_event_id_t

    System event types enumeration

    Values:

    SYSTEM_EVENT_WIFI_READY = 0
       ESP32 WiFi ready

    SYSTEM_EVENT_SCAN_DONE
       ESP32 finish scanning AP

    SYSTEM_EVENT_STA_START
       ESP32 station start

    SYSTEM_EVENT_STA_STOP
       ESP32 station stop

    SYSTEM_EVENT_STA_CONNECTED
       ESP32 station connected to AP

    SYSTEM_EVENT_STA_DISCONNECTED
       ESP32 station disconnected from AP

    SYSTEM_EVENT_STA_AUTHMODE_CHANGE
       the auth mode of AP connected by ESP32 station changed

    SYSTEM_EVENT_STA_GOT_IP
       ESP32 station got IP from connected AP

    SYSTEM_EVENT_STA_LOST_IP
       ESP32 station lost IP and the IP is reset to 0

    SYSTEM_EVENT_STA_WPS_ER_SUCCESS
       ESP32 station wps succeeds in enrollee mode

    SYSTEM_EVENT_STA_WPS_ER_FAILED
       ESP32 station wps fails in enrollee mode

    SYSTEM_EVENT_STA_WPS_ER_TIMEOUT
       ESP32 station wps timeout in enrollee mode

    SYSTEM_EVENT_STA_WPS_ER_PIN
       ESP32 station wps pin code in enrollee mode

    SYSTEM_EVENT_STA_WPS_ER_PBC_OVERLAP
       ESP32 station wps overlap in enrollee mode

    SYSTEM_EVENT_AP_START
       ESP32 soft-AP start
```
```
SYSTEM_EVENT_AP_STOP
    ESP32 soft-AP stop

SYSTEM_EVENT_AP_STACONNECTED
    a station connected to ESP32 soft-AP

SYSTEM_EVENT_AP_STADISCONNECTED
    a station disconnected from ESP32 soft-AP

SYSTEM_EVENT_AP_STAIPASSIGNED
    ESP32 soft-AP assign an IP to a connected station

SYSTEM_EVENT_AP_PROBEREQRECVED
    Receive probe request packet in soft-AP interface

SYSTEM_EVENT_GOT_IP6
    ESP32 station or ap or ethernet interface v6IP addr is preferred

SYSTEM_EVENT_ETH_START
    ESP32 ethernet start

SYSTEM_EVENT_ETH_STOP
    ESP32 ethernet stop

SYSTEM_EVENT_ETH_CONNECTED
    ESP32 ethernet phy link up

SYSTEM_EVENT_ETH_DISCONNECTED
    ESP32 ethernet phy link down

SYSTEM_EVENT_ETH_GOT_IP
    ESP32 ethernet got IP from connected AP

SYSTEM_EVENT_MAX
    Number of members in this enum
```

### 2.7.8 FreeRTOS

#### Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

For more information about FreeRTOS features specific to ESP-IDF, see *ESP-IDF FreeRTOS SMP Changes* and *ESP-IDF FreeRTOS Additions*.

#### Task API

#### Header File

- freertos/include/freertos/task.h
Functions

**xTaskCreatePinnedToCore** (TaskFunction_t *pvTaskCode, const char *pcName, const uint32_t usStackDepth, void *pvParameters, UBaseType_t uxPriority, TaskHandle_t *pvCreatedTask, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

**Return** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**Parameters**

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to ( 2 | portPRIVILEGE_BIT ).
- **pvCreatedTask**: Used to pass back a handle by which the created task can be referenced.
- **xCoreID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

**static BaseType_t xTaskCreate** (TaskFunction_t *pvTaskCode, const char *pcName, const uint32_t usStackDepth, void *pvParameters, UBaseType_t uxPriority, TaskHandle_t *pvCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

**xTaskCreate()** can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter
    ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared static.
    // If it was just an
    // an automatic stack variable it might no longer exist, or at least have been
    // corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_PRIORITY,
        &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined
in the file projdefs.h

Note If program uses thread local variables (ones specified with “__thread” keyword) then storage for them
will be allocated on the task’s stack.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e.
  continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. Max length
defined by configMAX_TASK_NAME_LEN - default is 16.
- usStackDepth: The size of the task stack specified as the number of bytes. Note that this differs
from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task should run. Systems that include MPU support can op-
  tionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority
  parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set
to ( 2 | portPRIVILEGE_BIT ).
- pvCreatedTask: Used to pass back a handle by which the created task can be referenced.
TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and a task handle will be returned by which the created task can be referenced. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- xCoreID: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200
```

(continues on next page)
// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( 
        vTaskCode, // Function that implements the task.
        "NAME", // Text name for the task.
        STACK_SIZE, // Stack size in bytes, not words.
        ( void * ) 1, // Parameter passed into the task.
        tskIDLE_PRIORITY,// Priority at which the task is created.
        &xTaskBuffer ); // Variable to hold the task’s data structure.

    // pxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task’s handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and a task handle
will be returned by which the created task can be referenced. If either pxStackBuffer or pxTaskBuffer are
NULL then the task will not be created and NULL is returned.

Note If program uses thread local variables (ones specified with “__thread” keyword) then storage for them
will be allocated on the task’s stack.

Parameters

• pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e.
continuous loop).

• pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum
length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.

• ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs
from vanilla FreeRTOS.

- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task will run.
- **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskDelete(TaskHandle_t xTaskToDelete)
Remove a task from the RTOS real time kernel’s management.
The task being deleted will be removed from all ready, blocked, suspended and event lists.
INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

See the demo application file death.c for sample code that utilises vTaskDelete().

**Note** The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

**Example usage:**

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

**Parameters**

- **xTaskToDelete**: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

```c
void vTaskDelay( const TickType_t xTicksToDelay)
Delay a task for a given number of ticks.
The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See
```
vTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;
    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

Parameters

- **xTicksToDelay**: The amount of time, in tick periods, that the calling task should block.

void **vTaskDelayUntil**(TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

Delay a task until a specified time.

INCLUDE_vTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path through the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, vTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here.
    }
}
```
Parameters

- `pxPreviousWakeTime`: Pointer to a variable that holds the time at which the task was last un-blocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within `vTaskDelayUntil()`.

- `xTimeIncrement`: The cycle time period. The task will be unblocked at time `*pxPreviousWakeTime + xTimeIncrement`. Calling `vTaskDelayUntil()` with the same `xTimeIncrement` parameter value will cause the task to execute with a fixed interface period.

UBaseType_t `uxTaskPriorityGet (TaskHandle_t xTask)`
Obtain the priority of any task.

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ... 

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

Return The priority of `xTask`.

Parameters

- `xTask`: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

UBaseType_t `uxTaskPriorityGetFromISR (TaskHandle_t xTask)`
A version of `uxTaskPriorityGet()` that can be used from an ISR.

Return The priority of `xTask`.

Parameters

- `xTask`: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.
**eTaskState eTaskGetState (TaskHandle_t xTask)**

Obtain the state of any task.

States are encoded by the eTaskState enumerated type.

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

**Return** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

**Parameters**

- **xTask**: Handle of the task to be queried.

**void vTaskPrioritySet (TaskHandle_t xTask, UBaseType_t uxNewPriority)**

Set the priority of any task.

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

**Parameters**

- **xTask**: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority**: The priority to which the task will be set.

**void vTaskSuspend (TaskHandle_t xTaskToSuspend)**

Suspend a task.

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

When suspended, a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.
Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...
