# 3 Hardware Reference

## 4 API Guides

### 4.1 Application Level Tracing Library

- 4.1.1 Overview .......................... 2475
- 4.1.2 Modes of Operation ............ 2475
- 4.1.3 Configuration Options and Dependencies .......................... 2476
- 4.1.4 How to Use This Library ........ 2477

### 4.2 Application Startup Flow

- 4.2.1 First Stage Bootloader ............ 2485
- 4.2.2 Second Stage Bootloader ......... 2486
- 4.2.3 Application Startup ............. 2486

### 4.3 BluFi

- 4.3.1 Overview .......................... 2487
- 4.3.2 The BluFi Flow .................... 2487
- 4.3.3 The Flow Chart of BluFi ......... 2489
- 4.3.4 The Frame Formats Defined in BluFi .......... 2489
- 4.3.5 The Security Implementation of ESP32 ........ 2495
- 4.3.6 GATT Related Instructions ....... 2496

### 4.4 Bluetooth® Overview

- 4.4.1 ESP Bluetooth Controller ..... 2496
- 4.4.2 Hosts .............................. 2497
- 4.4.3 Profiles ........................... 2498
- 4.4.4 Applications ...................... 2499

### 4.5 Bootloader

- 4.5.1 Bootloader Compatibility ......... 2499
- 4.5.2 Log Level ........................ 2500
- 4.5.3 Factory Reset ........................ 2500
- 4.5.4 Boot from Test Firmware ........ 2501
4.5.5 Rollback .......................................................... 2501
4.5.6 Watchdog ......................................................... 2501
4.5.7 Bootloader Size ................................................. 2502
4.5.8 Fast Boot from Deep-Sleep ................................. 2502
4.5.9 Custom Bootloader .............................................. 2502

4.6 Build System ....................................................... 2502
4.6.1 Overview ......................................................... 2503
4.6.2 Using the Build System ...................................... 2503
4.6.3 Example Project ............................................... 2505
4.6.4 Project CMakeLists File .................................... 2506
4.6.5 Component CMakeLists Files ............................... 2507
4.6.6 Component Configuration .................................... 2510
4.6.7 Preprocessor Definitions ..................................... 2510
4.6.8 Component Requirements .................................... 2510
4.6.9 Overriding Parts of the Project .......................... 2514
4.6.10 Configuration-Only Components ......................... 2516
4.6.11 Debugging CMake ............................................. 2516
4.6.12 Example Component CMakeLists ......................... 2516
4.6.13 Custom Sdkconfig Defaults ................................. 2520
4.6.14 Flash Arguments .............................................. 2521
4.6.15 Building the Bootloader ................................ 2521
4.6.16 Writing Pure CMake Components ....................... 2522
4.6.17 Using Third-Party CMake Projects with Components 2522
4.6.18 Using Prebuilt Libraries with Components ........ 2523
4.6.19 Using ESP-IDF in Custom CMake Projects ............ 2523
4.6.20 ESP-IDF CMake Build System API ...................... 2524
4.6.21 File Globbing & Incremental Builds .................. 2528
4.6.22 Build System Metadata .................................... 2528
4.6.23 Build System Internals .................................... 2529
4.6.24 Migrating from ESP-IDF GNU Make System ........ 2531

4.7 RF Coexistence .................................................... 2532
4.7.1 Overview ....................................................... 2532
4.7.2 Supported Coexistence Scenario for ESP32 ........... 2532
4.7.3 Coexistence Mechanism and Policy ................. 2533
4.7.4 How to Use the Coexistence Feature .................. 2534

4.8 C Support .......................................................... 2535
4.8.1 C Version ....................................................... 2535
4.8.2 Unsupported C Features ...................................... 2536

4.9 C++ Support ....................................................... 2536
4.9.1 esp-idf-cxx Component .................................... 2536
4.9.2 C++ Language Standard .................................... 2536
4.9.3 Multithreading ............................................... 2536
4.9.4 Exception Handling .......................................... 2537
4.9.5 Runtime Type Information (RTTI) ....................... 2537
4.9.6 Developing in C++ ............................................. 2537
4.9.7 Limitations ..................................................... 2539
4.9.8 What to Avoid ................................................ 2539

4.10 Core Dump ........................................................ 2539
4.10.1 Overview ....................................................... 2539
4.10.2 Configurations ............................................... 2539
4.10.3 Core Dump to Flash ......................................... 2540
4.10.4 Core Dump to UART ......................................... 2541
4.10.5 Core Dump Commands ...................................... 2542
4.10.6 ROM Functions in Backtraces ........................... 2543
4.10.7 Dumping Variables on Demand ......................... 2543
4.10.8 Running idf.py coredump-info and idf.py coredump-debug ......................... 2543

4.11 Current Consumption Measurement of Modules ........ 2546
4.11.1 Notes to Measurement ....................................... 2546

</table>
This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S, ESP32-C, ESP32-H and ESP32-P Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
If you have one of ESP32 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-DevKitC V4 Getting Started Guide**

This guide shows how to start using the ESP32-DevKitC V4 development board.

**What You Need**
- ESP32-DevKitC V4 board
- USB A/micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-DA
  - ESP32-WROOM-32E

Pin Layout

Note on C15 The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

1. P: Power supply; I: Input; O: Output.
2. The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory/SPI RAM.
3. The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.
In case these issues occur, please remove the component. The figure below shows the location of C15 highlighted in yellow.

Start Application Development  Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

What You Need

- ESP32-DevKitC V2 board
- USB A/micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview ESP32-DevKitC V2 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

Functional Description The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V2 board.

**ESP-WROVER-KIT V4.1 Getting Started Guide**

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options.

**What You Need**

- *ESP-WROVER-KIT V4.1 board*
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**  ESP-WROVER-KIT is an ESP32-based development board produced by *Espressif*.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROOM-E module
- LCD screen
- microSD card slot

Another distinguishing feature is the embedded FTDI FT2232HL chip, an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

**Functionality Overview**  The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.
Chapter 1. Get Started

Allocation of ESP32 Pins  Some pins or terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data/Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector/JP1 The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

Start Application Development  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the Power Switch to ON, and the 5 V Power On LED should light up.

Now to Development  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

A Board Support Package can be found in IDF Component Registry.
Chapter 1. Get Started

ESP-WROVER-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board's pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32's GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board's pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture
### Key Component Description

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32.768 kHz</td>
<td>External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.</td>
</tr>
<tr>
<td>0R</td>
<td>Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32's current consumption in different modes.</td>
</tr>
<tr>
<td>ESP32 Module</td>
<td>Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.</td>
</tr>
<tr>
<td>FT2232</td>
<td>The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V3 schematic.</td>
</tr>
<tr>
<td>UART</td>
<td>Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32's serial interface, remove the jumpers and connect another external serial device to the respective pins.</td>
</tr>
<tr>
<td>SPI</td>
<td>By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.</td>
</tr>
<tr>
<td>CTS/RTS</td>
<td>Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.</td>

</table>
Allocation of ESP32 Pins  Some pins/terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data/Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector/JP1  The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<tr>
<td>GPIO33</td>
</tr>
</tbody>
</table>

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11/R23 and re-soldering them to positions R12/R24.
**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

**Start Application Development**  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development**  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and microSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 12: ESP-WROVER-KIT block diagram

Fig. 13: ESP-WROVER-KIT board layout - front
Fig. 14: ESP-WROVER-KIT board layout - back
### Key Component | Description
--- | ---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

**ESP32 Module** Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.

**CTS/RTS** Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

**UART** Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

**SPI** By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.

**JTAG** JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

**FT2232** The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.

**EN** Reset button.

**Boot** Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

**USB** USB interface. Power supply for the board as well as the communication interface between a computer and the board.

**Power Select** Power supply selector interface. The board can be powered either via USB or via the 5 V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.

**Power Key** Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.

**5V Input** The 5 V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).

**LDO** NCP1117(1 A); 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1 A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.

**Camera** Camera interface, a standard OV7670 camera module.

**RGB** Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).

**I/O** All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, 12C, 12S, SPI, etc.

**microSD Card** microSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the microSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.

**LCD** Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

### Setup Options
There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table above.

**ESP32-PICO-KIT V4/V4.1 Getting Started Guide**

This guide shows how to get started with the ESP32-PICO-KIT V4/V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

**What You Need**

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
**Overview**  
ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth® functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer's USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

**Note:**

1. There are two versions of ESP32-PICO-KIT boards, respectively with male headers and female headers. In this guide, the male header version is taken as an example.
2. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details, see module's datasheet in Related Documents.

**Functionality Overview**  
The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

Fig. 15: ESP32-PICO-KIT block diagram
**Functional Description** The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

![ESP32-PICO-KIT board layout (with female headers)](image)

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
Pin Descriptions  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see ESP32-PICO-KIT board layout (with female headers). The pin numbering and header names are the same as in the schematic given in Related Documents.

Chapter 1. Get Started

Note:

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input, b) output.
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Fig. 17: ESP32-PICO-KIT Pin Layout (click to enlarge)

Pin Layout

Start Application Development  Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions  The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

Fig. 18: ESP32-PICO-KIT dimensions - back (with male headers)

For the board physical construction details, please refer to its Reference Design listed below.
Chapter 1. Get Started

ESP32-PICO-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check Hardware Reference.

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 20: ESP32-PICO-KIT V3 board layout
### Key Component | Description
--- | ---
ESP32-PICO-D4 | Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT V3 board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.

LDO | 5V-to-3.3V Low dropout voltage regulator (LDO).

USB-UART bridge | Single-chip USB-UART bridge provides up to 1 Mbps transfers rates.

Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.

Power On LED | This red LED turns on when power is supplied to the board.

I/O | All the pins on ESP32-PICO-D4 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.

BOOT Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

EN Button | Reset button.

---

**Start Application Development**  Before powering up your ESP32-PICO-KIT V3, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

**ESP32-Ethernet-Kit V1.2 Getting Started Guide**

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.2 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**  ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth®/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.
Fig. 21: ESP32-Ethernet-Kit V1.2 Overview (click to enlarge)
Fig. 22: ESP32-Ethernet-Kit V1.2 (click to enlarge)
Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

![ESP32-Ethernet-Kit Block Diagram](image)

</tbody>
</table>
Note: Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users do not need to do any operation with BOOT button or EN button.

PoE Board (B)  This board coverts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

RMII Clock Selection  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e., RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).
Note: For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

RMII Clock Sourced Externally by PHY By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 26: RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-upsampling phase).

RMII Clock Sourced Internally from ESP32’s APLL Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g., I2S peripheral), then you have no choice but use an external RMII clock.
Fig. 27: RMII Clock from ESP Internal APLL
**Chapter 1. Get Started**

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>

---

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also [RMII Clock Sourced Externally by PHY](#). For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic](#).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g., the ESP32-WROOM-32D or ESP32-SOLO-1.

---

**Start Application Development** Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**
1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development   Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example   After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.2 (click to enlarge).

Summary of Changes from ESP32-Ethernet-Kit V1.1
• Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
• Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
• Replace ESP32-WROVER-B with ESP32-WROVER-E.

ESP32-Ethernet-Kit V1.0 Getting Started Guide
This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need
• ESP32-Ethernet-Kit V1.0 board
• USB 2.0 A to Micro B Cable
• Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth®/Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)

The table below provides description starting from the picture’s top right corner and going clockwise.

PoE Board (B)  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

GPIO Allocation  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Chapter 1. Get Started

**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TX_EN</td>
<td>GPIO21</td>
</tr>
<tr>
<td>2 TXD[0]</td>
<td>GPIO19</td>
</tr>
<tr>
<td>3 TXD[1]</td>
<td>GPIO22</td>
</tr>
<tr>
<td>4 RXD[0]</td>
<td>GPIO25</td>
</tr>
<tr>
<td>5 RXD[1]</td>
<td>GPIO26</td>
</tr>
<tr>
<td>6 CRS_DV</td>
<td>GPIO27</td>
</tr>
<tr>
<td>7 REF_CLK</td>
<td>GPIO0</td>
</tr>
</tbody>
</table>

**Serial Management Interface**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>MIIFunction</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 MDC</td>
<td>GPIO23</td>
</tr>
<tr>
<td>9 MDIO</td>
<td>GPIO18</td>
</tr>
</tbody>
</table>

**PHY Reset**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>MIIFunction</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Reset_N</td>
<td>GPIO5</td>
</tr>
</tbody>
</table>

**Note:**  Except for REF_CLK, the allocation of all pins under the RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO32</td>
</tr>
<tr>
<td>GPIO33</td>
</tr>
<tr>
<td>GPIO34</td>
</tr>
<tr>
<td>GPIO35</td>
</tr>
<tr>
<td>GPIO36</td>
</tr>
<tr>
<td>GPIO39</td>
</tr>
</tbody>
</table>

**GPIO Header 2**  This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see **IP101GRI (PHY) Interface**. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>MII Function</th>

<td></td>
</tr>
<tr>
<td>GPIO2</td>
<td>n/a</td>
<td>See note 2</td>
</tr>
<tr>
<td>GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>See note 2</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPI RAM memory inside, e.g., the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.
## GPIO Header 3

The functionality of GPIOs connected to this header depends on the settings of the Function Switch.

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g., the ESP32-WROOM-32D or ESP32-SOLO-1.

### Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to ON.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the 5V Power On LED should light up.

**Now to Development**  Proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an example project onto your board.

To use the older GNU Make compilation system, please refer to *Installation* section.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**  After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.0 board*.

**ESP32-Ethernet-Kit V1.1 Getting Started Guide**

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The **ESP32-Ethernet-Kit** is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**  ESP32-Ethernet-Kit is an ESP32-based development board produced by *Espressif*.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth®/Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.
Fig. 32: ESP32-Ethernet-Kit V1.1
**Functionality Overview**  The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

**Functional Description**  The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)**  The table below provides description starting from the picture's top right corner and going clockwise.
### Table 3: Table 1 Component Description

<td>Link/Activity LEDs</td>
<td>Two LEDs (green and red) that respectively indicate the &quot;Link&quot; and &quot;Activity&quot; statuses of the Ethernet connection.</td>
</tr>
</tbody>
</table>
PoE Board (B)  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE board (B) layout](image)

Fig. 35: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)

### Table 4: Table PoE board (B)

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options**  This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e., RMII clock) that can be provided either externally, or generated from internal ESP32 APPL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.
**RMII Clock Sourced Externally by PHY**  
By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMII Clock Sourced Internally from ESP32’s APLL**  
Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g., I2S peripheral), then you have no choice but use an external RMII clock.

**GPIO Allocation**  
This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Fig. 37: RMII Clock from ESP Internal APLL
**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also [RMII Clock Sourced Externally by PHY](#). For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic](#).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g., the ESP32-WROOM-32D or ESP32-SOLO-1.

---

### Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

### Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on ESP32-Ethernet-Kit V1.1.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**ESP32-DevKitS(-R)**

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif. ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
Chapter 1. Get Started

The document consists of the following major sections:

- **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.
- **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)'s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section *How to Flash a Board* provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

**Overview**  ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

- **ESP32-DevKitS**:
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R**:
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

For information about above modules, please refer to ESP32 Series Modules.

### How to Flash a Board

Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Hardware Setup

Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:

- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

### Software Setup

#### Preferred Method

The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

#### Alternative Method

As an alternative, Windows users can flash binaries using the Flash Download Tool. Just download it, unzip it, and follow the instructions inside the *doc* folder.

### Note:

1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

### Board Dimensions

### Contents and Packaging
Fig. 40: ESP32-DevKitS board dimensions - back

Fig. 41: ESP32-DevKitS-R board dimensions - back
Chapter 1. Get Started

**Retail Orders**  If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

**Hardware Reference**

**Block Diagram**  A block diagram below shows the components of ESP32-DevKitS(-R) and their interconnections.

![Block Diagram](image)

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

**ESP32-PICO-KIT-1**

**Overview**  ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-V3 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth® functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:
Chapter 1. Get Started

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer's USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started**: Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
- **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference**: Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
- **Related Documents**: Gives links to related documentation.

### Getting Started
This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

### Description of Components
The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

<table>
<thead>
<tr>
<th>Key Component</th>

Chapter 1. Get Started

Fig. 44: ESP32-PICO-KIT-1 board layout - front (click to enlarge)

**Start Application Development**  Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

**Required Hardware**
- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment.

**Contents and Packaging**

**Retail Orders**  If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

**Hardware Reference**

**Block Diagram**  The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:
- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

Espressif Systems 79  Release master
Warning: The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

#### Note:

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

ESP32-PICO-DevKitM-2

Overview ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-MINI-02/02U module with complete Wi-Fi and Bluetooth® functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer's USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02/02U are led out to two rows of 18x0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started**: Provides an overview of the ESP32-PICO-DevKitM-2 and software setup instructions to get started.
- **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference**: Provides more detailed information about the ESP32-PICO-DevKitM-2's hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions (if any) of the ESP32-PICO-DevKitM-2.

**Start Application Development**  Before powering up your ESP32-PICO-DevKitM-2, please make sure that the board is in good condition with no obvious signs of damage.

**Required Hardware**
- 1 x ESP32-PICO-DevKitM-2
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS
Software Setup  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment.

Contents and Packaging

Retail Orders  If you order one or several samples of the board, each ESP32-PICO-DevKitM-2 development board comes in an individual package.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  The block diagram below shows the main components of ESP32-PICO-DevKitM-2 and their interconnections.

![ESP32-PICO-DevKitM-2 Block Diagram](image)

Fig. 49: ESP32-PICO-DevKitM-2 Block Diagram (click to enlarge)

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see Description of Components. The pin numbering and header names are the same as in the schematic given in Related Documents.

Note:

1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-DevKitM-2’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

**ESP32-DevKitM-1**

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-1/1U-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.
The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.

**Overview**  This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

**Contents and Packaging**

**Retail Orders**  If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Description of Components**  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.
### Key Component

### Start Application Development

Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Software Setup

Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.
Attention: ESP32-DevKitM-1 boards manufactured before December 2, 2021 have a single core module installed. To verify what module you have, please check module marking information in PCN-2021-021. If your board has a single core module installed, please enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing your applications.

Hardware Reference

Block Diagram  A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

![Block Diagram of ESP32-DevKitM-1](image)

Fig. 52: ESP32-DevKitM-1

Power Source Select  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

Warning:

- The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.

Pin Descriptions  The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

### Pin Layout

### Hardware Revision Details

No previous versions available.

### Related Documents

- ESP32-MINI-1 & ESP32-MINI-1U Datasheet (PDF)
- ESP32-DevKitM-1 Schematics (PDF)
- ESP32-DevKitM-1 PCB layout (PDF)

1. P: Power supply; I: Input; O: Output.
2. MTDO, GPIO0, GPIO2, MTDO, and GPIO5 are strapping pins. These pins are used to control several chip functions depending on binary voltage values applied to the pins during chip power-up or system reset. For description and application of the strapping pins, please refer to ESP32 Datasheet > Section Strapping Pins.
1.2.2 Software

To start using ESP-IDF on ESP32, install the following software:

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 IDE

Note: We highly recommend installing the ESP-IDF through your favorite IDE.

- Eclipse Plugin
- VSCode Extension

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

Standard Setup of Toolchain for Windows

**Introduction**  ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we are going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel > Change date, time, or number formats > Administrative tab > Change system locale > check the option Beta: Use Unicode UTF-8 for worldwide language support > Ok > reboot the computer.

**ESP-IDF Tools Installer**  The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.
Chapter 1. Get Started

What Is the Use case for Online and Offline Installer

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer downloads only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`.

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the Installation

The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf where `%userprofile%` is your home directory.

Launching ESP-IDF Environment

At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer launches ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

![Fig. 54: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment](image)

Run ESP-IDF Command Prompt (cmd.exe):
Fig. 55: ESP-IDF PowerShell

Fig. 56: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (cmd.exe)

Checking if Python packages are up to date...
Python requirements from C:/Users/test/esp/esp-idf/requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:/Users/test/esp/esp-idf>
Using the Command Prompt  For the remaining Getting Started steps, we are going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs export.bat script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

First Steps on ESP-IDF  Now since all requirements are met, the next topic guides you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

Note: There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device  Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32 for full details.

Note: Keep the port name handy as it is needed in the next steps.

Configure Your Project  Navigate to your hello_world directory, set ESP32 as the target, and run the project configuration utility menuconfig.
Chapter 1. Get Started

Windows

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello_world", since this example runs with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MIN1-1/1U module, please enable single core mode (`CONFIG_FREERTOS_UNICORE`) in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See Additional Tips for more information.

**Build the Project** Build the project by running:

```bash
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.
Chapter 1. Get Started

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x10000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'

If there are no errors, the build finishes by generating the firmware binary .bin files.

Flash onto the Device  To flash the binaries that you just built for the ESP32 in the previous step, you need to run the following command:

idf.py -p PORT flash

Replace PORT with your ESP32 board’s USB port name. If the PORT is not defined, the idf.py will try to connect automatically using the available USB ports.

For more information on idf.py arguments, see idf.py.

Note: The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32 for more detailed information.

Normal Operation  When flashing, you will see the output log similar to the following:

... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after-hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
--0x8000 partition_table/partition-table.bin 0x10000 bootloader/bootloader.bin--
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting...........
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14
Uploading stub...

Compressed 3072 bytes to 103...

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

If there are no issues by the end of the flash process, the board will reboot and start up the "hello_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running idf.py, check out Eclipse Plugin, VSCode Extension.

Monitor the Output. To check if "hello_world" is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
=== Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+H ===
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPL_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
...  
Hello world!  
Restarting in 10 seconds...  
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2 MB...  
external flash  
Minimum free heap size: 298968 bytes  
Restarting in 9 seconds...  
Restarting in 8 seconds...  
Restarting in 7 seconds...  
```

To exit IDF monitor use the shortcut Ctrl+.].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.
If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency, then change `CONFIG_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32 are as follows:

- 26 MHz
- 40 MHz

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- `idf.py` for a full reference of `idf.py` commands and options.

**That is all that you need to get started with ESP32!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

**Additional Tips**

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32. *This can be solved by adding the current user to the specific group*, such as dialout or uucp group.

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Start with Board Support Package** To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via [IDF Component Manager](#), so they can be found in IDF Component Registry.
Here is an example of how to add ESP-WROVER-KIT BSP to your project:

```
idf.py add-depency esp_wrover_kit
```

More examples of BSP usage can be found in BSP examples folder.

**Flash Erase**  Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents**  For advanced users who want to customize the install process:

- Updating ESP-IDF Tools on Windows
- Establish Serial Connection with ESP32
- Eclipse Plugin
- VSCode Extension
- IDF Monitor

**Updating ESP-IDF Tools on Windows**

**Install ESP-IDF Tools Using a Script**  From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This downloads and installs the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C: \Users\username\.espressif.

**Add ESP-IDF Tools to PATH Using an Export Script**  ESP-IDF tools installer creates a Start menu shortcut for "ESP-IDF Command Prompt". This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which was not started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.ps1:

```
cd ~/esp/esp-idf
export.ps1
```
Chapter 1. Get Started

When this is done, the tools will be available in this command prompt.

Establish Serial Connection with ESP32

Establishing a serial connection with the ESP32 target device could be done using a USB-to-UART bridge. Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**USB-to-UART Bridge on Development Board** For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32 is UART.

![Diagram of Development Board with USB-to-UART Bridge](image)

**External USB-to-UART Bridge** Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

![Diagram of External USB-to-UART Bridge](image)

**Flash Using UART** This section provides guidance on how to establish a serial connection between ESP32 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32 to PC** Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:
Chapter 1. Get Started

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with the device name for the serial port of your ESP32 board. Please note that `-b` is an optional argument. If you do not specify the baud rate, the default baud rate is 460800. If you need to specify the baud rate, replace `BAUD` with the baud rate you need.

To check the port name on Windows, please refer to check-port-on-windows. For Linux and macOS users, please see check-port-on-linux-and-macos.

For example, if the port name is COM3 on Windows and your desired baud rate is 115200, you can run the following command to flash the device:

```
idf.py -p COM3 -b 115200 flash
```

For Linux users, if the port name is `/dev/ttyUSB0` and the desired baud rate is 115200, you can run the following command to flash the device:

```
idf.py -p /dev/ttyUSB0 -b 115200 flash
```

For macOS users, if the port name is `/dev/cu.usbserial-1401` and the desired baud rate is 115200, you can run the following command to flash the device:

```
idf.py -p /dev/cu.usbserial-1401 -b 115200 flash
```

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the `BOOT` button and then press the `RESET` button once. After that release the `BOOT` button.

---

**Check Port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check Port on Linux and macOS** To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

**Note:** macOS users: if you do not see the serial port then check you have the USB/serial drivers installed. See Section Connect ESP32 to PC for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.
Fig. 61: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 62: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Adding User to **dialout** or **uucp** on Linux  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to **dialout** group with the following command:

```
sudo usermod -a -G dialout $USER
```

On Arch Linux this is done by adding the user to **uucp** group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify Serial Connection  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32.

The default console baud rate on ESP32 is 115200.

**Windows and Linux**  In this example, we use **PuTTY SSH Client** that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 63: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents depend on application loaded to ESP32, see **Example Output**. Reset the board if no log has been printed out.
Fig. 64: Setting Serial Communication in PuTTY on Linux
Chapter 1. Get Started

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

**Note:** If there is no log output, check

- if the required power is supplied to ESP32
- if the board was reset after starting the terminal program
- if the selected serial port is the correct one by using the method stated in Check Port on Windows and Check Port on Linux and macOS
- if the serial port is not being used by another program
- if the identified port has been selected in serial terminal programs you are using, as stated in Windows and Linux
- if settings of the serial port in serial terminal programs are applicable to corresponding applications
- if the correct USB connector (UART) is used on the development board
- if your application is expected to output some log
- if the log output has not been disabled (use hello world application to test)

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

  ```
  ls /dev/cu.*
  ```

  You should see similar output:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART
  ```

- The output varies depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

  ```
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents depend on application loaded to ESP32, see Example Output. To exit the current `screen` session, type Ctrl-A + K.

**Note:** Do not forget to exit the current `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)

entry 0x40080034
```

(continues on next page)
If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 booting and producing serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

If you got here from Step 5. First Steps on ESP-IDF when installing s/w for ESP32 development, then you can continue with Step 5. First Steps on ESP-IDF.

## Flashing Troubleshooting

### Failed to Connect

If you run the given command and see errors such as "Failed to connect", there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the esptool troubleshooting page.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP PU.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP PU).
- For other types of hardware, try pulling GPIO0 down.

## Standard Toolchain Setup for Linux and macOS

### Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

### Setting up Development Environment

These are the steps for setting up the ESP-IDF for your ESP32.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the Tools**
Chapter 1. Get Started

- **Step 4. Set up the Environment Variables**
- **Step 5. First Steps on ESP-IDF**

**Step 1. Install Prerequisites**  In order to use ESP-IDF with the ESP32, you need to install some software packages based on your Operating System. This setup guide helps you on getting everything installed on Linux and macOS based systems.

**For Linux Users**  To compile using ESP-IDF, you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- **Ubuntu and Debian:**
  ```bash
  sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

- **CentOS 7 & 8:**
  ```bash
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake --ninja-build ccache dfu-util libusb
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Arch:**
  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja-ccache dfu-util libusb
  ```

**Note:**
- CMake version 3.16 or newer is required for use with ESP-IDF. Run ”tools/idf_tools.py install cmake” to install a suitable version if your OS versions does not have one.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

**For macOS Users**  ESP-IDF uses the version of Python installed by default on macOS.

- **Install CMake & Ninja build:**
  - If you have HomeBrew, you can run:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```bash
    sudo port install cmake ninja dfu-util
    ```
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

  **Note:**  If an error like this is shown during any step:
  ```bash
  ```

  Then you need to install the XCode command line tools to continue. You can install these by running xcode-select --install.
Apple M1 Users If you use Apple M1 platform and see an error like this:

```plaintext
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```
or:

```plaintext
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you need to install Apple Rosetta 2 by running

```plaintext
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Installing Python 3 Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 is not included by default in future versions of macOS. Check what Python you currently have:

```plaintext
python --version
```

If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 is not already installed on your computer:

```plaintext
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:
  ```bash
  brew install python3
  ```
- If you have MacPorts, you can run:
  ```bash
  sudo port install python38
  ```

Step 2. Get ESP-IDF To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF is downloaded into `~/esp/esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Step 3. Set up the Tools Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32.

```bash
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell
Chapter 1. Get Started

```
cd ~/esp/esp-idf
./install.fish esp32
```

The above commands install tools for ESP32 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see Download Error While Installing ESP-IDF Tools.

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it does not change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Note:** For users in China, we recommend using our download server located in China for faster download speed.

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```
Customizing the Tools Installation Path  

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux. If you wish to install the tools into a different directory, export the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

```
export IDF_TOOLS_PATH="$HOME/required_idf_tools_path"
./install.sh
../export.sh
```

If changing the IDF_TOOLS_PATH, make sure it is exported in the environment before running any ESP-IDF tools or scripts.

Note:  

Using IDF_TOOLS_PATH in variable assignement, e.g., IDF_TOOLS_PATH="$HOME/required_idf_tools_path" ./install.sh, without prior exporting, will not work in most shells because the variable assignment will not affect the current execution environment, even if it's exported/changed in the sourced script.

Step 4. Set up the Environment Variables  

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell's profile (.profile, .bashrc, .zprofile, etc.)

   ```
   alias get_idf=' $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, source ~/.bashrc.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

Step 5. First Steps on ESP-IDF  

Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32 and build, flash, and monitor the device output.

Note:  

If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.
Chapter 1. Get Started

Start a Project  Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world ./
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device  Now connect your ESP32 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32 for full details.

**Note:** Keep the port name handy as it is needed in the next steps.

Configure Your Project  Navigate to your `hello_world` directory, set ESP32 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello_world", since this example runs with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MIN1-1/1U module, please enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See Additional Tips for more information.
Build the Project  

Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
  ../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
  --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
  -bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
  partition-table.bin or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

Flash onto the Device  

To flash the binaries that you just built for the ESP32 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32 board's USB port name. If the PORT is not defined, the idf.py will try to connect automatically using the available USB ports.

For more information on idf.py arguments, see idf.py.
Chapter 1. Get Started

Note: The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32 for more detailed information.

**Normal Operation**  When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
    → after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
    → 0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
    → 0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting........
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14

→ 5 kbit/s)... Hash of data verified.
Leaving...
Hard resetting via RTS pin...
Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the "hello_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out Eclipse Plugin, VSCode Extension.

**Monitor the Output**  To check if "hello_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:
Chapter 1. Get Started

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]//esp/hello_world/build
Executing "python [...]//esp-idf/tools/idf_monitor.py -b 115200 [...]//esp/hello_→world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FLASH_BOOT)
ets Jun 8 2016 00:22:57
... 

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2 MB...
external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2 MB...
external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency, then change CONFIG_XTAL_FREQ_SEL to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32 are as follows:

- 26 MHz
- 40 MHz

Note: You can combine building, flashing and monitoring into one step by running:

`idf.py -p PORT flash monitor`

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That is all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.
Important: Some of the examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

Additional Tips

Permission Denied Issue With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32. This can be solved by adding the current user to the specific group, such as dialout or uucp group.

Python Compatibility ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Start with Board Support Package To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via IDF Component Manager, so they can be found in IDF Component Registry.

Here is an example of how to add ESP-WROVER-KIT BSP to your project:

```
idf.py add-dependency esp_wrover_kit
```

More examples of BSP usage can be found in BSP examples folder.

Flash Erase Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

Tip: Updating ESP-IDF It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the Tools.
Once the new tools are installed, update the environment using the Export script. See instructions at *Step 4. Set up the Environment Variables.*

### 1.4 Build Your First Project

If you already have the ESP-IDF installed and are not using an IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

### 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the ESP-IDF CMake Build System API.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components contain an “ESP-IDF specific” wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF’s features. In other cases, third-party components present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the esp_err_t type. See Error Handling section for more information about error handling approaches. Error Codes Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration Structures

Important: Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.
Most initialization, configuration, and installation functions in ESP-IDF (typically named ..._init(), ..._config(), and ..._install()) take a configuration structure pointer as an argument. For example:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack. The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
->initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};

/// Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see Designated Initializers. Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are_-
->set to the default values, and any field can still be modified: */
config.server_port = 8081;
```
It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses **Semantic Versioning** as explained in the **Versioning Scheme**.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system's `backward compatibility` ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.
Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration Structures for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that do not fall into the categories below.

- Private APIs.
- Components in Example Projects.
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of `Kconfig` options in menuconfig.
- Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO Port

ASIO is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

- ASIO component on GitHub

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`.

Hosted Documentation

The documentation can be found on the link below:

- ASIO documentation (English)
2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, and Ethernet interfaces. Since ESP-IDF version v5.0, the component freemodbus has been moved from ESP-IDF to a separate repository:

- ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found through the link below:

- ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial and TCP ports for both slave and master implementations respectively.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the README.md documents of each specific example for details.

Protocol References

- For the detailed protocol specifications, see The Modbus Organization.

2.2.3 ESP-MQTTC

Overview

ESP-MQTT is an implementation of MQTT protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports MQTT v5.0.

Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

Application Examples

- protocols/mqtt/tcp: MQTT over TCP, default port 1883
- protocols/mqtt/ssl: MQTT over TLS, default port 8883
- protocols/mqtt/ssl_ds: MQTT over TLS using digital signature peripheral for authentication, default port 8883
- protocols/mqtt/ssl Mutual Auth: MQTT over TLS using certificates for authentication, default port 8883
Chapter 2. API Reference

- protocols/mqtt/ssl_psk: MQTT over TLS using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over WebSocket, default port 80
- protocols/mqtt/wss: MQTT over WebSocket Secure, default port 443
- protocols/mqtt5: Uses ESP-MQTT library to connect to broker with MQTT v5.0

MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`. Messages with QoS 0 is sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

Broker

Address

Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname, transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`

- Currently support `mqtt, mqtts, ws, wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:
```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    client);
esp_mqtt_client_start(client);
```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

### Verification
For secure connections with TLS used, and to guarantee Broker's identity, the verification struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent certificate_len field must be set. Otherwise, a null-terminated string in PEM format should be provided to certificate field.

- **Get certificate from server, example:** `mqtt.eclipseprojects.io`
  ```bash
  openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/null 2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
  ```
- Check the sample application: `protocols/mqtt/ssl`
- Configuration:
  ```c
  const esp_mqtt_client_config_t mqtt_cfg = {
      .broker = {
          .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
          .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
      },
  };
  ```

For details about other fields, please check the API Reference and TLS Server Verification.

### Client Credentials
All client related credentials are under the credentials field.
- **username:** pointer to the username used for connecting to the broker, can also be set by URI
- **client_id:** pointer to the client ID, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format

### Authentication
It is possible to set authentication parameters through the authentication field. The client supports the following authentication methods:
- **password:** use a password by setting
- **certificate and key:** mutual authentication with TLS, and both can be provided in PEM or DER format
- **use_secure_element:** use secure element (ATECC608A) interfaced to ESP32
- **ds_data:** use Digital Signature Peripheral available in some Espressif devices

### Session
For MQTT session-related configurations, session fields should be used.

### Last Will and Testament
MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the last_will struct.
- **topic:** pointer to the LWT message topic
- **msg:** pointer to the LWT message
- **msg_len:** length of the LWT message, required if `msg` is not null-terminated
• **qos**: quality of service for the LWT message  
• **retain**: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu**  
The settings for MQTT can be found using `idf.py menu-config`, under Component config > ESP-MQTT Configuration.

The following settings are available:

• `CONFIG_MQTT_PROTOCOL_311`: enable 3.1.1 version of MQTT protocol  
• `CONFIG_MQTT_TRANSPORT_SSL` and `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET_SECURE  
• `CONFIG_MQTT_CUSTOM_OUTBOX`: disable default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

• `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.  
• `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.  
• `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g., because the server is unavailable.  
• `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data contains the message ID of the subscribe message.  
• `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data contains the message ID of the unsubscribe message.  
• `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This is only posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data contains the message ID of the publish message.  
• `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple `MQTT_EVENT_DATA` events are posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.  
• `MQTT_EVENT_ERROR`: The client has encountered an error. The field `error_handle` in the event data contains `error_type` that can be used to identify the error. The type of error determines which parts of the `error_handle` struct is filled.

**API Reference**

**Header File**

• `components/mqtt/esp-mqtt/include/mqtt_client.h`  
This header file can be included with:

```c
#include "mqtt_client.h"
```

• This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your CMakeLists.txt:

```cmake
REQUIRES mqtt
```

or

```cmake
PRIV_REQUIRES mqtt
```

**Functions**
**esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)**

Creates MQTT client handle based on the configuration.

**Parameters**
- **config** -- MQTT configuration structure

**Returns**
- mqtt_client_handle if successfully created, NULL on error

**esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)**

Sets MQTT connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

**Parameters**
- **client** -- MQTT client handle
- **uri**

**Returns**
- ESP_FAIL if URI parse error, ESP_OK on success

**esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)**

Starts MQTT client with already created client handle.

**Parameters**
- **client** -- MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force reconnection upon a specific event.

**Parameters**
- **client** -- MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force disconnection from the broker.

**Parameters**
- **client** -- MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

**esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)**

Stops MQTT client tasks.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- **client** -- MQTT client handle

**Returns**
- ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**int esp_mqtt_client_subscribe_single (esp_mqtt_client_handle_t client, const char *topic, int qos)**

Subscribe the client to defined topic with defined qos.

**Notes:**
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- esp_mqtt_client_subscribe could be used to call this function.

**Parameters**
- **client** -- MQTT client handle
- **topic** -- topic filter to subscribe
- **qos** -- Max qos level of the subscription

**Returns**
- message_id of the subscribe message on success -1 on failure -2 in case of full outbox.
Chapter 2. API Reference

int esp_mqtt_client_subscribe_multiple (esp_mqtt_client_handle_t client, const esp_mqtt_topic_t *topic_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

• Client must be connected to send subscribe message
• This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task
  (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
• esp_mqtt_client_subscribe could be used to call this function.

Parameters

• client -- MQTT client handle
• topic_list -- List of topics to subscribe
• size -- size of topic_list

Returns message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int esp_mqtt_clientunsubscribe (esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

• Client must be connected to send unsubscribe message
• It is thread safe, please refer to esp_mqtt_client_subscribe_single for details

Parameters

• client -- MQTT client handle
• topic--

Returns message_id of the subscribe message on success -1 on failure

int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

• This API might block for several seconds, either due to network timeout (10s) or if publishing payloads
  longer than internal buffer (due to message fragmentation)
• Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning
  -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is
  enabled, this API will not attempt to publish when the client is not connected and will always return -1.
• It is thread safe, please refer to esp_mqtt_client_subscribe for details

Parameters

• client -- MQTT client handle
• topic -- topic string
• data -- payload string (set to NULL, sending empty payload message)
• len -- data length, if set to 0, length is calculated from payload string
• qos -- QoS of publish message
• retain -- retain flag

Returns message_id of the publish message (for QoS 0 message_id will always be zero) on success.
-1 on failure, -2 in case of full outbox.

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also
used for qos=0 messages if store=true.
This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

**Parameters**
- **client** -- MQTT client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message_id if queued successfully, -1 on failure, -2 in case of full outbox.

```c
esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)
```

Destroys the client handle.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- **client** -- MQTT client handle

**Returns** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

```c
esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
```

Set configuration structure, typically used when updating the config (i.e. on "before_connect" event).

**Parameters**
- **client** -- MQTT client handle
- **config** -- MQTT configuration structure

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

```c
esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Registers MQTT event.

**Parameters**
- **client** -- MQTT client handle
- **event** -- event type
- **event_handler** -- handler callback
- **event_handler_arg** -- handlers context

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

```c
esp_err_t esp_mqtt_client_unregister_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)
```

Unregisters mqtt event.

**Parameters**
- **client** -- mqtt client handle
- **event** -- event ID
- **event_handler** -- handler to unregister

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on invalid event ID ESP_OK on success

```c
int esp_mqtt_client_get_outbox_size (esp_mqtt_client_handle_t client)
```

Get outbox size.
**Parameters**

- `client` -- `MQTT` client handle

**Returns**

outbox size 0 on wrong initialization

```c
esp_err_t esp_mqtt_dispatch_custom_event (esp_mqtt_client_handle_t client, esp_mqtt_event_t *event)
```

Dispatch user event to the `mqtt` internal event loop.

**Parameters**

- `client` -- `MQTT` client handle
- `event` -- `MQTT` event handle structure

**Returns**

ESP_OK on success ESP_ERR_TIMEOUT if the event couldn’t be queued (ref also CONFIG_MQTT_EVENT_QUEUE_SIZE)

---

**Structures**

```c
struct esp_mqtt_error_codes
```

`MQTT` error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th><code>error_type</code></th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_log, esp_tls_stack_errno, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from <code>MQTT</code> broker on connection</td>
</tr>
</tbody>
</table>

**Public Members**

```c
esp_err_t esp_tls_last_errno
```

last esp_errno code reported from esp-tls component

```c
int esp_tls_stack_errno
```

tls specific error code reported from underlying tls stack

```c
int esp_tls_cert_verify_flags
```

tls flags reported from underlying tls stack during certificate verification

```c
esp_mqtt_error_type_t error_type
```

error type referring to the source of the error

```c
esp_mqtt_connect_return_code_t connect_return_code
```

connection refused error code reported from MQTT broker on connection

```c
int esp_transport_sock_errno
```

errno from the underlying socket

```c
struct esp_mqtt_event_t
```

`MQTT` event configuration structure
Public Members

\texttt{esp_mqtt_event_id_t \textbf{event\_id}}

\textit{MQTT} event type

\texttt{esp_mqtt_client_handle_t \textbf{client}}

\textit{MQTT} client handle for this event

char *\textbf{data}

Data associated with this event

int \textbf{data\_len}

Length of the data for this event

int \textbf{total\_data\_len}

Total length of the data (longer data are supplied with multiple events)

int \textbf{current\_data\_offset}

Actual offset for the data associated with this event

char *\textbf{topic}

Topic associated with this event

int \textbf{topic\_len}

Length of the topic for this event associated with this event

int \textbf{msg\_id}

\textit{MQTT} message id of message

int \textbf{session\_present}

\textit{MQTT} session\_present flag for connection event

\texttt{esp_mqtt_error_codes_t *\textbf{error\_handle}}

esp-mqtt error handle including esp-tls errors as well as internal \textit{MQTT} errors

bool \textbf{retain}

Retained flag of the message associated with this event

int \textbf{qos}

QoS of the messages associated with this event

bool \textbf{dup}

dup flag of the message associated with this event

\texttt{esp_mqtt_protocol_ver_t \textbf{protocol\_ver}}

\textit{MQTT} protocol version used for connection, defaults to value from menuconfig
struct esp_mqtt_client_config_t

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

**Public Members**

struct esp_mqtt_client_config_t::broker_t  
broker

Broker address and security verification

struct esp_mqtt_client_config_t::credentials_t  
credentials

User credentials for broker

struct esp_mqtt_client_config_t::session_t  
session

*MQTT* session configuration.

struct esp_mqtt_client_config_t::network_t  
network

Network configuration

struct esp_mqtt_client_config_t::task_t  
task

FreeRTOS task configuration.

struct esp_mqtt_client_config_t::buffer_t  
buffer

Buffer size configuration.

struct esp_mqtt_client_config_t::outbox_config_t  
outbox

Outbox configuration.

struct broker_t

Broker related configuration

**Public Members**

struct esp_mqtt_client_config_t::broker_t::address_t  
address

Broker address configuration

struct esp_mqtt_client_config_t::broker_t::verification_t  
verification

Security verification of the broker

struct address_t

Broker address

- uri have precedence over other fields
- If uri isn’t set at least hostname, transport and port should.
### Public Members

const char *`uri`
- Complete MQTT broker URI

const char *`hostname`
- Hostname, to set ipv4 pass it as string

**esp_mqtt_transport_t** `transport`
- Selects transport

const char *`path`
- Path in the URI

`uint32_t` `port`
- MQTT server port

**struct** `verification_t`
- Broker identity verification
  - If fields are not set broker's identity isn't verified. It's recommended to set the options in this struct for security reasons.

### Public Members

`bool` `use_global_ca_store`
- Use a global ca_store, look esp-tls documentation for details.

**esp_err_t** (*crt_bundle_attach*)(void *`conf`)
- Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char *`certificate`
- Certificate data, default is NULL, not required to verify the server.

`size_t` `certificate_len`
- Length of the buffer pointed to by certificate.

const struct `psk_key_hint` *`psk_hint_key`
- Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

`bool` `skip_cert_common_name_check`
- Skip any validation of server certificate CN field, this reduces the security of TLS and makes the MQTT client susceptible to MITM attacks

const char **`alpn_protos`
- NULL-terminated list of supported application protocols to be used for ALPN
const char *common_name

Pointer to the string containing server certificate common name. If non-NULL, server certificate
CN must match this name. If NULL, server certificate CN must match hostname. This is ignored
if skip_cert_common_name_check=true.

struct buffer_t

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int size

size of MQTT send/receive buffer

int out_size

size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t

Client related credentials for authentication.

Public Members

const char *username

MQTT username

const char *client_id

Set MQTT client identifier. Ignored if set_null_client_id == true. If NULL set the default client id.
Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool set_null_client_id

Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_t authentication

Client authentication

struct authentication_t

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital
signature peripheral if available.

Public Members

const char *password

MQTT password
const char *certificate
Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with key.

size_t certificate_len
Length of the buffer pointed to by certificate.

const char *key
Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also certificate has to be provided.

size_t key_len
Length of the buffer pointed to by key.

const char *key_password
Client key decryption password, not PEM nor DER, if provided key_password_len must be correctly set.

int key_password_len
Length of the password pointed to by key_password

bool use_secure_element
Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void *ds_data
Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct network_t
Network related configuration

Public Members

int reconnect_timeout_ms
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

int timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

bool disable_auto_reconnect
Client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable
esp_transport_handle_t transport
Custom transport handle to use. Warning: The transport should be valid during the client lifetime
and is destroyed when esp_mqtt_client_destroy is called.

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

struct outbox_config_t
Client outbox configuration options.

Public Members

uint64_t limit
Size limit for the outbox in bytes.

struct session_t
MQTT Session related configuration

Public Members

struct esp_mqtt_client_config_t::session_t::last_will_t last_will
Last will configuration

bool disable_clean_session
MQTT clean session, default clean_session is true

int keepalive
MQTT keepalive, default is 120 seconds When configuring this value, keep in mind that the client
attempts to communicate with the broker at half the interval that is actually set. This conservative
approach allows for more attempts before the broker’s timeout occurs

bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by de-
fault. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a
default keepalive period

esp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection.

int message_retransmit_timeout
timeout for retransmitting of failed packet

struct last_will_t
Last Will and Testament message configuration.
Chapter 2. API Reference

**Public Members**

const char *\_topic

LWT (Last Will and Testament) message topic

const char *\_msg

LWT message, may be NULL terminated

int \_msg\_len

LWT message length, if msg isn't NULL terminated must have the correct length

int \_qos

LWT message QoS

int \_retain

LWT retained message flag

struct task\_t

Client task configuration

**Public Members**

int priority

MQTT task priority

int stack\_size

MQTT task stack size

struct topic\_t

Topic definition struct

**Public Members**

const char *\_filter

Topic filter to subscribe

int \_qos

Max QoS level of the subscription

**Macros**

MQTT\_ERROR\_TYPE\_ESP\_TLS

MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT\_ERROR\_TYPE\_ESP\_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility
Chapter 2. API Reference

\textbf{esp_mqtt_client_subscribe} (client_handle, topic_type, qos_or_size)

Convenience macro to select subscribe function to use.

Notes:

\begin{itemize}
  \item Usage of \textit{esp_mqtt_client_subscribe_single} is the same as previous \textit{esp_mqtt_client_subscribe}, refer to it for details.
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \textit{client_handle} -- \textit{MQTT} client handle
  \item \textit{topic_type} -- Needs to be char* for single subscription or \textit{esp_mqtt_topic_t} for multiple topics
  \item \textit{qos_or_size} -- It’s either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.
\end{itemize}

\textbf{Returns} message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

\textbf{Type Definitions}

typedef struct esp_mqtt_client *\textit{esp_mqtt_client_handle_t}

typedef enum \textit{esp_mqtt_event_id_t} \textit{esp_mqtt_event_id_t}

\textit{MQTT} event types.

User event handler receives context data in \textit{esp_mqtt_event_t} structure with

\begin{itemize}
  \item client - \textit{MQTT} client handle
  \item various other data depending on event type
\end{itemize}

typedef enum \textit{esp_mqtt_connect_return_code_t} \textit{esp_mqtt_connect_return_code_t}

\textit{MQTT} connection error codes propagated via ERROR event

typedef enum \textit{esp_mqtt_error_type_t} \textit{esp_mqtt_error_type_t}

\textit{MQTT} connection error codes propagated via ERROR event

typedef enum \textit{esp_mqtt_transport_t} \textit{esp_mqtt_transport_t}

typedef enum \textit{esp_mqtt_protocol_ver_t} \textit{esp_mqtt_protocol_ver_t}

\textit{MQTT} protocol version used for connection

typedef struct \textit{esp_mqtt_error_codes} \textit{esp_mqtt_error_codes_t}

\textit{MQTT} error code structure to be passed as a contextual information into ERROR event

Important: This structure extends \textit{esp_tls_last_error} error structure and is backward compatible with it (so might be down-casted and treated as \textit{esp_tls_last_error} error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from \textit{MQTT} broker on connection</td>
</tr>
</tbody>
</table>

typedef struct \textit{esp_mqtt_event_t} \textit{esp_mqtt_event_t}

\textit{MQTT} event configuration structure
typedef *esp_mqtt_event_handle_t

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t
  
  MQTT client configuration structure

  • Default values can be set via menuconfig
  • All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

typedef struct topic_t esp_mqtt_topic_t
  
  Topic definition struct

Enumerations

enum esp_mqtt_event_id_t
  
  MQTT event types.
  User event handler receives context data in esp_mqtt_event_t structure with

  • client - MQTT client handle
  • various other data depending on event type

  Values:

enumerator MQTT_EVENT_ANY

enumerator MQTT_EVENT_ERROR
  
on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator MQTT_EVENT_CONNECTED
  
  connected event, additional context: session_present flag

enumerator MQTT_EVENT_DISCONNECTED
  
  disconnected event

enumerator MQTT_EVENT_SUBSCRIBED
  
  subscribed event, additional context:
  • msg_id message id
  • error_handle error_type in case subscribing failed
  • data pointer to broker response, check for errors.
  • data_len length of the data for this event

enumerator MQTT_EVENT_UNSUBSCRIBED
  
  unsubscribed event, additional context: msg_id

enumerator MQTT_EVENT_PUBLISHED
  
  published event, additional context: msg_id

enumerator MQTT_EVENT_DATA
  
  data event, additional context:
Chapter 2. API Reference

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- retain retain flag of the message
- `qos` QoS level of the message
- dup dup flag of the message

Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**enumerator** `MQTT_EVENT_BEFORE_CONNECT`

The event occurs before connecting

**enumerator** `MQTT_EVENT_DELETED`

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

**enumerator** `MQTT_USER_EVENT`

Custom event used to queue tasks into `mqtt` event handler. All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

**enum** `esp_mqtt_connect_return_code_t`

`MQTT` connection error codes propagated via `ERROR` event

**Values:**

- **enumerator** `MQTT_CONNECTION_ACCEPTED`
  
  Connection accepted

- **enumerator** `MQTT_CONNECTION_REFUSE_PROTOCOL`
  
  `MQTT` connection refused reason: Wrong protocol

- **enumerator** `MQTT_CONNECTION_REFUSE_ID_REJECTED`
  
  `MQTT` connection refused reason: ID rejected

- **enumerator** `MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE`
  
  `MQTT` connection refused reason: Server unavailable

- **enumerator** `MQTT_CONNECTION_REFUSE_BAD_USERNAME`
  
  `MQTT` connection refused reason: Wrong user

- **enumerator** `MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED`
  
  `MQTT` connection refused reason: `Wrong username or password`

**enum** `esp_mqtt_error_type_t`

`MQTT` connection error codes propagated via `ERROR` event

**Values:**
Chapter 2. API Reference

enumerator MQTT_ERROR_TYPE_NONE

enumerator MQTT_ERROR_TYPE_TCP_TRANSPORT

enumerator MQTT_ERROR_TYPE_CONNECTION_REFUSED

enumerator MQTT_ERROR_TYPE_SUBSCRIBE_FAILED

enum esp_mqtt_transport_t
Values:

enumerator MQTT_TRANSPORT_UNKNOWN

enumerator MQTT_TRANSPORT_OVER_TCP
MQTT over TCP, using scheme: MQTT

enumerator MQTT_TRANSPORT_OVER_SSL
MQTT over SSL, using scheme: MQTTs

enumerator MQTT_TRANSPORT_OVER_WS
MQTT over Websocket, using scheme: ws

enumerator MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection
Values:

enumerator MQTT_PROTOCOL_UNDEFINED

enumerator MQTT_PROTOCOL_V_3_1

enumerator MQTT_PROTOCOL_V_3_1_1

enumerator MQTT_PROTOCOL_V_5

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functions. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, and non-blocking connection among others. All the configurations can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
• `esp_tls_init()`: for initializing the TLS connection handle.
• `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
• `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
• `esp_tls_conn_read()`: for reading from the connection.
• `esp_tls_conn_write()`: for writing into the connection.
• `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2, etc can be executed on top of this layer.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: `protocols/https_request`.

**Tree Structure for ESP-TLS Component**

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally, the ESP-TLS component operates using either MbedTLS or WolfSSL, which are SSL/TLS libraries. APIs specific to MbedTLS are present in `esp-tls/private_include/esp_tls_mbedtls.h` and APIs specific to WolfSSL are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

**TLS Server Verification**

ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected, the client will return a fatal error by default during the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS uses the CA certificate present in the buffer to verify the server. The following variables in the `esp_tls_cfg_t` structure must be set.
  - `cacert_buf`: pointer to the buffer which contains the CA certification.
  - `cacert_bytes`: the size of the CA certificate in bytes.

- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See the API Reference section below for information regarding different APIs used for initializing and setting up the `global_ca_store`.

- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#).

- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to the PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purposes. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option
Chapter 2. API Reference

is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure.

**Warning:** Enabling this option comes with a potential risk of establishing a TLS connection with a server that has a fake identity, provided that the server certificate is not provided either through API or other mechanisms like ca_store etc.

**ESP-TLS Server Cert Selection Hook**

The ESP-TLS component provides an option to set the server certification selection hook when using the MbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake. The callback helps to select a certificate to present to the client based on the TLS extensions supplied in the client hello message, such as ALPN and SNI. To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig.

The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```c
int cert_selection_callback(mbedtls_ssl_context *ssl) {
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

**Underlying SSL/TLS Library Options**

The ESP-TLS component offers the option to use MbedTLS or WolfSSL as its underlying SSL/TLS library. By default, only MbedTLS is available and used, WolfSSL SSL/TLS library is also available publicly at https://github.com/espressif/esp-wolfssl. The repository provides the WolfSSL component in binary format, and it also provides a few examples that are useful for understanding the API. Please refer to the repository README.md for information on licensing and other options. Please see the below section for instructions on how to use WolfSSL in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

**How to Use WolfSSL with ESP-IDF**

There are two ways to use WolfSSL in your project:

1) Directly add WolfSSL as a component in your project with the following three commands:

   ```
   (First, change the directory (cd) to your project directory)
   mkdir components
   cd components
   git clone --recursive https://github.com/espressif/esp-wolfssl.git
   ```

2) Add WolfSSL as an extra component in your project.

   • Download WolfSSL with:

   ```
   git clone --recursive https://github.com/espressif/esp-wolfssl.git
   ```

   • Include ESP-WolfSSL in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project Variables in build-system.
Chapter 2. API Reference

After the above steps, you will have the option to choose WolfSSL as the underlying SSL/TLS library in the configuration menu of your project as follows:

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

**Comparison Between MbedTLS and WolfSSL**

The following table shows a typical comparison between WolfSSL and MbedTLS when the `protocols/https_request` example (which includes server authentication) is running with both SSL/TLS libraries and with all respective configurations set to default. For MbedTLS, the IN_CONTENT length and OUT_CONTENT length are set to 16384 bytes and 4096 bytes respectively.

<table>
<thead>
<tr>
<th>Property</th>
<th>WolfSSL</th>
<th>MbedTLS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 KB</td>
<td>~37 KB</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 KB</td>
<td>~3.6 KB</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 KB</td>
<td>~736 KB</td>
</tr>
</tbody>
</table>

**Note:** These values can vary based on configuration options and version of respective libraries.

**ATECC608A (Secure Element) with ESP-TLS**

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32 series of SoCs. The use of ATECC608A is supported only when ESP-TLS is used with MbedTLS as its underlying SSL/TLS stack. ESP-TLS uses MbedTLS as its underlying TLS/SSL stack by default unless changed manually.

**Note:** ATECC608A chip interfaced to ESP32 must be already configured. For details, please refer to `esp_cryptoauth_utility`.

To enable the secure element support, and use it in your project for TLS connection, you have to follow the below steps:

1) Add `esp-cryptoauthlib` in your project, for details please refer how to use `esp-cryptoauthlib` with ESP-IDF.
2) Enable the following menuconfig option:

```
menuconfig > Component config > ESP-TLS > Use Secure Element (ATECC608A) with...
```

3) Select type of ATECC608A chip with following option:

```
menuconfig > Component config > esp-cryptoauthlib > Choose Type of ATECC608A...
```

To know more about different types of ATECC608A chips and how to obtain the type of ATECC608A connected to your ESP module, please visit `ATECC608A chip type`.

4) Enable the use of ATECC608A in ESP-TLS by providing the following config option in `esp_tls_cfg_t`.

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```
Chapter 2. API Reference

TLS Ciphersuites

ESP-TLS provides the ability to set a ciphersuites list in client mode. The TLS ciphersuites list informs the server about the supported ciphersuites for the specific TLS connection regardless of the TLS stack configuration. If the server supports any ciphersuite from this list, then the TLS connection will succeed; otherwise, it will fail.

You can set ciphersuites_list in the `esp_tls_cfg_t` structure during client connection as follows:

```c
/* ciphersuites_list must end with 0 and must be available in the memory scope active during the entire TLS connection */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};

esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS will not check the validity of ciphersuites_list that was set, you should call `esp_tls_get_ciphersuites_list()` to get ciphersuites list supported in the TLS stack and cross-check it against the supplied list.

**Note:** This feature is supported only in the MbedTLS stack.

TLS Protocol Version

ESP-TLS provides the ability to set the TLS protocol version for the respective TLS connection. Once the version is specified, it should be exclusively used to establish the TLS connection. This provides an ability to route different TLS connections to different protocol versions like TLS 1.2 and TLS 1.3 at runtime.

**Note:** At the moment, the feature is supported only when ESP-TLS is used with MbedTLS as its underlying SSL/TLS stack.

To set TLS protocol version with ESP-TLS, set `esp_tls_cfg_t::tls_version` to the required protocol version from `esp_tls_proto_ver_t`. If the protocol version field is not set, then the default policy is to allow TLS connection based on the server requirement.

The ESP-TLS connection can be configured to use the specified protocol version as follows:

```c
#include "esp_tls.h"

esp_tls_cfg_t cfg = {
    .tls_version = ESP_TLS_VER_TLS_1_2,
};
```

API Reference

Header File

- `components/esp-tls/esp_tls.h`
- This header file can be included with:

  ```c
  #include "esp_tls.h"
  ```
- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

  ```cmake
  REQUIRES esp-tls
  ```
  or

Espressif Systems 147 Release master

Chapter 2. API Reference

PRIV_REQUIRES esp-tls

Functions

`esp_err_t esp_tls_cfg_server_session_tickets_init (esp_tls_cfg_server_t *cfg)`

Initialize the server side TLS session ticket context.

This function initializes the server side TLS session ticket context which holds all necessary data structures to enable TLS session tickets according to RFC5077. Use `esp_tls_cfg_server_session_tickets_free` to free the data.

**Parameters**
- `cfg` -- [in] server configuration as `esp_tls_cfg_server_t`

**Returns**
- ESP_OK if setup succeeded
- ESP_ERR_INVALID_ARG if context is already initialized
- ESP_ERR_NO_MEM if memory allocation failed
- ESP_ERR_NOT_SUPPORTED if session tickets are not available due to build configuration
- ESP_FAIL if setup failed

`void esp_tls_cfg_server_session_tickets_free (esp_tls_cfg_server_t *cfg)`

Free the server side TLS session ticket context.

**Parameters**
- `cfg` -- server configuration as `esp_tls_cfg_server_t`

`esp_tls_t *esp_tls_init (void)`

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns**
- tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

`esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)`

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

**Parameters**
- `cfg` -- [in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp_tls_cfg_t'. At a minimum, this structure should be zero-initialized.

**Returns**
- pointer to esp_tls_t, or NULL if connection couldn’t be opened.

`int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)`

Create a new blocking TLS/SSL connection with the specified host in blocking manner.

**Parameters**
- `hostname` -- [in] Hostname of the host.
- `hostlen` -- [in] Length of hostname.
- `port` -- [in] Port number of the host.
- `cfg` -- [in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- `tls` -- [in] Pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

`int esp_tls_conn_http_new_sync (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)`

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_sync()` API. However this API accepts host's url.
### Parameters
- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp_tls_cfg_t'. At a minimum, this structure should be zero-initialized.
- **tls** -- [in] Pointer to esp-tls as esp-tls handle.

### Returns
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

### Parameters
- **hostname** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.

### Returns
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.

### Parameters
- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.

### Returns
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

### Parameters
- **tls** -- [in] pointer to esp-tls as esp-tls handle.
- **data** -- [in] Buffer from which data will be written.
- **datalen** -- [in] Length of data buffer.

### Returns
- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions need to be called again when the underlying transport is ready for operation.

```c
ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer ‘data’.
Parameters

- **tls** -- [in] pointer to esp-tls as esp-tlshandle.
- **data** -- [in] Buffer to hold read data.
- **datalen** -- [in] Length of data buffer.

Returns

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

```c
int esp_tls_conn_destroy(esp_tls_t *tls) {
    // Close the TLS/SSL connection and free any allocated resources.
}
```

Parameters **tls** -- [in] pointer to esp-tls as esp-tlshandle.

Returns

- 0 on success
- -1 if socket error or an invalid argument

```c
ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls) {
    // Return the number of application data bytes remaining to be read from the current record.
}
```

Parameters **tls** -- [in] pointer to esp-tls as esp-tlshandle.

Returns

- -1 in case of invalid arg
- bytes available in the application data record read buffer

```c
esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd) {
    // Returns the connection socket file descriptor from esp_tls session.
}
```

Parameters

- **tls** -- [in] handle to esp_tls context
- **sockfd** -- [out] int pointer to sockfd value.

Returns

- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

```c
esp_err_t esp_tls_set_conn_sockfd(esp_tls_t *tls, int sockfd) {
    // Sets the connection socket file descriptor for the esp_tls session.
}
```

Parameters

- **tls** -- [in] handle to esp_tls context
- **sockfd** -- [in] sockfd value to set.

Returns

- ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd < 0)

```c
esp_err_t esp_tls_get_conn_state(esp_tls_t *tls, esp_tls_conn_state_t *conn_state) {
    // Gets the connection state for the esp_tls session.
}
```

Parameters

- **tls** -- [in] handle to esp_tls context
- **conn_state** -- [out] pointer to the connection state value.

Returns

- ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

```c
esp_err_t esp_tls_set_conn_state(esp_tls_t *tls, esp_tls_conn_state_t conn_state) {
    // Sets the connection state for the esp_tls session.
}
```
Parameters
• **tls** -- [in] handle to esp_tls context
• **conn_state** -- [in] connection state value to set.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value
  • ESP_ERR_INVALID_ARG (Invalid arguments)

```c
void *esp_tls_get_ssl_context (esp_tls_t *tls)
```

Returns the ssl context.

Parameters **tls** -- [in] handle to esp_tls context

**Returns**
- ssl_ctx pointer to ssl context of underlying TLS layer on success
  • NULL in case of error

```c
esp_err_t esp_tls_init_global_ca_store (void)
```

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Returns**
• ESP_OK if creating global CA store was successful.
• ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

```c
esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
```

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Parameters
• **cacert_pem_buf** -- [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
• **cacert_pem_bytes** -- [in] Length of the buffer.

**Returns**
• ESP_OK if adding certificates was successful.
• Other if an error occurred or an action must be taken by the calling process.

```c
void esp_tls_free_global_ca_store (void)
```

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

```c
esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
```

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Parameters
• **h** -- [in] esp-tls error handle.
• **esp_tls_code** -- [out] last error code returned from mbedtls api (set to zero if none)
  This pointer could be NULL if caller does not care about esp_tls_code
• **esp_tls_flags** -- [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**
• ESP_ERR_INVALID_ARG if invalid parameters
• ESP_OK (0) if no error occurred
• specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise
```
esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
```

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

**Parameters**
- `h` -- [in] esp-tls error handle.
- `err_type` -- [in] specific error type
- `error_code` -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

```
esp_err_t esp_tls_get_error_handle(esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
```

Returns the ESP-TLS error_handle.

**Parameters**
- `tls` -- [in] handle to esp_tls context
- `error_handle` -- [out] pointer to the error handle.

**Returns**
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

```
mbedtls_x509_crt *esp_tls_get_global_ca_store(void)
```

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

```
const int *esp_tls_get_ciphersuites_list(void)
```

Get supported TLS ciphersuites list.

See [https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4](https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4) for the list of ciphersuites

**Returns** Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

```
int esp_tls_server_session_create(esp_tls_cfg_server_t *cfg, int sockfd, esp_tls_t *tls)
```

Create TLS/SSL server session.

This function creates a TLS/SSL server context for already accepted client connection and performs TLS/SSL handshake with the client

**Parameters**
- `cfg` -- [in] Pointer to esp_tls_cfg_server_t
- `sockfd` -- [in] FD of accepted connection
- `tls` -- [out] Pointer to allocated esp_tls_t

**Returns**
- 0 if successful
- <0 in case of error

```
void esp_tls_server_session_delete(esp_tls_t *tls)
```

Close the server side TLS/SSL connection and free any allocated resources.
This function should be called to close each TLS connection opened with esp_tls_server_session_create()

```c
Parameters
  tls -- [in] pointer to esp_tls_t
```

`esp_err_t esp_tls_plain_tcp_connect (const char*host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)`

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**
- host -- [in] Hostname of the host.
- hostlen -- [in] Length of hostname.
- port -- [in] Port number of the host.
- cfg -- [in] ESP-TLS configuration as esp_tls_cfg_t.
- error_handle -- [out] ESP-TLS error handle holding potential errors occurred during connection
- sockfd -- [out] Socket descriptor if successfully connected on TCP layer

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid output parameters
- ESP-TLS based error codes on failure

**Structures**

```c
struct psk_key_hint
```

ESP-TLS preshared key and hint structure.

**Public Members**

```c
const uint8_t* key
```

key in PSK authentication mode in binary format

```c
const size_t key_size
```

length of the key

```c
const char* hint
```

hint in PSK authentication mode in string format

```c
struct tls_keep_alive_cfg
```

esp-tls client session ticket ctx

Keep alive parameters structure

**Public Members**

```c
bool keep_alive_enable
```

Enable keep-alive timeout

```c
int keep_alive_idle
```

Keep-alive idle time (second)

```c
int keep_alive_interval
```

Keep-alive interval time (second)

```c
int keep_alive_count
```

Keep-alive packet retry send count
struct esp_tls_cfg

ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char *cacert_buf

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM.

const unsigned char *cacert_pem_buf

CA certificate buffer legacy name

unsigned int cacert_bytes

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes

Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM.

const unsigned char *clientcert_pem_buf

Client certificate legacy name

unsigned int clientcert_bytes

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes

Size of client certificate legacy name
const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool use_ecdsa_peripheral
Use the ECDSA peripheral for the private key operations

uint8_t ecdsa_key_efuse_blk
The efuse block where the ECDSA key is stored

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip

int timeout_ms
Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection
const `psk_hint_key_t *psk_hint_key`

Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection.

`esp_err_t (*crt_bundle_attach)(void *conf)`

Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig.

`void *ds_data`

Pointer for digital signature peripheral context.

`bool is_plain_tcp`

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API.

`struct ifreq *if_name`

The name of interface for data to go through. Use the default interface without setting.

`esp_tls_addr_family_t addr_family`

The address family to use when connecting to a host.

`const int *ciphersuites_list`

Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity by esp_tls_get_ciphersuites_list() API.

`esp_tls_proto_ver_t tls_version`

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

`struct esp_tls_cfg_server`

ESP-TLS Server configuration parameters.

**Public Members**

`const char **alpn_protos`

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

* where 'h2' is the protocol name

`const unsigned char *cacert_buf`

Client CA certificate in a buffer. This buffer should be NULL terminated.

`const unsigned char *cacert_pem_buf`

Client CA certificate legacy name.

`unsigned int cacert_bytes`

Size of client CA certificate pointed to by cacert_pem_buf.
unsigned int cacert_pem_bytes
    Size of client CA certificate legacy name

const unsigned char *servercert_buf
    Server certificate in a buffer This buffer should be NULL terminated

const unsigned char *servercert_pem_buf
    Server certificate legacy name

unsigned int servercert_bytes
    Size of server certificate pointed to by servercert_pem_buf

unsigned int servercert_pem_bytes
    Size of server certificate legacy name

const unsigned char *serverkey_buf
    Server key in a buffer This buffer should be NULL terminated

const unsigned char *serverkey_pem_buf
    Server key legacy name

unsigned int serverkey_bytes
    Size of server key pointed to by serverkey_pem_buf

unsigned int serverkey_pem_bytes
    Size of server key legacy name

const unsigned char *serverkey_password
    Server key decryption password string

unsigned int serverkey_password_len
    String length of the password pointed to by serverkey_password

bool use_ecdsa_peripheral
    Use ECDSA peripheral to use private key

uint8_t ecdsa_key_efuse_blk
    The efuse block where ECDSA key is stored

bool use_secure_element
    Enable this option to use secure element or atecc608a chip

void *userdata
    User data to be added to the ssl context. Can be retrieved by callbacks

Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
    ESP-TLS Connection State.
typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
    ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
    esp-tls client session ticket ctx
    Keep alive parameters structure

typedef enum esp_tls_addr_family esp_tls_addr_family_t

typedef struct esp_tls_cfg esp_tls_cfg_t
    ESP-TLS configuration parameters.

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef void *esp_tls_handshake_callback

typedef struct esp_tls cfg_server esp_tlsCfg_server_t
    ESP-TLS Server configuration parameters.

typedef struct esp_tls esp_tls_t

**Enumerations**

enum esp_tls_conn_state
    ESP-TLS Connection State.

    **Values:**

    enumerator ESP_TLS_INIT

    enumerator ESP_TLS_CONNECTING

    enumerator ESP_TLS_HANDSHAKE

    enumerator ESP_TLS_FAIL

    enumerator ESP_TLS_DONE
enum esp_tls_role

  Values:

  enumerator ESP_TLS_CLIENT

  enumerator ESP_TLS_SERVER

enum esp_tls_addr_family

  Values:

  enumerator ESP_TLS_AF_UNSPEC
      Unspecified address family.

  enumerator ESP_TLS_AF_INET
      IPv4 address family.

  enumerator ESP_TLS_AF_INET6
      IPv6 address family.

enum esp_tls_proto_ver_t

  Values:

  enumerator ESP_TLS_VER_ANY

  enumerator ESP_TLS_VER_TLS_1_2

  enumerator ESP_TLS_VER_TLS_1_3

  enumerator ESP_TLS_VER_TLS_MAX

Header File

- components/esp-tls/esp_tls_errors.h
- This header file can be included with:

  ```
  #include "esp_tls_errors.h"
  ```

- This header file is a part of the API provided by the esp-tls component. To declare that your component depends on esp-tls, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp-tls
  or
  PRIV_REQUIRES esp-tls
  ```

Structures

struct esp_tls_last_error

  Error structure containing relevant errors in case tls error occurred.
Chapter 2. API Reference

Public Members

```c
esp_err_t last_error
```

error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

```c
int esp_tls_error_code
```

esp_tls error code from last esp_tls failed api

```c
int esp_tls_flags
```

last certification verification flags

Macros

```c
ESP_ERR_ESP_TLS_BASE
```

Starting number of ESP-TLS error codes

```c

Chapter 2. API Reference

**ESP_ERR_WOLFSSL_SSL_WRITE_FAILED**
wolfSSL api returned failed

**ESP_TLS_ERR_SSL_WANT_READ**
Definition of errors reported from IO API (potentially non-blocking) in case of error:
- esp_tls_conn_read()
- esp_tls_conn_write()

**ESP_TLS_ERR_SSL_WANT_WRITE**

**ESP_TLS_ERR_SSL_TIMEOUT**

**Type Definitions**
typedef struct esp_tls_last_error *esp_tls_error_handle_t
typedef struct esp_tls_last_error esp_tls_last_error_t
Error structure containing relevant errors in case tls error occurred.

**Enumerations**
enum esp_tls_error_type_t
Definition of different types/sources of error codes reported from different components

Values:

- enumerator **ESP_TLS_ERR_TYPE_UNKNOWN**
- enumerator **ESP_TLS_ERR_TYPE_SYSTEM**
  System error –errno
- enumerator **ESP_TLS_ERR_TYPE_MBEDTLS**
  Error code from mbedTLS library
- enumerator **ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS**
  Certificate flags defined in mbedTLS
- enumerator **ESP_TLS_ERR_TYPE_ESP**
  ESP-IDF error type –esp_err_t
- enumerator **ESP_TLS_ERR_TYPE_WOLFSSL**
  Error code from wolfSSL library
- enumerator **ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS**
  Certificate flags defined in wolfSSL
- enumerator **ESP_TLS_ERR_TYPE_MAX**
  Last err type –invalid entry
2.2.5 ESP HTTP Client

Overview

`esp_http_client` component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_handle_t` instance, i.e., an HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values are assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events are invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at `protocols/esp_http_client`.

Basic HTTP Request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

Use Secure Element (ATECC608) for TLS

A secure element (ATECC608) can be also used for the underlying TLS connection in the HTTP client connection. Please refer to the ATECC608A (Secure Element) with ESP-TLS section in the ESP-TLS documentation for more details. The secure element support has to be first enabled in menuconfig through `CONFIG_ESP_TLS_USE_SECURE_ELEMENT`. Then the HTTP client can be configured to use secure element as follows:

```c
esp_http_client_config_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```
HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the url configuration starting with https scheme or transport_type set to HTTP_TRANSPORT_OVER_SSL. HTTPS support can be configured via CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS (enabled by default).

Note: While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the cert_pem member in the esp_http_client_config_t configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the crt_bundle_attach member of the esp_http_client_config_t configuration.

Check out the example functions https_with_url and https_with_hostname_path in the application example for implementation details of the above note.

HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- esp_http_client_init(): Create a HTTP client handle.
- esp_http_client_set_* or esp_http_client_delete_*: Modify the HTTP connection parameters (optional).
- esp_http_client_open(): Open the HTTP connection with write_len parameter (content length that needs to be written to server), set write_len=0 for read-only connection.
- esp_http_client_write(): Write data to server with a maximum length equal to write_len of esp_http_client_open() function; no need to call this function for write_len=0.
- esp_http_client_fetch_headers(): Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the content-length from the server and can be succeeded by esp_http_client_get_status_code() for getting the HTTP status of the connection.
- esp_http_client_read(): Read the HTTP stream.
- esp_http_client_close(): Close the connection.
- esp_http_client_cleanup(): Release allocated resources.

Check out the example function http_perform_as_stream_reader in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the url or the username and password members of the esp_http_client_config_t configuration. For auth_type = HTTP_AUTH_TYPE_BASIC, the HTTP client takes only one perform operation to pass the authentication process.
- If auth_type = HTTP_AUTH_TYPE_NONE, but the username and password fields are present in the configuration, the HTTP client takes two perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions http_auth_basic, http_auth_basic_redirect (for Basic authentication) and http_auth_digest (for Digest authentication) in the application example for implementation details.
- Currently, Digest authentication supports only MD5 and SHA-256 algorithms.

Examples of Authentication Configuration

- Authentication with URI
```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

### Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

### ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with the Event Loop library. This feature has been added by keeping in mind the ESP Insights framework which collects the diagnostic information. However, this feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- **HTTP_EVENT_ERROR**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_CONNECTED**: `esp_http_client_handle_t`
- **HTTP_EVENT_HEADERS_SENT**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_HEADER**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_DATA**: `esp_http_client_on_data_t`
- **HTTP_EVENT_ON_FINISH**: `esp_http_client_handle_t`
- **HTTP_EVENT_DISCONNECTED**: `esp_http_client_handle_t`
- **HTTP_EVENT_REDIRECT**: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

### TLS Protocol Version

TLS protocol version to be used for the underlying TLS connection can be set in `esp_http_client_config_t`. Please refer to the **TLS Protocol Version** section in the ESP-TLS for more details.

The TLS protocol version for the HTTP client can be configured as follows:

```c
#include "esp_http_client.h"
esp_http_client_config_t config = {
    .tls_version = ESP_HTTP_CLIENT_TLS_VER_TLS_1_2,
};
```
API Reference

Header File

- components/esp_http_client/include/esp_http_client.h
- This header file can be included with:

```
#include "esp_http_client.h"
```

- This header file is a part of the API provided by the `esp_http_client` component. To declare that your component depends on `esp_http_client`, add the following to your CMakeLists.txt:

```
REQUIRES esp_http_client
```
or

```
PRIV_REQUIRES esp_http_client
```

Functions

**esp_http_client_handle_t esp_http_client_init**(const `esp_http_client_config_t *config`)  
Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters**
- `config` -- [in] The configurations, see `http_client_config_t`

**Returns**
- `esp_http_client_handle_t`
- NULL if any errors

**esp_err_t esp_http_client_perform**( `esp_http_client_handle_t` client )  
Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

**Parameters**
- `client` -- The `esp_http_client` handle

**Returns**
- ESP_OK on successful
- ESP_FAIL on error

**esp_err_t esp_http_client_cancel_request**( `esp_http_client_handle_t` client )  
Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same `esp_http_client` context.
Chapter 2. API Reference

Parameters client -- The esp_http_client handle

Returns
• ESP_OK on successful
• ESP_FAIL on error
• ESP_ERR_INVALID_ARG
• ESP_ERR_INVALID_STATE

*esp_err_t* esp_http_client_set_url (*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Parameters
• client -- [in] The esp_http_client handle
• url -- [in] The url

Returns
• ESP_OK
• ESP_FAIL

*esp_err_t* esp_http_client_set_post_field (*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Parameters
• client -- [in] The esp_http_client handle
• data -- [in] post data pointer
• len -- [in] post length

Returns
• ESP_OK
• ESP_FAIL

int esp_http_client_get_post_field (*esp_http_client_handle_t* client, char **data)

Get current post field information.

Parameters
• client -- [in] The client
• data -- [out] Point to post data pointer

Returns Size of post data

*esp_err_t* esp_http_client_set_header (*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

Parameters
• client -- [in] The esp_http_client handle
• key -- [in] The header key
• value -- [in] The header value

Returns
• ESP_OK
• ESP_FAIL

*esp_err_t* esp_http_client_get_header (*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters
• client -- [in] The esp_http_client handle
• key -- [in] The header key
• value -- [out] The header value

Returns
• ESP_OK
• ESP_FAIL
**esp_err_t esp_http_client_get_username** *(esp_http_client_handle_t client, char **value)*

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after *esp_http_client_init*.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *value* -- [out] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_username** *(esp_http_client_handle_t client, const char *username)*

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *username* -- [in] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_get_password** *(esp_http_client_handle_t client, char **value)*

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after *esp_http_client_init*.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *value* -- [out] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_password** *(esp_http_client_handle_t client, const char *password)*

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *password* -- [in] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_authtype** *(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)*

Set http request auth_type.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *auth_type* -- [in] The esp_http_client auth type

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_get_user_data** *(esp_http_client_handle_t client, void **data)*

Get http request user data. The value stored from the *esp_http_client_config_t* will be written to the address passed into data.

**Parameters**
- *client* -- [in] The esp_http_client handle
- *data* -- [out] A pointer to the pointer that will be set to user_data.
Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_user_data(esp_http_client_handle_t client, void *data)
```
Set http request user_data. The value passed in `data` will be available during event callbacks. No memory management will be performed on the user's behalf.

Parameters
• `client` -- [in] The `esp_http_client` handle
• `data` -- [in] The pointer to the user data

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

```c
int esp_http_client_get_errno(esp_http_client_handle_t client)
```
Get HTTP client session errno.

Parameters
• `client` -- [in] The `esp_http_client` handle

Returns
• (-1) if invalid argument
• errno

```c
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)
```
Set http request method.

Parameters
• `client` -- [in] The `esp_http_client` handle
• `method` -- [in] The method

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
```
Set http request timeout.

Parameters
• `client` -- [in] The `esp_http_client` handle
• `timeout_ms` -- [in] The timeout value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)
```
Delete http request header.

Parameters
• `client` -- [in] The `esp_http_client` handle
• `key` -- [in] The key

Returns
• ESP_OK
• ESP_FAIL

```c
esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)
```
This function will be open the connection, write all header strings and return.

Parameters
• `client` -- [in] The `esp_http_client` handle
• `write_len` -- [in] HTTP Content length need to write to the server

Returns
• ESP_OK
• ESP_FAIL
Chapter 2. API Reference

int esp_http_client_write (esp_http_client_handle_t client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

Parameters
- client -- [in] The esp_http_client handle
- buffer -- The buffer
- len -- [in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

Returns
- (-1) if any errors
- Length of data written

int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

Parameters client -- [in] The esp_http_client handle

Returns
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)

Check response data is chunked.

Parameters client -- [in] The esp_http_client handle

Returns true or false

int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)

Read data from http stream.

Note: (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

Parameters
- client -- [in] The esp_http_client handle
- buffer -- The buffer
- len -- [in] The length

Returns
- (-1) if any errors
- Length of data was read

int esp_http_client_get_status_code (esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Parameters client -- [in] The esp_http_client handle

Returns Status code

int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Parameters client -- [in] The esp_http_client handle

Returns
- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t esp_http_client_close (esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Parameters client -- [in] The esp_http_client handle
Chapter 2. API Reference

Returns

• ESP_OK
• ESP_FAIL

`esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)`

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Parameters `client` -- [in] The esp_http_client handle

Returns

• ESP_OK
• ESP_FAIL

`esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)`

Get transport type.

Parameters `client` -- [in] The esp_http_client handle

Returns

• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

`esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

Parameters `client` -- [in] The esp_http_client handle

Returns

• ESP_OK
• ESP_FAIL

`esp_err_t esp_http_client_set_auth_data(esp_http_client_handle_t client, const char* auth_data, int len)`

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

Parameters

• `client` -- [in] The esp_http_client handle
• `auth_data` -- [in] The authentication data received in the header
• `len` -- [in] length of auth_data.

Returns

• ESP_ERR_INVALID_ARG
• ESP_OK

`void esp_http_client_add_auth(esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters `client` -- [in] The esp_http_client handle

`bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

Parameters `client` -- [in] The esp_http_client handle
Chapter 2. API Reference

Returns

• true
• false

int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)
  Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

Parameters

• client -- [in] The esp_http_client handle
• buffer -- The buffer
• len -- [in] The buffer length

Returns

• Length of data was read

esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)
  Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to esp_http_client_read_response in situations where the content of the response may be ignored.

Parameters

• client -- [in] The esp_http_client handle
• len -- Length of data discarded

Returns

• ESP_OK If successful, len will have discarded length
• ESP_FAIL If failed to read response
• ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)
  Get URL from client.

Parameters

• client -- [in] The esp_http_client handle
• url -- [inout] The buffer to store URL.
• len -- [in] The buffer length

Returns

• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)
  Get Chunk-Length from client.

Parameters

• client -- [in] The esp_http_client handle
• len -- [out] Variable to store length

Returns

• ESP_OK If successful, len will have length of current chunk
• ESP_FAIL If the server is not a chunked server
• ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct esp_http_client_event
  HTTP Client events data.

Public Members
**Chapter 2. API Reference**

```c
esp_http_client_event_id_t event_id
    event_id, to know the cause of the event

esp_http_client_handle_t client
    esp_http_client_handle_t context

void *data
    data of the event

int data_len
    data length of data

void *user_data
    user_data context, from esp_http_client_config_t user_data

char *header_key
    For HTTP_EVENT_ON_HEADER event_id, it's store current http header key

char *header_value
    For HTTP_EVENT_ON_HEADER event_id, it's store current http header value
```

**struct esp_http_client_on_data**

Argument structure for HTTP_EVENT_ON_DATA event.

**Public Members**

```c
esp_http_client_handle_t client
    Client handle

int64_t data_process
    Total data processed
```

**struct esp_http_client_redirect_event_data**

Argument structure for HTTP_EVENT_REDIRECT event.

**Public Members**

```c
esp_http_client_handle_t client
    Client handle

int status_code
    Status Code
```

**struct esp_http_client_config_t**

HTTP configuration.
Public Members

const char *url
    HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
    Using for Http authentication

const char *password
    Using for Http authentication

esp_http_client_auth_type_t auth_type
    Http authentication type, see esp_http_client_auth_type_t

const char *path
    HTTP Path, if not set, default is /

const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password
**esp_http_client_proto_ver_t**

*tls_version*

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

**const char **user_agent**

The User Agent string to send with HTTP requests

**esp_http_client_method_t**

*method*

HTTP Method

**int** timeout_ms

Network timeout in milliseconds

**bool** disable_auto_redirect

Disable HTTP automatic redirects

**int** max_redirection_count

Max number of redirections on receiving HTTP redirect status code, using default value if zero

**int** max_authorization_retries

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

**http_event_handle_cb**

*event_handler*

HTTP Event Handle

**esp_http_client_transport_t**

*transport_type*

HTTP transport type; see **esp_http_client_transport_t**

**int** buffer_size

HTTP receive buffer size

**int** buffer_size_tx

HTTP transmit buffer size

**void **user_data**

HTTP user_data context

**bool** is_async

Set asynchronous mode, only supported with HTTPS for now

**bool** use_global_ca_store

Use a global ca_store for all the connections in which this bool is set.

**bool** skip_cert_common_name_check

Skip any validation of server certificate CN field

**const char **common_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.
\texttt{esp_err_t (*crt_bundle_attach)(void *conf)}

Function pointer to \texttt{esp\_crt\_bundle\_attach}. Enables the use of certification bundle for server verification, must be enabled in menuconfig

\begin{verbatim}
bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting
\end{verbatim}

\textbf{Macros}

\texttt{DEFAULT\_HTTP\_BUF\_SIZE}

\texttt{ESP\_ERR\_HTTP\_BASE}
Starting number of HTTP error codes

\texttt{ESP\_ERR\_HTTP\_MAX\_REDIRECT}
The error exceeds the number of HTTP redirects

\texttt{ESP\_ERR\_HTTP\_CONNECT}
Error open the HTTP connection

\texttt{ESP\_ERR\_HTTP\_WRITE\_DATA}
Error write HTTP data

\texttt{ESP\_ERR\_HTTP\_FETCH\_HEADER}
Error read HTTP header from server

\texttt{ESP\_ERR\_HTTP\_INVALID\_TRANSPORT}
There are no transport support for the input scheme

\texttt{ESP\_ERR\_HTTP\_CONNECTING}
HTTP connection hasn't been established yet

\texttt{ESP\_ERR\_HTTP\_EAGAIN}
Mapping of errno EAGAIN to \texttt{esp\_err\_t}

\texttt{ESP\_ERR\_HTTP\_CONNECTION\_CLOSED}
Read FIN from peer and the connection closed
### Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef struct esp_http_client_on_data esp_http_client_on_data_t
    Argument structure for HTTP_EVENT_ON_DATA event.

typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
    Argument structure for HTTP_EVENT_REDIRECT event.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

### Enumerations

enum esp_http_client_event_id_t
    HTTP Client events id.
      
    Values:

    enumerator HTTP_EVENT_ERROR
        This event occurs when there are any errors during execution

    enumerator HTTP_EVENT_ON_CONNECTED
        Once the HTTP has been connected to the server, no data exchange has been performed

    enumerator HTTP_EVENT_HEADERS_SENT
        After sending all the headers to the server

    enumerator HTTP_EVENT_HEADER_SENT
        This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

    enumerator HTTP_EVENT_ON_HEADER
        Occurs when receiving each header sent from the server

    enumerator HTTP_EVENT_ON_DATA
        Occurs when receiving data from the server, possibly multiple portions of the packet

    enumerator HTTP_EVENT_ON_FINISH
        Occurs when finish a HTTP session

    enumerator HTTP_EVENT_DISCONNECTED
        The connection has been disconnected

    enumerator HTTP_EVENT_REDIRECT
        Intercepting HTTP redirects to handle them manually
enum esp_http_client_transport_t

HTTP Client transport.

Values:

enumerator HTTP_TRANSPORT_UNKNOWN
Unknown

enumerator HTTP_TRANSPORT_OVER_TCP
Transport over tcp

enumerator HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_proto_ver_t

Values:

enumerator ESP_HTTP_CLIENT_TLS_VER_ANY

enumerator ESP_HTTP_CLIENT_TLS_VER_TLS_1_2

enumerator ESP_HTTP_CLIENT_TLS_VER_TLS_1_3

enumerator ESP_HTTP_CLIENT_TLS_VER_MAX

enum esp_http_client_method_t

HTTP method.

Values:

enumerator HTTP_METHOD_GET
HTTP GET Method

enumerator HTTP_METHOD_POST
HTTP POST Method

enumerator HTTP_METHOD_PUT
HTTP PUT Method

enumerator HTTP_METHOD_PATCH
HTTP PATCH Method

enumerator HTTP_METHOD_DELETE
HTTP DELETE Method

enumerator HTTP_METHOD_HEAD
HTTP HEAD Method

enumerator HTTP_METHOD_NOTIFY
HTTP NOTIFY Method
enumerator **HTTP_METHOD_SUBSCRIBE**
  HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**
  HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**
  HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**
  HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**
  HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**
  HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**
  HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**
  HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**
  HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**
  HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**
  HTTP Authentication type.
  
  **Values:**
  
  enumerator **HTTP_AUTH_TYPE_NONE**
    No authentication

  enumerator **HTTP_AUTH_TYPE_BASIC**
    HTTP Basic authentication

  enumerator **HTTP_AUTH_TYPE_DIGEST**
    HTTP Digest authentication

enum **HttpStatus_Code**
  Enum for the HTTP status codes.
  
  **Values:**
enumerator HttpStatus_Ok
enumerator HttpStatus_MultipleChoices
enumerator HttpStatus_MovedPermanently
enumerator HttpStatus_Found
enumerator HttpStatus_SeeOther
enumerator HttpStatus_TemporaryRedirect
enumerator HttpStatus_PermanentRedirect
enumerator HttpStatus_BadRequest
enumerator HttpStatus_Unauthorized
enumerator HttpStatus_Forbidden
enumerator HttpStatus_NotFound
enumerator HttpStatus_InternalError

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over HTTPS or Bluetooth® Low Energy. It provides access to application defined properties that are available for reading/writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over Bluetooth Low Energy transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) { 
        .device_name = SERVICE_NAME,
        .service_uuid = {
            /* LSB <----------------------------- MSB */
            0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a, 
            0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
        }
    }
},
    .proto_sec = {
        .version = PROTOCOL_SEC0,
    }
```

(continues on next page)
Initialization of the `esp_local_ctrl` service over HTTPS transport is performed as follows:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem__start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem__end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem__start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem__end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```
You may set security for transport in ESP local control using following options:

1. **PROTOCOL_SEC2**: specifies that SRP6a-based key exchange and end-to-end encryption based on AES-GCM are used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol, i.e., SRP6a.
2. **PROTOCOL_SEC1**: specifies that Curve25519-based key exchange and end-to-end encryption based on AES-CTR are used.
3. **PROTOCOL_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTOCOL_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in *Protocol Communication* for more details.

### Creating a Property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a type (e.g., enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g., if it is a string or bytestream). For data types with fixed-length property value, like int, float, etc., setting the `size` field to the right value helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property `get/set` handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, 
    const esp_local_ctrl_prop_t *props, 
    esp_local_ctrl_prop_val_t *prop_, 
    esp_local_ctrl_prop_val_t *values, 
    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            (continues on next page)
```
Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, const esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx) {
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }

    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl.

**Client Side Implementation**

The client side implementation establishes a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service translates these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. **get_prop_count**: This should simply return the total number of properties supported by the service.
2. **get_prop_values**: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. **set_prop_values**: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call get_prop_count and then get_prop_values, hence form an index-to-name mapping for all properties. Now when calling set_prop_values for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index-to-name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:
Chapter 2. API Reference

Table 1: Endpoints provided by ESP Local Control

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h
- This header file can be included with:
  ```
  #include "esp_local_ctrl.h"
  ```
- This header file is a part of the API provided by the esp_local_ctrl component. To declare that your component depends on esp_local_ctrl, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_local_ctrl
  ```
  or
  ```
  PRIV_REQUIRES esp_local_ctrl
  ```

Functions

- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)`
  Function for obtaining BLE transport mode.
- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)`
  Function for obtaining HTTPD transport mode.
- `esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)`
  Start local control service.
  **Parameters** config -- [in] Pointer to configuration structure
  **Returns**
  - ESP_OK : Success
  - ESP_FAIL : Failure
- `esp_err_t esp_local_ctrl_stop (void)`
  Stop local control service.
- `esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)`
  Add a new property.
  This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties
  **Parameters** prop -- [in] Property description structure
  **Returns**
  - ESP_OK : Success
  - ESP_FAIL : Failure
Chapter 2. API Reference

**esp_err_t esp_local_ctrl_remove_property (const char *name)**

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** name -- [in] Name of the property to remove

**Returns**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

**const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)**

Get property description structure by name.

This API may be used to get a property's context structure esp_local_ctrl_prop_t when its name is known.

**Parameters** name -- [in] Name of the property to find

**Returns**

- Pointer to property
- NULL if not found

**esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)**

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note:** In case of BLE transport the names and uids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().

**Parameters**

- **ep_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user_ctx** -- [in] User data

**Returns**

- ESP_OK : Success
- ESP_FAIL : Failure

**Unions**

union esp_local_ctrl_transport_config_t

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

**Public Members**

**esp_local_ctrl_transport_config_ble_t *ble**

This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

**esp_local_ctrl_transport_config_httpd_t *httpd**

This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.
Structures

struct esp_local_ctrl_prop

Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name

Unique name of property

uint32_t type

Type of property. This may be set to application defined enums

size_t size

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t flags

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx

Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)

Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val

Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data

Pointer to memory holding property value

size_t size

Size of property value
void (*free_fn)(void *data)

This may be set by the application in get_prop_values() handler to tell esp_local_ctrl
to call this function on the data pointer above, for freeing its resources after sending the
get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in prop_values
need to be set

Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the current values for which have been requested by
the client
Param prop_values [out] Array of empty property values, the elements of which need to be
populated with the current values of those properties specified by props argument
Param usr_ctx [in] This provides value of the usr_ctx field of
esp_local_ctrl_handlers_t structure

Return Returning different error codes will convey the corresponding protocol level errors to
the client:
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : InvalidArgument
• ESP_ERR_INVALID_STATE : InvalidProto
• All other error codes : InternalError

esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

Note: If any of the properties have variable sizes, the size field of the corresponding element in
prop_values must be checked explicitly before making any assumptions on the size.

Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the values for which the client requests to change
Param prop_values [in] Array of property values, the elements of which need to be used for
updating those properties specified by props argument
Param usr_ctx [in] This provides value of the usr_ctx field of
esp_local_ctrl_handlers_t structure

Return Returning different error codes will convey the corresponding protocol level errors to
the client:
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : InvalidArgument
• ESP_ERR_INVALID_STATE : InvalidProto
• All other error codes : InternalError
Chapter 2. API Reference

void *usr_ctx

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

void (*usr_ctx_free_fn)(void *usr_ctx)

Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

struct esp_local_ctrl_proto_sec_cfg

Protocom security configs

Public Members

global_cfg

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

void *custom_handle

Custom security handle if security is set custom via proto_sec above This handle must follow protocom_security_t signature

const void *pop

Proof of possession to be used for local control. Could be NULL.

const void *sec_params

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type esp_local_ctrl_security1_params_t for protocomm security 1 and esp_local_ctrl_security2_params_t for protocomm security 2 respectively. Could be NULL.

struct esp_local_ctrl_config

Configuration structure to pass to esp_local_ctrl_start()
Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE
ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the
    esp_local_ctrl_add_property() function.
    Once a property is added, its structure is available for read-only access inside get_prop_values() and
    set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE/HTTPD) over which the service will be provided.
    This is a forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.
    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CON-
    FIG_BT_ENABLED and include protocomm_ble.h.

typedef struct httpd_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.
    This is a forward declaration for httpd_ssl_config_t (for HTTPS) or httpd_config_t (for HTTP).

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.

typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t

typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()
Chapter 2. API Reference

Enumerations

enum esp_local_ctrl_proto_sec

Security types for esp_local_control.

Values:

enumerator PROTOCOM_SEC0
enumerator PROTOCOM_SEC1
enumerator PROTOCOM_SEC2
enumerator PROTOCOM_SEC_CUSTOM

2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Note: The ESP-IDF component esp_serial_slave_link has been moved from ESP-IDF since version v5.0 to a separate repository:

  • ESSL component on GitHub

To add ESSL component in your project, please run idf.py add-dependency espressif/esp_serial_slave_link.

Espressif Device Protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave

This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to functions 1-7) without any details regarding the underlying hardware implementation.
**SDIO Slave Capabilities of Espressif Chips**  The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDIO slave</td>
<td>Y</td>
</tr>
<tr>
<td>Tohost intr</td>
<td>8</td>
</tr>
<tr>
<td>Frohost intr</td>
<td>8</td>
</tr>
<tr>
<td>TX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>RX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>Shared registers</td>
<td>56*</td>
</tr>
</tbody>
</table>

* Not including the interrupt registers

**ESP SDIO Slave Initialization**  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of **SDIO Simplified Specification**). In this specification as well as below, the SDIO slave is called an SDIO/IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. SDIO reset
   CMD52 (Write 0x6 = 0x8)
2. SD reset
   CMD0
3. Check whether IO card (optional)
   CMD8
4. Send SDIO op cond and wait for card ready
   CMD5 arg = 0x00000000
   CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
   **Example:**
   Arg of R4 after first CMD5 (arg = 0x00000000) is 0XXFFFF00.
   Keep sending CMD5 with arg = 0x00FFFF00 until the R4 shows card ready (arg bit 31 = 1).
5. Set address
   CMD3
6. Select card
   CMD7 (arg address according to CMD3 response)
   **Example:**
   Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. Select 4-bit mode (optional)
   CMD52 (Write 0x07 = 0x02)
8. Enable func1
   CMD52 (Write 0x02 = 0x02)
9. Enable SDIO interrupt (required if interrupt line (DAT1) is used)
   CMD52 (Write 0x04 = 0x03)
10. Set Func0 blocksize (optional, default value is 512 (0x200))
    CMD52/53 (Read 0x10 - 0x11)
    CMD52/53 (Write 0x10 = 0x00)
    CMD52/53 (Write 0x11 = 0x02)
    CMD52/53 (Read 0x10 - 0x11, read to check the final value)
11. Set Func1 blocksize (optional, default value is 512 (0x200))
    CMD52/53 (Read 0x110 - 0x111)
    CMD52/53 (Write 0x110 = 0x00)
    CMD52/53 (Write 0x111 = 0x02)
    CMD52/53 (Read 0x110 - 0x111, read to check the final value)

**ESP SDIO Slave Protocol**  The ESP SDIO Slave protocol is based on the SDIO Specification's I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:
• Sending FIFO and receiving FIFO
• 52 8-bit R/W registers shared by host and slave (For details, see ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF])
• 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example: peripherals/sdio

The ESP Serial Slave Link component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

**Slave Register Table**

### 32-bit
- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

### 8-bit
Shared general purpose registers:
- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers:
- 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

### FIFO (Sending and Receiving)

0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[ \text{requested length} = 0x1F800 - \text{address} \]

The slave responds to data that has a length equal to the length field of CMD53. In cases where the data is longer than the **requested length**, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

**Note:** The function number should be set to 1, and OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write or get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count = 2 (1024 bytes) to address 0x1F3F9 = 0xF800 - 1031.
2. Then send CMD53 in byte mode, byte count = 8 (or 7 if your controller supports that) to address 0x1F7F9 = 0x1F800 - 7.
Interrupts  SDIO interrupts are "level sensitive". For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

Receiving FIFO  To write to the slave's receiving FIFO, the host should complete the following steps:

1. Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044). The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to step 1 until the buffer size is sufficient.
3. Write to the FIFO address with CMD53. Note that the requested length should not exceed the length calculated at step 2, and the FIFO address is related to requested length.
4. Calculate used buffers. Note that a partially-used buffer at the tail is counted as used.

Sending FIFO  To read the slave's sending FIFO, the host should complete the following steps:

1. Wait for the interrupt line to become active (optional, low by default).
2. Read (poll) the interrupt bits in the INT_ST register to monitor if new packets exist.
3. If new packets are ready, read the PKT_LEN register. Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. Read from the FIFO using CMD53. Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to the requested length.
5. Update the read length.

ESP SPI Slave HD (Half Duplex) Mode Protocol

Warning:  ESP32 does not support this feature.

Introduction  In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (listed by the order they should exist):

- Command: 8-bit, master to slave
This phase determines the rest phases of the transactions. See Supported Commands.

- **Address**: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared register to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy**: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data**: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The **direction** means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number (WN) used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Command WN</th>
<th>Address WN</th>
<th>Dummy cycles</th>
<th>Data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>

<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it is not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**

**Note**: The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>

<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, and RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Mask</th>

**Segment Transaction Mode**  
Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave loads onto the DMA, the master is allowed to read or write in segments. In this way, the master does not have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for WRDMA and CMD8 (0x08) for RDDMA.

Here is an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA.
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave.
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave.
5. The slave loads another 4092 bytes of data onto the RDDMA.
6. The master can start new reading transactions after it sends the CMD8.

**Terminology**

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the esp_serial_slave_link component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  - The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services Provided by ESP Slave**

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. TX FIFO (master to slave): The slave can receive data from the master in units of receiving buffers. The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. RX FIFO (slave to master): The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See [SDIO Slave Capabilities of Espressif Chips](#) and [SPI Slave Capabilities of Espressif Chips](#) for more details.

**Initialization of ESP Serial Slave Link**

**ESP SDIO Slave**

The ESP SDIO slave link (ESSL SDIO) devices relies on the SDMMC component. It includes the usage of communicating with ESP SDIO Slave device via the SDMMC Host or SDSPI Host feature. The ESSL device should be initialized as below:

1. Initialize a SDMMC card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>` ) structure.
2. Call sdmmc_card_init() to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

*Note:* If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the `SDIO interface` instead.

Has not been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**To host Interrupts (Optional)**

1. Call `essl_get_intr_ena()` to know which events trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Fr host Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it updates the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset Counters (Optional)**

Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32 SDIO host and slave communicate with each other. The host uses the ESSL SDIO:

peripherals/sdio

Please refer to the specific example README.md for details.
API Reference

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

`esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)`

Initialize the slave.

Parameters

- `handle` -- Handle of an ESSL device.
- `wait_ms` -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)`

Wait for interrupt of an ESSL slave device.

Parameters

- `handle` -- Handle of an ESSL device.
- `wait_ms` -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Parameters

- `handle` -- Handle of an ESSL device.
- `out_tx_num` -- Output of buffer num that host can send data to ESSL slave.
- `wait_ms` -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)`

Get the size, in bytes, of the data that the ESSL slave is ready to send

Parameters

- `handle` -- Handle of an ESSL device.
- `out_rx_size` -- Output of data size to read from slave, in bytes
- `wait_ms` -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_reset_cnt (essl_handle_t handle)`

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

Parameters `handle` -- Handle of an ESSL device.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.
**esp_err_t essl_send_packet** (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. TheSlave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**Parameters**
- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send
- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_get_packet** (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **out_data** -- [out] Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out_length** -- [out] Output of length the data actually received from slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FOUND: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_SUPPORTED: Slave is not ready to send data.
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_write_reg** (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value_o** -- Output of the returned written value.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**esp_err_t essl_read_reg** (essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.
Chapter 2. API Reference

Parameters

• **handle** -- Handle of a essl device.
• **add** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see essl_spi.h
• **value_o** -- Output value read from the register.
• **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

• ESP_OK Success
• One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

Parameters

• **handle** -- Handle of an ESSL device.
• **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

• ESP_OK: If interrupt is triggered.
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters

• **handle** -- Handle of an ESSL device.
• **intr_mask** -- Mask of interrupt bits to clear.
• **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

Parameters

• **handle** -- Handle of an ESSL device.
• **intr_raw** -- Output of the raw interrupt bits. Set to NULL if only masked bits are read.
• **intr_st** -- Output of the masked interrupt bits. Set to NULL if only raw bits are read.
• **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

• ESP_OK: Success
• ESP_INVALID_ARG: If both **intr_raw** and **intr_st** are NULL.
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters

• **handle** -- Handle of an ESSL device.
• **ena_mask** -- Mask of the interrupt bits to enable.
• **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller
**esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **ena_mask_o** -- Output of interrupt bit enable mask.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **intr_mask** -- Mask of interrupt bits to send to slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.

**Header File**

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

**Parameters**
- **out_handle** -- Output of the handle.
- **config** -- Configuration for the ESSL SDIO device.

**Returns**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)**

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters**
- **handle** -- Handle of the ESSL SDIO device to deinit.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

**Structures**

struct essl_sdio_config_t

Configuration for the ESSL SDIO device.
Chapter 2. API Reference

Public Members

sdmmc_card_t *card

The initialized sdmmc card pointer of the slave.

int recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

• components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)

Initialize the ESSL SPI device function list and get its handle.

Parameters

• out_handle -- [out] Output of the handle

• init_config -- Configuration for the ESSL SPI device

Returns

• ESP_OK: On success

• ESP.ERR_NO_MEM: Memory exhausted

• ESP.ERR_INVALID_STATE: SPI driver is not initialized

• ESP.ERR_INVALID_ARG: Wrong register ID

esp_err_t essl_spi_deinit_dev (essl_handle_t handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters handle -- Handle of the ESSL SPI device

Returns

• ESP_OK: On success

• ESP.ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Parameters

• arg -- Context of the component. (Member arg from essl_handle_t)

• addr -- Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).

• out_value -- [out] Read buffer for the shared registers.

• wait_ms -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

• ESP_OK: success

• ESP.ERR_INVALID_STATE: ESSL SPI has not been initialized.

• ESP.ERR_INVALID_ARG: The address argument is not valid. See note 1.

• or other return value from esp:func:spi_device_transmit.

esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.
Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** -- [out] Output data address
- **size** -- The size of the output data.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires `size` bytes of data but Slave did not load enough bytes.

```c
esp_err_t essl_spi_write_reg(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```

Write to the shared registers.

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out_value** -- [out] Not supported, should be set to NULL.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note 2.
- or other return value from :cpp:func:`spi_device_transmit`

```c
esp_err_t essl_spi_send_packet(void *arg, const void *data, size_t size, uint32_t wait_ms)
```

Send a packet to Slave.

Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer
Chapter 2. API Reference

```c
void essl_spi_reset_cnt (void *arg)
  Reset the counter in Master context.
```

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

**Parameters**
- `arg` -- Context of the component. (Member `arg` from `essl_handle_t`)

```c
esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in ISR way.
```

**Note:** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Parameters**
- `spi` -- SPI device handle representing the slave
- `out_data` -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr` -- Address of the slave shared buffer
- `len` -- Length to read
- `flags` -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: on success
- or other return value from `cpp:func:spi_device_transmit`.

```c
esp_err_t essl_spi_rdbuf_polling (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in polling way.
```

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Parameters**
- `spi` -- SPI device handle representing the slave
- `out_data` -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr` -- Address of the slave shared buffer
- `len` -- Length to read
- `flags` -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: on success
- or other return value from `cpp:func:spi_device_transmit`.

```c
esp_err_t essl_spi_wrbuf (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
Write the shared buffer of the slave in ISR way.
```
Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- spi -- SPI device handle representing the slave
- data -- Buffer for data to send, strongly suggested to be in the DRAM
- addr -- Address of the slave shared buffer,
- len -- Length to write
- flags -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func:spl_device_transmit`.

`esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t*data, int addr, int len, uint32_t flags)`

Write the shared buffer of the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- spi -- SPI device handle representing the slave
- data -- Buffer for data to send, strongly suggested to be in the DRAM
- addr -- Address of the slave shared buffer,
- len -- Length to write
- flags -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func:spl_device_polling_transmit`.

`esp_err_t essl_spi_rddma(spi_device_handle_t spi, uint8_t*out_data, int len, int seg_len, uint32_t flags)`

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several `cpp:func:essl_spi_rddma_seg` and one `cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Parameters
- spi -- SPI device handle representing the slave
- out_data -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len -- Total length of data to receive.
- seg_len -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from `cpp:func:spl_device_transmit`.
**esp_err_t** `essl_spi_rddma_seg` *(spi_device_handle_t spi, uint8_t*out_data, int seg_len, uint32_t flags)*

Read one data segment from the slave through its DMA.

**Note:** To read long buffer, call `cpp:func:essl_spi_rddma` instead.

**Parameters**
- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer to hold the received data. Strongly suggested to be in the DRAM and aligned to 4
- **seg_len** -- Length of this segment
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- Or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_rddma_done` *(spi_device_handle_t spi, uint32_t flags)*

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even if there are data unsent, and maybe prepare the next buffer to send.

**Note:** This is required only when the slave is working in segment mode.

**Parameters**
- **spi** -- SPI device handle representing the slave
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- Or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_wrdma` *(spi_device_handle_t spi, const uint8_t*data, int len, int seg_len, uint32_t flags)*

Send long buffer in segments to the slave through its DMA.

**Note:** This function combines several `cpp:func:essl_spi_wrdma_seg` and one `cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **len** -- Total length of data to send.
- **seg_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the SPI device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- Or other return value from `cpp:func:spi_device_transmit`.

**esp_err_t** `essl_spi_wrdma_seg` *(spi_device_handle_t spi, const uint8_t*data, int seg_len, uint32_t flags)*

Send one data segment to the slave through its DMA.

**Note:** To send long buffer, call `cpp:func:essl_spi_wrdma` instead.
Chapter 2. API Reference

Parameters
- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** -- Length of this segment
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

```
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

**Note:** This is required only when the slave is working in segment mode.

Structures

```
struct essl_spi_config_t
```

Configuration of ESSL SPI device.

**Public Members**

```
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.2.8 ESP x509 Certificate Bundle
Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

**Note:** The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility, the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Mon Mar 11 15:25:27 2024 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition, it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake generates the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root certificate list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here

The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl.
Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla.

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech's SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities. csv, from this list provided by Mozilla.

**Updating the Certificate Bundle**

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in *Generating the List of Root Certificates*.

**Periodic Sync**

The bundle is kept updated by periodic sync with the Mozilla's NSS root certificate store. The deprecated certs from the upstream bundle are added to deprecated list (for compatibility reasons) in ESP-IDF minor or patch release. If required, the deprecated certs can be added to the default bundle by enabling `CONFIGMBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST`. The deprecated certs shall be removed (reset) on the next major ESP-IDF release.

**Application Examples**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

**API Reference**

**Header File**

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h
- This header file can be included with:

  ```c
  #include "esp_crt_bundle.h"
  ```

- This header file is a part of the API provided by the mbedtls component. To declare that your component depends on mbedtls, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE mbedtls
  ```

  or

  ```cmake
  PRIVREQUIRE mbedtls
  ```

**Functions**

* `esp_err_t esp_crt_bundle_attach (void *conf)`

  Attach and enable use of a bundle for certificate verification.

  Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_crt_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

  **Parameters**

  - `conf` -- [in] The config struct for the SSL connection.
Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

```c
void esp_crt_bundle_detach (mbedtls_ssl_config *conf)
```

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters**

- `conf` -- [in] The config struct for the SSL connection.

```c
esp_err_t esp_crt_bundle_set (const uint8_t *x509_bundle, size_t bundle_size)
```

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

**Returns**

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

### 2.2.9 HTTP Server

#### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task closes all open connections, removes registered URI handlers and resets all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri` name, `method` type (e.g. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

#### Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler (httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}
```

(continues on next page)
/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
  /* Destination buffer for content of HTTP POST request.
   * httpd_req_recv() accepts char* only, but content could
   * as well be any binary data (needs type casting).
   * In case of string data, null termination will be absent, and
   * content length would give length of string */
  char content[100];

  /* Truncate if content length larger than the buffer */
  size_t recv_size = MIN(req->content_len, sizeof(content));

  int ret = httpd_req_recv(req, content, recv_size);
  if (ret <= 0) { /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
      /* In case of timeout one can choose to retry calling
         * httpd_req_recv(), but to keep it simple, here we
         * respond with an HTTP 408 (Request Timeout) error */
      httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
     * ensure that the underlying socket is closed */
    return ESP_FAIL;
  }

  /* Send a simple response */
  const char resp[] = "URI POST Response";
  httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
  return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
  .uri = "/uri",
  .method = HTTP_GET,
  .handler = get_handler,
  .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
  .uri = "/uri",
  .method = HTTP_POST,
  .handler = post_handler,
  .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
  /* Generate default configuration */
  httpd_config_t config = HTTPD_DEFAULT_CONFIG();

  /* Empty handle to esp_http_server */
  httpd_handle_t server = NULL;

  /* Start the httpd server */

if (httpd_start(server, &config) == ESP_OK) {
    /* Register URI handlers */
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
/* If server failed to start, handle will be NULL */
return server;

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server) {
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx) {
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req) {
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }
    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ..........
    ..........
    return ESP_OK;
}
Check the example under protocols/http_server/persistent.Sockets.

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the CONFIG_HTTPD_WS_SUPPORT option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.

Event Handling

ESP HTTP server has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using esp_event_handler_register(). This helps in event handling for ESP HTTP server.

esp_http_server_event_id_t has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- HTTP_SERVER_EVENT_ERROR: httpd_err_code_t
- HTTP_SERVER_EVENT_START: NULL
- HTTP_SERVER_EVENT_ON_CONNECTED: int
- HTTP_SERVER_EVENT_ON_HEADER: int
- HTTP_SERVER_EVENT_HEADERS_SENT: int
- HTTP_SERVER_EVENT_ON_DATA: esp_http_server_event_data
- HTTP_SERVER_EVENT_SENT_DATA: esp_http_server_event_data
- HTTP_SERVER_EVENT_DISCONNECTED: int
- HTTP_SERVER_EVENT_STOP: NULL

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h
- This header file can be included with:

  ```
  #include "esp_http_server.h"
  ```

- This header file is a part of the API provided by the esp_http_server component. To declare that your component depends on esp_http_server, add the following to your CMakeLists.txt:

  ```
  REQUIRE esp_http_server
  ```

  or

  ```
  PRIV_REQUIRES esp_http_server
  ```

Functions

esp_err_t httpd_start (httpd_handle_t *handle, const httpd_config_t *config)

  Starts the web server.

  Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

  Example usage:

  ```
  //Function for starting the webserver
  httpd_handle_t start_webserver (void)
  {
    // Generate default configuration
  }
  ```

(continues on next page)
httpd_config_t config = HTTPD_DEFAULT_CONFIG();

// Empty handle to http_server
    httpd_handle_t server = NULL;

// Start the httpd server
if (httpd_start(&server, &config) == ESP_OK) {
    // Register URI handlers
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}

// If server failed to start, handle will be NULL
return server;

Parameters
• config -- [in] Configuration for new instance of the server
• handle -- [out] Handle to newly created instance of the server. NULL on error

Returns
• ESP_OK : Instance created successfully
• ESP_ERR_INVALID_ARG : Null argument(s)
• ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK : Failed to launch server task

esp_err_t httpd_stop(httpd_handle_t handle)

Stopsthe web server.
Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

Parameters handle -- [in] Handle to server returned by httpd_start

Returns
• ESP_OK : Server stopped successfully
• ESP_ERR_INVALID_ARG : Handle argument is Null

esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)

Registers a URI handler.

Example usage:

esp_err_t my_uri_handler(httpd_req_t * req)
{
    // Recv, Process and Send
    ....
    ....
    ....
}
// Fail condition
if (...) {
    // Return fail to close session
    return ESP_FAIL;
}

// On success
return ESP_OK;

// URI handler structure
httpd_uri_t my_uri {
    .uri = "my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters
- handle -- [in] handle to HTTPD server instance
- uri_handler -- [in] pointer to handler that needs to be registered

Returns
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

```
esp_err_t httpd_unregister_uri_handler (httpd_handle_t handle, const char *uri, httpd_method_t method)
```

Unregister a URI handler.

Parameters
- handle -- [in] handle to HTTPD server instance
- uri -- [in] URI string
- method -- [in] HTTP method

Returns
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

```
esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)
```

Unregister all URI handlers with the specified uri string.

Parameters
- handle -- [in] handle to HTTPD server instance
- uri -- [in] uri string specifying all handlers that need to be deregistered

Returns
- ESP_OK: On successfully deregistering all such handlers
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: No handler registered with specified uri string

**esp_err_t** **httpd_sess_set_recv_override** (**httpd_handle_t** hd, **int** sockfd, **httpd_recv_func_t** recv_func)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Parameters**
- **hd** -- [in] HTTPD instance handle
- **sockfd** -- [in] Session socket FD
- **recv_func** -- [in] The receive function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** **httpd_sess_set_send_override** (**httpd_handle_t** hd, **int** sockfd, **httpd_send_func_t** send_func)

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Parameters**
- **hd** -- [in] HTTPD instance handle
- **sockfd** -- [in] Session socket FD
- **send_func** -- [in] The send function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** **httpd_sess_set_pending_override** (**httpd_handle_t** hd, **int** sockfd, **httpd_pending_func_t** pending_func)

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Parameters**
- **hd** -- [in] HTTPD instance handle
- **sockfd** -- [in] Session socket FD
Chapter 2. API Reference

**pending_func** -- [in]  The receive function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

```c
esp_err_t httpd_req_async_handler_begin(httpd_req_t *r, httpd_req_t **out)
```

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on a async thread.

**Note:**
- This function is necessary in order to handle multiple requests simultaneously. See examples/async_requests for example usage.
- You must call `httpd_req_async_handler_complete()` when you are done with the request.

**Parameters**
- `r` -- [in]  The request to create an async copy of
- `out` -- [out]  A newly allocated request which can be used on an async thread

**Returns**
- ESP_OK: async request object created

```c
esp_err_t httpd_req_async_handler_complete(httpd_req_t *r)
```

Mark an asynchronous request as completed. This will.

- free the request memory
- relinquish ownership of the underlying socket, so it can be reused.
- allow the http server to close our socket if needed (lru_purge_enable)

**Note:**  If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a "httpd_accept_conn: error in accept (23)" message if this happens.

**Parameters**
- `r` -- [in]  The request to mark async work as completed

**Returns**
- ESP_OK: async request was marked completed

```c
int httpd_req_to_sockfd(httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie.: `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note:**  This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Parameters**
- `r` -- [in]  The request whose socket descriptor should be found

**Returns**
- Socket descriptor: The socket descriptor for this request
- -1: Invalid/NULL request pointer
int *httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
• Presently Chunked Encoding is not supported

Parameters

• r -- [in] The request being responded to
• buf -- [in] Pointer to a buffer that the data will be read into
• buf_len -- [in] Length of the buffer

Returns

• Bytes: Number of bytes read into the buffer successfully
• 0: Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)

Search for a field in request headers and return the string length of it's value.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters

• r -- [in] The request being responded to
• field -- [in] The header field to be searched in the request

Returns

• Length : If field is found in the request URL
• Zero : Field not found / Invalid request / Null arguments

esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Use httpd_req_get_hdr_value_len() to know the right buffer length
Chapter 2. API Reference

Parameters
- **r** -- [in] The request being responded to
- **field** -- [in] The field to be searched in the header
- **val** -- [out] Pointer to the buffer into which the value will be copied if the field is found
- **val_size** -- [in] Size of the user buffer "val"

Returns
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

```c
size_t httpd_req_get_url_query_len(httpd_req_t *r)
```
Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Parameters **r** -- [in] The request being responded to

Returns
- Length: Query is found in the request URL
- Zero: Query not found / Null arguments / Invalid request

```c
esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char*buf, size_tbuf_len)
```
Get Query string from the request URL.

Note:
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Parameters
- **r** -- [in] The request being responded to
- **buf** -- [out] Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** -- [in] Length of output buffer

Returns
- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated
**esp_err_t** `httpd_query_key_value` (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

**Note:**

- The components of URL query string (keys and values) are not URL decoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

**Parameters**

- **qry** -- [in] Pointer to query string
- **key** -- [in] The key to be searched in the query string
- **val** -- [out] Pointer to the buffer into which the value will be copied if the key is found
- **val_size** -- [in] Size of the user buffer "val"

**Returns**

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

**esp_err_t** `httpd_req_get_cookie_val` (httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

**Parameters**

- **req** -- [in] Pointer to the HTTP request
- **cookie_name** -- [in] The cookie name to be searched in the request
- **val** -- [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val_size** -- [inout] Pointer to size of the user buffer "val". This variable will contain cookie length if ESP_OK is returned and required buffer length increase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

**Returns**

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

**bool** `httpd_uri_matchWildcard` (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "*" for a wildcard match, and "?*" to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo and /foo/bar, but not /foo or /foo/bar
- /foo/*? or /foo/*? (sans the backslash) matches /foo, /foo/bar, and also /foo, but not /foo/bar or /foo/bar

The special characters "?" and "*" anywhere else in the template will be taken literally.

**Parameters**

- **uri_template** -- [in] URI template (pattern)
- **uri_to_match** -- [in] URI to be matched
Chapter 2. API Reference

- **match_upto** -- [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

  **Returns** true if a match was found

  ```c
  esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
  ```

  API to send a complete HTTP response.

  This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

  If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

  - `httpd_resp_set_status()` - for setting the HTTP status string
  - `httpd_resp_set_type()` - for setting the Content Type
  - `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

  **Note:**
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, the request has been responded to.
  - No additional data can then be sent for the request.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

  **Parameters**
  - **r** -- [in] The request being responded to
  - **buf** -- [in] Buffer from where the content is to be fetched
  - **buf_len** -- [in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use `strlen()`

  **Returns**
  - ESP_OK : On successfully sending the response packet
  - ESP_ERR_INVALID_ARG : Null request pointer
  - ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
  - ESP_ERR_HTTPD_RESP_SEND : Error in raw send
  - ESP_ERR_HTTPD_INVALID_REQ : Invalid request

  ```c
  esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)
  ```

  API to send one HTTP chunk.

  This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

  If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

  - `httpd_resp_set_status()` - for setting the HTTP status string
  - `httpd_resp_set_type()` - for setting the Content Type
  - `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

  **Note:**
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

  **Parameters**
  - **r** -- [in] The request being responded to
Chapter 2. API Reference

- **buf** -- [in] Pointer to a buffer that stores the data
- **buf_len** -- [in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

**Returns**
- ESP_OK: On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline *esp_err_t httpd_resp_sendstr* (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**
- **r** -- [in] The request being responded to
- **str** -- [in] String to be sent as response body

**Returns**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

static inline *esp_err_t httpd_resp_sendstr_chunk* (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**
- **r** -- [in] The request being responded to
- **str** -- [in] String to be sent as response body (NULL to finish response packet)

**Returns**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

*esp_err_t httpd_resp_set_status* (httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Parameters**
- **r** -- [in] The request being responded to
- **status** -- [in] The HTTP status code of this response

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

\textbf{\textit{esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)}}

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

\textbf{Note:}

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the type string is valid till send function is called.

\textbf{Parameters}

• \textit{r} -- [in] The request being responded to
• \textit{type} -- [in] The Content Type of the response

\textbf{Returns}

• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

\textbf{\textit{esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)}}

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

\textbf{Note:}

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

\textbf{Parameters}

• \textit{r} -- [in] The request being responded to
• \textit{field} -- [in] The field name of the HTTP header
• \textit{value} -- [in] The value of this HTTP header

\textbf{Returns}

• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

\textbf{\textit{esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)}}

For sending out error code in response to HTTP request.

\textbf{Note:}

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Parameters**

- `req` -- [in] Pointer to the HTTP request for which the response needs to be sent
- `error` -- [in] Error type to send
- `msg` -- [in] Error message string (pass NULL for default message)

**Returns**

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

```c
esp_err_t httpd_resp_send_custom_err(httpd_req_t *req, const char* status, const char *msg)
```
For sending out custom error code in response to HTTP request.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Parameters**

- `req` -- [in] Pointer to the HTTP request for which the response needs to be sent
- `status` -- [in] Error status to send
- `msg` -- [in] Error message string

**Returns**

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

```c
static inline esp_err_t httpd_resp_send_404(httpd_req_t *r)
```
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
static inline esp_err_t httpd_resp_send_408(httpd_req_t *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters** r -- [in] The request being responded to

**Returns**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_send_500(httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters** r -- [in] The request being responded to

**Returns**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int httpd_send(httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()
### Parameters
- **r** -- [in] The request being responded to
- **buf** -- [in] Buffer from where the fully constructed packet is to be read
- **buf_len** -- [in] Length of the buffer

### Returns
- Bytes: Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

### Parameters
- **hd** -- [in] server instance
- **sockfd** -- [in] session socket file descriptor
- **buf** -- [in] buffer with bytes to send
- **buf_len** -- [in] data size
- **flags** -- [in] flags for the send() function

### Returns
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_recv (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

Parameters
- handle -- [in] HTTP server handle
- error -- [in] Error type
- handler_fn -- [in] User implemented handler function (Pass NULL to unset any previously set handler)

Returns
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution.

Note: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Parameters
- handle -- [in] Handle to server returned by httpd_start
- work -- [in] Pointer to the function to be executed in the HTTPD's context
- arg -- [in] Pointer to the arguments that should be passed to this function

Returns
- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in ctrl socket
- ESP_ERR_INVALID_ARG: Null arguments

void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Parameters
- handle -- [in] Handle to server returned by httpd_start
- sockfd -- [in] The socket descriptor for which the context should be extracted.

Returns
- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

Parameters
- handle -- [in] Handle to server returned by httpd_start
- sockfd -- [in] The socket descriptor for which the context should be extracted.
- ctx -- [in] Context object to assign to the session
- free_fn -- [in] Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)

Get session 'transport' context by socket descriptor.
This context is used by the send/receive functions, for example to manage SSL context.

See also:
httpd_sess_get_ctx()

Parameters
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.

Returns
- **void**: Pointer to the transport context associated with this session
- **NULL**: Empty context / Invalid handle / Invalid socket fd

```
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session 'transport' context by socket descriptor.

See also:
httpd_sess_set_ctx()

```
Parameters
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.
- **ctx** -- [in] Transport context object to assign to the session
- **free_fn** -- [in] Function that should be called to free the transport context
```

```
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

Parameters **handle** -- [in] Handle to server returned by httpd_start

Returns global user context

```
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

Parameters **handle** -- [in] Handle to server returned by httpd_start

Returns global transport context

```
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```

Trigger an httpd session close externally.

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

```
Parameters
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor of the session to be closed

Returns
- **ESP_OK**: On successfully initiating closure
- **ESP_FAIL**: Failure to queue work
- **ESP_ERR_NOT_FOUND**: Socket fd not found
- **ESP_ERR_INVALID_ARG**: Null arguments
**esp_err_t httpd_sess_update_lru_counter (httpd_handle_t handle, int sockfd)**

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Parameters**

- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor of the session for which LRU counter is to be updated

**Returns**

- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

**esp_err_t httpd_get_client_list (httpd_handle_t handle, size_t *fds, int *client_fds)**

Returns list of current socket descriptors of active sessions.

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Parameters**

- **handle** -- [in] Handle to server returned by httpd_start
- **fds** -- [inout] In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds** -- [out] Array of client fds

**Returns**

- ESP_OK : Successfully retrieved session list
- ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

**Structures**

**struct esp_http_server_event_data**

Argument structure for HTTP_SERVER_EVENT_ON_DATA and HTTP_SERVER_EVENT_SENT_DATA event

**Public Members**

- **int fd**
  - Session socket file descriptor
- **int data_len**
  - Data length
Chapter 2. API Reference

struct httpd_config
HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned task_priority
Priority of FreeRTOS task which runs the server

size_t stack_size
The maximum stack size allowed for the server task

BaseType_t core_id
The core the HTTP server task will run on

uint32_t task_caps
The memory capabilities to use when allocating the HTTP server task's stack

uint16_t server_port
TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets
Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16_t max_uri_handlers
Maximum allowed uri handlers

uint16_t max_resp_headers
Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
Number of backlog connections

bool lru_purge_enable
Purge "Least Recently Used" connection

uint16_t recv_wait_timeout
Timeout for recv function (in seconds)
**Chapter 2. API Reference**

```
uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.
    This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.
    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
    If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.
    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

bool enable_so_linger
    bool to enable/disable linger

int linger_timeout
    linger timeout (in seconds)

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
    Keep-alive interval time. Default is 5 (second)

int keep_alive_count
    Keep-alive packet retry send count. Default is 3 counts

httpd_open_func_t open_fn
    Custom session opening callback.
    Called on a new session socket just after accept(), but before reading any data.
    This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.
    If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()
    Returning a value other than ESP_OK will immediately close the new socket.
```
**httpd_close_func_t close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

**httpd_uri_match_func_t uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`.

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

```c
struct httpd_req
```

HTTP Request Data Structure.

### Public Members

**httpd_handle_t handle**

Handle to server instance

**int method**

The type of HTTP request, -1 if unsupported method, HTTP_ANY for wildcard method to support every method

**const char uri[HTTPD_MAX_URI_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size_t content_len**

Length of the request body

**void *aux**

Internally used members

**void *user_ctx**

User context pointer passed during URI registration.

**void *sess_ctx**

Session Context Pointer
A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

`httpd_free_ctx_fn_t free_ctx`

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

`bool ignore_sess_ctx_changes`

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freening of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

`struct httpd_uri`

Structure for URI handler.

**Public Members**

`const char *uri`

The URI to handle

`httpd_method_t method`

Method supported by the URI, HTTP_ANY for wildcard method to support all methods

`esp_err_t (*handler)(httpd_req_t *)`

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

`void *user_ctx`

Pointer to user context data which will be available to handler

**Macros**

`HTTPD_MAX_REQ_HDR_LEN`

`HTTPD_MAX_URI_LEN`

`HTTPD_SOCK_ERR_FAIL`
HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200
    HTTP Response 200

HTTPD_204
    HTTP Response 204

HTTPD_207
    HTTP Response 207

HTTPD_400
    HTTP Response 400

HTTPD_404
    HTTP Response 404

HTTPD_408
    HTTP Response 408

HTTPD_500
    HTTP Response 500

HTTPD_TYPE_JSON
    HTTP Content type JSON

HTTPD_TYPE_TEXT
    HTTP Content type text/HTML

HTTPD_TYPE_OCTET
    HTTP Content type octet-stream

ESP_HTTPD_DEF_CTRL_PORT
    HTTP Server control socket port

HTTPD_DEFAULT_CONFIG

ESP_ERR_HTTPD_BASE
    Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
    All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
    URI handler with same method and target URI already registered
Chapter 2. API Reference

ESERR_HTTPD_INVALID_REQ
Invalid request pointer

ESERR_HTTPD_RESULT_TRUNC
Result string truncated

ESERR_HTTPD_RESP_HDR
Response header field larger than supported

ESERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions
typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.
typedef enum http_method httpd_method_t
HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)
   Param ctx [in] object to free
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the
   Param hd [in] server instance
   Param sockfd [in] session socket file descriptor
   Return
      • ESP_OK : On success
      • Any value other than ESP_OK will signal the server to close the socket immediately
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.

Note: It's possible that the socket descriptor is invalid at this point, the function is called for all terminated
sessions. Ensure proper handling of return codes.
Chapter 2. API Reference

Param hd [in] server instance
Param sockfd [in] session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched
Param uri_to_match [in] URI/template being matched to the reference URI/template
Param match_upto [in] For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)
Return true on match

typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

Note: User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Param buf [in] buffer with bytes to send
Param buf_len [in] data size
Param flags [in] flags for the send() function
Return
• Bytes: The number of bytes sent successfully
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

Note: User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function
Chapter 2. API Reference

**Param hd** [in] server instance

**Param sockfd** [in] session socket file descriptor

**Param buf** [in] buffer with bytes to send

**Param buf_len** [in] data size

**Param flags** [in] flags for the send() function

**Return**

- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK_ERR INVALID: Invalid arguments
- HTTPD SOCK_ERR TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD SOCK_ERR FAIL: Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level ”get pending bytes” function.

**Note:** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD SOCK ERR codes, which will be handled accordingly in the server task.

**Param hd** [in] server instance

**Param sockfd** [in] session socket file descriptor

**Return**

- Bytes: The number of bytes waiting to be received
- HTTPD SOCK ERR INVALID: Invalid arguments
- HTTPD SOCK ERR TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD SOCK ERR FAIL: Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd resp send err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD 500 INTERNAL SERVER ERROR and the socket closed anyway.

**Param req** [in] HTTP request for which the error needs to be handled

**Param error** [in] Error type

**Return**

- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

typedef void (*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

**Param arg** [in] The arguments for this work function
Enumerations

enum **httpd_err_code_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD_500_INTERNAL_SERVER_ERROR**

enumerator **HTTPD_501_METHOD_NOT_IMPLEMENTED**

enumerator **HTTPD_505_VERSION_NOT_SUPPORTED**

enumerator **HTTPD_400_BAD_REQUEST**

enumerator **HTTPD_401_UNAUTHORIZED**

enumerator **HTTPD_403_FORBIDDEN**

enumerator **HTTPD_404_NOT_FOUND**

enumerator **HTTPD_405_METHOD_NOT_ALLOWED**

enumerator **HTTPD_408_REQ_TIMEOUT**

enumerator **HTTPD_411_LENGTH_REQUIRED**

enumerator **HTTPD_414_URI_TOO_LONG**

enumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

enumerator **HTTPD_ERR_CODE_MAX**

enum **esp_http_server_event_id_t**

HTTP Server events id.

*Values:*

enumerator **HTTP_SERVER_EVENT_ERROR**

    This event occurs when there are any errors during execution

enumerator **HTTP_SERVER_EVENT_START**

    This event occurs when HTTP Server is started

enumerator **HTTP_SERVER_EVENT_ON_CONNECTED**

    Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP_SERVER_EVENT_ON_HEADER**

    Occurs when receiving each header sent from the client
enumerator **HTTP_SERVER_EVENT_HEADERS_SENT**
   After sending all the headers to the client

enumerator **HTTP_SERVER_EVENT_ON_DATA**
   Occurs when receiving data from the client

enumerator **HTTP_SERVER_EVENT_SENT_DATA**
   Occurs when an ESP HTTP server session is finished

enumerator **HTTP_SERVER_EVENT_DISCONNECTED**
   The connection has been disconnected

enumerator **HTTP_SERVER_EVENT_STOP**
   This event occurs when HTTP Server is stopped

### 2.2.10 HTTPS Server

**Overview**

This component is built on top of **HTTP Server**. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for **HTTP Server** applies also to a server you create this way.

**Used APIs**

The following APIs of **HTTP Server** should not be used with **HTTPS Server**, as they are used internally to handle secure sessions and to maintain internal state:

- "send", "receive" and "pending" callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`

- "transport context" - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

**Usage**

Please see the example `protocols/https_server` to learn how to set up a secure server.

 Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.
Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

Event Handling

ESP HTTPS Server has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTPS Server.

`esp_https_server_event_id_t` has all the events which can happen for ESP HTTPS server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTPS_SERVER_EVENT_ERROR`: `esp_https_server_last_error_t`
- `HTTPS_SERVER_EVENT_START`: `NULL`
- `HTTPS_SERVER_EVENT_ON_CONNECTED`: `NULL`
- `HTTPS_SERVER_EVENT_ON_DATA`: `int`
- `HTTPS_SERVER_EVENT_SENT_DATA`: `NULL`
- `HTTPS_SERVER_EVENT_DISCONNECTED`: `NULL`
- `HTTPS_SERVER_EVENT_STOP`: `NULL`

API Reference

Header File

- `components/esp_https_server/include/esp_https_server.h`
- This header file can be included with:

  ```
  #include "esp_https_server.h"
  ```
- `REQUIRES esp_https_server`
  or
  ```
  PRIV_REQUIRES esp_https_server
  ```

Functions

`esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_conf_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters

- `config` -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- `handle` -- [out] - storage for the server handle, must be a valid pointer

Returns

success

`esp_err_t httpd_ssl_stop (httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

Parameters `handle` -- [in]

Returns

- ESP_OK: Server stopped successfully
- ESP_ERR_INVAL_ID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server
**Structures**

```c
struct esp_https_server_user_cb_arg
```

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

**Public Members**

```c
httpd_ssl_user_cb_state_t user_cb_state
```

State of user callback

```c
esp_tls_t *tls
```

ESP-TLS connection handle

**Public Members**

```c
httpd_ssl_config
```

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

**Public Members**

```c
httpd_t httpd
```

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```c
const uint8_t *servercert
```

Server certificate

```c
size_t servercert_len
```

Server certificate byte length

```c
const uint8_t *cacert_pem
```

CA certificate ((CA used to sign clients, or client cert itself)

```c
size_t cacert_len
```

CA certificate byte length

```c
const uint8_t *prvtkey_pem
```

Private key

```c
size_t prvtkey_len
```

Private key byte length

```c
bool use_ecdsa_peripheral
```

Use ECDSA peripheral to use private key

```c
uint8_t ecdsa_key_efuse_blk
```

The efuse block where ECDSA key is stored
**Chapter 2. API Reference**

```c
httpd_ssl_transport_mode_t transport_mode
    Transport Mode (default secure)

uint16_t port_secure
    Port used when transport mode is secure (default 443)

uint16_t port_insecure
    Port used when transport mode is insecure (default 80)

bool session_tickets
    Enable tls session tickets

bool use_secure_element
    Enable secure element for server session

dsp_https_server_user_cb *user_cb
    User callback for esp_https_server

void *ssl_userdata
    User data to add to the ssl context

dsp_tls_handshake_callback cert_select_cb
    Certificate selection callback to use. The callback is only applicable when CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK is enabled in menuconfig

const char **alpn_protos
    Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself
```

**Macros**

```c
HTTPD_SSL_CONFIG_DEFAULT()
    Default config struct init Notes:
    • port is set when starting the server, according to ‘transport_mode’
    • one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
    • SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
    • Stack size may need adjustments depending on the user application
```

**Type Definitions**

```c
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
    Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef esp_tls_last_error_t esp_https_server_last_error_t

typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
    Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.
```

```c
Param user_cb
    Callback data struct
```
typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations

defined enum esp_https_server_event_id_t

Values:

- enumerator HTTPS_SERVER_EVENT_ERROR
  This event occurs when there are any errors during execution

- enumerator HTTPS_SERVER_EVENT_START
  This event occurs when HTTPS Server is started

- enumerator HTTPS_SERVER_EVENT_ON_CONNECTED
  Once the HTTPS Server has been connected to the client

- enumerator HTTPS_SERVER_EVENT_ON_DATA
  Occurs when receiving data from the client

- enumerator HTTPS_SERVER_EVENT_SENT_DATA
  Occurs when an ESP HTTPS server sends data to the client

- enumerator HTTPS_SERVER_EVENT_DISCONNECTED
  The connection has been disconnected

- enumerator HTTPS_SERVER_EVENT_STOP
  This event occurs when HTTPS Server is stopped

defined enum httpd_ssl_transport_mode_t

Values:

- enumerator HTTPD_SSL_TRANSPORT_SECURE

- enumerator HTTPD_SSL_TRANSPORT_INSECURE

defined enum httpd_ssl_user_cb_state_t

Indicates the state at which the user callback is executed, i.e. at session creation or session close.

Values:

- enumerator HTTPD_SSL_USER_CB_SESS_CREATE

- enumerator HTTPD_SSL_USER_CB_SESS_CLOSE

2.2.11 ICMP Echo
Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and waits for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g., packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending or parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a New Ping Session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    (continues on next page)
```
Chapter 2. API Reference

(continued from previous page)

```c
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that feeds to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}
```

Start and Stop Ping Session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session does not start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a Ping Session If a ping session will not be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e., you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get Runtime Statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: `protocols/icmp_echo`

API Reference

Header File
components/lwip/include/apps/ping/ping_sock.h

This header file can be included with:

```c
#include "ping/ping_sock.h"
```

This header file is a part of the API provided by the lwip component. To declare that your component depends on lwip, add the following to your CMakeLists.txt:

```cmake
REQUIRES lwip

or

PRIV_REQUIRES lwip
```

## Functions

**esp_err_t esp_ping_new_session** (*const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out*)

Create a ping session.

**Parameters**

- `config` -- ping configuration
- `cbs` -- a bunch of callback functions invoked by internal ping task
- `hdl_out` -- handle of ping session

**Returns**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

**esp_err_t esp_ping_delete_session** (*esp_ping_handle_t hdl*)

Delete a ping session.

**Parameters**

- `hdl` -- handle of ping session

**Returns**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

**esp_err_t esp_ping_start** (*esp_ping_handle_t hdl*)

Start the ping session.

**Parameters**

- `hdl` -- handle of ping session

**Returns**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

**esp_err_t esp_ping_stop** (*esp_ping_handle_t hdl*)

Stop the ping session.

**Parameters**

- `hdl` -- handle of ping session

**Returns**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

**esp_err_t esp_ping_get_profile** (*esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size*)

Get runtime profile of ping session.

**Parameters**

- `hdl` -- handle of ping session
- `profile` -- type of profile
- `data` -- profile data
**Chapter 2. API Reference**

- **size** -- profile data size

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP_OK: get profile successfully

**Structures**

**struct esp_ping_callbacks_t**
Type of "ping" callback functions.

**Public Members**

```c
void *cb_args
arguments for callback functions
```

```c
void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.
```

```c
void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.
```

```c
void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.
```

**struct esp_ping_config_t**
Type of "ping" configuration.

**Public Members**

```c
uint32_t count
A "ping" session contains count procedures
```

```c
uint32_t interval_ms
Milliseconds between each ping procedure
```

```c
uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure
```

```c
uint32_t data_size
Size of the data next to ICMP packet header
```

```c
int tos
Type of Service, a field specified in the IP header
```

```c
int ttl
Time to Live, a field specified in the IP header
```
Chapter 2. API Reference

ip_addr_t \texttt{target_addr}

Target IP address, either IPv4 or IPv6

uint32_t \texttt{task_stack_size}

Stack size of internal ping task

uint32_t \texttt{task_prio}

Priority of internal ping task

uint32_t \texttt{interface}

Netif index, interface=0 means NETIF_NO_INDEX

\textbf{Macros}

\texttt{ESP\_PING\_DEFAULT\_CONFIG()}

Default ping configuration.

\texttt{ESP\_PING\_COUNT\_INFINITE}

Set ping count to zero will ping target infinitely

\textbf{Type Definitions}

typedef void *\texttt{esp\_ping\_handle\_t}

Type of "ping" session handle.

\textbf{Enumerations}

enum \texttt{esp\_ping\_profile\_t}

Profile of ping session.

Values:

enumerator \texttt{ESP\_PING\_PROF\_SEQNO}

Sequence number of a ping procedure

enumerator \texttt{ESP\_PING\_PROF\_TOS}

Type of service of a ping procedure

enumerator \texttt{ESP\_PING\_PROF\_TTL}

Time to live of a ping procedure

enumerator \texttt{ESP\_PING\_PROF\_REQUEST}

Number of request packets sent out

enumerator \texttt{ESP\_PING\_PROF\_REPLY}

Number of reply packets received

enumerator \texttt{ESP\_PING\_PROF\_IPADDR}

IP address of replied target
Chapter 2. API Reference

enumerator **ESP_PING_PROF_SIZE**
Size of received packet

enumerator **ESP_PING_PROF_TIMEGAP**
Elapsed time between request and reply packet

enumerator **ESP_PING_PROF_DURATION**
Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:

- mDNS component on GitHub

To add mDNS component in your project, please run `idf.py add-dependency espressif/mdns`.

**Hosted Documentation**

The documentation can be found on the link below:

- mDNS documentation

### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

**Note:** ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Supported TLS versions include SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3, but on the latest ESP-IDF, SSL 3.0, TLS 1.0, and TLS 1.1 have been removed from Mbed TLS. Supported DTLS versions include DTLS 1.0, DTLS 1.1, and DTLS 1.2, but on the latest ESP-IDF, DTLS 1.0 has been removed from Mbed TLS.

**Mbed TLS Documentation**

For Mbed TLS documentation please refer to the following (upstream) pointers:

- API Reference
- Knowledge Base
Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions presented in different branches of ESP-IDF here.

Note: Please refer the Mbed TLS to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options docs for more information on this and comparison of Mbed TLS and wolfSSL.

Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: ESP x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1, and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage  The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Mbed TLS Test</th>
<th>Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td><strong>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</strong></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><strong>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</strong></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td><strong>CONFIG_MBEDTLS_DYNAMIC_BUFFER</strong> <strong>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</strong> <strong>CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</strong></td>
<td>22013 B</td>
</tr>
</tbody>
</table>

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under Component Config → mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in *Minimizing Binary Size* docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

### 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in *Networking APIs*.

### 2.3 Bluetooth® API

#### 2.3.1 Bluetooth® Common

**Bluetooth® Generic Defines**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h
- This header file can be included with:
  ```
  #include "esp_bt_defs.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRES bt
  ```
  or
  ```
  PRIV_REQUIRES bt
  ```
Structures

struct **esp_bt_uuid_t**
UUID type.

Public Members

uint16_t **len**
UUID length, 16bit, 32bit or 128bit

uint16_t **uuid16**
16bit UUID

uint32_t **uuid32**
32bit UUID

uint8_t **uuid128**[ESP_UUID_LEN_128]
128bit UUID

union **esp_bt_uuid_t::[anonymous]** **uuid**
UUID

Macros

ESP_BLUEDROID_STATUS_CHECK(status)

ESP_BT_STATUS_BASE_FOR_HCI_ERR

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF
Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN
Minimum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_PRIM_ADV_INT_MAX
Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h
Chapter 2. API Reference

ESP_BLE_CONN_SUP_TOUT_MIN

relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX

relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_IS_VALID_PARAM(x, min, max)

Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN

Bluetooth address length.

ESP_BLE_ENC_KEY_MASK

Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK

Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK

Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN

Minimum of the application id.

ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX(addr)

Type Definitions

typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]

typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]

typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
   Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

**Enumerations**

enum esp_bt_status_t
   Status Return Value.
   Values:

        enumerator ESP_BT_STATUS_SUCCESS

        enumerator ESP_BT_STATUS_FAIL

        enumerator ESP_BT_STATUS_NOT_READY

        enumerator ESP_BT_STATUS_NOMEM

enumerator ESP_BT_STATUS_HCI_CONN_FAILED_ESTABLISHMENT
enumerator ESP_BT_STATUS_HCI_MAC_CONNECTION_FAILED
enum esp_bt_dev_type_t
    Bluetooth device type.
    
    Values:
    
    enumerator ESP_BT_DEVICE_TYPE_BREDR
    enumerator ESP_BT_DEVICE_TYPE_BLE
    enumerator ESP_BT_DEVICE_TYPE_DUMO

enum esp_ble_addr_type_t
    BLE device address type.
    
    Values:
    
    enumerator BLE_ADDR_TYPE_PUBLIC
        Public Device Address
    
    enumerator BLE_ADDR_TYPE_RANDOM
        Random Device Address. To set this address, use the function esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
    
    enumerator BLE_ADDR_TYPE_RPA_PUBLIC
        Resolvable Private Address (RPA) with public identity address
    
    enumerator BLE_ADDR_TYPE_RPA_RANDOM
        Resolvable Private Address (RPA) with random identity address. To set this address, use the function esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)

enum esp_ble_wl_addr_type_t
    white list address type
    
    Values:
    
    enumerator BLE_WL_ADDR_TYPE_PUBLIC
    enumerator BLE_WL_ADDR_TYPE_RANDOM

Bluetooth® Main API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h
- This header file can be included with:

```c
#include "esp_bt_main.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
Functions

`esp_bluedroid_status_t esp_bluedroid_get_status (void)`
Get bluetooth stack status.

- **Returns** Bluetooth stack status

`esp_err_t esp_bluedroid_enable (void)`
Enable bluetooth, must after esp_bluedroid_init()/esp_bluedroid_init_with_cfg().

- **Returns**
  - ESP_OK : Succeed
  - Other : Failed

`esp_err_t esp_bluedroid_disable (void)`
Disable bluetooth, must prior to esp_bluedroid_deinit().

- **Returns**
  - ESP_OK : Succeed
  - Other : Failed

`esp_err_t esp_bluedroid_init (void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

- **Returns**
  - ESP_OK : Succeed
  - Other : Failed

`esp_err_t esp_bluedroid_init_with_cfg (esp_bluedroid_config_t *cfg)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

- **Parameters**
  - `cfg` -- Initial configuration of ESP Bluedroid stack.

- **Returns**
  - ESP_OK : Succeed
  - Other : Failed

`esp_err_t esp_bluedroid_deinit (void)`
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

- **Returns**
  - ESP_OK : Succeed
  - Other : Failed

Structures

`struct esp_bluedroid_config_t`
Bluetooth stack configuration.

Public Members

`bool ssp_en`
Whether SSP(secure simple pairing) or legacy pairing is used for Classic Bluetooth
Chapter 2. API Reference

Macros

```
BT_BLUEDROID_INIT_CONFIG_DEFAULT()
```

Enumerations

```c
enum esp_bluedroid_status_t
{
    Bluetooth stack status type, to indicate whether the bluetooth stack is ready.
    
    Values:
    
    enumerator ESP_BLUEDROID_STATUS_UNINITIALIZED
        Bluetooth not initialized
    
    enumerator ESP_BLUEDROID_STATUS_INITIALIZED
        Bluetooth initialized but not enabled
    
    enumerator ESP_BLUEDROID_STATUS_ENABLED
        Bluetooth initialized and enabled
```

Bluetooth® Device APIs

Overview

Bluetooth device reference APIs.

API Reference

Header File

```
- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
- This header file can be included with:

```
#include "esp_bt_device.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

```
esp_err_t esp_bt_dev_register_callback (esp_bt_dev_cb_t callback)
```

register callback function. This function should be called after esp_bluedroid_enable() completes successfully

Returns

```
- ESP_OK : Succeed
- ESP_FAIL: others
```

```
const uint8_t* esp_bt_dev_get_address (void)
```

Get bluetooth device address. Must use after "esp_bluedroid_enable".

Returns

```
bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled
```
**esp_err_t esp_bt_dev_set_device_name** (const char *name)

Set Bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Parameters** name -- [in] : device name to be set

**Returns**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if Bluetooth stack is not yet enabled
- ESP_FAIL : others

**esp_err_t esp_bt_dev_get_device_name** (void)

Get Bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Returns**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE : if Bluetooth stack is not yet enabled
- ESP_FAIL : others

**esp_err_t esp_bt_dev_coex_status_config** (esp_bt_dev_coex_type_t type, esp_bt_dev_coex_op_t op, uint8_t status)

Config Bluetooth device coexis status. This function should be called after esp_bluedroid_enable() completes successfully.

**Parameters**
- type -- [in] : coexist type to operate on
- op -- [in] : clear or set coexist status
- status -- [in] : coexist status to be configured

**Returns**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if Bluetooth stack is not yet enabled
- ESP_FAIL : others

**esp_err_t esp_bt_config_file_path_update** (const char *file_path)

This function is used to update the path name of Bluetooth bond keys saved in the NVS module and need to be called before esp_bluedroid_init().

**Parameters** file_path -- [in] : the name of config file path, the length of file_path should be less than NVS_NS_NAME_MAX_SIZE

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_dev_vendor_command_send** (esp_bt_dev_vendor_cmd_params_t *vendor_cmd_param)

This function is called to send vendor hci command.

**Parameters** vendor_cmd_param -- [in] : vendor hci command parameters

**Returns**
- ESP_OK : success
- other : failed
Unions

union esp_bt_dev_cb_param_t

Type Definitions
typedef uint8_t esp_bt_dev_coex_op_t

typedef void (*esp_bt_dev_cb_t)(esp_bt_dev_cb_event_t event, esp_bt_dev_cb_param_t *param)
bluetooth device callback function type

Param event : Event type
Param param : Pointer to callback parameter

Enumerations
enum esp_bt_dev_coex_type_t
Bluetooth device coex type.
Values:

enumerator ESP_BT_DEV_COEX_TYPE_BLE
enumerator ESP_BT_DEV_COEX_TYPE_BT

enum esp_bt_dev_cb_event_t
BT device callback events.
Values:
enumerator **ESP_BT_DEV_NAME_RES_EVT**
    
    Device name result event

enumerator **ESP_BT_DEV_VENDOR_CMD_COMPLETE_EVT**
    
    When vendor HCI command complete, the event comes

enumerator **ESP_BT_DEV_EVT_MAX**

### 2.3.2 Bluetooth® Low Energy (Bluetooth LE)

**GAP API**

**Application Example**  
Check the `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- The following shows an SMP security client demo with its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - `bluetooth/bluedroid/ble/gatt_security_client`
  - GATT Security Client Example Walkthrough
- The following shows an SMP security server demo with its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - `bluetooth/bluedroid/ble/gatt_security_server`
  - GATT Security Server Example Walkthrough

**API Reference**

**Header File**

- `components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h`
- This header file can be included with:

```
#include "esp_gap_ble_api.h"
```

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your `CMakeLists.txt`:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

**Functions**

```c
esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)
```

This function is called to occur gap event, such as scan result.

**Parameters**  
`callback` -- [in] callback function

**Returns**

- ESP_OK : success
- other : failed
esp_gap_ble_cb_t esp_ble_gap_get_callback (void)

This function is called to get the current gap callback.

Returns
- esp_gap_ble_cb_t: callback function

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)

This function is called to override the BTA default ADV parameters.

Parameters adv_data -- [in] Pointer to User defined ADV data structure. This memory space
can not be freed until callback of config_adv_data is received.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)

This function is called to set scan parameters.

Parameters scan_params -- [in] Pointer to User defined scan_params data structure. This
memory space can not be freed until callback of set_scan_params

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_start_scanning (uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

Parameters duration -- [in] Keeping the scanning time, the unit is second.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_stop_scanning (void)

This function call to stop the device scanning the peer device which advertising on the air.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)

This function is called to start advertising.

Parameters adv_params -- [in] pointer to User defined adv_params data structure.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_stop_advertising (void)

This function is called to stop advertising.

Returns
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)

Update connection parameters, can only be used when connection is up.

Parameters params -- [in] - connection update parameters

Returns
- ESP_OK : success
- other : failed
**esp_err_t** **esp_ble_gap_set_pkt_data_len** *(esp_bd_addr_t remote_device, uint16_t tx_data_length)*
This function is to set maximum LE data packet size.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_set_rand_addr** *(esp_bd_addr_t rand_addr)*
This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

**Parameters**
- **rand_addr** -- [in] The address to be configured. Refer to the table below for possible address subtypes:

<table>
<thead>
<tr>
<th>address [47:46]</th>
<th>Address Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>----------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>0b00</td>
<td>Non-Resolvable Private</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>0b11</td>
<td>Static Random Address</td>
</tr>
</tbody>
</table>

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_clear_rand_addr** *(void)*
This function clears the random address for the application.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_config_local_privacy** *(bool privacy_enable)*
Enable/disable privacy (including address resolution) on the local device.

**Parameters**
- **privacy_enable** -- [in] - enable/disable privacy on remote device.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_config_local_icon** *(uint16_t icon)*
set local gap appearance icon

**Parameters**
- **icon** -- [in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to [https://www.bluetooth.com/specifications/assigned-numbers/](https://www.bluetooth.com/specifications/assigned-numbers/)

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_update_whitelist** *(bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)*
Add or remove device from white list.

**Parameters**
- **add_remove** -- [in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** -- [in] the remote device address add/remove from the white list.
- **wl_addr_type** -- [in] whitelist address type

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t** **esp_ble_gap_clear_whitelist** *(void)*
Clear all white list.
Chapter 2. API Reference

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_get_whitelist_size(uint16_t*length)
```

Get the whitelist size in the controller.

Parameters

- length -- [out] the white list length.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int,
                                          uint16_t max_conn_int, uint16_t slave_latency,
                                          uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Parameters

- bd_addr -- [in] BD address of the peripheral
- min_conn_int -- [in] minimum preferred connection interval
- max_conn_int -- [in] maximum preferred connection interval
- slave_latency -- [in] preferred slave latency
- supervision_tout -- [in] preferred supervision timeout

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_device_name(const char*name)
```

Set device name to the local device Note: This API don't affect the advertising data.

Parameters

- name -- [in] device name.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_get_device_name(void)
```

Get device name of the local device.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
```

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Parameters

- local_used_addr -- [in] - current local used ble address (six bytes)
- addr_type -- [in] - ble address type

Returns

- ESP_OK : success
- other : failed

```c
uint8_t* esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t *type, uint8_t *length)
```

This function is called to get ADV data for a specific type.

Parameters

- adv_data -- [in] - pointer of ADV data which to be resolved
- type -- [in] - finding ADV data type
- length -- [out] - return the length of ADV data not including type

Returns

pointer of ADV data
esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters
• raw_data -- [in] : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2]...
• raw_data_len -- [in] : raw advertising data length, less than 31 bytes

Returns
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw scan response data. User need to fill scan response data by self.

Parameters
• raw_data -- [in] : raw scan response data
• raw_data_len -- [in] : raw scan response data length, less than 31 bytes

Returns
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Parameters
remote_addr -- [in] : The remote connection device address.

Returns
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)
This function is called to add a device info into the duplicate scan exceptional list.

Parameters
• type -- [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
• device_info -- [in] the device information.

Returns
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)
This function is called to remove a device info from the duplicate scan exceptional list.

Parameters
• type -- [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
• device_info -- [in] the device information.

Returns
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)
This function is called to clean the duplicate scan exceptional list. This API will delete all device information
in the duplicate scan exceptional list.

**Parameters**

*list_type* -- [in] duplicate scan exceptional list type, the value can be one or more
of esp_duplicate_scan_exceptional_list_type_t.

**Returns**

- ESP_OK: success
- other : failed

```c
esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only `secure connection mode`, it is necessary do as...

- following:
  1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is 
     `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit
     `ESP_LE_AUTH_REQ_MITM` is optional as required.
  2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_` is 
     `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

**Parameters**

- **param_type** -- [in]: the type of the param which to be set
- **value** -- [in]: the param value
- **len** -- [in]: the length of the param value

**Returns**

- ESP_OK: success
- other : failed

```c
esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)
```

Grant security request access.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer
- **accept** -- [in]: accept the security request or not

**Returns**

- ESP_OK: success
- other : failed

```c
esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
```

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Parameters**

- **bd_addr** -- [in]: the address of the peer device need to encryption
- **sec_act** -- [in]: This is the security action to indicate what kind of BLE security level
  is required for the BLE link if the BLE is supported

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```

Reply the key value to the peer device in the legacy connection stage.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer
- **accept** -- [in]: passkey entry successful or declined.
• **passkey** -- [in] : passkey value, must be a 6 digit number, can be lead by 0.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)
```

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**
- **bd_addr** -- [in] : BD address of the peer device
- **accept** -- [in] : numbers to compare are the same or different.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
```

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters**
- **bd_addr** -- [in] : BD address of the peer device

**Returns**
- ESP_OK : success
- other : failed

```c
int esp_ble_get_bond_device_num (void)
```

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns**
- >= 0 : bonded devices number.
- ESP_FAIL : failed

```c
esp_err_t esp_ble_get_bond_device_list (int*dev_num, esp_ble_bond_dev_t*dev_list)
```

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**
- **dev_num** -- [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** -- [out] an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t*TK, uint8_t len)
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Parameters**
- **bd_addr** -- [in] BD address of the peer device.
- **TK** -- [in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** -- [in] length of temporary key, should always be 128-bit

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_sc_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t_p_c[16], uint8_t_p_r[16])
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

**Parameters**
- **bd_addr** -- [in] BD address of the peer device.
- **p_c** -- [in] Confirmation value, it shall be a 128-bit random number
- **p_r** -- [in] Randomizer value, it should be a 128-bit random number

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_create_sc_oob_data (void)
```

This function is called to create the OOB data for SMP when secure connection.
Chapter 2. API Reference

Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)`
This function is to disconnect the physical connection of the peer device. gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Parameters remote_device -- [in] : BD address of the peer device
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)`
This function is called to read the connection parameters information of the device.

Parameters
• bd_addr -- [in] BD address of the peer device.
• conn_params -- [out] the connection parameters information
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)`
BLE set channels.

Parameters channels -- [in] : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.
Returns - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

`esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)`
This function is called to authorized a link after Authentication(MITM protection)

Parameters
• bd_addr -- [in] BD address of the peer device.
• authorize -- [out] Authorized the link or not.
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)`
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Parameters bd_addr -- [in] : BD address of the peer device
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_set_preferred_default_phy (esp_gap_phy_mask_t tx_phy_mask, esp_gap_phy_mask_t rx_phy_mask)`
This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Parameters
• tx_phy_mask -- [in] : indicates the transmitter PHYs that the Host prefers the Controller to use
• rx_phy_mask -- [in] : indicates the receiver PHYs that the Host prefers the Controller to use
Returns - ESP_OK : success
**esp_err_t esp_ble_gap_set_preferred_phy** (esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Parameters**
- **bd_addr** -- [in] : remote address
- **all_phys_mask** -- [in] : a bit field that allows the Host to specify
- **tx_phy_mask** -- [in] : a bit field that indicates the transmitter PHYS that the Host prefers the Controller to use
- **rx_phy_mask** -- [in] : a bit field that indicates the receiver PHYS that the Host prefers the Controller to use
- **phy_options** -- [in] : a bit field that allows the Host to specify options for PHYs

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_ext_adv_set_rand_addr** (uint8_t instance, esp_bd_addr_t rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Parameters**
- **instance** -- [in] : Used to identify an advertising set
- **rand_addr** -- [in] : Random Device Address

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_ext_adv_set_params** (uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)

This function is used by the Host to set the advertising parameters.

**Parameters**
- **instance** -- [in] : identifies the advertising set whose parameters are being configured.
- **params** -- [in] : advertising parameters

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_ext_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

**Parameters**
- **instance** -- [in] : identifies the advertising set whose data are being configured
- **length** -- [in] : data length
- **data** -- [in] : data information

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw** (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

**Parameters**
- **instance** -- [in] : identifies the advertising set whose response data are being configured.
- **length** -- [in] : respondedata length
- **scan_rsp_data** -- [in] : response data information

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_ext_adv_start** (uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**
- **num_adv** -- [in]: Number of advertising sets to enable or disable
- **ext_adv** -- [in]: adv parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_ext_adv_stop** (uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**
- **num_adv** -- [in]: Number of advertising sets to enable or disable
- **ext_adv_inst** -- [in]: ext adv instance

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_ext_adv_set_remove** (uint8_t instance)

This function is used to remove an advertising set from the Controller.

**Parameters**
- **instance** -- [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_ext_adv_set_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_set_params** (uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.

**Parameters**
- **instance** -- [in]: identifies the advertising set whose periodic advertising parameters are being configured.
- **params** -- [in]: periodic adv parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

**Parameters**
- **instance** -- [in]: identifies the advertising set whose periodic advertising parameters are being configured.
- **length** -- [in]: the length of periodic data
- **data** -- [in]: periodic data information

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Parameters**
- **instance** -- [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed
### esp_err_t esp_ble_gap_periodic_adv_stop (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Parameters**
- **instance** -- [in]: Used to identify an advertising set

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_set_ext_scan_params (const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Parameters**
- **params** -- [in]: scan parameters

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_start_ext_scan (uint32_t duration, uint16_t period)

This function is used to enable scanning.

**Parameters**
- **duration** -- [in]: Scan duration time, where Time = N * 10 ms. Range: 0x0001 to 0xFFFF.
- **period** -- [in]: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration. Time = N * 1.28 sec. Range: 0x0001 to 0xFFFF.

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_stop_ext_scan (void)

This function is used to disable scanning.

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_periodic_adv_create_sync (const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Parameters**
- **params** -- [in]: sync parameters

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Parameters**
- **sync_handle** -- [in]: identify the periodic advertiser

**Returns**
- ESP_OK : success
- other : failed

### esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Parameters**
- **addr_type** -- [in]: address type
- **addr** -- [in]: Device Address
- **sid** -- [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list** (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Parameters**
- `addr_type` -- [in]: address type
- `addr` -- [in]: Device Address
- `sid` -- [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_prefer_ext_connect_params_set** (esp_bd_addr_t addr, esp_ble_gap_phy_mask_t phy_mask, const esp_ble_gap_conn_params_t *phy_1m_conn_params, const esp_ble_gap_conn_params_t *phy_2m_conn_params, const esp_ble_gap_conn_params_t *phy_coded_conn_params)

This function is used to set aux connection parameters.

**Parameters**
- `addr` -- [in]: device address
- `phy_mask` -- [in]: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- `phy_1m_conn_params` -- [in]: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- `phy_2m_conn_params` -- [in]: Connection parameters for the LE 2M PHY are provided.
- `phy_coded_conn_params` -- [in]: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_recv_enable** (uint16_t sync_handle, uint8_t enable)

This function is used to set periodic advertising receive enable.

**Parameters**
- `sync_handle` -- [in]: Handle of periodic advertising sync
- `enable` -- [in]: Determines whether reporting and duplicate filtering are enabled or disabled

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_trans** (esp_bd_addr_t addr, uint16_t service_data, uint16_t sync_handle)

This function is used to transfer periodic advertising sync.

**Parameters**
- `addr` -- [in]: Peer device address
- `service_data` -- [in]: Service data used by Host
- `sync_handle` -- [in]: Handle of periodic advertising sync
Returns - ESP_OK: success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_gap\_periodic\_adv\_set\_info\_trans} (\textit{esp\_bd\_addr\_t} addr, uint16\_t service\_data, uint8\_t adv\_handle)

This function is used to transfer periodic advertising set info.

\textbf{Parameters}

• \textit{addr} -- [in] : Peer device address
• service\_data -- [in] : Service data used by Host
• adv\_handle -- [in] : Handle of advertising set

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_gap\_set\_periodic\_adv\_sync\_trans\_params} (\textit{esp\_bd\_addr\_t} addr, const \textit{esp\_ble\_gap\_past\_params\_t} *params)

This function is used to set periodic advertising sync transfer params.

\textbf{Parameters}

• \textit{addr} -- [in] : Peer device address
• \textit{params} -- [in] : Params of periodic advertising sync transfer

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_dtm\_tx\_start} (const \textit{esp\_ble\_dtm\_tx\_t} *tx\_params)

This function is used to start a test where the DUT generates reference packets at a fixed interval.

\textbf{Parameters} \textit{tx\_params} -- [in] : DTM Transmitter parameters

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_dtm\_rx\_start} (const \textit{esp\_ble\_dtm\_rx\_t} *rx\_params)

This function is used to start a test where the DUT receives test reference packets at a fixed interval.

\textbf{Parameters} \textit{rx\_params} -- [in] : DTM Receiver parameters

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_dtm\_enh\_tx\_start} (const \textit{esp\_ble\_dtm\_enh\_tx\_t} *tx\_params)

This function is used to start a test where the DUT generates reference packets at a fixed interval.

\textbf{Parameters} \textit{tx\_params} -- [in] : DTM Transmitter parameters

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_dtm\_enh\_rx\_start} (const \textit{esp\_ble\_dtm\_enh\_rx\_t} *rx\_params)

This function is used to start a test where the DUT receives test reference packets at a fixed interval.

\textbf{Parameters} \textit{rx\_params} -- [in] : DTM Receiver parameters

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_dtm\_stop} (void)

This function is used to stop any test which is in progress.

\textbf{Returns}

- ESP_OK : success
• other : failed

\texttt{esp\_err\_t} \textit{esp\_ble\_gap\_clear\_advertising} (void)

This function is used to clear legacy advertising.

\textbf{Returns}

- ESP_OK : success
• other : failed

**Public Members**

*esp_bt_status_t* `status`
  Indicate update connection parameters success status

*esp_bd_addr_t* `bda`
  Bluetooth device address

`uint16_t` `min_int`
  Min connection interval

`uint16_t` `max_int`
  Max connection interval

`uint16_t` `latency`
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t` `conn_int`
  Current connection interval

`uint16_t` `timeout`
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

**Struct** `ble_update_duplicate_exceptional_list_cmpl_evt_param`

#include `<esp_gap_ble_api.h>`

**Public Members**

*esp_bt_status_t* `status`
  Indicate update duplicatescan exceptional list operation success status

`uint8_t` `subcode`
  Define in esp_bt_duplicate_exceptional_subcode_type_t

`uint16_t` `length`
  The length of device_info

*esp_duplicate_info_t* `device_info`
  device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

**Struct** `ble_update_whitelist_cmpl_evt_param`

#include `<esp_gap_ble_api.h>`

**Public Members**
**esp_bt_status_t** *status*

Indicate the add or remove whitelist operation success status

**esp_ble_wl_operation_t** *wl_operation*

The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

**Structures**

**struct esp_ble_dtm_tx_t**

DTM TX parameters.

**Public Members**

uint8_t *tx_channel*

channel for sending test data, tx_channel = \((\text{Frequency} - 2402)/2\), tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

uint8_t *len_of_data*

length in bytes of payload data in each packet

**esp_ble_dtm_pkt_payload_t** *pkt_payload*

packet payload type. value range: 0x00-0x07

**struct esp_ble_dtm_rx_t**

DTM RX parameters.

**Public Members**

uint8_t *rx_channel*

channel for test data reception, rx_channel = \((\text{Frequency} - 2402)/2\), tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

**struct esp_ble_adv_params_t**

Advertising parameters.

**Public Members**

uint16_t *adv_int_min*

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t *adv_int_max*

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval
```c
exp_ble_adv_type_t adv_type
    Advertising type

exp_ble_addr_type_t own_addr_type
    Owner bluetooth device address type

exp_bd_addr_t peer_addr
    Peer device bluetooth device address

exp_ble_addr_type_t peer_addr_type
    Peer device bluetooth device address type, only support public address type and random address type

exp_ble_adv_channel_t channel_map
    Advertising channel map

exp_ble_adv_filter_t adv_filter_policy
    Advertising filter policy

struct esp_ble_adv_data_t
    Advertising data content, according to "Supplement to the Bluetooth Core Specification".

Public Members

bool set_scan_rsp
    Set this advertising data as scan response or not

bool include_name
    Advertising data include device name or not

bool include_txpower
    Advertising data include TX power

int min_interval
    Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn.Interval.Min * 1.25 ms Conn.Interval.Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval
    Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn.Interval.Max * 1.25 ms Conn.Interval.Max range: 0x0006 to 0x0C80 Conn.Interval.Max shall be equal to or greater than the Conn.Interval.Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
    External appearance of device

uint16_t manufacturer_len
    Manufacturer data length
```
uint8_t *p_manufacturer_data
  Manufacturer data point

uint16_t service_data_len
  Service data length

uint8_t *p_service_data
  Service data point

uint16_t service_uuid_len
  Service uuid length

uint8_t *p_service_uuid
  Service uuid array point

uint8_t flag
  Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
  Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
  Scan type

esp_ble_addr_type_t own_addr_type
  Owner address type

esp_ble_scan_filter_t scan_filter_policy
  Scan filter policy

uint16_t scan_interval
  Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
  Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
  The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
  connection parameters information
Public Members

```c
uint16_t interval
    connection interval
```

```c
uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```c
uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_ble_conn_update_params_t
    Connection update parameters.
```

Public Members

```c
esp_bd_addr_t bda
    Bluetooth device address
```

```c

create extend connection parameters

**Public Members**

```c
uint16_t scan_interval
```

init scan interval

```c
uint16_t scan_window
```

init scan window

```c
uint16_t interval_min
```

minimum interval

```c
uint16_t interval_max
```

maximum interval

```c
uint16_t latency
```

ext scan type

```c
uint16_t supervision_timeout
```

connection supervision timeout

```c
uint16_t min_ce_len
```

minimum ce length

```c
uint16_t max_ce_len
```

maximum ce length

```c
struct esp_ble_gap_ext_adv_t
```

extend adv enable parameters

**Public Members**

```c
uint8_t instance
```

advertising handle

```c
int duration
```

advertising duration

```c
int max_events
```

maximum number of extended advertising events

```c
struct esp_ble_gap_periodic_adv_params_t
```

periodic adv parameters
Public Members

uint16_t interval_min
periodic advertising minimum interval

uint16_t interval_max
periodic advertising maximum interval

uint8_t properties
periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
periodic adv sync parameters

Public Members

esp_ble_gap_sync_t filter_policy
Configures the filter policy for periodic advertising sync: 0: Use Advertising SID, Advertiser Address Type, and Advertiser Address parameters to determine the advertiser to listen to. 1: Use the Periodic Advertiser List to determine the advertiser to listen to.

uint8_t sid
SID of the periodic advertising

esp_ble_addr_type_t addr_type
Address type of the periodic advertising

esp_bd_addr_t addr
Address of the periodic advertising

uint16_t skip
Maximum number of periodic advertising events that can be skipped

uint16_t sync_timeout
Synchronization timeout

struct esp_ble_gap_ext_adv_report_t
extend adv report parameters

Public Members

esp_ble_gap_adv_type_t event_type
extend advertising type

uint8_t addr_type
extend advertising address type
**Chapter 2. API Reference**

*esp_bd_addr_t* **addr**  
extend advertising address

*esp_ble_gap_pri_phy_t* **primary_phy**  
extend advertising primary phy

*esp_ble_gap_phy_t* **secondly_phy**  
extend advertising secondary phy

uint8_t **sid**  
extend advertising sid

uint8_t **tx_power**  
extend advertising tx power

int8_t **rssi**  
extend advertising rssi

uint16_t **per_adv_interval**  
periodic advertising interval

uint8_t **dir_addr_type**  
direct address type

*esp_bd_addr_t* **dir_addr**  
direct address

*esp_ble_gap_ext_adv_data_status_t* **data_status**  
data type

uint8_t **adv_data_len**  
extend advertising data length

uint8_t **adv_data[251]**  
extend advertising data

**struct esp_ble_gap_periodic_adv_report_t**  
periodic adv report parameters

**Public Members**

uint16_t **sync_handle**  
periodic advertising train handle

uint8_t **tx_power**  
periodic advertising tx power
int8_t rssi
    periodic advertising rssi

    *esp_ble_gap_ext_adv_data_status_t* data_status
    periodic advertising data type

    uint8_t data_length
    periodic advertising data length

    uint8_t data[251]
    periodic advertising data

    struct *esp_ble_gap_periodic_adv_sync_estab_t*
    periodic adv sync establish parameters

**Public Members**

    uint8_t status
    periodic advertising sync status

    uint16_t sync_handle
    periodic advertising train handle

    uint8_t sid
    periodic advertising sid

    *esp_ble_addr_type_t* addr_type
    periodic advertising address type

    *esp_bd_addr_t* adv_addr
    periodic advertising address

    *esp_ble_gap_phy_t* adv_phy
    periodic advertising adv phy type

    uint16_t period_adv_interval
    periodic advertising interval

    uint8_t adv_clk_accuracy
    periodic advertising clock accuracy

    struct *esp_ble_dtm_enh_tx_t*
    DTM TX parameters.

**Public Members**
uint8_t tx_channel
channel for sending test data, tx_channel = (Frequency - 2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

uint8_t len_of_data
length in bytes of payload data in each packet

esp_ble_dtm_pkt_payload_t pkt_payload
packet payload type. value range: 0x00-0x07

esp_ble_gap_phy_t phy
the phy type used by the transmitter, coded phy with S=2:0x04

struct esp_ble_dtm_enh_rx_t
DTM RX parameters.

Public Members

uint8_t rx_channel
channel for test data reception, rx_channel = (Frequency -2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

esp_ble_gap_phy_t phy
the phy type used by the receiver, 1M phy: 0x01, 2M phy:0x02, coded phy:0x03

uint8_t modulation_idx
modulation index, 0x00:standard modulation index, 0x01:stable modulation index

struct esp_ble_gap_past_params_t
periodic adv sync transfer parameters

Public Members

esp_ble_gap_past_mode_t mode
periodic advertising sync transfer mode

uint16_t skip
the number of periodic advertising packets that can be skipped

uint16_t sync_timeout
synchronization timeout for the periodic advertising train

uint8_t cte_type
periodic advertising sync transfer CET type
Chapter 2. API Reference

 Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC
BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE
relate to BTM_LE_KEY_xxx in stack/btm_api.h
No encryption key

ESP_LE_KEY_PENC
encryption key, encryption information of peer device

ESP_LE_KEY_PID
identity key of the peer device

ESP_LE_KEY_PCSRK
peer SRK

ESP_LE_KEY_PLK
Link key

ESP_LE_KEY_LLK
peer link key

ESP_LE_KEY_LENC
master role security information:div

ESP_LE_KEY_LID
master device ID key

ESP_LE_KEY_LCSRK
local CSRK has been deliver to peer

ESP_LE_AUTH_NO_BOND
relate to BTM_LE_AUTH_xxx in stack/btm_api.h
0 no bondingv

ESP_LE_AUTH_BOND
1 << 0 device in the bonding with peer
ESP_LE_AUTH_REQ_MITM
1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM
0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY
1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND
1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM
1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND
1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE
authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE
authentication enable

ESP_BLE_OOB_DISABLE
disable the out of bond

ESP_BLE_OOB_ENABLE
enable the out of bond

ESP_IO_CAP_OUT
relate to BTM_IO_CAP_xxx in stack/btm_api.h
DisplayOnly

ESP_IO_CAP_IO
DisplayYesNo

ESP_IO_CAP_IN
KeyboardOnly

ESP_IO_CAP_NONE
NoInputNoOutput

ESP_IO_CAP_KBDISP
Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN
relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h
**ESP_BLE_APPEARANCE_GENERIC_PHONE**
relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_COMPUTER**
relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_WATCH**
relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_SPORTS_WATCH**
relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_CLOCK**
relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_DISPLAY**
relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_REMOTE**
relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES**
relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_TAG**
relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_KEYRING**
relate to BTM_BLE_APPEARANCE_GENERIC_KEYRING in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER**
relate to BTM_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER**
relate to BTM_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_THERMOMETER**
relate to BTM_BLE_APPEARANCE_GENERIC_THERMOMETER in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_THERMOMETER_EAR**
relate to BTM_BLE_APPEARANCE_THERMOMETER_EAR in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_HEART_RATE**
relate to BTM_BLE_APPEARANCE_GENERIC_HEART_RATE in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_HEART_RATE_BELT**
relate to BTM_BLE_APPEARANCE_HEART_RATE_BELT in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE
relate to BTM_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_ARM
relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_ARM in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST
relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HID
relate to BTM_BLE_APPEARANCE_GENERIC_HID in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_KEYBOARD
relate to BTM_BLE_APPEARANCE_HID_KEYBOARD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_MOUSE
relate to BTM_BLE_APPEARANCE_HID_MOUSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_JOYSTICK
relate to BTM_BLE_APPEARANCE_HID_JOYSTICK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_GAMEPAD
relate to BTM_BLE_APPEARANCE_HID_GAMEPAD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITIZER_TABLET
relate to BTM_BLE_APPEARANCE_HID_DIGITIZER_TABLET in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_CARD_READER
relate to BTM_BLE_APPEARANCE_HID_CARD_READER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITAL_PEN
relate to BTM_BLE_APPEARANCE_HID_DIGITAL_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_BARCODE_SCANNER
relate to BTM_BLE_APPEARANCE_HID_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_GLUCOSE
relate to BTM_BLE_APPEARANCE_GENERIC_GLUCOSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WALKING
relate to BTM_BLE_APPEARANCE_GENERIC_WALKING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_IN_SHOE
relate to BTM_BLE_APPEARANCE_WALKING_IN_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_SHOE
relate to BTM_BLE_APPEARANCE_WALKING_ON_SHOE in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_WALKING_ON_HIP
    relate to BTM_BLE_APPEARANCE_WALKING_ON_HIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CYCLING
    relate to BTM_BLE_APPEARANCE GENERIC_CYCLING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_COMPUTER
    relate to BTM_BLE_APPEARANCE_CYCLING_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED
    relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE
    relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER
    relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE
    relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER
    relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP
    relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST
    relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT
    relate to BTM_BLE_APPEARANCE GENERIC WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
    relate to BTM_BLE_APPEARANCE GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR
    relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER
    relate to BTM_BLE_APPEARANCE MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR
    relate to BTM_BLE_APPEARANCE GENERIC CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP
    relate to BTM_BLE_APPEARANCE GENERIC_INSULIN_PUMP in stack/btm_ble_api.h
Chapter 2. API Reference

**ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP**
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP**
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_INSULIN_PEN**
relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY**
relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS**
relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION**
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV**
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD**
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV**
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

**BLE_DTM_PKT_PAYLOAD_0x00**
PRBS9 sequence ‘11111111100000111101...’ (in transmission order) as described in [Vol 6] Part F, Section 4.1.5

**BLE_DTM_PKT_PAYLOAD_0x01**
Repeated ‘11110000’ (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE_DTM_PKT_PAYLOAD_0x02**
Repeated ‘10101010’ (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE_DTM_PKT_PAYLOAD_0x03**
PRBS15 sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE_DTM_PKT_PAYLOAD_0x04**
Repeated ‘11111111’ (in transmission order) sequence

**BLE_DTM_PKT_PAYLOAD_0x05**
Repeated ‘00000000’ (in transmission order) sequence
BLE_DTM_PKT_PAYLOAD_0x06
Repeated ‘00001111’ (in transmission order) sequence

BLE_DTM_PKT_PAYLOAD_0x07
Repeated ‘01010101’ (in transmission order) sequence

BLE_DTM_PKT_PAYLOAD_MAX
0x08 ~ 0xFF, Reserved for future use

ESP_GAP_BLE_CHANNELS_LEN
channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT
This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX
Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX
Scan response data maximum length.

BLE_BIT (n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED
Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE
Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE
Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED
Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED
High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY
Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV
Omit advertiser’s address from all PDUs (“anonymous advertising”)

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR
Include TxPower in the extended header of the advertising PDU
**ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK**

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND**

ADV_DIRECT_IND (low duty cycle)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR**

ADV_DIRECT_IND (high duty cycle)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR**

ADV_SCAN_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN**

ADV_NONCONN_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN**

**ESP_BLE_GAP_PHY_1M**

Secondary Advertisement PHY is LE1M

**ESP_BLE_GAP_PHY_2M**

Secondary Advertisement PHY is LE2M

**ESP_BLE_GAP_PHY_CODED**

Secondary Advertisement PHY is LE Coded

**ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY**

No Prefer TX PHY supported by controller

**ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY**

No Prefer RX PHY supported by controller

**ESP_BLE_GAP_PRI_PHY_1M**

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

**ESP_BLE_GAP_PRI_PHY_CODED**

Primary Phy is LE CODED

**ESP_BLE_GAP_PHY_1M_PREF_MASK**

The Host prefers use the LE1M transmitter or reciever PHY

**ESP_BLE_GAP_PHY_2M_PREF_MASK**

The Host prefers use the LE2M transmitter or reciever PHY

**ESP_BLE_GAP_PHY_CODED_PREF_MASK**

The Host prefers use the LE CODED transmitter or reciever PHY
ESP_BLE_GAP_PHY_OPTIONS_NO_PREF
The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING
The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING
The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK
Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK
Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE
Advertising data.
extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE
extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED
extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO
Advertising SYNC policy.
sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST
periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND
Advertising report.
advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND
advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV
advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP
advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND
advertising report with legacy advertising indication type
Chapter 2. API Reference

**ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND**
Advertising report with legacy direct indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND**
Advertising report with legacy scan indication type

**ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND**
Advertising report with legacy non connectable indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND**
Advertising report with legacy scan response indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND**
Advertising report with legacy advertising with scan response indication type

**EXT_ADV_TX_PWR_NO_PREFERENCE**
Extend advertising tx power, range: [-127, +126] dBm.
Host has no preference for tx power

**ESP_BLE_GAP_PAST_MODE_NO_SYNC_EVT**
Periodic advertising sync trans mode.
No attempt is made to sync and no periodic adv sync transfer received event

**ESP_BLE_GAP_PAST_MODE_NO_REPORT_EVT**
An periodic adv sync transfer received event and no periodic adv report events

**ESP_BLE_GAP_PAST_MODE_DUP_FILTER_DISABLED**
Periodic adv report events will be enabled with duplicate filtering disabled

**ESP_BLE_GAP_PAST_MODE_DUP_FILTER_ENABLED**
Periodic adv report events will be enabled with duplicate filtering enabled

### Type Definitions

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t
combination of the above bit pattern

typedef uint8_t esp_ble_io_cap_t
combination of the io capability

typedef uint8_t esp_ble_dtm_pkt_payload_t

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t esp_duplicate_info_t[ESP BD_ADDR_LEN]
typedef uint16_t esp_ble_ext_adv_type_mask_t
typedef uint8_t esp_ble_gap_phy_t
typedef uint8_t esp_ble_gap_all_phys_t
typedef uint8_t esp_ble_gap_pri_phy_t
typedef uint8_t esp_ble_gap_phy_mask_t
typedef uint16_t esp_ble_gap_prefer_phy_options_t
typedef uint8_t esp_ble_ext_scan_cfg_mask_t
typedef uint8_t esp_ble_gap_ext_adv_data_status_t
typedef uint8_t esp_ble_gap_sync_t
typedef uint8_t esp_ble_gap_adv_type_t
typedef uint8_t esp_ble_gap_past_mode_t

typedef void (*)(esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
GAP callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

### Enumerations

enum esp_gap_ble_cb_event_t
GAP BLE callback event type.

*Values:*

- **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**: When advertising data set complete, the event comes
- **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**: When scan response data set complete, the event comes
- **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**: When scan parameters set complete, the event comes
- **ESP_GAP_BLE_SCAN_RESULT_EVT**: When one scan result ready, the event comes each time
- **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**: When raw advertising data set complete, the event comes
enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**
   When raw scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**
   When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**
   When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**
   Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**
   BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**
   BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**
   passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**
   passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**
   OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**
   BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**
   BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**
   Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
   When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
   When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**
   When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
   When update connection parameters complete, the event comes
enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**

When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**

When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**

When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**

When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

When reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**

When preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**

When preferred phy complete, this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**

When extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**

When extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**

When extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**

When extended scan response data complete, the event comes
enumerator **ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT**
when extended advertising start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT**
when extended advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT**
when extended advertising set remove complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT**
when extended advertising set clear complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT**
when periodic advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT**
when periodic advertising data complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT**
when periodic advertising start complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT**
when periodic advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT**
when periodic advertising create sync complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT**
when extended advertising sync cancel complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT**
when extended advertising sync terminate complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT**
when extended advertising add device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT**
when extended advertising remove device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT**
when extended advertising clear device, the event comes

enumerator **ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT**
when extended scan parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT**
when extended scan start complete, the event comes
Chapter 2. API Reference

enumerator **ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT**
when extended scan stop complete, the event comes

enumerator **ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT**
when extended prefer connection parameter set complete, the event comes

enumerator **ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT**
when BLE phy update complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_REPORT_EVT**
when extended advertising report complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_TIMEOUT_EVT**
when scan timeout complete, the event comes

enumerator **ESP_GAP_BLE_ADV_TERMINATED_EVT**
when advertising terminate data complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT**
when scan req received complete, the event comes

enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**
when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**
when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**
when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**
when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_SC_OOB_REQ_EVT**
Secure Connection OOB request event

enumerator **ESP_GAP_BLE_SC_CR_LOC_OOB_EVT**
Secure Connection create OOB data complete event

enumerator **ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT**
When getting BT device name complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT**
when set periodic advertising receive enable complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT**
when periodic advertising sync transfer complete, the event comes
enumerator `ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT`
when periodic advertising set info transfer complete, the event comes

enumerator `ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT`
when set periodic advertising sync transfer params complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT`
when periodic advertising sync transfer received, the event comes

enumerator `ESP_GAP_BLE_DTM_TEST_UPDATE_EVT`
when direct test mode state changes, the event comes

enumerator `ESP_GAP_BLE_ADV_CLEAR_COMPLETE_EVT`
When clear advertising complete, the event comes

enumerator `ESP_GAP_BLE_EVT_MAX`
when maximum advertising event complete, the event comes

enum `esp_ble_adv_data_type`
The type of advertising data(not adv_type)

Values:

enumerator `ESP_BLE_AD_TYPE_FLAG`

enumerator `ESP_BLE_AD_TYPE_16SRV_PART`

enumerator `ESP_BLE_AD_TYPE_16SRV_CMPL`

enumerator `ESP_BLE_AD_TYPE_32SRV_PART`

enumerator `ESP_BLE_AD_TYPE_32SRV_CMPL`

enumerator `ESP_BLE_AD_TYPE_128SRV_PART`

enumerator `ESP_BLE_AD_TYPE_128SRV_CMPL`

enumerator `ESP_BLE_AD_TYPE_NAME_SHORT`

enumerator `ESP_BLE_AD_TYPE_NAME_CMPL`

enumerator `ESP_BLE_AD_TYPE_TX_PWR`

enumerator `ESP_BLE_AD_TYPE_DEV_CLASS`

enumerator `ESP_BLE_AD_TYPE_SM_TK`

enumerator `ESP_BLE_AD_TYPE_SM_OOB_FLAG`
enumerator `ESP_BLE_AD_TYPE_INT_RANGE`
enumerator `ESP_BLE_AD_TYPE_SOL_SRV_UUID`
enumerator `ESP_BLE_AD_TYPE_128_SOL_SRV_UUID`
enumerator `ESP_BLE_AD_TYPE_SERVICE_DATA`
enumerator `ESP_BLE_AD_TYPE_PUBLIC_TARGET`
enumerator `ESP_BLE_AD_TYPE_RANDOM_TARGET`
enumerator `ESP_BLE_AD_TYPE_APPEARANCE`
enumerator `ESP_BLE_AD_TYPE_ADV_INT`
enumerator `ESP_BLE_AD_TYPE_LE_DEV_ADDR`
enumerator `ESP_BLE_AD_TYPE_LE_ROLE`
enumerator `ESP_BLE_AD_TYPE_SPAIR_C256`
enumerator `ESP_BLE_AD_TYPE_SPAIR_R256`
enumerator `ESP_BLE_AD_TYPE_32_SOL_SRV_UUID`
enumerator `ESP_BLE_AD_TYPE_32SERVICE_DATA`
enumerator `ESP_BLE_AD_TYPE_128SERVICE_DATA`
enumerator `ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM`
enumerator `ESP_BLE_AD_TYPE_LE_SECURE_RANDOM`
enumerator `ESP_BLE_AD_TYPE_URI`
enumerator `ESP_BLE_AD_TYPE_INDOOR_POSITION`
enumerator `ESP_BLE_AD_TYPE_TRANS_DISC_DATA`
enumerator `ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE`
enumerator `ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE`
enumerator `ESP_BLE_AD_TYPE_MANUFACTURER_SPECIFIC_TYPE`
enum `esp_ble_adv_type_t`  
Advertising mode.

Values:

enumerator `ADV_TYPE_IND`
enumerator `ADV_TYPE_DIRECT_IND_HIGH`
enumerator `ADV_TYPE_SCAN_IND`
enumerator `ADV_TYPE_NONCONN_IND`
enumerator `ADV_TYPE_DIRECT_IND_LOW`

enum `esp_ble_adv_channel_t`  
Advertising channel mask.

Values:

enumerator `ADV_CHNL_37`
enumerator `ADV_CHNL_38`
enumerator `ADV_CHNL_39`
enumerator `ADV_CHNL_ALL`

enum `esp_ble_adv_filter_t`  
Values:

enumerator `ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY`  
Allow both scan and connection requests from anyone.

eenumerator `ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY`  
Allow both scan req from White List devices only and connection req from anyone.

eenumerator `ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST`  
Allow both scan req from anyone and connection req from White List devices only.

eenumerator `ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST`  
Allow scan and connection requests from White List devices only.

enum `esp_ble_sec_act_t`  
Values:

enumerator `ESP_BLE_SEC_ENCRYPT`
Chapter 2. API Reference

relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn’t bonded, the stack will use the default authentication request used the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use NO MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

**enum esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**

Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**

Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**

Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**

Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**

Accept only specified SMP Authentication requirement
enum `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`

Enable/Disable OOB support

enum `ESP_BLE_SM_OOB_SUPPORT`

Appl encryption key size

enum `ESP_BLE_APP_ENC_KEY_SIZE`

authentication max param

enum `ESP_BLE_SM_MAX_PARAM`

enum `esp_ble_dtm_update_evt_t`

Values:

enumerator `DTM_TX_START_EVT`

DTM TX start event.

enumerator `DTM_RX_START_EVT`

DTM RX start event.

enumerator `DTM_TEST_STOP_EVT`

DTM test end event.

enum `esp_ble_scan_type_t`

Ble scan type.

Values:

enumerator `BLE_SCAN_TYPE_PASSIVE`

Passive scan

enumerator `BLE_SCAN_TYPE_ACTIVE`

Active scan

enum `esp_ble_scan_filter_t`

Ble scan filter type.

Values:

enumerator `BLE_SCAN_FILTER_ALLOW_ALL`

Accept all:

i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator `BLE_SCAN_FILTER_ALLOW_ONLY_WLST`

Accept only:

i. advertisement packets from devices where the advertiser’s address is in the White list.

ii. Directed advertising packets which are not addressed for this device shall be ignored.
enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all:

i. undirected advertisement packets, and 
ii. directed advertising packets where the initiator address is a resolvable private address, and 
iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all:

i. advertisement packets from devices where the advertiser’s address is in the White list, and 
ii. directed advertising packets where the initiator address is a resolvable private address, and 
iii. directed advertising packets addressed to this device.

detector **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

**Values:**

enumerator **BLE_SCAN_DUPLICATE_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

counter **BLE_SCAN_DUPLICATE_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

counter **BLE_SCAN_DUPLICATE_ENABLE_RESET**

Duplicate filtering enabled, reset for each scan period, only supported in BLE 5.0.

counter **BLE_SCAN_DUPLICATE_MAX**

Reserved for future use.

detector **esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

**Values:**

enumerator **ESP_GAP_SEARCH_INQ_RES_EVT**

Inquiry result for a peer device.

counter **ESP_GAP_SEARCH_INQ_CMPL_EVT**

Inquiry complete.

counter **ESP_GAP_SEARCH_DISC_RES_EVT**

Discovery result for a peer device.

counter **ESP_GAP_SEARCH_DISC_BLE_RES_EVT**

Discovery result for BLE GATT based service on a peer device.

counter **ESP_GAP_SEARCH_DISC_CMPL_EVT**

Discovery complete.
enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**
Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT**
Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**
The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator **ESP_BLE_EVT_CONN_ADV**
Connectable undirected advertising (ADV_IND)

enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**
Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

Values:

enumerator **ESP_BLE_WHITELIST_REMOVE**
remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**
add address to whitelist

enumerator **ESP_BLE_WHITELIST_CLEAR**
clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
Remove device info from duplicate scan exceptional list
Chapter 2. API Reference

enumerator ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
    Clean duplicate scan exceptional list

denum esp_ble_duplicate_exceptional_info_type_t
    Values:

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR
    BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
    BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
    BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
    BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | .... |

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
    BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | .... |

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SOLIC_ADV
    BLE mesh adv with proxy solicitation PDU uuid, the format is | Len | 0x24 | data |

denum esp_duplicate_scan_exceptional_list_type_t
    Values:

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST
    duplicate scan exceptional addr list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST
    duplicate scan exceptional mesh link ID list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST
    duplicate scan exceptional mesh beacon type list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST
    duplicate scan exceptional mesh adv with provisioning service uuid

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST
    duplicate scan exceptional mesh adv with proxy service uuid

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SOLIC_ADV_LIST
    duplicate scan exceptional mesh adv with proxy solicitation PDU uuid
enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_URI_ADV_LIST
duplicate scan exceptional URI list

enumerator ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST
duplicate scan exceptional all list

GATT Defines

API Reference

Header File

- components/bluetooth/host/bluedroid/api/include/api/esp_gatt_defs.h
- This header file can be included with:

```c
#include "esp_gatt_defs.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```
or

```cmake
PRIV_REQUIRES bt
```

Unions

union esp_gatt_rsp_t

```c
#include <esp_gatt_defs.h> GATT remote read request response type.
```

Public Members

```c
esp_gatt_value_t attr_value
Gatt attribute structure
```

```c
uint16_t handle
Gatt attribute handle
```

Structures

struct esp_gatt_id_t

```c
Gatt id, include uuid and instance id.
```

Public Members

```c
esp_bt_uuid_t uuid
UUID
```

```c
uint8_t inst_id
Instance id
```
struct esp_gatt_srvc_id_t
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t id
Gatt id, include uuid and instance

bool is_primary
This service is primary or not

struct esp_attr_desc_t
Attribute description (used to create database)

Public Members

uint16_t uuid_length
UUID length

uint8_t *uuid_p
UUID value

uint16_t perm
Attribute permission

uint16_t max_length
Maximum length of the element

uint16_t length
Current length of the element

uint8_t *value
Element value array

struct esp_attr_control_t
attribute auto response flag

Public Members

uint8_t auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database
Public Members

`esp_attr_control_t attr_control`

The attribute control type

`esp_attr_desc_t att_desc`

The attribute type

struct `esp_attr_value_t`

set the attribute value type

**Public Members**

`uint16_t attr_max_len`
attribute max value length

`uint16_t attr_len`
attribute current value length

`uint8_t *attr_value`
the pointer to attribute value

struct `esp_gatts_incl_svc_desc_t`

Gatt includes service entry element.

**Public Members**

`uint16_t start_hdl`
Gatt start handle value of included service

`uint16_t end_hdl`
Gatt end handle value of included service

`uint16_t uuid`
Gatt attribute value UUID of included service

struct `esp_gatts_incl128_svc_desc_t`

Gatt include 128 bits service entry element.

**Public Members**

`uint16_t start_hdl`
Gatt start handle value of included 128 bit service

`uint16_t end_hdl`
Gatt end handle value of included 128 bit service

```c
struct esp_gatt_value_t
{
    Gatt attribute value.

    Public Members

    uint8_t value[ESP_GATT_MAX_ATTR_LEN]
        Gatt attribute value

    uint16_t handle
        Gatt attribute handle

    uint16_t offset
        Gatt attribute value offset

    uint16_t len
        Gatt attribute value length

    uint8_t auth_req
        Gatt authentication request
}

struct esp_gatt_conn_params_t
{
    Connection parameters information.

    Public Members

    uint16_t interval
        connection interval

    uint16_t latency
        Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

    uint16_t timeout
        Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
        Time = N * 10 msec Time Range: 100 msec to 32 seconds
}

struct esp_gattc_multi_t
{
    read multiple attribute

    Public Members

    uint8_t num_attr
        The number of the attribute

    uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
        The handles list
}

struct esp_gattc_db_elem_t
{
    data base attribute element
```
Public Members

`esp_gatt_db_attr_type_t` type
  The attribute type

`uint16_t attribute_handle`
  The attribute handle, it's valid for all of the type

`uint16_t start_handle`
  The service start handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`uint16_t end_handle`
  The service end handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`esp_gatt_char_prop_t` properties
  The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

`esp_bt_uuid_t` uuid
  The attribute uuid, it's valid for all of the type

struct `esp_gattc_service_elem_t`
  service element

Public Members

`bool is_primary`
  The service flag, true if the service is primary service, else is secondary service

`uint16_t start_handle`
  The start handle of the service

`uint16_t end_handle`
  The end handle of the service

`esp_bt_uuid_t` uuid
  The uuid of the service

struct `esp_gattc_char_elem_t`
  characteristic element

Public Members

`uint16_t char_handle`
  The characteristic handle
**esp_gatt_char_prop_t** properties
The characteristic properties

**esp_bt_uuid_t** uuid
The characteristic uuid

**struct esp_gattc_descr_elem_t**
descriptor element

**Public Members**

uint16_t **handle**
The characteristic descriptor handle

**esp_bt_uuid_t** uuid
The characteristic descriptor uuid

**struct esp_gattc_incl_svc_elem_t**
include service element

**Public Members**

uint16_t **handle**
The include service current attribute handle

uint16_t **incl_srvc_s_handle**
The start handle of the service which has been included

uint16_t **incl_srvc_e_handle**
The end handle of the service which has been included

**esp_bt_uuid_t** uuid
The include service uuid

**Macros**

ESP_GATT_UUID_IMMEDIATE_ALERT_SVC

ESP_GATT_MAX_ATTR_LEN
    GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE
    If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:

        enumerator ESP_GATT_PREP_WRITE_CANCEL
            Prepare write cancel

        enumerator ESP_GATT_PREP_WRITE_EXEC
            Prepare write execute

enum esp_gatt_status_t
    GATT success code and error codes.
    Values:

        enumerator ESP_GATT_OK

        enumerator ESP_GATT_INVALID_HANDLE

        enumerator ESP_GATT_READ_NOT_PERMIT

        enumerator ESP_GATT_WRITE_NOT_PERMIT

        enumerator ESP_GATT_INVALID_PDU

        enumerator ESP_GATT_INSUF_AUTHENTICATION
enumerator ESP_GATT_REQ_NOT_SUPPORTED
enumerator ESP_GATT_INVALID_OFFSET
enumerator ESP_GATT_INSUF_AUTHORIZATION
enumerator ESP_GATT_PREPARE_Q_FULL
enumerator ESP_GATT_NOT_FOUND
enumerator ESP_GATT_NOT_LONG
enumerator ESP_GATT_INSUF_KEY_SIZE
enumerator ESP_GATT_INVALID_ATTR_LEN

enumerator ESP_GATT_APP_RSP

enumerator ESP_GATT_UNKNOWN_ERROR

enumerator ESP_GATT_CCC_CFG_ERR

enumerator ESP_GATT_PRC_IN_PROGRESS

enumerator ESP_GATT_OUT_OF_RANGE

enum esp_gatt_conn_reason_t

    Gatt Connection reason enum.

    Values:

    enumerator ESP_GATT_CONN_UNKNOWN
        Gatt connection unknown

    enumerator ESP_GATT_CONN_L2C_FAILURE
        General L2cap failure

    enumerator ESP_GATT_CONN_TIMEOUT
        Connection timeout

    enumerator ESP_GATT_CONN_TERMINATE_PEER_USER
        Connection terminate by peer user
enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**
Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**
Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**
Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**
L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**
No connection to cancel

enum **esp_gatt_auth_req_t**
Gatt authentication request type.

*Values:*

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

*Values:*

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**
Gatt write type.

*Values:*

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**
Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**
Gatt write attribute need remote response
enum esp_gatt_db_attr_type_t
    the type of attribute element

    Values:

    enumerator ESP_GATT_DB_PRIMARY_SERVICE
        Gattc primary service attribute type in the cache

    enumerator ESP_GATT_DB_SECONDARY_SERVICE
        Gattc secondary service attribute type in the cache

    enumerator ESP_GATT_DB_CHARACTERISTIC
        Gattc characteristic attribute type in the cache

    enumerator ESP_GATT_DB_DESCRIPTOR
        Gattc characteristic descriptor attribute type in the cache

    enumerator ESP_GATT_DB_INCLUDED_SERVICE
        Gattc include service attribute type in the cache

    enumerator ESP_GATT_DB_ALL
        Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT Server API

Application Examples  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT server demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from the operation of adding attributes one by one. This is the recommended method of adding attributes (officially recommended).
  – bluetooth/bluedroid/ble/gatt_server_service_table
  – GATT Server Service Table Example Walkthrough

• This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Blueiroid. The recommended method of adding attributes is presented in the example below.
  – bluetooth/bluedroid/ble/gatt_server
  – GATT Server Example Walkthrough

• This is a demo similar to Bluetooth® Low Energy (Bluetooth LE) SPP. In this demo, GATT server can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatts_api.h
• This header file can be included with:

```
#include "esp_gatts_api.h"
```
Chapter 2. API Reference

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES bt
  or
  PRIV_REQUIRES bt
  ```

**Functions**

`esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)`

This function is called to register application callbacks with BTA GATTS module.

**Returns**

- ESP_OK: success
- other: failed

`esp_gatts_cb_t esp_ble_gatts_get_callback (void)`

This function is called to get the current application callbacks with BTA GATTS module.

**Returns**

- esp_gatts_cb_t: current callback

`esp_err_t esp_ble_gatts_app_register (uint16_t app_id)`

This function is called to register application identifier.

**Returns**

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)`

unregister with GATT Server.

**Parameters**

- gatts_if -- [in] GATT server access interface

**Returns**

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)`

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- gatts_if -- [in] GATT server access interface
- service_id -- [in] service ID.
- num_handle -- [in] number of handle requested for this service.

**Returns**

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint16_t max_nb_attr, uint8_t srcvc_inst_id)`

Create a service attribute tab.

**Parameters**

- gatts_attr_db -- [in] the pointer to the service attr tab
- gatts_if -- [in] GATT server access interface
- max_nb_attr -- [in] the number of attribute to be added to the service database.
- srcvc_inst_id -- [in] the instance id of the service

**Returns**
### esp_err_t esp_ble_gatts_add_included_service

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Parameters**

- `service_handle` -- [in] service handle to which this included service is to be added.
- `included_service_handle` -- [in] the service ID to be included.

**Returns**

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gatts_add_char

This function is called to add a characteristic into a service.

**Parameters**

- `service_handle` -- [in] service handle to which this included service is to be added.
- `char_uuid` -- [in]: Characteristic UUID.
- `perm` -- [in]: Characteristic value declaration attribute permission.
- `property` -- [in]: Characteristic Properties
- `char_val` -- [in]: Characteristic value
- `control` -- [in]: attribute response control byte

**Returns**

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gatts_add_char_descr

This function is called to add characteristic descriptor. When it's done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Parameters**

- `service_handle` -- [in] service handle to which this characteristic descriptor is to be added.
- `descr_uuid` -- [in]: descriptor access permission.
- `descr_uuid` -- [in]: descriptor UUID.
- `char_descr_val` -- [in]: Characteristic descriptor value
- `control` -- [in]: attribute response control byte

**Returns**

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gatts_delete_service

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

**Parameters**

- `service_handle` -- [in] service_handle to be deleted.

**Returns**

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gatts_start_service

This function is called to start a service.

**Parameters**

- `service_handle` -- [in] the service handle to be started.
Chapter 2. API Reference

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)
```
This function is called to stop a service.

Parameters
- service_handle -- [in] - service to be stopped.

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t* value, bool need_confirm)
```
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size, see "esp_ble_gatts_send_mtu_req".

Parameters
- gatts_if -- [in] GATT server access interface
- conn_id -- [in] - connection id to indicate.
- attr_handle -- [in] - attribute handle to indicate.
- value_len -- [in] - indicate value length.
- value -- [in] value to indicate.
- need_confirm -- [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
```
This function is called to send a response to a request.

Parameters
- gatts_if -- [in] GATT server access interface
- trans_id -- [in] - transfer id
- status -- [in] - response status

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t *value)
```
This function is called to set the attribute value by the application.

Parameters
- attr_handle -- [in] the attribute handle which to be set
- length -- [in] the value length
- value -- [in] the pointer to the attribute value

Returns
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gatts_get_attr_value (uint16_t attr_handle, uint16_t *length, const uint8_t **value)
```
Retrieve attribute value.

Parameters
- length -- [out] pointer to the attribute value length
- value -- [out] Pointer to attribute value payload, the value cannot be modified by user
Returns
• ESP_GATT_OK : success
• other : failed

`esp_err_t esp_ble_gatts_open` ([`esp_gatt_if_t` `gatts_if`, `esp_bd_addr_t` `remote_bda`, `bool is_direct`])
Open a direct open connection or add a background auto connection.

Parameters
• `gatts_if` -- [in] GATT server access interface
• `remote_bda` -- [in] remote device Bluetooth device address.
• `is_direct` -- [in] direct connection or background auto connection

Returns
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gatts_close` ([`esp_gatt_if_t` `gatts_if`, `uint16_t` `conn_id`])
Close a connection a remote device.

Parameters
• `gatts_if` -- [in] GATT server access interface
• `conn_id` -- [in] connection ID to be closed.

Returns
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gatts_send_service_change_indication` ([`esp_gatt_if_t` `gatts_if`, `esp_bd_addr_t` `remote_bda`])
Send service change indication.

Parameters
• `gatts_if` -- [in] GATT server access interface
• `remote_bda` -- [in] remote device Bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Returns
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gatts_show_local_database` (void)
Print local database (GATT service table)

Returns
• ESP_OK : success
• other : failed

Unions

union `esp_ble_gatts_cb_param_t`

`#include <esp_gatts_api.h>` Gatt server callback parameters union.

Public Members

struct `esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`
Gatt server callback param of ESP_GATT_S_REG_EVT

struct `esp_ble_gatts_cb_param_t::gatts_readevt_param read`
Gatt server callback param of ESP_GATT_S_READ_EVT
struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write
    Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write
    Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu
    Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf
    Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create
    Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

Submit Document Feedback
struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

  Transfer id

- **esp_bd_addr_t bda**
  
  The bluetooth device address which been written

- **uint16_t handle**
  
  The attribute handle

- **uint16_t offset**
  
  Offset of the value, if the value is too long

- **bool need_rsp**
  
  The write operation need to do response

- **bool is_prep**
  
  This write operation is prepare write

- **uint16_t len**
  
  The write attribute value length

- **uint8_t *value**
  
  The write attribute value

**Macros**

- **ESP_GATT_PREP_WRITE_CANCEL**
  
  Prepare write flag to indicate cancel prepare write

- **ESP_GATT_PREP_WRITE_EXEC**
  
  Prepare write flag to indicate execute prepare write

**Type Definitions**

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)

  GATT Server callback function type.

- **Param event** : Event type

- **Param gatts_if** : GATT server access interface, normally different gatts_if correspond to different profile

- **Param param** : Point to callback parameter, currently is union type
Enumerations

enum esp_gatts_cb_event_t
    GATT Server callback function events.

    Values:

    enumerator ESP_GATTS_REG_EVT
        When register application id, the event comes

    enumerator ESP_GATTS_READ_EVT
        When gatt client request read operation, the event comes

    enumerator ESP_GATTS_WRITE_EVT
        When gatt client request write operation, the event comes

    enumerator ESP_GATTS_EXEC_WRITE_EVT
        When gatt client request execute write, the event comes

    enumerator ESP_GATTS_MTU_EVT
        When set mtu complete, the event comes

    enumerator ESP_GATTS_CONF_EVT
        When receive confirm, the event comes

    enumerator ESP_GATTS_UNREG_EVT
        When unregister application id, the event comes

    enumerator ESP_GATTS_CREATE_EVT
        When create service complete, the event comes

    enumerator ESP_GATTS_ADD_INCL_SRVC_EVT
        When add included service complete, the event comes

    enumerator ESP_GATTS_ADD_CHAR_EVT
        When add characteristic complete, the event comes

    enumerator ESP_GATTS_ADD_CHAR_DESCR_EVT
        When add descriptor complete, the event comes

    enumerator ESP_GATTS_DELETE_EVT
        When delete service complete, the event comes

    enumerator ESP_GATTS_START_EVT
        When start service complete, the event comes

    enumerator ESP_GATTS_STOP_EVT
        When stop service complete, the event comes

    enumerator ESP_GATTS_CONNECT_EVT
        When gatt client connect, the event comes
enumerator ESP_GATTS_DISCONNECT_EVT
    When gatt client disconnect, the event comes

enumerator ESP_GATTS_OPEN_EVT
    When connect to peer, the event comes

enumerator ESP_GATTS_CANCEL_OPEN_EVT
    When disconnect from peer, the event comes

enumerator ESP_GATTS_CLOSE_EVT
    When gatt server close, the event comes

enumerator ESP_GATTS_LISTEN_EVT
    When gatt listen to be connected the event comes

enumerator ESP_GATTS_CONGEST_EVT
    When congest happen, the event comes

enumerator ESP_GATTS_RESPONSE_EVT
    When gatt send response complete, the event comes

enumerator ESP_GATTS_CREAT_ATTR_TAB_EVT
    When gatt create table complete, the event comes

enumerator ESP_GATTS_SET_ATTR_VAL_EVT
    When gatt set attr value complete, the event comes

enumerator ESP_GATTS_SEND_SERVICE_CHANGE_EVT
    When gatt send service change indication complete, the event comes

GATT Client API

Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  – bluetooth/bluedroid/ble/gatt_client
  – GATT Client Example Walkthrough

• This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  – bluetooth/bluedroid/ble/gatcc_multi_connect
  – GATT Client Multi-connection Example Walkthrough

• This is a demo similar to Bluetooth® Low Energy (Bluetooth LE) SPP. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_client

API Reference
**Header File**

- components/bluetooth/bluedroid/api/include/api/esp_gattc_api.h
  - This header file can be included with:
    ```
    #include "esp_gattc_api.h"
    ```
  - This header file is a part of the API provided by the **bt** component. To declare that your component depends on **bt**, add the following to your CMakeLists.txt:
    ```
    REQUIRES bt
    ```
    or
    ```
    PRIV_REQUIRES bt
    ```

**Functions**

- `esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)`
  - This function is called to register application callbacks with GATTC module.
  - **Parameters**
    - `callback` -- [in] : pointer to the application callback function.
  - **Returns**
    - ESP_OK: success
    - other: failed

- `esp_gattc_cb_t esp_ble_gattc_get_callback (void)`
  - This function is called to get the current application callbacks with BTA GATTC module.
  - **Returns**
    - esp_gattC_cb_t: current callback

- `esp_err_t esp_ble_gattc_app_register (uint16_t app_id)`
  - This function is called to register application callbacks with GATTC module.
  - **Parameters**
    - `app_id` -- [in] : Application Identify (UUID), for different application
  - **Returns**
    - ESP_OK: success
    - other: failed

- `esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)`
  - This function is called to unregister an application from GATTC module.
  - **Parameters**
  - **Returns**
    - ESP_OK: success
    - other: failed

- `esp_err_t esp_ble_gattc_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)`
  - Open a direct connection or add a background auto connection.
  - **Parameters**
    - `remote_bda` -- [in] remote device bluetooth device address.
    - `remote_addr_type` -- [in] remote device bluetooth device the address type.
    - `is_direct` -- [in] direct connection or background auto connection(by now, background auto connection is not supported).
  - **Returns**
    - ESP_OK: success
    - other: failed

- `esp_err_t esp_ble_gattc_aux_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)`

---

Submit Document Feedback
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Parameters
• conn_id -- [in] connection ID to be closed.

Returns
• ESP_OK: success
• other: failed

esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Parameters
• conn_id -- [in] connection ID.

Returns
• ESP_OK: success
• other: failed

esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

Parameters
• conn_id -- [in] connection ID.
• filter_uuid -- [in] a UUID of the service application is interested in. If Null, discover for all services.

Returns
• ESP_OK: success
• other: failed

esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)
Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Parameters
• conn_id -- [in] connection ID which identify the server.
• svc_uuid -- [in] the pointer to the service uuid.
• result -- [out] The pointer to the service which has been found in the gattc cache.
• count -- [inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• offset -- [in] Offset of the service position to get.

Returns
• ESP_OK: success
• other: failed

esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle.
- `end_handle` -- [in] the attribute end handle
- `result` -- [out] The pointer to the characteristic in the service.
- `count` -- [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- `offset` -- [in] Offset of the characteristic position to get.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connectionID which identify the server.
- `char_handle` -- [in] the given characteristic handle
- `result` -- [out] The pointer to the descriptor in the characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- `offset` -- [in] Offset of the descriptor position to get.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)`

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `char_uuid` -- [in] the characteristic uuid
- `result` -- [out] The pointer to the characteristic in the service.
- `count` -- [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)`

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `char_uuid` -- [in] the characteristic uuid
- `result` -- [out] The pointer to the descriptor in the characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
cache, won’t get from remote devices.

**Parameters**

- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `char_uuid` -- [in] the characteristic uuid.
- `descr_uuid` -- [in] the descriptor uuid.
- `result` -- [out] The pointer to the descriptor in the given characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Parameters**

- `conn_id` -- [in] connection ID which identify the server.
- `char_handle` -- [in] the characteristic handle.
- `descr_uuid` -- [in] the descriptor uuid.
- `result` -- [out] The pointer to the descriptor in the given characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatter_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

**Parameters**

- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `incl_uuid` -- [in] the include service uuid.
- `result` -- [out] The pointer to the include service in the given service.
- `count` -- [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_gatter_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```
Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `type` -- [in] the attribute type.
- `start_handle` -- [in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- `end_handle` -- [in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- `char_handle` -- [in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- `count` -- [out] output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

**Parameters**
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `conn_id` -- [in] connection ID which identify the server.
- `db` -- [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- `count` -- [in] number of elements in database.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

**Parameters**
- `conn_id` -- [in] : connection ID.
- `handle` -- [in] : characteristic handle to read.
- `auth_req` -- [in] : authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic UUID.

**Parameters**
- `conn_id` -- [in] : connection ID.
- `start_handle` -- [in] : the attribute start handle.
- `end_handle` -- [in] : the attribute end handle
- `uuid` -- [in] : The UUID of attribute which will be read.
• **auth_req** -- [in] : authenticate request type

**Retruns**

• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Parameters**

• **gattc_if** -- [in] Gatt client access interface.
• **conn_id** -- [in] : connection ID.
• **read_multi** -- [in] : pointer to the read multiple parameter.
• **auth_req** -- [in] : authenticate request type

**Retruns**

• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gattc_read_multiple_variable(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple variable length characteristic or characteristic descriptors.

**Parameters**

• **gattc_if** -- [in] Gatt client access interface.
• **conn_id** -- [in] : connection ID.
• **read_multi** -- [in] : pointer to the read multiple parameter.
• **auth_req** -- [in] : authenticate request type

**Retruns**

• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Parameters**

• **gattc_if** -- [in] Gatt client access interface.
• **conn_id** -- [in] : connection ID.
• **handle** -- [in] : descriptor handle to read.
• **auth_req** -- [in] : authenticate request type

**Retruns**

• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Parameters**

• **gattc_if** -- [in] Gatt client access interface.
• **conn_id** -- [in] : connection ID.
• **handle** -- [in] : characteristic handle to write.
• **value_len** -- [in] length of the value to be written.
• **value** -- [in] : the value to be written.
• **write_type** -- [in] : the type of attribute write operation.
• **auth_req** -- [in] : authentication request.

**Retruns**

• ESP_OK : success
• other : failed
`esp_err_t esp_ble_gattc_write_char_descr` *(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)*

This function is called to write characteristic descriptor value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: descriptor handle to write.
- `value_len` -- [in]: length of the value to be written.
- `value` -- [in]: the value to be written.
- `write_type` -- [in]: the type of attribute write operation.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_prepare_write` *(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)*

This function is called to prepare write a characteristic value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: characteristic handle to prepare write.
- `offset` -- [in]: offset of the write value.
- `value_len` -- [in]: length of the value to be written.
- `value` -- [in]: the value to be written.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_prepare_write_char_descr` *(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)*

This function is called to prepare write a characteristic descriptor value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: characteristic descriptor handle to prepare write.
- `offset` -- [in]: offset of the write value.
- `value_len` -- [in]: length of the value to be written.
- `value` -- [in]: the value to be written.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_execute_write` *(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)*

This function is called to execute write a prepare write sequence.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `is_execute` -- [in]: execute or cancel.

**Returns**
```c
esp_err_t esp_ble_gattc_register_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```
This function is called to register for notification of a service.

**Parameters**

**Returns**
- ESP_OK: registration succeeds
- other: failed

```c
esp_err_t esp_ble_gattc_unregister_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```
This function is called to de-register for notification of a service.

**Parameters**

**Returns**
- ESP_OK: unregister succeeds
- other: failed

```c
esp_err_t esp_ble_gattc_cache_refresh (esp_bd_addr_t remote_bda)
```
Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Parameters**
- `remote_bda` -- [in] remote device BD address.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_cache_assoc (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```
Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database that has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Parameters**
- `src_addr` -- [in] the source address which provide the attribute table.
- `assoc_addr` -- [in] the associated device address which went to share the attribute table with the source address.
- `is_assoc` -- [in] true add the associated device address, false remove the associated device address.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_cache_get_addr_list (esp_gatt_if_t gattc_if)
```
Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Parameters**
Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

Parameters `remote_bda` -- [in] remote device BD address.

Returns

- ESP_OK: success
- other: failed

Unions

```c
union esp_ble_gattc_cb_param_t
```

`#include <esp_gattc_api.h>` Gatt client callback parameters union.

Public Members

```c
struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg
```

Gatt client callback param of ESP_GATTC_REG_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_open_evt_param open
```

Gatt client callback param of ESP_GATTC_OPEN_EVT

```c

```

**Type Definitions**

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

   GATT Client callback function type.

   **Param event** : Event type
**Param gattc_if** : GATT client access interface, normally different gattc_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
{
    ESP_GATTC_REG_EVT,    // When GATT client is registered, the event comes
    ESP_GATTC_UNREG_EVT,  // When GATT client is unregistered, the event comes
    ESP_GATTC_OPEN_EVT,   // When GATT virtual connection is set up, the event comes
    ESP_GATTC_READ_CHAR_EVT,  // When GATT characteristic is read, the event comes
    ESP_GATTC_WRITE_CHAR_EVT,  // When GATT characteristic write operation completes, the event comes
    ESP_GATTC_CLOSE_EVT,   // When GATT virtual connection is closed, the event comes
    ESP_GATTC_SEARCH_CMPL_EVT,  // When GATT service discovery is completed, the event comes
    ESP_GATTC_SEARCH_RES_EVT,  // When GATT service discovery result is got, the event comes
    ESP_GATTC_READ_DESCR_EVT,  // When GATT characteristic descriptor read completes, the event comes
    ESP_GATTC_WRITE_DESCR_EVT,  // When GATT characteristic descriptor write completes, the event comes
    ESP_GATTC_NOTIFY_EVT,   // When GATT notification or indication arrives, the event comes
    ESP_GATTC_PREP_WRITE_EVT,  // When GATT prepare-write operation completes, the event comes
    ESP_GATTC_EXEC_EVT,     // When write execution completes, the event comes
};
```
enumerator **ESP_GATTC_ACL_EVT**
   When ACL connection is up, the event comes

denumerator **ESP_GATTC_CANCEL_OPEN_EVT**
   When GATT client ongoing connection is cancelled, the event comes

denumerator **ESP_GATTC_SRVC_CHG_EVT**
   When "service changed" occurs, the event comes

denumerator **ESP_GATTC_ENC_CMPL_CB_EVT**
   When encryption procedure completes, the event comes

denumerator **ESP_GATTC_CFG_MTU_EVT**
   When configuration of MTU completes, the event comes

denumerator **ESP_GATTC_ADV_DATA_EVT**
   When advertising of data, the event comes

denumerator **ESP_GATTC_MULT_ADV_ENB_EVT**
   When multi-advertising is enabled, the event comes

denumerator **ESP_GATTC_MULT_ADV_UPD_EVT**
   When multi-advertising parameters are updated, the event comes

denumerator **ESP_GATTC_MULT_ADV_DATA_EVT**
   When multi-advertising data arrives, the event comes

denumerator **ESP_GATTC_MULT_ADV_DIS_EVT**
   When multi-advertising is disabled, the event comes

denumerator **ESP_GATTC_CONGEST_EVT**
   When GATT connection congestion comes, the event comes

denumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**
   When batch scan is enabled, the event comes

denumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**
   When batch scan storage is configured, the event comes

denumerator **ESP_GATTC_BTH_SCAN_RD_EVT**
   When Batch scan read event is reported, the event comes

denumerator **ESP_GATTC_BTH_SCAN_THR_EVT**
   When Batch scan threshold is set, the event comes

denumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**
   When Batch scan parameters are set, the event comes
enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**  
When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**  
When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**  
When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**  
When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**  
When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**  
When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**  
When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**  
When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**  
When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**  
When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**  
When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**  
When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**  
When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**  
When the ble discover service complete, the event comes

enumerator **ESP_GATTC_READ_MULTI_VAR_EVT**  
When read multiple variable characteristic complete, the event comes

**BluFi API**

**Overview**  BluFi is a profile based GATT to config ESP32 Wi-Fi to connect/disconnect AP or setup a softap and etc.
Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the "Key Exchange/Negotiation" procedure.

**Application Example**  
Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BluFi demo. This demo can set ESP32's Wi-Fi to softap/station/softap&station mode and config Wi-Fi connections - bluetooth/blufi

**API Reference**

**Header File**

- components/bt/common/api/include/api/esp_blufi_api.h
- This header file can be included with:

```c
#include "esp_blufi_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

**Functions**

- **esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)**
  This function is called to receive blufi callback event.
  ```c
  Parameters callbacks -- [in] callback functions
  Returns ESP_OK - success, other - failed
  ```

- **esp_err_t esp_blufi_profile_init (void)**
  This function is called to initialize blufi_profile.
  ```c
  Returns ESP_OK - success, other - failed
  ```

- **esp_err_t esp_blufi_profile_deinit (void)**
  This function is called to de-initialize blufi_profile.
  ```c
  Returns ESP_OK - success, other - failed
  ```

- **esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)**
  This function is called to send wifi connection report.
  ```c
  Parameters
  • opmode -- : wifi opmode
  • sta_conn_state -- : station is already in connection or not
  • softap_conn_num -- : softap connection number
  • extra_info -- : extra information, such as sta_ssid, softap_ssid and etc.
  Returns ESP_OK - success, other - failed
  ```

- **esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)**
  This function is called to send wifi list.
  ```c
  Parameters
  ```
Chapter 2. API Reference

- `apCount` -- : wifi list count
- `list` -- : wifi list

Returns ESP_OK - success, other - failed

```c
uint16_t esp_blufi_get_version (void)
```

Get BLUFI profile version.

Returns Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```

This function is called to send blufi error information.

Parameters state -- : error state

Returns ESP_OK - success, other - failed

```c
esp_err_t esp_blufi_send_custom_data (uint8_t* data, uint32_t data_len)
```

This function is called to custom data.

Parameters
- `data` -- : custom data value
- `data_len` -- : the length of custom data

Returns ESP_OK - success, other - failed

Unions

```c
union esp_blufi_cb_param_t
```

#include <esp_blufi_api.h> BLUFI callback parameters union.

    esp_blufi_decrypt_func_t decrypt_func
        BLUFI decrypt data function with share key generated by negotiate_data_handler

    esp_blufi_checksum_func_t checksum_func
        BLUFI check sum function (FCS)

    Macros

    ESP_BLUFI_bd_addr_len
        Bluetooth address length.

    Type Definitions

typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_bd_addr_len]
    Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_event_cb_t event, esp_blufi_cb_param_t *param)
    BLUFI event callback function type.

    Param event : Event type
    Param param : Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data,
    int *output_len, bool *need_free)
    BLUFI negotiate data handler.

    Param data : data from phone
    Param len : length of data from phone
    Param output_data : data want to send to phone
    Param output_len : length of data want to send to phone
    Param need_free : output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
    BLUFI encrypt the data after negotiate a share key.
**API Reference**

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt_data**: plain text and encrypted data, the encrypt function must support auto-chthonous encrypt

**Param crypt_len**: length of plain text

**Return**: Nonnegative number is encrypted length, if error, return negative number;

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt_data**: encrypted data and plain text, the encrypt function must support auto-chthonous decrypt

**Param crypt_len**: length of encrypted text

**Return**: Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param data**: data need to checksum

**Param len**: length of data

2.3.3  Classic Bluetooth®

Classic Bluetooth® GAP API

API Reference
Chapter 2. API Reference

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h
- This header file can be included with:

  ```
  #include "esp_gap_bt_api.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

  ```
  REQUIRE bt
  or
  PRIV_REQUIRES bt
  ```

**Functions**

*static inline uint32_t esp_bt_gap_get_cod_svc (uint32_t cod)*

get major service field of COD

**Parameters**
- **cod** -- [in] Class of Device

**Returns**
- major service bits

*static inline uint32_t esp_bt_gap_get_cod_major_dev (uint32_t cod)*

get major device field of COD

**Parameters**
- **cod** -- [in] Class of Device

**Returns**
- major device bits

*static inline uint32_t esp_bt_gap_get_cod_minor_dev (uint32_t cod)*

get minor service field of COD

**Parameters**
- **cod** -- [in] Class of Device

**Returns**
- minor service bits

*static inline uint32_t esp_bt_gap_get_cod_format_type (uint32_t cod)*

get format type of COD

**Parameters**
- **cod** -- [in] Class of Device

**Returns**
- format type

*static inline bool esp_bt_gap_is_valid_cod (uint32_t cod)*

decide the integrity of COD

**Parameters**
- **cod** -- [in] Class of Device

**Returns**
- true if cod is valid
- false otherwise

*esp_err_t esp_bt_gap_register_callback (esp_bt_gap_cb_t callback)*

register callback function. This function should be called after esp_bluedroid_enable() completes successfully

**Returns**
- ESP_OK : Succeed
- ESP_FAIL : others

*esp_err_t esp_bt_gap_set_scan_mode (esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)*

Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

**Parameters**
- **c_mode** -- [in] : one of the enums of esp_bt_connection_mode_t
- **d_mode** -- [in] : one of the enums of esp_bt_discovery_mode_t

**Returns**
### ESP_OK: Succeed

### ESP_ERR_INVALID_ARG: if argument invalid

### ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled

### ESP_FAIL: others

---

**`esp_err_t esp_bt_gap_start_discovery`**

(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)

This function starts Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.

#### Parameters

- **mode**: [in] - Inquiry mode
- **inq_len**: [in] - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process, - when this time expires, Inquiry will be halted.
- **num_rsps**: [in] - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

#### Returns

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_ERR_INVALID_ARG**: if invalid parameters are provided
- **ESP_FAIL**: others

---

**`esp_err_t esp_bt_gap_cancel_discovery`**

(void)

Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.

#### Returns

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

---

**`esp_err_t esp_bt_gap_get_remote_services`**

(esp_bd_addr_t remote_bda)

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

#### Returns

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

---

**`esp_err_t esp_bt_gap_get_remote_service_record`**

(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends.

#### Returns

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

---

**`uint8_t* esp_bt_gap_resolve_eir_data`**

(uint8_t*eir, esp_bt_eir_type_t type, uint8_t*length)

This function is called to get EIR data for a specific type.

#### Parameters
• **eir** -- [in] - pointer of raw eir data to be resolved
• **type** -- [in] - specific EIR data type
• **length** -- [out] - return the length of EIR data excluding fields of length and data type

Returns: pointer of starting position of eir data excluding eir data type, NULL if not found

```c
esp_err_t esp_bt_gap_config_eir_data(esp_bt_eir_data_t *eir_data)
```

This function is called to config EIR data.

```c
esp bt gap cb t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.
```

Parameters:
- **eir_data** -- [in] - pointer of EIR data content

Returns:
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_set_cod(esp_bt_cod_t cod, esp_bt_cod_mode_t mode)
```

This function is called to set class of device. The structure esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. This function should be called after Bluetooth profiles are initialized, otherwise the user configured class of device can be overwritten. Some profiles have special restrictions on class of device, and changes may make these profiles unable to work.

Parameters:
- **cod** -- [in] - class of device
- **mode** -- [in] - setting mode

Returns:
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

```c
esp_err_t esp_bt_gap_get_cod(esp bt cod t *cod)
```

This function is called to get class of device.

Parameters:
- **cod** -- [out] - class of device

Returns:
- ESP_OK: Succeed
- ESP_FAIL: others

```c
esp_err_t esp bt gap read_rssi_delta(esp bd addr t remote_addr)
```

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Parameters:
- **remote_addr** -- [in] - remote device address, corresponding to a certain connection handle

Returns:
- ESP_OK: Succeed
- ESP_FAIL: others

```c
esp_err_t esp bt gap remove_bond_device(esp bd addr t bd_addr)
```

Removes a device from the security database list of peer device.

Parameters:
- **bd_addr** -- [in] - BD address of the peer device

Returns:
- ESP_OK: success
- ESP_FAIL: failed

```c
int esp bt gap get_bond_device_num(void)
```

Get the device number from the security database list of peer device. It will return the device bonded number immediately.
Returns

- \( \geq 0 \) : bonded devices number
- ESP_FAIL : failed

```c
esp_err_t esp_bt_gap_get_bond_device_list(int *dev_num, esp_bd_addr_t *dev_list)
```

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Parameters

- **dev_num** -- [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** -- [out] an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

Returns

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

```c
esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
```

Set pin type and default pin code for legacy pairing.

Parameters

- **pin_type** -- [in] Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- **pin_code_len** -- [in] Length of pin_code
- **pin_code** -- [in] Pin_code

Returns

- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

```c
esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
```

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Parameters

- **bd_addr** -- [in] BD address of the peer
- **accept** -- [in] Pin_code reply successful or declined.
- **pin_code_len** -- [in] Length of pin_code
- **pin_code** -- [in] Pin_code

Returns

- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

```c
esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

Parameters

- **param_type** -- [in] : the type of the param which is to be set
- **value** -- [in] : the param value
- **len** -- [in] : the length of the param value

Returns

- ESP_OK : success
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- other : failed

```c
esp_err_t esp_bt_gap_ssp_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```

Reply the key value to the peer device in the legacy connection stage.

Parameters

- **bd_addr** -- [in] : BD address of the peer
• **accept** -- [in]: passkey entry successful or declined.
• **passkey** -- [in]: passkey value, must be a 6 digit number, can be lead by 0.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_ssp_confirm_reply(esp_bd_addr_t bd_addr, bool accept)
```

Reply the confirm value to the peer device in the legacy connection stage.

**Parameters**
- **bd_addr** -- [in]: BD address of the peer device
- **accept** -- [in]: numbers to compare are the same or different

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_set_afh_channels(esp_bt_gap_afh_channels channels)
```

Set the AFH channels.

**Parameters channels** -- [in]: The n th such field (in the range 0 to 78) contains the value for channel n: 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_read_remote_name(esp_bd_addr_t remote_bda)
```

Read the remote device name.

**Parameters remote_bda** -- [in]: The remote device's address

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_set_qos(esp_bd_addr_t remote_bda, uint32_t t_poll)
```

Config Quality of service.

**Parameters**
- **remote_bda** -- [in]: The remote device's address
- **t_poll** -- [in]: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_set_page_timeout(uint16_t page_to)
```

Set the page timeout esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_PAGE_TO_EVT after set page timeout ends. The value to be set will not be effective until the next page procedure, it's suggested to set the page timeout before initiating a connection.

**Parameters page_to** -- [in]: Page timeout, the maximum time the master will wait for a Baseband page response from the remote device at a locally initiated connection attempt. The valid range is 0x0016 ~ 0xffff, the default value is 0x2000, unit is 0.625ms.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

```c
esp_err_t esp_bt_gap_get_page_timeout()
```

Get the page timeout esp_bt_gap_cb_t will be called with ESP_BT_GAP_GET_PAGE_TO_EVT after get page timeout ends.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
Chapter 2. API Reference

- other: failed

```c
esp_err_t esp_bt_gap_set_acl_pkt_types (esp_bd_addr_t remote_bda, esp_bt_acl_pkt_type_t pkt_types)
```

Set ACL packet types An ESP_BT_GAP_SET_ACL_PPKT_TYPES_EVT event will reported to the APP layer.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

### Unions

union `esp_bt_gap_cb_param_t`

```c
#include <esp_gap_bt_api.h>
```

GAP state callback parameters.

### Public Members

struct `esp_bt_gap_cb_param_t::disc_res_param` **disc_res**

discovery result parameter struct

struct `esp_bt_gap_cb_param_t::disc_state_changed_param` **disc_stchg**

discovery state changed parameter struct

struct `esp_bt_gap_cb_param_t::rmt_srvcs_param` **rmt_srvcs**

services of remote device parameter struct

struct `esp_bt_gap_cb_param_t::rmt_svc_rec_param` **rmt_svc_rec**

specific service record from remote device parameter struct

struct `esp_bt_gap_cb_param_t::read_rssi_delta_param` **read_rssi_delta**

read rssi parameter struct

struct `esp_bt_gap_cb_param_t::config_eir_data_param` **config_eir_data**

config EIR data

struct `esp_bt_gap_cb_param_t::auth_cmpl_param` **auth_cmpl**

authentication complete parameter struct

struct `esp_bt_gap_cb_param_t::enc_chg_param` **enc_chg**

encryption change parameter struct

struct `esp_bt_gap_cb_param_t::pin_req_param` **pin_req**

pin request parameter struct

struct `esp_bt_gap_cb_param_t::cfm_req_param` **cfm_req**

confirm request parameter struct

struct `esp_bt_gap_cb_param_t::key_notif_param` **key_notif**

passkey notif parameter struct
struct esp_bt_gap_cb_param_t::key_req_param key_req
   passkey request parameter struct

struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels
   set AFH channel parameter struct

struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name
   read Remote Name parameter struct

struct esp_bt_gap_cb_param_t::modechg_param mode_chg
   mode change event parameter struct

struct esp_bt_gap_cb_param_t::bt_remove_bond_dev_cmpl_evt_param remove_bond_dev_cmpl
   Event parameter of ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT

struct esp_bt_gap_cb_param_t::qos_cmpl_param qos_cmpl
   QoS complete parameter struct

struct esp_bt_gap_cb_param_t::page_to_set_param set_page_timeout
   set page timeout parameter struct

struct esp_bt_gap_cb_param_t::page_to_get_param get_page_timeout
   get page timeout parameter struct

struct esp_bt_gap_cb_param_t::set_acl_pkt_types_param set_acl_pkt_types
   set ACL packet types parameter struct

struct esp_bt_gap_cb_param_t::acl_conn_cmpl_stat_param acl_conn_cmpl_stat
   ACL connection complete status parameter struct

struct esp_bt_gap_cb_param_t::acl_disconn_cmpl_stat_param acl_disconn_cmpl_stat
   ACL disconnection complete status parameter struct

struct acl_conn_cmpl_stat_param
   #include "esp_gap_bt_api.h" ESP_BT_GAP_ACL_CONN_CMPL_STAT_EVT.

**Public Members**

```c
esp_bt_status_t stat
   ACL connection status
```

```c
uint16_t handle
   ACL connection handle
```

Chapter 2. API Reference

```c
uint32_t num_val
    the numeric value for comparison.

struct config_eir_data_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_CONFIG_EIR_DATA_EVT *.

Public Members

esp_bt_status_t stat
    config EIR status: ESP_BT_STATUS_SUCCESS: config success
    ESP_BT_STATUS_EIR_TOO_LARGE: the EIR data is more than 240B. The EIR may not
    contain the whole data. others: failed

uint8_t eir_type_num
    the number of EIR types in EIR type

esp_bt_eir_type_t eir_type[ESP_BT_EIR_TYPE_MAX_NUM]
    EIR types in EIR type

struct disc_res_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_RES_EVT.

Public Members

esp_bd_addr_t bda
    remote bluetooth device address

int num_prop
    number of properties got

esp_bt_gap_dev_prop_t *prop
    properties discovered from the new device

struct disc_state_changed_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_STATE_CHANGED_EVT.

Public Members

esp_BT_gap_discovery_state_t state
    discovery state

struct enc_chg_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_ENC_CHG_EVT.
```
Public Members

```
esp_bd_addr_t bda
remote bluetooth device address
```

```
esp_bt_enc_mode_t enc_mode
encryption mode
```

```

struct mode_chg_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_MODE_CHG_EVT.
```

Public Members

```
esp_bd_addr_t bda
remote bluetooth device address
```

```
esp_bt_pm_mode_t mode
PM mode
```

```
struct page_to_get_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_GET_PAGE_TO_EVT.
```

Public Members

```
esp_bt_status_t stat
get page timeout status
```
uint16_t page_to
page_timeout value to be set, unit is 0.625ms.

struct page_to_set_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_SET_PAGE_TO_EVT.

Public Members

esp_bt_status_t stat
set page timeout status

struct pin_req_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_PIN_REQ_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address

bool min_16_digit
TRUE if the pin returned must be at least 16 digits

struct qos_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_QOS_CMPL_EVT.

Public Members

esp_bt_status_t stat
QoS status

esp_bd_addr_t bda
remote bluetooth device address

uint32_t t_poll
poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms.

struct read_rmt_name_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_REMOTE_NAME_EVT.

Public Members

esp_bd_addr_t bda
remote bluetooth device address
```c
esp_bt_status_t stat
    read Remote Name status

uint8_t rmt_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]
    Remote device name
```

```c
struct read_rssi_delta_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_READ_RSSI_DELTA_EVT *
```

**Public Members**

```c
esp_bd_addr_t bda
    remote bluetooth device address
```

```c
esp_bt_status_t stat
    read rssi status
```

```c
int8_t rssi_delta
    rssi delta value range -128 ~127, The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP_BT_GAP_RSSI_LOW_THRLD to ESP_BT_GAP_RSSI_HIGH_THRLD
```

```c
struct rmt_srvc_rec_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVC_REC_EVT.
```

**Public Members**

```c
esp_bd_addr_t bda
    remote bluetooth device address
```

```c
esp_bt_status_t stat
    service search status
```

```c
struct rmt_srvcs_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVCS_EVT.
```

**Public Members**

```c
esp_bd_addr_t bda
    remote bluetooth device address
```

```c
esp_bt_status_t stat
    service search status
```

```c
int num_uuids
    number of UUID in uuid_list
```
*esp_bt_uuid_t *uuid_list*
list of service UUIDs of remote device

`struct set_acl_pkt_types_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_ACL_PKT_TYPE_CHANGED_EVT.

**Public Members**

*esp_bt_status_t* status
set ACL packet types status

*esp_bd_addr_t* bda
remote bluetooth device address

`uint16_t` pkt_types
packet types successfully set

`struct set_afh_channels_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_SET_AFH_CHANNELS_EVT.

**Public Members**

*esp_bt_status_t* stat
set AFH channel status

**Structures**

`struct esp_bt_cod_t`
Class of device.

**Public Members**

`uint32_t` reserved_2
undefined

`uint32_t` minor
minor class

`uint32_t` major
major class

`uint32_t` service
service class

`uint32_t` reserved_8
undefined
struct esp_bt_gap_dev_prop_t
    Bluetooth Device Property Descriptor.

Public Members

*esp_bt_gap_dev_prop_type_t* \texttt{type}
    Device property type

int \texttt{len}
    Device property value length

void *\texttt{val}
    Device property value

struct esp.bt.eir.data.t
    EIR data content, according to "Supplement to the Bluetooth Core Specification".

Public Members

bool \texttt{fec_required}
    FEC is required or not, true by default

bool \texttt{include_txpower}
    EIR data include TX power, false by default

bool \texttt{include_uuid}
    EIR data include UUID, false by default

bool \texttt{include_name}
    EIR data include device name, true by default

uint8_t \texttt{flag}
    EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16_t \texttt{manufacturer_len}
    Manufacturer data length, 0 by default

uint8_t *\texttt{p manufacture_data}
    Manufacturer data point

uint16_t \texttt{url_len}
    URL length, 0 by default

uint8_t *\texttt{p.url}
    URL point
Macros

ESP_BT_GAP_RSSI_HIGH_THRLD
RSSI threshold.
High RSSI threshold

ESP_BT_GAP_RSSI_LOW_THRLD
Low RSSI threshold

ESP_BT_GAP_AFH_CHANNELS_LEN

ESP_BT_GAP_MAX_BDNAMEN_LEN
Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN
Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL
Uniform resource identifier
ESP_BT_EIR_TYPE_MANU_SPECIFIC
  Manufacturer specific data

ESP_BT_EIR_TYPE_MAX_NUM
  MAX number of EIR type

ESP_BT_ACL_PKT_TYPES_MASK_DM1

ESP_BT_ACL_PKT_TYPES_MASK_DH1

ESP_BT_ACL_PKT_TYPES_MASK_DM3

ESP_BT_ACL_PKT_TYPES_MASK_DH3

ESP_BT_ACL_PKT_TYPES_MASK_DM5

ESP_BT_ACL_PKT_TYPES_MASK_DH5

ESP_BT_ACL_PKT_TYPES_MASK_NO_2_DH1

ESP_BT_ACL_PKT_TYPES_MASK_NO_3_DH1

ESP_BT_ACL_PKT_TYPES_MASK_NO_2_DH3

ESP_BT_ACL_PKT_TYPES_MASK_NO_3_DH3

ESP_BT_ACL_PKT_TYPES_MASK_NO_2_DH5

ESP_BT_ACL_PKT_TYPES_MASK_NO_3_DH5

ESP_BT_ACL_DM1_ONLY

ESP_BT_ACL_DH1_ONLY

ESP_BT_ACL_DM3_ONLY

ESP_BT_ACL_DH3_ONLY

ESP_BT_ACL_DM5_ONLY

ESP_BT_ACL_DH5_ONLY

ESP_BT_ACL_2_DH1_ONLY

ESP_BT_ACL_3_DH1_ONLY
ESP_BT_ACL_2_DH3_ONLY
ESP_BT_ACL_3_DH3_ONLY
ESP_BT_ACL_2_DH5_ONLY
ESP_BT_ACL_3_DH5_ONLY
ESP_BT_EIR_FLAG_LIMIT_DISC
ESP_BT_EIR_FLAG_GEN_DISC
ESP_BT_EIR_FLAG_BREDR_NOT_SPT
ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT
ESP_BT_EIR_FLAG_DMT_HOST_SPT
ESP_BT_EIR_MAX_LEN
ESP_BT_PIN_CODE_LEN
    Max pin code length
ESP_BT_IO_CAP_OUT
ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE
ESP_BT_PM_MD_ACTIVE
    Active mode
ESP_BT_PM_MD_HOLD
    Hold mode
ESP_BT_PM_MD_SNIFF
    Sniff mode
ESP_BT_PM_MD_PARK
    Park state
ESP_BT_COD_SRVC_BIT_MASK
    Bits of major service class field.
    Major service bit mask
ESP_BT_COD_SRVC_BIT_OFFSET
Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
Bits of major device class field.
Major device bit mask

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
Bits of minor device class field.
Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
Bits of format type.
Format type bit mask

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1
Class of device format type 1.

ESP_BT_LINK_KEY_COMB
Type of link key.
Combination Key

ESP_BT_LINK_KEY_DBG_COMB
Debug Combination Key

ESP_BT_LINK_KEY_UNAUTHED_COMB_P192
Unauthenticated Combination Key generated from P-192

ESP_BT_LINK_KEY_AUTHED_COMB_P192
Authenticated Combination Key generated from P-192

ESP_BT_LINK_KEY_CHG_COMB
Changed Combination Key

ESP_BT_LINK_KEY_UNAUTHED_COMB_P256
Unauthenticated Combination Key generated from P-256

ESP_BT_LINK_KEY_AUTHED_COMB_P256
Authenticated Combination Key generated from P-256
**Chapter 2. API Reference**

**ESP_BT_ENC_MODE_OFF**
Type of encryption.
Link Level Encryption is OFF

**ESP_BT_ENC_MODE_E0**
Link Level Encryption is ON with E0

**ESP_BT_ENC_MODE_AES**
Link Level Encryption is ON with AES-CCM

**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**ESP_BT_GAP_TPOLL_MIN**
Minimum, Default and Maximum poll interval Minimum poll interval, unit is 625 microseconds

**ESP_BT_GAP_TPOLL_DFT**
Default poll interval, unit is 625 microseconds

**ESP_BT_GAP_TPOLL_MAX**
Maximum poll interval, unit is 625 microseconds

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]

typedef uint8_t esp_bt_eir_type_t

typedef uint16_t esp_bt_acl_pkt_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
Combination of the IO Capability

typedef uint8_t esp_bt_pm_mode_t

typedef uint8_t esp_bt_link_key_type_t

typedef uint8_t esp_bt_enc_mode_t

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

  **Param event** : Event type
  **Param param** : Pointer to callback parameter
Enumerations

enum esp_bt_cod_mode_t
class of device settings

Values:

enumerator ESP_BT_SET_COD_MAJOR_MINOR
overwrite major, minor class

enumerator ESP_BT_SET_COD_SERVICE_CLASS
set the bits in the input, the current bit will remain

enumerator ESP_BT_CLR_COD_SERVICE_CLASS
clear the bits in the input, others will remain

enumerator ESP_BT_SET_COD_ALL
overwrite major, minor, set the bits in service class

enumerator ESP_BT_INIT_COD
overwrite major, minor, and service class

enum esp_bt_connection_mode_t
Discoverability and Connectability mode.

Values:

enumerator ESP_BT_NON_CONNECTABLE
Non-connectable

enumerator ESP_BT_CONNECTABLE
Connectable

enum esp_bt_discovery_mode_t

Values:

enumerator ESP_BT_NON_DISCOVERABLE
Non-discoverable

enumerator ESP_BT_LIMITED_DISCOVERABLE
Limited Discoverable

enumerator ESP_BT_GENERAL_DISCOVERABLE
General Discoverable

enum esp_bt_gap_dev_prop_type_t
Bluetooth Device Property type.

Values:

enumerator ESP_BT_GAP_DEV_PROP_BDNNAME
Bluetooth device name, value type is int8_t []
enumerator ESP_BT_GAP_DEV_PROP_COD
   Class of Device, value type is uint32_t

disEMALE Definition
enumerator ESP_BT_GAP_DEV_PROP_RSSI
   Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

disEMALE Definition
enumerator ESP_BT_GAP_DEV_PROP_EIR
   Extended Inquiry Response, value type is uint8_t[]

disEMALE Definition
enum esp_bt_cod_srvc_t
   Major service class field of Class of Device, multiple bits can be set.
   Values:

   enumerator ESP_BT_COD_SRVC_NONE
      None indicates an invalid value

   enumerator ESP_BT_COD_SRVC_LMTD_DISCOVER
      Limited Discoverable Mode

   enumerator ESP_BT_COD_SRVC_POSITIONING
      Positioning (Location identification)

   enumerator ESP_BT_COD_SRVC_NETWORKING
      Networking, e.g. LAN, Ad hoc

   enumerator ESP_BT_COD_SRVC_RENDERING
      Rendering, e.g. Printing, Speakers

   enumerator ESP_BT_COD_SRVC_CAPTURING
      Capturing, e.g. Scanner, Microphone

   enumerator ESP_BT_COD_SRVC_OBJ_TRANSFER
      Object Transfer, e.g. v-Inbox, v-Folder

   enumerator ESP_BT_COD_SRVC_AUDIO
      Audio, e.g. Speaker, Microphone, Headset service

   enumerator ESP_BT_COD_SRVC_TELEPHONY
      Telephony, e.g. Cordless telephony, Modem, Headset service

   enumerator ESP_BT_COD_SRVC_INFORMATION
      Information, e.g., WEB-server, WAP-server

disEMALE Definition
enum esp_bt_pin_type_t
   Values:

   enumerator ESP_BT_PIN_TYPE_VARIABLE
      Refer to BTM_PIN_TYPE_VARIABLE
enumerator **ESP_BT_PIN_TYPE_FIXED**
Refer to **BTM_PIN_TYPE_FIXED**

enum **esp_bt_sp_param_t**
Values:

enumerator **ESP_BT_SP_IOCAP_MODE**
Set IO mode

enum **esp_bt_cod_major_dev_t**
Major device class field of Class of Device.
Values:

enumerator **ESP_BT_COD_MAJOR_DEV_MISC**
Miscellaneous

enumerator **ESP_BT_COD_MAJOR_DEV_COMPUTER**
Computer

enumerator **ESP_BT_COD_MAJOR_DEV_PHONE**
Phone (cellular, cordless, pay phone, modem)

enumerator **ESP_BT_COD_MAJOR_DEV_LAN_NAP**
LAN, Network Access Point

enumerator **ESP_BT_COD_MAJOR_DEV_AV**
Audio/Video (headset, speaker, stereo, video display, VCR)

enumerator **ESP_BT_COD_MAJOR_DEV_PERIPHERAL**
Peripheral (mouse, joystick, keyboard)

enumerator **ESP_BT_COD_MAJOR_DEV_IMAGING**
Imaging (printer, scanner, camera, display)

enumerator **ESP_BT_COD_MAJOR_DEV_WEARABLE**
Wearable

enumerator **ESP_BT_COD_MAJOR_DEV_TOY**
Toy

enumerator **ESP_BT_COD_MAJOR_DEV_HEALTH**
Health

enumerator **ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED**
Uncategorized: device not specified

enum **esp_bt_gap_discovery_state_t**
Bluetooth Device Discovery state
Values:
enumerator **ESP_BT_GAP_DISCOVERY_STOPPED**
   Device discovery stopped

enumerator **ESP_BT_GAP_DISCOVERY_STARTED**
   Device discovery started

enum **esp_bt_gap_cb_event_t**
   BT GAP callback events.
   
   Values:

enumerator **ESP_BT_GAP_DISC_RES_EVT**
   Device discovery result event

enumerator **ESP_BT_GAP_DISC_STATE_CHANGED_EVT**
   Discovery state changed event

enumerator **ESP_BT_GAP_RMT_SRVCS_EVT**
   Get remote services event

enumerator **ESP_BT_GAP_RMT_SRVC_REC_EVT**
   Get remote service record event

enumerator **ESP_BT_GAP_AUTH_CMPL_EVT**
   Authentication complete event

enumerator **ESP_BT_GAP_PIN_REQ_EVT**
   Legacy Pairing Pin code request

enumerator **ESP_BT_GAP_CFM_REQ_EVT**
   Security Simple Pairing User Confirmation request.

enumerator **ESP_BT_GAP_KEY_NOTIF_EVT**
   Security Simple Pairing Passkey Notification

enumerator **ESP_BT_GAP_KEY_REQ_EVT**
   Security Simple Pairing Passkey request

enumerator **ESP_BT_GAP_READ_RSSI_DELTA_EVT**
   Read rssi event

enumerator **ESP_BT_GAP_CONFIG_EIR_DATA_EVT**
   Config EIR data event

enumerator **ESP_BT_GAP_SET_AFH_CHANNELS_EVT**
   Set AFH channels event

enumerator **ESP_BT_GAP_READ_REMOTE_NAME_EVT**
   Read Remote Name event
enumerator **ESP_BT_GAP_MODE_CHG_EVT**

enumerator **ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT**
  remove bond device complete event

enumerator **ESP_BT_GAP_QOS_CMPL_EVT**
  QOS complete event

enumerator **ESP_BT_GAP_ACL_CONN_CMPL_STAT_EVT**
  ACL connection complete status event

enumerator **ESP_BT_GAP_ACL_DISCONNECT_CMPL_STAT_EVT**
  ACL disconnection complete status event

enumerator **ESP_BT_GAP_SET_PAGE_TO_EVT**
  Set page timeout event

enumerator **ESP_BT_GAP_GET_PAGE_TO_EVT**
  Get page timeout event

enumerator **ESP_BT_GAP_ACL_PKT_TYPE_CHANGED_EVT**
  Set ACL packet types event

enumerator **ESP_BT_GAP_ENC_CHG_EVT**
  Encryption change event

enumerator **ESP_BT_GAP_EVT_MAX**

enum **esp_bt_inq_mode_t**
  Inquiry Mode

  *Values:*

enumerator **ESP_BT_INQ_MODE_GENERAL_INQUIRY**
  General inquiry mode

enumerator **ESP_BT_INQ_MODE_LIMITED_INQUIRY**
  Limited inquiry mode

**Bluetooth® A2DP API**

**Application Example**  Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - `bluetooth/bluedroid/classic_bt/a2dp_sink`

**API Reference**
Header File

- components(bt/host/bluedroid/api/include/api/esp_a2dp_api.h
- This header file can be included with:

```c
#include "esp_a2dp_api.h"
```

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

- **esp_err_t esp_a2d_register_callback(esp_a2d_cb_t callback)**

  Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

  **Parameters**
  callback -- [in] A2DP event callback function

  **Returns**
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: if callback is a NULL function pointer

- **esp_err_t esp_a2d_sink_register_data_callback(esp_a2d_sink_data_cb_t callback)**

  Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

  **Parameters**
  callback -- [in] A2DP sink data callback function

  **Returns**
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: if callback is a NULL function pointer

- **esp_err_t esp_a2d_sink_init(void)**

  Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

  **Returns**
  - ESP_OK: if the initialization request is sent successfully
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

- **esp_err_t esp_a2d_sink_deinit(void)**

  De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

  **Returns**
  - ESP_OK: if the deinitialization request is sent successfully
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

- **esp_err_t esp_a2d_sink_connect(esp_bd_addr_t remote_bda)**

  Connect to remote bluetooth A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().
**Parameters** `remote_bda` -- [in] remote bluetooth device address

**Returns**
- ESP_OK: connect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

**Parameters** `remote_bda` -- [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_set_delay_value (uint16_t delay_value)`

Set delay reporting value. The delay value of sink is caused by buffering (including protocol stack and application layer), decoding and rendering. The default delay value is 120ms, if the set value is less than 120ms, the setting will fail. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

**Parameters** `delay_value` -- [in] reporting value is in 1/10 millisecond

**Returns**
- ESP_OK: delay value is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_get_delay_value (void)`

Get delay reporting value. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

**Returns**
- ESP_OK: if the request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`

Media control commands. This API can be used for both A2DP sink and source and must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

**Parameters** `ctrl` -- [in] control commands for A2DP data channel

**Returns**
- ESP_OK: control command is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_init (void)`

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

**Returns**
- ESP_OK: if the initialization request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_deinit (void)`

De-initialize for A2DP source module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Returns**
Chapter 2. API Reference

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)`
Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after `esp_bluedroid_enable()` completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Parameters**
- `callback` -- [in] A2DP source data callback function

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

`esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)`
Connect to remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

**Parameters**
- `remote_bda` -- [in] remote bluetooth device address

**Returns**
- ESP_OK: connect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

**Parameters**
- `remote_bda` -- [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Unions

```
union esp_a2d_cb_param_t
{
    #include <esp_a2dp_api.h> A2DP state callback parameters.

Public Members

struct esp_a2d_cb_param_t:a2d_conn_stat_param conn_stat
    A2DP connection status

struct esp_a2d_cb_param_t:a2d_audio_stat_param audio_stat
    audio stream playing state

struct esp_a2d_cb_param_t:a2d_audio_cfg_param audio_cfg

Type Definitions

typedef uint8_t esp_a2d_mct_t

typedef uint16_t esp_a2d_psc_t

typedef void (*esp_a2d_cb_t)(esp_a2d_event_t event, esp_a2d_param_t *param)
A2DP profile callback function type.

Param event : Event type
Param param : Pointer to callback parameter

typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t*buf, uint32_t len)
A2DP sink data callback function.

Param buf [in] : pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
Param len [in] : size(in bytes) in buf

typedef int32_t (*esp_a2d_source_data_cb_t)(uint8_t *buf, int32_t len)
A2DP source data read callback function.

Param buf [in] : buffer to be filled with PCM data stream from higher layer
Param len [in] : size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed
Return size of bytes read successfully, if the argument len is -1, this value is ignored.

Enumerations

enum esp_a2d_connection_state_t
Bluetooth A2DP connection states.

Values:
enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTED**
    connection released

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTING**
    connecting remote device

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTED**
    connection established

enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTING**
    disconnecting remote device

enum **esp_a2d_disc_rsn_t**
    Bluetooth A2DP disconnection reason.
    Values:

enumerator **ESP_A2D_DISC_RSN_NORMAL**
    Finished disconnection that is initiated by local or remote device

enumerator **ESP_A2D_DISC_RSN_ABNORMAL**
    Abnormal disconnection caused by signal loss

enum **esp_a2d_audio_state_t**
    Bluetooth A2DP datapath states.
    Values:

enumerator **ESP_A2D_AUDIO_STATE_SUSPEND**
    audio stream datapath suspended by remote device

enumerator **ESP_A2D_AUDIO_STATE_STARTED**
    audio stream datapath started

enumerator **ESP_A2D_AUDIO_STATE_STOPPED**
    
    __Note:__ Deprecated

enumerator **ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND**
    
    __Note:__ Deprecated

enum **esp_a2d_media_ctrl_ack_t**
    A2DP media control command acknowledgement code.
    Values:

enumerator **ESP_A2D_MEDIA_CTRL_ACK_SUCCESS**
    media control command is acknowledged with success
enumerator **ESP_A2D_MEDIA_CTRL_ACK_FAILURE**
media control command is acknowledged with failure

enumerator **ESP_A2D_MEDIA_CTRL_ACK_BUSY**
media control command is rejected, as previous command is not yet acknowledged

**enum esp_a2d_media_ctrl_t**
A2DP media control commands.

*Values:*

enumerator **ESP_A2D_MEDIA_CTRL_NONE**
Not for application use, use inside stack only.

enumerator **ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY**
check whether AVDTP is connected, only used in A2DP source

enumerator **ESP_A2D_MEDIA_CTRL_START**
command to set up media transmission channel

enumerator **ESP_A2D_MEDIA_CTRL_SUSPEND**
command to suspend media transmission

enumerator **ESP_A2D_MEDIA_CTRL_STOP**

*Note:* Deprecated, Please use ESP_A2D_MEDIA_CTRL_SUSPEND

**enum esp_a2d_init_state_t**
Bluetooth A2DP Initiation states.

*Values:*

enumerator **ESP_A2D_DEINIT_SUCCESS**
A2DP profile deinit successful event

enumerator **ESP_A2D_INIT_SUCCESS**
A2DP profile init successful event

**enum esp_a2d_set_delay_value_state_t**
Bluetooth A2DP set delay report value states.

*Values:*

enumerator **ESP_A2D_SET_SUCCESS**
A2DP profile set delay report value successful

enumerator **ESP_A2D_SET_INVALID_PARAMS**
A2DP profile set delay report value is invalid parameter
enum esp_a2d_cb_event_t

A2DP callback events.

Values:

enumerator ESP_A2D_CONNECTION_STATE_EVT
    connection state changed event

eumerator ESP_A2D_AUDIO_STATE_EVT
    audio stream transmission state changed event

eumerator ESP_A2D_AUDIO_CFG_EVT
    audio codec is configured, only used for A2DP SINK

eumerator ESP_A2D_MEDIA_CTRL_ACK_EVT
    acknowledge event in response to media control commands

eumerator ESP_A2D_PROF_STATE_EVT
    indicate a2dp init&deinit complete

eumerator ESP_A2D_SNK_PSC_CFG_EVT
    protocol service capabilities configured, only used for A2DP SINK

eumerator ESP_A2D_SNK_SET_DELAY_VALUE_EVT
    indicate a2dp sink set delay report value complete, only used for A2DP SINK

eumerator ESP_A2D_SNK_GET_DELAY_VALUE_EVT
    indicate a2dp sink get delay report value complete, only used for A2DP SINK

eumerator ESP_A2D_REPORT_SNK_DELAY_VALUE_EVT
    report delay value, only used for A2DP SRC

Bluetooth® AVRCP APIs

Overview  Bluetooth AVRCP reference APIs.

API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_avrc_api.h
- This header file can be included with:

```
#include "esp_avrc_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or
Functions

`esp_err_t esp_avrc_ct_register_callback (esp_avrc_ct_cb_t callback)`

Register application callbacks to AVRCP module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Parameters**

- `callback` -- [in] AVRCP controller callback function

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_ct_init (void)`

Initialize the bluetooth AVRCP controller module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_ct_deinit (void)`

De-initialize AVRCP controller module. This function should be called after after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_t tl, uint8_t attr_id, uint8_t value_id)`

Send player application settings command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Parameters**

- `tl` -- [in]: transaction label, 0 to 15, consecutive commands should use different values
- `attr_id` -- [in]: player application setting attribute IDs from one of `esp_avrc_ps_attr_ids_t`
- `value_id` -- [in]: attribute value defined for the specific player application setting attribute

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd (uint8_t tl)`

Send GetCapabilities PDU to AVRCP target to retrieve remote device's supported notification event_ids. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Parameters**

- `tl` -- [in]: transaction label, 0 to 15, consecutive commands should use different values

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others
esp_err_t esp_avrc_ct_send_register_notification_cmd (uint8_t tl, uint8_t event_id, uint32_t event_parameter)

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- tl -- [in]: transaction label, 0 to 15, consecutive commands should use different values.
- event_id -- [in]: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
- event_parameter -- [in]: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd (uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- tl -- [in]: transaction label, 0 to 15, consecutive commands should use different values
- volume -- [in]: volume, 0 to 0x7f, means 0% to 100%

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_metadata_cmd (uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- tl -- [in]: transaction label, 0 to 15, consecutive commands should use different values.
- attr_mask -- [in]: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_passthrough_cmd (uint8_t tl, uint8_t key_code, uint8_t key_state)

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Parameters
- tl -- [in]: transaction label, 0 to 15, consecutive commands should use different values.
- key_code -- [in]: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- key_state -- [in]: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

Parameters callback -- [in] AVRCP target callback function

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_tg_init (void)

Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_tg_deinit (void)

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)

Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCTG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)

Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set "1" as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type "NOT IMPLEMENTED" (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type "ESP_AVRC_PSTH_FILTER_ALLOWED_CMD". Filter type "ESP_AVRC_PSTH_FILTER_ALLOWED_CMD" does not apply to this function.

Returns
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
• ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes commands that are not allowed

bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PAST THROUGH command.

Parameters
- op -- [in] operation requested on the bit mask field
- psth -- [in] pointer to passthrough command bit mask structure
- cmd -- [in] passthrough command code

Returns
For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

esp_err_t esp_avrc_tg_get_rn_evt_cap (esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

For capability type "ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap().

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if cap is invalid or evt_set is NULL
- ESP_FAIL: otherwise

esp_err_t esp_avrc_tg_set_rn_evt_cap (const esp_avrc_rn_evt_cap_mask_t *evt_set)

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in evt_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if evt_set is NULL

bool esp_avrc_rn_evt_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)

Operate on the type esp_avrc_rn_evt_cap_mask_t with regard to a specific event.

For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

Parameters
- op -- [in] operation requested on the bit mask field
- events -- [in] pointer to event notification capability bit mask structure
- event_id -- [in] notification event code
For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false.

```c
esp_err_t esp_avrc_tg_send_rn_rsp (esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using esp_avrc_tg_set_rn_evt_cap(), in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

### Parameters
- `event_id` -- [in] notification event ID that remote AVRCP CT registers
- `rsp` -- [in] notification response code
- `param` -- [in] parameters included in the specific notification

### Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

### Unions

```c
union esp_avrc_rn_param_t
#include <esp_avrc_api.h> AVRCP notification parameters.
```

### Public Members

```c
uint8_t_t volume
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127
```

```c
esp_avrc_playback_stat_t playback
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE
```

```c
uint8_t_t elm_id[8]
response data for ESP_AVRC_RN_TRACK_CHANGE
```

```c
uint32_t play_pos
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond
```

```c
esp_avrc_batt_stat_t batt
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE
```

```c
union esp_avrc_ct_cb_param_t
#include <esp_avrc_api.h> AVRC controller callback parameters.
```

### Public Members

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
AVRC connection status
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
passthrough command response
```
struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
    metadata attributes response

struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
    notifications

struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
    AVRC features discovered from remote SDP server

struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
    get supported event capabilities response from AVRCP target

struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
    set absolute volume response event

struct avrc_ct_change_notify_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.

**Public Members**

`uint8_t event_id`
    id of AVRC event notification

`esp_avrc_rn_param_t event_parameter`
    event notification parameter

struct avrc_ct_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.

**Public Members**

`bool connected`
    whether AVRC connection is set up

`esp_bd_addr_t remote_bda`
    remote bluetooth device address

struct avrc_ct_get_rn_caps_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.

**Public Members**

`uint8_t cap_count`
    number of items provided in event or company_id according to cap_id used
**Chapter 2. API Reference**

```c
esp_avrc_rn_evt_cap_mask_t evt_set

supported event_ids represented in bit-mask
```

```c
struct avrc_ct_meta_rsp_param

#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
```

**Public Members**

- `uint8_t attr_id`
  - id of metadata attribute
- `uint8_t *attr_text`
  - attribute itself
- `int attr_length`
  - attribute character length

```c
struct avrc_ct_psth_rsp_param

#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

**Public Members**

- `uint8_t tl`
  - transaction label, 0 to 15
- `uint8_t keyCode`
  - passthrough command code
- `uint8_t key_state`
  - 0 for PRESSED, 1 for RELEASED
- `esp_avrc_rsp_t rsp_code`
  - response code

```c
struct avrc_ct_rmt_feats_param

#include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

**Public Members**

- `uint32_t feat_mask`
  - AVRC feature mask of remote device
- `uint16_t tg_feat_flag`
  - feature flag of remote device as TG
```c
esp_bd_addr_t remote_bda
    remote bluetooth device address

struct avrc_ct_set_volume_rsp_param
    #include <esp_avrc_api.h> ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.

Public Members

uint8_t volume
    the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%

union esp_avrc_tg_cb_param_t
    #include <esp_avrc_api.h> AVRC target callback parameters.

Public Members

struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
    AVRC connection status

struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
    AVRC features discovered through SDP

struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
    passthrough command

struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
    set absolute volume command targeted on audio sink

struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
    register notification

struct esp_avrc_tg_cb_param_t::avrc_tg_set_app_value_param set_app_value
    set player application value

struct avrc_tg_conn_stat_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.

Public Members

bool connected
    whether AVRC connection is set up

esp_bd_addr_t remote_bda
    remote bluetooth device address

struct avrc_tg_psth_cmd_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.
```
Chapter 2. API Reference

**Public Members**

```c
uint8_t key_code
    passthrough command code

uint8_t key_state
    0 for PRESSED, 1 for RELEASED
```

```c
struct avrc_tg_reg_ntf_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.
```

**Public Members**

```c
uint8_t event_id
    event id of AVRC RegisterNotification

uint32_t event_parameter
    event notification parameter
```

```c
struct avrc_tg_rmt_feats_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_REMOTEFEATURES_EVT.
```

**Public Members**

```c
uint32_t feat_mask
    AVRC feature mask of remote device

uint16_t ct_feat_flag
    feature flag of remote device as CT

esp_bd_addr_t remote_bda
    remote bluetooth device address
```

```c
struct avrc_tg_set_abs_vol_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_SETABSOLUTE_VOLUME_CMD_EVT.
```

**Public Members**

```c
uint8_t volume
    volume ranges from 0 to 127
```

```c
struct avrc_tg_set_app_value_param
    #include <esp_avrc_api.h> ESP_AVRC_TG_SETPLAYER_APP_VALUE_EVT.
```
Public Members

```c
uint8_t num_val
attribute
```

```c
esp_avrc_set_app_value_param_t *p_vals
point to the id and value of player application attribute
```

Structures

`struct esp_avrc_psth_bit_mask_t`

AVRC passthrough command bit mask.

Public Members

```c
uint16_t bits[8]
bit mask representation of PASSTHROUGH commands
```

`struct esp_avrc_rn_evt_cap_mask_t`

AVRC target notification event capability bit mask.

Public Members

```c
uint16_t bits
bit mask representation of PASSTHROUGH commands
```

`struct esp_avrc_set_app_value_param_t`

AVRCP set app value parameters.

Public Members

```c
uint8_t attr_id
player application attribute id
```

```c
uint8_t attr_val
player application attribute value
```

Macros

```c
ESP_AVRC_TRANS_LABEL_MAX
max transaction label
```

Type Definitions

typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)

AVRCP controller callback function type.

- **Param event**: Event type
- **Param param**: Pointer to callback parameter union

Submit Document Feedback
typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)

AVRCP target callback function type.

**Param event**: Event type  
**Param param**: Pointer to callback parameter union

### Enumerations

#### enum esp_avrc_features_t

AVRC feature bit mask.

**Values:**

- Enumerator **ESP_AVRC_FEAT_RCTG**  
  remote control target

- Enumerator **ESP_AVRC_FEAT_RCCT**  
  remote control controller

- Enumerator **ESP_AVRC_FEAT_VENDOR**  
  remote control vendor dependent commands

- Enumerator **ESP_AVRC_FEAT_BROWSE**  
  use browsing channel

- Enumerator **ESP_AVRC_FEAT_META_DATA**  
  remote control metadata transfer command/response

- Enumerator **ESP_AVRC_FEAT_ADV_CTRL**  
  remote control advanced control command/response

#### enum esp_avrc_feature_flag_t

AVRC supported features flag retrieved in SDP record.

**Values:**

- Enumerator **ESP_AVRC_FEAT_FLAG_CAT1**  
  category 1

- Enumerator **ESP_AVRC_FEAT_FLAG_CAT2**  
  category 2

- Enumerator **ESP_AVRC_FEAT_FLAG_CAT3**  
  category 3

- Enumerator **ESP_AVRC_FEAT_FLAG_CAT4**  
  category 4

- Enumerator **ESP_AVRC_FEAT_FLAG_BROWSING**  
  browsing

  vendor unique

enum esp_avrc_psth_filter_t
AVRC passthrough command filter.
Values:

enumerator ESP_AVRC_PSTH_FILTER_ALLOWED_CMD
  all of the PASSTHROUGH commands that can possibly be used, immutable
enumerator ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD
  PASSTHROUGH commands selectively supported according to the current configuration
enumerator ESP_AVRC_PSTH_FILTER_SUPPORT_MAX

enum esp_avrc_bit_mask_op_t
    Values:

    enumerator ESP_AVRC_BIT_MASK_OP_TEST
        operation code to test a specific bit

    enumerator ESP_AVRC_BIT_MASK_OP_SET
        operation code to set a specific bit

    enumerator ESP_AVRC_BIT_MASK_OP_CLEAR
        operation code to clear a specific bit

enum esp_avrc_pt_cmd_state_t
AVRC passthrough command state.
    Values:

    enumerator ESP_AVRC_PT_CMD_STATE_PRESSED
        key pressed

    enumerator ESP_AVRC_PT_CMD_STATE_RELEASED
        key released

enum esp_avrc_ct_cb_event_t
AVRC Controller callback events.
    Values:

    enumerator ESP_AVRC_CT_CONNECTION_STATE_EVT
        connection state changed event

    enumerator ESP_AVRC_CT_PASSTHROUGH_RSP_EVT
        passthrough response event

    enumerator ESP_AVRC_CT_METADATA_RSP_EVT
        metadata response event

    enumerator ESP_AVRC_CT_PLAY_STATUS_RSP_EVT
        play status response event

    enumerator ESP_AVRC_CT_CHANGE_NOTIFY_EVT
        notification event

    enumerator ESP_AVRC_CT_REMOTE_FEATURES_EVT
        feature of remote device indication event

    enumerator ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT
        supported notification events capability of peer device
Chapter 2. API Reference

**enumerator** `ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT`  
set absolute volume response event

**enum** `esp_avrc_tg_cb_event_t`  
AVRC Target callback events.  
*Values:*

- **enumerator** `ESP_AVRC_TG_CONNECTION_STATE_EVT`  
  connection state changed event

- **enumerator** `ESP_AVRC_TG_REMOTE_FEATURES_EVT`  
  feature of remote device indication event

- **enumerator** `ESP_AVRC_TG_PASSTHROUGH_CMD_EVT`  
  passthrough command event

- **enumerator** `ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT`  
  set absolute volume command from remote device

- **enumerator** `ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT`  
  register notification event

- **enumerator** `ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT`  
  set application attribute value, attribute refer to `esp_avrc_ps_attr_ids_t`

**enum** `esp_avrc_md_attr_mask_t`  
AVRC metadata attribute mask.  
*Values:*

- **enumerator** `ESP_AVRC_MD_ATTR_TITLE`  
  title of the playing track

- **enumerator** `ESP_AVRC_MD_ATTR_ARTIST`  
  track artist

- **enumerator** `ESP_AVRC_MD_ATTR_ALBUM`  
  album name

- **enumerator** `ESP_AVRC_MD_ATTR_TRACK_NUM`  
  track position on the album

- **enumerator** `ESP_AVRC_MD_ATTR_NUM_TRACKS`  
  number of tracks on the album

- **enumerator** `ESP_AVRC_MD_ATTR_GENRE`  
  track genre
enumerator **ESP_AVRC_MD_ATTR_PLAYING_TIME**
   total album playing time in milliseconds

enum **esp_avrc_rn_event_ids_t**
   AVRC event notification ids.
   *Values:*

   - enumerator **ESP_AVRC_RN_PLAY_STATUS_CHANGE**
     track status change, eg. from playing to paused
   - enumerator **ESP_AVRC_RN_TRACK_CHANGE**
     new track is loaded
   - enumerator **ESP_AVRC_RN_TRACK_REACHED_END**
     current track reached end
   - enumerator **ESP_AVRC_RN_TRACK_REACHED_START**
     current track reached start position
   - enumerator **ESP_AVRC_RN_PLAY_POS_CHANGED**
     track playing position changed
   - enumerator **ESP_AVRC_RN_BATTERY_STATUS_CHANGE**
     battery status changed
   - enumerator **ESP_AVRC_RN_SYSTEM_STATUS_CHANGE**
     system status changed
   - enumerator **ESP_AVRC_RN_APP_SETTING_CHANGE**
     application settings changed
   - enumerator **ESP_AVRC_RN_NOW_PLAYING_CHANGE**
     now playing content changed
   - enumerator **ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE**
     available players changed
   - enumerator **ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE**
     the addressed player changed
   - enumerator **ESP_AVRC_RN_UIDS_CHANGE**
     UIDs changed
   - enumerator **ESP_AVRC_RN_VOLUME_CHANGE**
     volume changed locally on TG
   - enumerator **ESP_AVRC_RN_MAX_EVT**
enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.

Values:

enumerator ESP_AVRC_RN_CAP_ALLOWED_EVT
   all of the notification events that can possibly be supported, immutable

enumerator ESP_AVRC_RN_CAP_SUPPORTED_EVT
   notification events selectively supported according to the current configuration

enumerator ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.

Values:

enumerator ESP_AVRC_RN_RSP_INTERIM
   initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

enumerator ESP_AVRC_RN_RSP_CHANGED
   final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.

Values:

enumerator ESP_AVRC_PS_EQUALIZER
   equalizer, on or off

enumerator ESP_AVRC_PS_REPEAT_MODE
   repeat mode

enumerator ESP_AVRC_PS_SHUFFLE_MODE
   shuffle mode

enumerator ESP_AVRC_PS_SCAN_MODE
   scan mode on or off

enumerator ESP_AVRC_PS_MAX_ATTR

enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.

Values:

enumerator ESP_AVRC_PS_EQUALIZER_OFF
   equalizer OFF
enumerator ESP_AVRC_PS_EQUALIZER_ON
  equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
  AVRC repeat modes.
  Values:

  enumerator ESP_AVRC_PS_REPEAT_OFF
    repeat mode off

  enumerator ESP_AVRC_PS_REPEAT_SINGLE
    single track repeat

  enumerator ESP_AVRC_PS_REPEAT_GROUP
    group repeat

enum esp_avrc_ps_shf_value_ids_t
  AVRC shuffle modes.
  Values:

  enumerator ESP_AVRC_PS_SHUFFLE_OFF

  enumerator ESP_AVRC_PS_SHUFFLE_ALL

  enumerator ESP_AVRC_PS_SHUFFLE_GROUP

enum esp_avrc_ps_scn_value_ids_t
  AVRC scan modes.
  Values:

  enumerator ESP_AVRC_PS_SCAN_OFF
    scan off

  enumerator ESP_AVRC_PS_SCAN_ALL
    all tracks scan

  enumerator ESP_AVRC_PS_SCAN_GROUP
    group scan

enum esp_avrc_rsp_t
  AVCTP response codes.
  Values:

  enumerator ESP_AVRC_RSP_NOT_IMPL
    not implemented
enumerator ESP_AVRC_RSP_ACCEPT
   accept

enumerator ESP_AVRC_RSP_REJECT
   reject

enumerator ESP_AVRC_RSP_IN_TRANS
   in transition

enumerator ESP_AVRC_RSP_IMPL_STBL
   implemented/stable

enumerator ESP_AVRC_RSP_CHANGED
   changed

enumerator ESP_AVRC_RSP_INTERIM
   interim

enum esp_avrc_batt_stat_t
   AVRCP battery status.
   Values:

enumerator ESP_AVRC_BATT_NORMAL
   normal state

enumerator ESP_AVRC_BATT_WARNING
   unable to operate soon

enumerator ESP_AVRC_BATT_CRITICAL
   cannot operate any more

enumerator ESP_AVRC_BATT_EXTERNAL
   plugged to external power supply

enumerator ESP_AVRC_BATT_FULL_CHARGE
   when completely charged from external power supply

enum esp_avrc_playback_stat_t
   AVRCP current status of playback.
   Values:

enumerator ESP_AVRC_PLAYBACK_STOPPED
   stopped

enumerator ESP_AVRC_PLAYBACK_PLAYING
   playing
Chapter 2. API Reference

enumerator **ESP_AVRC_PLAYBACK_PAUSED**
    paused

enumerator **ESP_AVRC_PLAYBACK_FWD_SEEK**
    forward seek

enumerator **ESP_AVRC_PLAYBACK_REV_SEEK**
    reverse seek

enumerator **ESP_AVRC_PLAYBACK_ERROR**
    error

SPP API

**Application Example** Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:
- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_spp_api.h
- This header file can be included with:
  ```c
  #include "esp_spp_api.h"
  ```
- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE bt
  ```
  or
  ```cmake
  PRIV_REQUIRE bt
  ```

**Functions**

* `esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)`

This function is called to init callbacks with SPP module.

**Parameters**
- callback -- [in] pointer to the init callback function.

**Returns**
- ESP_OK: success
- other: failed

* `esp_err_t esp_spp_init (esp_spp_mode_t mode)`

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

**Parameters**
- mode -- [in] Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

**Returns**
- ESP_OK: success
- other: failed
**esp_err_t esp_spp_enhanced_init** (const esp_spp_cfg_t *cfg)

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

**Note:** The member variable enable_l2cap_etrm in esp_spp_cfg_t can affect all L2CAP channel configurations of the upper layer RFCOMM protocol.

**Parameters**

*cfg* -- [in] SPP configuration.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_spp_deinit** (void)

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init()/esp_spp_enhanced_init() completes successfully.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_spp_start_discovery** (esp_bd_addr_t bd_addr)

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

**Parameters**

*bd_addr* -- [in] Remote device bluetooth device address.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_spp_connect** (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

**Parameters**

- *role* -- [in] Master or slave.
- *remote_scn* -- [in] Remote device bluetooth device SCN.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_spp_disconnect** (uint32_t handle)

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

**Parameters**

*handle* -- [in] The connection handle.

**Returns**

- ESP_OK: success
- other: failed
• ESP_OK: success
• other: failed

esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)

This function creates an SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

Parameters
• sec_mask -- [in] Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
• role -- [in] Master or slave.
• local_scn -- [in] The specific channel you want to get. If channel is 0, means get any channel.
• name -- [in] Server's name.

Returns
• ESP_OK: success
• other: failed

esp_err_t esp_spp_stop_srv (void)

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

Returns
• ESP_OK: success
• other: failed

esp_err_t esp_spp_stop_srv_scn (uint8_t scn)

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

Parameters scn -- [in] Server channel number.

Returns
• ESP_OK: success
• other: failed

esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter 'cong' is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter 'cong' is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter 'cong' equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

Parameters
• handle -- [in] The connection handle.
• len -- [in] The length of the data written.
• p_data -- [in] The data written.

Returns
• ESP_OK: success
• other: failed
Chapter 2. API Reference

`esp_err_t esp_spp_vfs_register(void)`
This function is used to register VFS. For now, SPP only supports write, read and close. When the operation is completed, the callback function will be called with ESP_SPP_VFS_REGISTER_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_spp_vfs_unregister(void)`
This function is used to unregister VFS. When the operation is completed, the callback function will be called with ESP_SPP_VFS_UNREGISTER_EVT. This function must be called after esp_spp_vfs_register() successful and before esp_spp_deinit().

**Returns**
- ESP_OK: success
- other: failed

**Unions**

union `esp_spp_cb_param_t`

#include <esp_spp_api.h> SPP callback parameters union.

**Public Members**

struct `esp_spp_cb_param_t::spp_init_evt_param init`
SPP callback param of SPP_INIT_EVT

struct `esp_spp_cb_param_t::spp_uninit_evt_param uninit`
SPP callback param of SPP_UNINIT_EVT

struct `esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp`
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct `esp_spp_cb_param_t::spp_open_evt_param open`
SPP callback param of ESP_SPP_OPEN_EVT

struct `esp_spp_cb_param_t::spp_srv_open_evt_param srv_open`
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct `esp_spp_cb_param_t::spp_close_evt_param close`
SPP callback param of ESP_SPP_CLOSE_EVT

struct `esp_spp_cb_param_t::spp_start_evt_param start`
SPP callback param of ESP_SPP_START_EVT

struct `esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop`
SPP callback param of ESP_SPP_SRV_STOP_EVT

struct `esp_spp_cb_param_t::spp_cl_init_evt_param cl_init`
SPP callback param of ESP_SPP_CL_INIT_EVT
struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT

struct esp_spp_cb_param_t::spp_vfs_register_evt_param vfs_register
SPP callback param of ESP_SPP_VFS_REGISTER_EVT

struct esp_spp_cb_param_t::spp_vfs_unregister_evt_param vfs_unregister
SPP callback param of ESP_SPP_VFS_UNREGISTER_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

esp_spp_status_t status

uint32_t handle
The connection handle

uint8_t sec_id
security ID used by this server

bool use_co
TRUE to use co_rfc_data

struct spp_close_evt_param
#include <esp_spp_api.h> ESP_SPP_CLOSE_EVT.

Public Members

uint32_t `handle`

The connection handle

int `len`

The length of the data written.

bool `cong`

Congestion status

Structures

`struct esp_spp_cfg_t`

SPP configuration parameters.

Public Members

```c
#include <esp_spp_api.h>
```

`esp_spp_mode_t` `mode`

Choose the mode of SPP, `ESP_SPP_MODE_CB` or `ESP_SPP_MODE_VFS`.

bool `enable_l2cap_ertm`

Enable/disable Logical Link Control and Adaptation Layer Protocol enhanced retransmission mode.

uint16_t `tx_buffer_size`

Tx buffer size for a new SPP channel. A smaller setting can save memory, but may incur a decrease in throughput. Only for `ESP_SPP_MODE_VFS` mode.
Chapter 2. API Reference

Macros

**ESP_SPP_MAX_MTU**
SPP max MTU

**ESP_SPP_MAX_SCN**
SPP max SCN

**ESP_SPP_MIN_TX_BUFFER_SIZE**
SPP min tx buffer

**ESP_SPP_MAX_TX_BUFFER_SIZE**
SPP max tx buffer size

**BT_SPP_DEFAULT_CONFIG**
SPP default configuration.

**ESP_SPP_SEC_NONE**
No security. relate to BTA_SEC_NONE in bta/bta_api.h

**ESP_SPP_SEC_AUTHORIZE**
Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

**ESP_SPP_SEC_AUTHENTICATE**
Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

**ESP_SPP_SEC_ENCRYPT**
Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

**ESP_SPP_SEC_MODE4_LEVEL4**
Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

**ESP_SPP_SEC_MITM**
Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

**ESP_SPP_SEC_IN_16_DIGITS**
Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

Type Definitions

typedef uint16_t **esp_spp_sec_t**

typedef void (*esp_spp_cb_t)(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Param event** Event type

**Param param** Point to callback parameter, currently is union type
Enumerations

enum esp_spp_status_t

Values:

enumerator ESP_SPP_SUCCESS
   Successful operation.

enumerator ESP_SPP_FAILURE
   Generic failure.

enumerator ESP_SPP_BUSY
   Temporarily can not handle this request.

enumerator ESP_SPP_NO_DATA
   No data

enumerator ESP_SPP_NO_RESOURCE
   No more resource

enumerator ESP_SPP_NEED_INIT
   SPP module shall init first

enumerator ESP_SPP_NEED_DEINIT
   SPP module shall deinit first

enumerator ESP_SPP_NO_CONNECTION
   Connection may have been closed

enumerator ESP_SPP_NO_SERVER
   No SPP server

enum esp_spp_role_t

Values:

enumerator ESP_SPP_ROLE_MASTER
   Role: master

enumerator ESP_SPP_ROLE_SLAVE
   Role: slave

enum esp_spp_mode_t

Values:

enumerator ESP_SPP_MODE_CB
   When data is coming, a callback will come with data

enumerator ESP_SPP_MODE_VFS
   Use VFS to write/read data
enum esp_spp_cb_event_t
    SPP callback function events.
    
    Values:
    
    enumerator ESP_SPP_INIT_EVT
        When SPP is initialized, the event comes
    
    enumerator ESP_SPP_UNINIT_EVT
        When SPP is deinitialized, the event comes
    
    enumerator ESP_SPP_DISCOVERY_COMP_EVT
        When SDP discovery complete, the event comes
    
    enumerator ESP_SPP_OPEN_EVT
        When SPP Client connection open, the event comes
    
    enumerator ESP_SPP_CLOSE_EVT
        When SPP connection closed, the event comes
    
    enumerator ESP_SPP_START_EVT
        When SPP server started, the event comes
    
    enumerator ESP_SPP_CL_INIT_EVT
        When SPP client initiated a connection, the event comes
    
    enumerator ESP_SPP_DATA_IND_EVT
        When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB
    
    enumerator ESP_SPP_CONG_EVT
        When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB
    
    enumerator ESP_SPP_WRITE_EVT
        When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB
    
    enumerator ESP_SPP_SRV_OPEN_EVT
        When SPP Server connection open, the event comes
    
    enumerator ESP_SPP_SRV_STOP_EVT
        When SPP server stopped, the event comes
    
    enumerator ESP_SPP_VFS_REGISTER_EVT
        When SPP VFS register, the event comes
    
    enumerator ESP_SPP_VFS_UNREGISTER_EVT
        When SPP VFS unregister, the event comes

Enumerations

enum **esp hf in band ring state t**

in-band ring tone state

*Values:*

- enumerator **ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED**
- enumerator **ESP_HF_IN_BAND_RINGTONE_PROVIDED**

enum **esp hf vr state t**

voice recognition state

*Values:*

- enumerator **ESP_HF_VR_STATE_DISABLED**
  - voice recognition disabled
- enumerator **ESP_HF_VR_STATE_ENABLED**
  - voice recognition enabled

enum **esp hf volume control target t**

Bluetooth HFP audio volume control target.

*Values:*

- enumerator **ESP_HF_VOLUME_CONTROL_TARGET_SPK**
  - speaker
- enumerator **ESP_HF_VOLUME_CONTROL_TARGET_MIC**
  - microphone

enum **esp hf audio state t**

Bluetooth HFP audio connection status.

*Values:*

- enumerator **ESP_HF_AUDIO_STATE_DISCONNECTED**
  - audio connection released
enumerator **ESP_HF_AUDIO_STATE_CONNECTING**
    audio connection has been initiated

denumerator **ESP_HF_AUDIO_STATE_CONNECTED**
    audio connection is established

denumerator **ESP_HF_AUDIO_STATE_CONNECTED_MSBC**
    mSBC audio connection is established

**enum esp hf volume type t**

*Values:*

denumerator **ESP_HF_VOLUME_TYPE_SPK**

denumerator **ESP_HF_VOLUME_TYPE_MIC**

**enum esp hf network state t**

*+CIND network service availability status*

*Values:*

  enumerator **ESP_HF_NETWORK_STATE_NOT_AVAILABLE**

  enumerator **ESP_HF_NETWORK_STATE_AVAILABLE**

**enum esp hf ciev report type t**

*+CIEV report type*

*Values:*

  enumerator **ESP_HF_IND_TYPE_CALL**
  position of call indicator

  enumerator **ESP_HF_IND_TYPE_CALLSETUP**
  position of callsetup indicator

  enumerator **ESP_HF_IND_TYPE_SERVICE**
  position of service indicator

  enumerator **ESP_HF_IND_TYPE_SIGNAL**
  position of signal strength indicator, range: 0-5

  enumerator **ESP_HF_IND_TYPE_ROAM**
  position of roaming indicator

  enumerator **ESP_HF_IND_TYPE_BATTCHG**
  position of battery charge indicator, range: 0-5

  enumerator **ESP_HF_IND_TYPE_CALLHELD**
  position of callheld indicator
enum esp hf service type t
+CIEV Service type

Values:

enumerator ESP_HF_SERVICE_TYPE_HOME

enumerator ESP_HF_SERVICE_TYPE_ROAMING

enum esp hf call status t
+CIND call status indicator values

Values:

enumerator ESP_HF_CALL_STATUS_NO_CALLS
no call in progress

denumerator ESP_HF_CALL_STATUS_CALL_IN_PROGRESS
call is present(active or held)

enum esp hf call setup status t
+CIND call setup status indicator values

Values:

enumerator ESP_HF_CALL_SETUP_STATUS_IDLE
no call setup in progress

denumerator ESP_HF_CALL_SETUP_STATUS_INCOMING
incoming call setup in progress

denumerator ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING
outgoing call setup in dialing state

denumerator ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING
outgoing call setup in alerting state

enum esp hf roaming status t
+CIND roaming status indicator values

Values:

enumerator ESP_HF_ROAMING_STATUS_INACTIVE
roaming is not active

denumerator ESP_HF_ROAMING_STATUS_ACTIVE
a roaming is active

enum esp hf call held status t
+CIND call held indicator values

Values:
enumerator ESP_HF_CALL_HELD_STATUS_NONE
  no calls held
enumerator ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE
  both active and held call
enumerator ESP_HF_CALL_HELD_STATUS_HELD
  call on hold, no active call

define esp_hf_current_call_status_t
  +CLCC status of the call
  Values:
  enumerator ESP_HF_CURRENT_CALL_STATUS_ACTIVE
    active
  enumerator ESP_HF_CURRENT_CALL_STATUS_HELD
    held
  enumerator ESP_HF_CURRENT_CALL_STATUS_DIALING
    dialing (outgoing calls only)
  enumerator ESP_HF_CURRENT_CALL_STATUS_ALERTING
    alerting (outgoing calls only)
  enumerator ESP_HF_CURRENT_CALL_STATUS_INCOMING
    incoming (incoming calls only)
  enumerator ESP_HF_CURRENT_CALL_STATUS_WAITING
    waiting (incoming calls only)
  enumerator ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD
    call held by response and hold

define esp_hf_current_call_direction_t
  +CLCC direction of the call
  Values:
  enumerator ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING
    outgoing
  enumerator ESP_HF_CURRENT_CALL_DIRECTION_INCOMING
    incoming

define esp_hf_current_call_mpty_type_t
  +CLCC multi-party call flag
  Values:
enumerator **ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE**
   not a member of a multi-party call

enumerator **ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI**
   member of a multi-party call

enum **esp_hf_current_call_mode_t**
   +CLCC call mode
   *Values:*
   
   enumerator **ESP_HF_CURRENT_CALL_MODE_VOICE**

   enumerator **ESP_HF_CURRENT_CALL_MODE_DATA**

   enumerator **ESP_HF_CURRENT_CALL_MODE_FAX**

enum **esp_hf_call_addr_type_t**
   +CLCC address type
   *Values:*
   
   enumerator **ESP_HF_CALL_ADDR_TYPE_UNKNOWN**
      unkown address type

   enumerator **ESP_HF_CALL_ADDR_TYPE INTERNATIONAL**
      international address

enum **esp_hf_subscriber_service_type_t**
   +CNUM service type of the phone number
   *Values:*
   
   enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN**
      unknown

   enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE**
      voice service

   enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX**
      fax service

enum **esp_hf_btrh_status_t**
   +BTRH response and hold result code
   *Values:*
   
   enumerator **ESP_HF_BTRH_STATUS_HELD**
      incoming call is put on hold in AG
enumerator **ESP_HF_BTRH_STATUS_ACCEPTED**
held incoming call is accepted in AG

enumerator **ESP_HF_BTRH_STATUS_REJECTED**
held incoming call is rejected in AG

enum **esp_hf_btrh_cmd_t**
AT+BTRH response and hold action code.
*Values:*

enumerator **ESP_HF_BTRH_CMD_HOLD**
put the incoming call on hold

enumerator **ESP_HF_BTRH_CMD_ACCEPT**
accept a held incoming call

enumerator **ESP_HF_BTRH_CMD_REJECT**
reject a held incoming call

enum **esp_hf_nrec_t**
*Values:*

enumerator **ESP_HF_NREC_STOP**

enumerator **ESP_HF_NREC_START**

enum **esp_hf_call_waiting_status_t**
+CCWA response status
*Values:*

enumerator **ESP_HF_CALL_WAITING_INACTIVE**

enumerator **ESP_HF_CALL_WAITING_ACTIVE**

enum **esp_hf_wbs_config_t**
*Values:*

enumerator **ESP_HF_WBS_NONE**

enumerator **ESP_HF_WBS_NO**

enumerator **ESP_HF_WBS_YES**

enum **esp_hf_connection_state_t**
Bluetooth HFP RFCOMM connection and service level connection status.
*Values:*

---

Submit Document Feedback
enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTED**
RFCCOMM data link channel released

enumerator **ESP_HF_CONNECTION_STATE_CONNECTING**
connecting remote device on the RFCOMM data link

enumerator **ESP_HF_CONNECTION_STATE_CONNECTED**
RFCCOMM connection established

enumerator **ESP_HF_CONNECTION_STATE_SLC_CONNECTED**
service level connection established

enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTING**
disconnecting with remote device on the RFCOMM data link

**enum esp_hf_chld_type_t**

AT+CHLD command values.

*Values:*

enumerator **ESP_HF_CHLD_TYPE_REL**
<0>, Terminate all held or set UDUB("busy") to a waiting call

enumerator **ESP_HF_CHLD_TYPE_REL_ACC**
<1>, Terminate all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_HOLD_ACC**
<2>, Hold all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_MERGE**
<3>, Add all held calls to a conference

enumerator **ESP_HF_CHLD_TYPE_MERGE_DETACH**
<4>, connect the two calls and disconnects the subscriber from both calls

enumerator **ESP_HF_CHLD_TYPE_REL_X**
<1x>, releases specified calls only

enumerator **ESP_HF_CHLD_TYPE_PRIV_X**
<2x>, request private consultation mode with specified call

**enum esp_hf_at_response_code_t**

*Values:*

enumerator **ESP_HF_AT_RESPONSE_CODE_OK**
acknowledges execution of a command line

enumerator **ESP_HF_AT_RESPONSE_CODE_ERR**
command not accepted
enumerator `ESP_HF_AT_RESPONSE_CODE_NO_CARRIER`
connection terminated

enumerator `ESP_HF_AT_RESPONSE_CODE_BUSY`
busy signal detected

enumerator `ESP_HF_AT_RESPONSE_CODE_NO_ANSWER`
connection completion timeout

enumerator `ESP_HF_AT_RESPONSE_CODE_DELAYED`
delayed

enumerator `ESP_HF_AT_RESPONSE_CODE_BLACKLISTED`
blacklisted

enumerator `ESP_HF_AT_RESPONSE_CODE_CME`
CME error

defined `esp_hf_at_response_t`
Values:

enumerator `ESP_HF_AT_RESPONSE_ERROR`

enumerator `ESP_HF_AT_RESPONSE_OK`

defined `esp_hf_cme_err_t`
Extended Audio Gateway Error Result Code Response.
Values:

enumerator `ESP_HF_CME_AG_FAILURE`
ag failure

enumerator `ESP_HF_CME_NO_CONNECTION_TO_PHONE`
no connection to phone

enumerator `ESP_HF_CME_OPERATION_NOT_ALLOWED`
operation not allowed

enumerator `ESP_HF_CME_OPERATION_NOT_SUPPORTED`
operation not supported

enumerator `ESP_HF_CME_PH_SIM_PIN_REQUIRED`
PH-SIM PIN Required

enumerator `ESP_HF_CME_SIM_NOT_INSERTED`
SIM not inserted
enumerator **ESP_HF_CME_SIM_PIN_REQUIRED**
SIM PIN required

enumerator **ESP_HF_CME_SIM_PUK_REQUIRED**
SIM PUK required

enumerator **ESP_HF_CME_SIM_FAILURE**
SIM failure

enumerator **ESP_HF_CME_SIM_BUSY**
SIM busy

enumerator **ESP_HF_CME_INCORRECT_PASSWORD**
incorrect password

enumerator **ESP_HF_CME_SIM_PIN2_REQUIRED**
SIM PIN2 required

enumerator **ESP_HF_CME_SIM_PUK2_REQUIRED**
SIM PUK2 required

enumerator **ESP_HF_CME_MEMORY_FULL**
memory full

enumerator **ESP_HF_CME_INVALID_INDEX**
invalid index

enumerator **ESP_HF_CME_MEMORY_FAILURE**
memory failure

enumerator **ESP_HF_CME_TEXT_STRING_TOO_LONG**
text string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING**
invalid characters in text string

enumerator **ESP_HF_CME_DIAL_STRING_TOO_LONG**
dial string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING**
invalid characters in dial string

enumerator **ESP_HF_CME_NO_NETWORK_SERVICE**
no network service

enumerator **ESP_HF_CME_NETWORK_TIMEOUT**
network timeout

enumerator **ESP_HF_CME_NETWORK_NOT_ALLOWED**
network not allowed—emergency calls only
HFP Client API

API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h

This header file can be included with:
```
#include "esp_hf_client_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```
or
```
PRIV_REQUIRES bt
```

Functions

**esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)**

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Parameters**
callback -- [in] HFP client event callback function

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**esp_err_t esp_hf_client_init**(void)

Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

**Returns**
- ESP_OK: if the initialization request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_deinit**(void)

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_connect(esp_bd_addr_t remote_bda)**

Establish a Service Level Connection to remote bluetooth HFP audio gateway(AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

**Parameters**
remote_bda -- [in] remote bluetooth device address

**Returns**
- ESP_OK: connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_disconnect(esp_bd_addr_t remote_bda)**

Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().
Parameters `remote_bda` -- [in] remote bluetooth device address

Returns
- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)`
Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters `remote_bda` -- [in] remote bluetooth device address

Returns
- ESP_OK: connect audio request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_disconnect_audio (esp_bd_addr_t remote_bda)`
Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters `remote_bda` -- [in] remote bluetooth device address

Returns
- ESP_OK: disconnect audio request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_start_voice_recognition (void)`
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
- ESP_OK: starting voice recognition is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_stop_voice_recognition (void)`
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Returns
- ESP_OK: stopping voice recognition is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_volume_update (esp_hf_volume_control_target_t type, int volume)`
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters
- `type` -- [in] volume control target, speaker or microphone
- `volume` -- [in] gain of the speaker of microphone, ranges 0 to 15

Returns
- ESP_OK: volume update is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_dial (const char *number)`
Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

Parameters `number` -- [in] number string of the call. If NULL, the last number is called (aka re-dial)

Returns
**ESP_OK**: a call placing is sent to lower layer

**ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled

**ESP.FAIL**: others

### esp_err_t esp_hf_client_dial_memory (int location)

Place a call with number specified by location(speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- `location` -- [in] location of the number in the memory

**Returns**

- **ESP_OK**: a memory call placing is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others

### esp_err_t esp_hf_client_send_chld_cmd (esp_hf_chld_type_t chld, int idx)

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- `chld` -- [in] AT+CHLD call hold and multiparty handling AT command.
- `idx` -- [in] used in Enhanced Call Control Mechanisms, used if `chld` is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

**Returns**

- **ESP_OK**: command AT+CHLD is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others

### esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Parameters**

- `btrh` -- [in] response and hold action to send

**Returns**

- **ESP_OK**: command AT+BTRH is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others

### esp_err_t esp_hf_client_answer_call (void)

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**

- **ESP_OK**: a call answering is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others

### esp_err_t esp_hf_client_reject_call (void)

Reject an incoming call or terminate an ongoing call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**

- **ESP_OK**: the call rejecting is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others

### esp_err_t esp_hf_client_query_current_calls (void)

Query list of current calls in AG(send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**

- **ESP_OK**: query of current calls is sent to lower layer
- **ESP.ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP.FAIL**: others
Chapter 2. API Reference

`esp_err_t esp_hf_client_query_current_operator_name (void)`
Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

- **Returns**
  - ESP_OK: query of current operator name is sent to lower layer
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_hf_client_retrieve_subscriber_info (void)`
Get subscriber information number from AG (send AT+CNUM command). As a precondition to use this API, Service Level Connection shall exist with AG.

- **Returns**
  - ESP_OK: the retrieving of subscriber information is sent to lower layer
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_hf_client_send_dtmf (char code)`
Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

  - **Parameters**
    - `code` -- [in] dtmf code, single ascii character in the set 0-9, #, *, A-D

  - **Returns**
    - ESP_OK: the DTMF codes are sent to lower layer
    - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
    - ESP_FAIL: others

`esp_err_t esp_hf_client_send_xapl (char* information, uint32_t features)`
Send command to enable Vendor specific feature to indicate battery level and dock status. This is Apple-specific commands, but used by most device, including Android and Windows.

  - **Parameters**
    - `information` -- [in] XAPL vendorID-productID-version, such as "0505-1995-0610"
      vendorID: A string representation of the hex value of the vendor ID from the manufacturer, without the 0x prefix. productID: A string representation of the hex value of the product ID from the manufacturer, without the 0x prefix. version: The revision of the software
    - `features` -- [in] A base-10 representation of a bit field. such as ESP_HF_CLIENT_XAPL_FEAT_BATTERY_REPORT

  - **Returns**
    - ESP_OK: Feature enable request is sent to lower layer
    - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
    - ESP_FAIL: others

`esp_err_t esp_hf_client_send_iphoneaccev (uint32_t bat_level, bool docked)`
Send Battery level and dock status. Enable this feature using XAPL command first. This is Apple-specific commands, but used by most device, including Android and Windows.

  - **Parameters**
    - `bat_level` -- [in] Battery Level: value between 0 and 9
    - `docked` -- [in] Dock State: false = undocked, true = docked

  - **Returns**
    - ESP_OK: battery level is sent to lower layer
    - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
    - ESP_FAIL: others

`esp_err_t esp_hf_client_request_last_voice_tag_number (void)`
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

- **Returns**
Chapter 2. API Reference

- ESP_OK: the phone number request corresponding to last voice tag recorded is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_nrec (void)
```
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Returns**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
```
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Parameters**
- `recv` -- [in] HFP client incoming data callback function
- `send` -- [in] HFP client outgoing data callback function

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
esp_err_t esp_hf_client_pkt_stat_nums_get (uint16_t sync_conn_handle)
```
Get the number of packets received and sent. This function is only used in the case that Voice Over HCI is enabled and the audio state is connected. When the operation is completed, the callback function will be called with ESP_HF_CLIENT_PKT_STAT_NUMS_GET_EVT.

**Parameters**
- `sync_conn_handle` -- [in] the (e)SCO connection handle

**Returns**
- ESP_OK: if the request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
void esp_hf_client_outgoing_data_ready (void)
```
Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

```c
void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)
```
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- `src_sps` -- [in] original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- `bits` -- [in] number of bits per pcm sample (16)
- `channels` -- [in] number of channels (i.e. mono(1), stereo(2)...)
Chapter 2. API Reference

- **in_bytes** -- [in] length of the input PCM sample buffer in byte
- **dst** -- [in] pointer to the buffer which is to be used to store the converted PCM samples

**Returns** number of samples converted

**Unions**

```c
union esp_hf_client_cb_param_t
{
    #include <esp_hf_client_api.h> HFP client callback parameters.

**Public Members**

the total number of packets received

uint32_t rx_correct
the total number of packets data correctly received

uint32_t rx_err
the total number of packets data with possible invalid

uint32_t rx_none
the total number of packets data no received

uint32_t rx_lost
the total number of packets data partially lost

uint32_t tx_total
the total number of packets send

uint32_t tx_discarded
the total number of packets send lost

struct hf_client_service_availability_param

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t* buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

    Param buf [in]: pointer to incoming data (payload of HCI synchronous data packet), the buffer
    is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
    finished.

    Param len [in]: size (in bytes) in buf

typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t* buf, uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio
connection is set up and the application layer has prepared data to send, the lower layer will call this function
to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not
enough, return value 0 is supposed.

    Param buf [in]: pointer to incoming data (payload of HCI synchronous data packet), the buffer
    is allocated inside bluetooth protocol stack and will be released after invoke of the callback is
    finished.

    Param len [in]: size (in bytes) in buf

    Return length of data successfully read

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
HFP client callback function type.
Chapter 2. API Reference

**Param event**: Event type

**Param param**: Pointer to callback parameter

### Enumerations

**enum esp_hf_client_connection_state_t**
Bluetooth HFP RFCOMM connection and service level connection status.

*Values:*

- **enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED**
  RFCOMM data link channel released

- **enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING**
  connecting remote device on the RFCOMM data link

- **enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED**
  RFCOMM connection established

- **enumerator ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED**
  service level connection established

- **enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING**
  disconnecting with remote device on the RFCOMM data link

**enum esp_hf_client_audio_state_t**
Bluetooth HFP audio connection status.

*Values:*

- **enumerator ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED**
  audio connection released

- **enumerator ESP_HF_CLIENT_AUDIO_STATE_CONNECTING**
  audio connection has been initiated

- **enumerator ESP_HF_CLIENT_AUDIO_STATE_CONNECTED**
  audio connection is established

- **enumerator ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC**
  mSBC audio connection is established

**enum esp_hf_client_in_band_ring_state_t**
in-band ring tone state

*Values:*

- **enumerator ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED**

- **enumerator ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED**
enum esp_hf_client_cb_event_t

HF CLIENT callback events.

Values:

enumerator ESP_HF_CLIENT_CONNECTION_STATE_EVT
    connection state changed event

enumerator ESP_HF_CLIENT_AUDIO_STATE_EVT
    audio connection state change event

enumerator ESP_HF_CLIENT_BVRA_EVT
    voice recognition state change event

enumerator ESP_HF_CLIENT_CIND_CALL_EVT
    call indication

enumerator ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
    call setup indication

enumerator ESP_HF_CLIENT_CIND_CALL_HELD_EVT
    call held indication

enumerator ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
    network service availability indication

enumerator ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
    signal strength indication

enumerator ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
    roaming status indication

enumerator ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
    battery level indication

enumerator ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
    current operator information

enumerator ESP_HF_CLIENT_BTRH_EVT
    call response and hold event

enumerator ESP_HF_CLIENT_CLIP_EVT
    Calling Line Identification notification

enumerator ESP_HF_CLIENT_CCWA_EVT
    call waiting notification

enumerator ESP_HF_CLIENT_CLCC_EVT
    list of current calls notification
enumerator **ESP_HF_CLIENT_VOLUME_CONTROL_EVT**
  audio volume control command from AG, provided by +VGM or +VGS message

enumerator **ESP_HF_CLIENT_AT_RESPONSE_EVT**
  AT command response event

enumerator **ESP_HF_CLIENT_CNUM_EVT**
  subscriber information response from AG

enumerator **ESP_HF_CLIENT_BSIR_EVT**
  setting of in-band ring tone

enumerator **ESP_HF_CLIENT_BINP_EVT**
  requested number of last voice tag from AG

enumerator **ESP_HF_CLIENT_RING_IND_EVT**
  ring indication event

enumerator **ESP_HF_CLIENT_PKT_STAT_NUMS_GET_EVT**
  requested number of packet different status

**HFP AG API**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h
- This header file can be included with:
  ```
  #include "esp_hf_ag_api.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRES bt
  ```
  or
  ```
  PRIV_REQUIRES bt
  ```

**Functions**

```cpp
esp_err_t esp_hf_ag_register_callback(esp_hf_cb_t callback)
```

Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Parameters**

- callback -- [in] HFP AG event callback function

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
**esp_err_t esp_hf_ag_init**(void)

Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

**Returns**
- ESP_OK: if the initialization request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_deinit**(void)

De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_slc_connect**(esp_bd_addr_t remote_bda)

To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

**Parameters**
- **remote_bda** -- [in] remote bluetooth HFP client device address

**Returns**
- ESP_OK: connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_slc_disconnect**(esp_bd_addr_t remote_bda)

Disconnect from the remote HFP client. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

**Parameters**
- **remote_bda** -- [in] remote bluetooth device address

**Returns**
- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_audio_connect**(esp_bd_addr_t remote_bda)

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_bda** -- [in] remote bluetooth device address

**Returns**
- ESP_OK: audio connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_audio_disconnect**(esp_bd_addr_t remote_bda)

Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_bda** -- [in] remote bluetooth device address

**Returns**
- ESP_OK: audio disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_vra_control**(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)

Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
Chapter 2. API Reference

• `remote_bda` -- [in] the device address of voice recognition initiator
• `value` -- [in] 0 - voice recognition disabled, 1- voice recognition enabled

Returns
• ESP_OK: response of volume recognition is sent to lower layer
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_ag_volume_control (esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)
```

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
• `remote_bda` -- [in] remote bluetooth device address
• `type` -- [in] volume control target, speaker or microphone
• `volume` -- [in] gain of the speaker of microphone, ranges 0 to 15

Returns
• ESP_OK: volume synchronization control is sent to lower layer
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if arguments are invalid
• ESP_FAIL: others

```c
esp_err_t esp_hf_ag_unknown_at_send (esp_bd_addr_t remote_addr, char*unat)
```

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
• `remote_addr` -- [in] remote bluetooth device address
• `unat` -- [in] User AT command response to HF Client. It will response "ERROR" by default if unat is NULL.

Returns
• ESP_OK: response of unknown AT command is sent to lower layer
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cmee_send (esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)
```

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
• `remote_bda` -- [in] remote bluetooth device address
• `response_code` -- [in] AT command response code
• `error_code` -- [in] CME error code

Returns
• ESP_OK: extend error code is sent to lower layer
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_ag_devices_status_indchange (esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)
```

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Parameters
• `remote_addr` -- [in] remote bluetooth device address
• `call_state` -- [in] call state
• `call_setup_state` -- [in] call setup state
• `ntk_state` -- [in] network service state
Chapter 2. API Reference

- **signal** -- [in] signal strength from 0 to 5

**Returns**
- ESP_OK: device status notification is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if arguments are invalid
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_ciev_report( esp_bd_addr_t remote_addr, esp_hf_ciev_report_type_t ind_type, int value )
```

Send indicator report "+CIEV:<ind><value>" to HFP Client. "CIEV" means "indicator events reporting", and all indicator types can be sent one type at a time. As a pre-condition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** -- [in] remote bluetooth device address
- **ind_type** -- [in] indicator type
- **value** -- [in] indicator value

**Returns**
- ESP_OK: indicator report is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cind_response( esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal, esp_hf_roaming_status_t roam, int batt_lev, esp_hf_call_held_status_t call_held_status )
```

Response to device individual indicators to HFP Client. As a pre-condition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** -- [in] remote bluetooth device address
- **call_state** -- [in] call state
- **call_setup_state** -- [in] call setup state
- **ntk_state** -- [in] network service state
- **signal** -- [in] signal strength from 0 to 5
- **roam** -- [in] roam state
- **batt_lev** -- [in] battery level from 0 to 5
- **call_held_status** -- [in] call held status

**Returns**
- ESP_OK: response to device individual indicators is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if the arguments are invalid
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cops_response( esp_bd_addr_t remote_addr, char *name )
```

Response for AT+COPS command from HF Client. As a pre-condition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** -- [in] remote bluetooth device address
- **name** -- [in] current operator name

**Returns**
- ESP_OK: response for AT+COPS command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_clcc_response( esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_mpty_type_t mpty, char *number, esp_hf_call_addr_type_t type )
```

---

Submit Document Feedback

Espressif Systems 492  Release master
Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_addr` -- [in] remote bluetooth device address
- `index` -- [in] the index of current call, starting with 1, finishing response with 0 (send OK)
- `dir` -- [in] call direction (incoming/outgoing)
- `current_call_state` -- [in] current call state
- `mode` -- [in] current call mode (voice/data/fax)
- `mpty` -- [in] single or multi type
- `number` -- [in] current call number
- `type` -- [in] international type or unknown

**Returns**
- ESP_OK: response to AT+CLCC command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cnum_response(esp_bd_addr_t remote_addr, char*number, int number_type,
          esp_hf_subscriber_service_type_t service_type)
```

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_addr` -- [in] remote bluetooth device address
- `number` -- [in] registration number
- `number_type` -- [in] value of number type from 128-143: national or international, may contain prefix and/or escape digits 144-159: international, includes country code prefix, add “+” if needed 160-175: national, but no prefix nor escape digits
- `service_type` -- [in] service type (unknown/voice/fax)

**Returns**
- ESP_OK: response for AT+CNUM command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)
```

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_addr` -- [in] remote bluetooth device address
- `state` -- [in] in-band ring tone state

**Returns**
- ESP_OK: information of in-band ring tone is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if arguments are invalid
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_answer_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
          esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
          char *number, esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- `remote_addr` -- [in] remote bluetooth device address
- `num_active` -- [in] the number of active call
- `num_held` -- [in] the number of held call
- `call_state` -- [in] call state
Chapter 2. API Reference

- **call_setup_state** -- [in] call setup state
- **number** -- [in] number of the incoming call
- **call_addr_type** -- [in] call address type

**Returns**

- ESP_OK: answer incoming call is sent to lower layer
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_reject_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                           esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                           char* number, esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- **remote_addr** -- [in] remote Bluetooth device address
- **num_active** -- [in] the number of active call
- **num_held** -- [in] the number of held call
- **call_state** -- [in] call state
- **call_setup_state** -- [in] call setup state
- **number** -- [in] number of the incoming call
- **call_addr_type** -- [in] call address type

**Returns**

- ESP_OK: reject incoming call is sent to lower layer
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                           esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                           char* number, esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client. If the AG is driven by the HF to call esp_hf_ag_out_call, it needs to respond an OK or ERROR to HF. But if the AG is actively calling esp_hf_ag_out_call, it does not need to take a response to HF.

**Parameters**

- **remote_addr** -- [in] remote Bluetooth device address
- **num_active** -- [in] the number of active call
- **num_held** -- [in] the number of held call
- **call_state** -- [in] call state
- **call_setup_state** -- [in] call setup state
- **number** -- [in] number of the outgoing call
- **call_addr_type** -- [in] call address type

**Returns**

- ESP_OK: a call initiation is sent to lower layer
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                           esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                           char* number, esp_hf_call_addr_type_t call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**

- **remote_addr** -- [in] remote Bluetooth device address
- **num_active** -- [in] the number of active call
- **num_held** -- [in] the number of held call
- **call_state** -- [in] call state
- **call_setup_state** -- [in] call setup state
- **number** -- [in] number of the call
call_addr_type -- [in] call address type

**Returns**

- ESP_OK: end an ongoing call is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_register_data_callback(esp_hf_incoming_data_cb_t recv,
                                         esp_hf_outgoing_data_cb_t send)
```

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

**Parameters**

- `recv` -- [in] HFP client incoming data callback function
- `send` -- [in] HFP client outgoing data callback function

**Returns**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
esp_err_t esp_hf_ag_pkt_stat_nums_get(uint16_t sync_conn_handle)
```

Get the number of packets received and sent.

**Parameters**

- `sync_conn_handle` -- [in] the (e)SCO connection handle

**Returns**

- ESP_OK: if the request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
void esp_hf_ag_outgoing_data_ready(void)
```

Trigger the lower-layer to fetch and send audio data.

**Public Members**

```c
union esp_hf_cb_param_t
```

Include `<esp_hf_ag_api.h>` HFP AG callback parameters.

**Unions**

```c
union esp_hf_cb_param_t
```

AG callback param of ESP_HF_CONNECTION_STATE_EVT

```c

**Type Definitions**

```c
typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t* buf, uint32_t len)

AG incoming data callback function, the callback is useful in case of Voice Over HCI.

- **Param buf [in]**: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len [in]**: size (in bytes) in buf
```

```c
typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t* buf, uint32_t len)

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

- **Param buf [in]**: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len [in]**: size (in bytes) in buf
- **Return**: length of data successfully read
```

```c
typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)

HF AG callback function type.

- **Param event**: Event type
- **Param param**: Pointer to callback parameter
```

**Enumerations**

```c
enum esp_hf_cb_event_t

HF callback events.

Values:

- enumerator ESP_HF_CONNECTION_STATE_EVT
  Connection state changed event
```

Final Codec Choice
### Bluetooth® HID Device API

**Overview**  A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

**Application Example**  Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - `bluetooth/bluedroid/classic_bt/bt_hid_mouse_device`

### API Reference

**Header File**

- `components/bt/host/bluedroid/api/include/api/esp_hidd_api.h`

  This header file can be included with:

  ```
  #include "esp_hidd_api.h"
  ```

  This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES bt
  ```

  or

  ```
  PRIV_REQUIRES bt
  ```

**Functions**

- `esp_err_t esp_bt_hid_device_register_callback(esp_hd_cb_t callback)`  
  This function is called to init callbacks with HID device module.

  **Parameters**  `callback`  -- [in] pointer to the init callback function.

  **Returns**  
  - ESP_OK: success  
  - other: failed
**esp_err_t esp_bt_hid_device_init (void)**

Initializes HIDD interface. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_register_callback. When the operation is complete, the callback function will
be called with ESP_HIDD_INIT_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_deinit (void)**

De-initializes HIDD interface. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called
with ESP_HIDD_DEINIT_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_register_app (esp_hidd_app_param_t *app_param,**

`esp_hidd_qos_param_t *in_qos,**

`esp_hidd_qos_param_t *out_qos`)**

Registers HIDD parameters with SDP and sets l2cap Quality of Service. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called
with ESP_HIDD_REGISTER_APP_EVT.

**Parameters**
- app_param -- [in] HIDD parameters
- in_qos -- [in] incoming QoS parameters
- out_qos -- [in] outgoing QoS parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_unregister_app (void)**

Removes HIDD parameters from SDP and resets l2cap Quality of Service. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called
with ESP_HIDD_UNREGISTER_APP_EVT.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_connect (esp_bd_addr_t bd_addr)**

Connects to the peer HID Host with virtual cable. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called
with ESP_HIDD_OPEN_EVT.

**Parameters**
- bd_addr -- [in] Remote host bluetooth device address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_bt_hid_device_disconnect (void)**

Disconnects from the currently connected HID Host. This function should be called after
esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be
called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called
with ESP_HIDD_CLOSE_EVT.
Note: The disconnect operation will not remove the virtually cabled device. If the connect request from the different HID Host, it will reject the request.

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_send_report (esp_hid_report_type_t type, uint8_t id, uint16_t len, uint8_t *data)
```

Sends HID report to the currently connected HID Host. This function should be called after esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called with ESP_HIDD_SEND_REPORT_EVT.

Parameters
- `type` -- [in] type of report
- `id` -- [in] report id as defined by descriptor
- `len` -- [in] length of report
- `data` -- [in] report data

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_report_error (esp_hid_handshake_error_t error)
```

Sends HID Handshake with error info for invalid set_report to the currently connected HID Host. This function should be called after esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called with ESP_HIDD_REPORT_ERR_EVT.

Parameters
- `error` -- [in] type of error

Returns
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_virtual_cable_unplug (void)
```

Remove the virtually cabled device. This function should be called after esp_bluedroid_init()/esp_bluedroid_init_with_cfg() and esp_bluedroid_enable() success, and should be called after esp.bt_hid_device_init(). When the operation is complete, the callback function will be called with ESP_HIDD_VC_UNPLUG_EVT.

Note: If the connection exists, then HID Device will send a VIRTUAL_CABLE_UNPLUG control command to the peer HID Host, and the connection will be destroyed. If the connection does not exist, then HID Device will only unplug on it's single side. Once the unplug operation is success, the related pairing and bonding information will be removed, then the HID Device can accept connection request from the different HID Host.

Returns
- ESP_OK: success
- other: failed

Unions

```c
union esp_hidd_cb_param_t
```

#undef include <esp_hid_api.h> HID device callback parameters union.

```

**Type Definitions**

```c
typedef void (*esp_hd_cb_t)(esp_hidd_cb_event_t event, esp_hidd_cb_param_t *param)
    HID device callback function type.

    **Param event** Event type
    **Param param** Point to callback parameter, currently is union type
```
Enumerations

enum `esp_hid_handshake_error_t`
  HIDD handshake result code.
  
  **Values:**
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_SUCCESS`
  successful
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_NOT_READY`
  not ready, device is too busy to accept data
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_REP_ID`
  invalid report ID
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNSUPPORTED_REQ`
  device does not support the request
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_PARAM`
  parameter value is out of range or inappropriate
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNKNOWN`
  device could not identify the error condition
  
  enumerator `ESP_HID_PAR_HANDSHAKE_RSP_ERR_FATAL`
  restart is essential to resume functionality

enum `esp_hid_report_type_t`
  HIDD report types.
  
  **Values:**
  
  enumerator `ESP_HID_REPORT_TYPE_OTHER`
  unknown report type
  
  enumerator `ESP_HID_REPORT_TYPE_INPUT`
  input report
  
  enumerator `ESP_HID_REPORT_TYPE_OUTPUT`
  output report
  
  enumerator `ESP_HID_REPORT_TYPE_FEATURE`
  feature report
  
  enumerator `ESP_HID_REPORT_TYPE_INTRDATA`
  special value for reports to be sent on interrupt channel, INPUT is assumed

enum `esp_hid_connection_state_t`
  HIDD connection state.
  
  **Values:**
enumerator **ESP_HIDD_CONN_STATE_CONNECTED**
   HID connection established

enumerator **ESP_HIDD_CONN_STATE_CONNECTING**
   connection to remote Bluetooth device

enumerator **ESP_HIDD_CONN_STATE_DISCONNECTED**
   connection released

enumerator **ESP_HIDD_CONN_STATE_DISCONNECTING**
   disconnecting to remote Bluetooth device

enumerator **ESP_HIDD_CONN_STATE_UNKNOWN**
   unknown connection state

enum **esp_hidd_protocol_mode_t**
   HID device protocol modes.
   
   *Values:*

   enumerator **ESP_HIDD_REPORT_MODE**
      Report Protocol Mode

   enumerator **ESP_HIDD_BOOT_MODE**
      Boot Protocol Mode

   enumerator **ESP_HIDD_UNSUPPORTED_MODE**
      unsupported

enum **esp_hidd_boot_report_id_t**
   HID Boot Protocol report IDs.
   
   *Values:*

   enumerator **ESP_HIDD_BOOT_REPORT_ID_KEYBOARD**
      report ID of Boot Protocol keyboard report

   enumerator **ESP_HIDD_BOOT_REPORT_ID_MOUSE**
      report ID of Boot Protocol mouse report

enum [anonymous]
   HID Boot Protocol report size including report ID.
   
   *Values:*

   enumerator **ESP_HIDD_BOOT_REPORT_SIZE_KEYBOARD**
      report size of Boot Protocol keyboard report

   enumerator **ESP_HIDD_BOOT_REPORT_SIZE_MOUSE**
      report size of Boot Protocol mouse report
enum esp_hidd_cb_event_t

HID device callback function events.

Values:

- enumerator ESP_HIDD_INIT_EVT
  - When HID device is initialized, the event comes

- enumerator ESP_HIDD_DEINIT_EVT
  - When HID device is deinitialized, the event comes

- enumerator ESP_HIDD_REGISTER_APP_EVT
  - When HID device application registered, the event comes

- enumerator ESP_HIDD_UNREGISTER_APP_EVT
  - When HID device application unregistered, the event comes

- enumerator ESP_HIDD_OPEN_EVT
  - When HID device connection to host opened, the event comes

- enumerator ESP_HIDD_CLOSE_EVT
  - When HID device connection to host closed, the event comes

- enumerator ESP_HIDD_SEND_REPORT_EVT
  - When HID device send report to lower layer, the event comes

- enumerator ESP_HIDD_REPORT_ERR_EVT
  - When HID device report handshake error to lower layer, the event comes

- enumerator ESP_HIDD_GET_REPORT_EVT
  - When HID device receives GET_REPORT request from host, the event comes

- enumerator ESP_HIDD_SET_REPORT_EVT
  - When HID device receives SET_REPORT request from host, the event comes

- enumerator ESP_HIDD_SET_PROTOCOL_EVT
  - When HID device receives SET_PROTOCOL request from host, the event comes

- enumerator ESP_HIDD_INTR_DATA_EVT
  - When HID device receives DATA from host on intr, the event comes

- enumerator ESP_HIDD_VC_UNPLUG_EVT
  - When HID device initiates Virtual Cable Unplug, the event comes

- enumerator ESP_HIDD_API_ERR_EVT
  - When HID device has API error, the event comes

enum esp_hidd_status_t

Values:
enumerator **ESP_HIDD_SUCCESS**

enumerator **ESP_HIDD_ERROR**
    general ESP HID error

enumerator **ESP_HIDD_NO_RES**
    out of system resources

enumerator **ESP_HIDD_BUSY**
    Temporarily can not handle this request.

enumerator **ESP_HIDD_NO_DATA**
    No data.

enumerator **ESP_HIDD_NEED_INIT**
    HIDD module shall init first

enumerator **ESP_HIDD_NEED_DEINIT**
    HIDD module shall deinit first

enumerator **ESP_HIDD_NEED_REG**
    HIDD module shall register first

enumerator **ESP_HIDD_NEED_DEREG**
    HIDD module shall deregister first

enumerator **ESP_HIDD_NO_CONNECTION**
    connection may have been closed

**Bluetooth® HID Host API**

**Overview** A Bluetooth HID host is a device or software that is capable of connecting and communicating with Bluetooth HID devices, such as keyboards, mice. Users can use the Bluetooth HID Host APIs to send output data or control commands to the HID devices, enabling them to control the behavior or settings of the devices.

**Application Example** Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- Example `bluetooth/esp_hid_host` is implemented using the generic `esp_hid` APIs. `esp_hid` APIs are build upon the Bluetooth HID APIs and can be a reference.

**API Reference**

**Header File**

- `components/bt/host/bluedroid/api/include/api/esp_hidh_api.h`
- This header file can be included with:

  ```c
  #include "esp_hidh_api.h"
  ```

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your `CMakeLists.txt`:

Submit Document Feedback
Functions

\texttt{esp_err_t esp_bt_hid_host_register_callback (esp_hh_cb_t callback)}

This function is called to init callbacks with HID host module.

\textbf{Parameters} \texttt{callback} -- [in] pointer to the init callback function.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_init (void)}

This function initializes HID host. This function should be called after esp_bluedroid_enable() and esp_bluedroid_init()/esp_bluedroid_init_with_cfg() success, and should be called after esp_bt_hid_host_register_callback(). When the operation is complete the callback function will be called with ESP_HIDH_INIT_EVT.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_deinit (void)}

Closes the interface. This function should be called after esp_bluedroid_enable() and esp_bluedroid_init()/esp_bluedroid_init_with_cfg() success, and should be called after esp_bt_hid_host_init(). When the operation is complete the callback function will be called with ESP_HIDH_DEINIT_EVT.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_connect (esp_bd_addr_t bd_addr)}

Connect to HID device. When the operation is complete the callback function will be called with ESP_HIDH_OPEN_EVT.

\textbf{Parameters} \texttt{bd_addr} -- [in] Remote device bluetooth device address.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_disconnect (esp_bd_addr_t bd_addr)}

Disconnect from HID device. When the operation is complete the callback function will be called with ESP_HIDH_CLOSE_EVT.

\textbf{Parameters} \texttt{bd_addr} -- [in] Remote device bluetooth device address.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_virtual_cable_unplug (esp_bd_addr_t bd_addr)}

Virtual UnPlug (VUP) the specified HID device. When the operation is complete the callback function will be called with ESP_HIDH_VC_UNPLUG_EVT.

\textbf{Parameters} \texttt{bd_addr} -- [in] Remote device bluetooth device address.

\textbf{Returns}
- ESP_OK: success
- other: failed

\texttt{esp_err_t esp_bt_hid_host_set_info (esp_bd_addr_t bd_addr, esp_hidh_hid_info_t *hid_info)}

Set the HID device descriptor for the specified HID device. When the operation is complete the callback function will be called with ESP_HIDH_SET_INFO_EVT.

\textbf{Parameters}
- \texttt{bd_addr} -- [in] Remote device bluetooth device address.
• **hid_info** -- [in] HID device descriptor structure.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_get_protocol (esp_bd_addr_t bd_addr)
```

Get the HID proto mode. When the operation is complete the callback function will be called with ESP_HIDH_GET_PROTO_EVT.

**Parameters**

- **bd_addr** -- [in] Remote device Bluetooth device address.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_set_protocol (esp_bd_addr_t bd_addr, esp_hidh_protocol_mode_t protocol_mode)
```

Set the HID proto mode. When the operation is complete the callback function will be called with ESP_HIDH_SET_PROTO_EVT.

**Parameters**

- **bd_addr** -- [in] Remote device Bluetooth device address.
- **protocol_mode** -- [in] Protocol mode type.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_get_idle (esp_bd_addr_t bd_addr)
```

Get the HID Idle Time. When the operation is complete the callback function will be called with ESP_HIDH_GET_IDLE_EVT.

**Parameters**

- **bd_addr** -- [in] Remote device Bluetooth device address.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_set_idle (esp_bd_addr_t bd_addr, uint16_t idle_time)
```

Set the HID Idle Time. When the operation is complete the callback function will be called with ESP_HIDH_SET_IDLE_EVT.

**Parameters**

- **bd_addr** -- [in] Remote device Bluetooth device address.
- **idle_time** -- [in] Idle time rate

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_get_report (esp_bd_addr_t bd_addr, esp_hidh_report_type_t report_type, uint8_t *report, size_t len, int buffer_size)
```

Send a GET_REPORT to HID device. When the operation is complete the callback function will be called with ESP_HIDH_GET_RPT_EVT.

**Parameters**

- **bd_addr** -- [in] Remote device Bluetooth device address.
- **report_type** -- [in] Report type
- **report_id** -- [in] Report id
- **buffer_size** -- [in] Buffer size

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_set_report (esp_bd_addr_t bd_addr, esp_hidh_report_type_t report_type, uint8_t *report, size_t len)
```

Send a SET_REPORT to HID device. When the operation is complete the callback function will be called with ESP_HIDH_SET_RPT_EVT.

**Parameters**
• `bd_addr` -- [in] Remote device Bluetooth device address.
• `report_type` -- [in] Report type
• `report` -- [in] Report data pointer
• `len` -- [in] Report data length

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_host_send_data (esp_bd_addr_t *bd_addr, uint8_t *data, size_t len)
```

Send data to HID device. When the operation is complete the callback function will be called with ESP_HIDH_DATA_EVT.

**Parameters**
- `bd_addr` -- [in] Remote device Bluetooth device address.
- `data` -- [in] Data pointer
- `len` -- [in] Data length

**Returns**
- ESP_OK: success
- other: failed

**Unions**

```c
union esp_hidh_cb_param_t
```

#include `<esp_hidh_api.h>` HID host callback parameters union.

**Public Members**

```c
struct esp_hidh_cb_param_t::hidh_init_evt_param init
```

HIDH callback param of ESP_HIDH_INIT_EVT

```c
struct esp_hidh_cb_param_t::hidh_uninit_evt_param deinit

BTHH_MAX_DSC_LEN
maximum size of HID Device report descriptor
```
Type Definitions

typedef void (*esp_hh_cb_t)(esp_hidh_cb_event_t event, esp_hidh_cb_param_t *param)

HID host callback function type.

Param event Event type
Param param Point to callback parameter, currently is union type

Enumerations

enum esp_hidh_connection_state_t

HID host connection state.

Values:

enumerator ESP_HIDH_CONN_STATE_CONNECTED

connected state

enumerator ESP_HIDH_CONN_STATE_CONNECTING

connecting state

enumerator ESP_HIDH_CONN_STATE_DISCONNECTED

disconnected state

enumerator ESP_HIDH_CONN_STATE_DISCONNECTING

disconnecting state

enumerator ESP_HIDH_CONN_STATE_UNKNOWN

unknown state (initial state)

enum esp_hidh_status_t

HID handshake error code and vendor-defined result code.

Values:

enumerator ESP_HIDH_OK

successful

enumerator ESP_HIDH_HS_HID_NOT_READY

handshake error: device not ready

enumerator ESP_HIDH_HS_INVALID_RPT_ID

handshake error: invalid report ID

enumerator ESP_HIDH_HS_TRANS_NOT_SPT

handshake error: HID device does not support the request

enumerator ESP_HIDH_HS_INVALID_PARAM

handshake error: parameter value does not meet the expected criteria of called function or API

enumerator ESP_HIDH_HS_ERROR

handshake error: HID device could not identify the error condition
enumerator **ESP_HIDH_ERR**
- general ESP HID Host error

enumerator **ESP_HIDH_ERR_SDP**
- SDP error

enumerator **ESP_HIDH_ERR_PROTO**
- SET_PROTOCOL error, only used in ESP_HIDH_OPEN_EVT callback

enumerator **ESP_HIDH_ERR_DB_FULL**
- device database full, used in ESP_HIDH_OPEN_EVT/ESP_HIDH_ADD_DEV_EVT

enumerator **ESP_HIDH_ERR_TOD_UNSPT**
- type of device not supported

enumerator **ESP_HIDH_ERR_NO_RES**
- out of system resources

enumerator **ESP_HIDH_ERR_AUTH_FAILED**
- authentication fail

enumerator **ESP_HIDH_ERR_HDL**
- connection handle error

enumerator **ESP_HIDH_ERR_SEC**
- encryption error

enumerator **ESP_HIDH_BUSY**
- vendor-defined: temporarily can not handle this request

enumerator **ESP_HIDH_NO_DATA**
- vendor-defined: no data.

enumerator **ESP_HIDH_NEED_INIT**
- vendor-defined: HIDH module shall initialize first

enumerator **ESP_HIDH_NEED_DEINIT**
- vendor-defined: HIDH module shall de-initialize first

enumerator **ESP_HIDH_NO_CONNECTION**
- vendor-defined: connection may have been closed

enum **esp_hidh_protocol_mode_t**
- HID host protocol modes.

_values:

enumerator **ESP_HIDH_BOOT_MODE**
- boot protocol mode
Chapter 2. API Reference

enumerator ESP_HIDH_REPORT_MODE
    report protocol mode

enumerator ESP_HIDH_UNSUPPORTED_MODE
    unsupported protocol mode

enum esp_hidh_report_type_t
    HID host report types.
    Values:

enumerator ESP_HIDH_REPORT_TYPE_OTHER
    unsupported report type

enumerator ESP_HIDH_REPORT_TYPE_INPUT
    input report type

enumerator ESP_HIDH_REPORT_TYPE_OUTPUT
    output report type

enumerator ESP_HIDH_REPORT_TYPE_FEATURE
    feature report type

enum esp_hidh_cb_event_t
    HID host callback function events.
    Values:

enumerator ESP_HIDH_INIT_EVT
    when HID host is initialized, the event comes

enumerator ESP_HIDH_DEINIT_EVT
    when HID host is deinitialized, the event comes

enumerator ESP_HIDH_OPEN_EVT
    when HID host connection opened, the event comes

enumerator ESP_HIDH_CLOSE_EVT
    when HID host connection closed, the event comes

enumerator ESP_HIDH_GET_RPT_EVT
    when Get_Report command is called, the event comes

enumerator ESP_HIDH_SET_RPT_EVT
    when Set_Report command is called, the event comes

enumerator ESP_HIDH_GET_PROTO_EVT
    when Get_Protocol command is called, the event comes
enumerator ESP_HIDH_SET_PROTO_EVT
    when Set_Protocol command is called, the event comes

enumerator ESP_HIDH_GET_IDLE_EVT
    when Get_Idle command is called, the event comes

enumerator ESP_HIDH_SET_IDLE_EVT
    when Set_Idle command is called, the event comes

enumerator ESP_HIDH_GET_DSCP_EVT
    when HIDH is initialized, the event comes

enumerator ESP_HIDH_ADD_DEV_EVT
    when a device is added, the event comes

enumerator ESP_HIDH_RMV_DEV_EVT
    when a device is removed, the event comes

enumerator ESP_HIDH_VC_UNPLUG_EVT
    when virtually unplugged, the event comes

enumerator ESP_HIDH_DATA_EVT
    when send data on interrupt channel, the event comes

enumerator ESP_HIDH_DATA_IND_EVT
    when receive data on interrupt channel, the event comes

enumerator ESP_HIDH_SET_INFO_EVT
    when set the HID device descriptor, the event comes

enum esp_hidh_dev_attr_t
    HID device information from HID Device Service Record and Device ID Service Record.
    Values:

enumerator ESP_HIDH_DEV_ATTR_VIRTUAL_CABLE
    whether Virtual Cables is supported

enumerator ESP_HIDH_DEV_ATTR_NORMALLY_CONNECTABLE
    whether device is in Page Scan mode when there is no active connection

enumerator ESP_HIDH_DEV_ATTR_RECONNECT_INITIATE
    whether the HID device initiates the reconnection process

enum esp_hidh_dev_app_id_t
    application ID(non-zero) for each type of device
    Values:
enumerator **ESP_HIDH_APP_ID_MOUSE**  
pointing device

enumerator **ESP_HIDH_APP_ID_KEYBOARD**  
keyboard

enumerator **ESP_HIDH_APP_ID_REMOTE_CONTROL**  
remote control

enumerator **ESP_HIDH_APP_ID_JOYSTICK**  
joystick

enumerator **ESP_HIDH_APP_ID_GAMEPAD**  
gamepad

### Classic Bluetooth® L2CAP API

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a BT_L2CAP demo. This demo can connect, send and receive L2CAP data `bluetooth/bluedroid/classic_bt/bt_l2cap_client`, `bluetooth/bluedroid/classic_bt/bt_l2cap_server`

### API Reference

#### Header File

- components/bt/host/bluedroid/api/include/api/esp_l2cap_bt_api.h
- This header file can be included with:

```c
#include "esp_l2cap_bt_api.h"
```

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

#### Functions

**`esp_err_t esp_bt_l2cap_register_callback(esp_bt_l2cap_cb_t callback)`**

This function is called to init callbacks with L2CAP module.

**Parameters** `callback` -- [in] pointer to the init callback function.

**Returns**
- ESP_OK: success
- other: failed

**`esp_err_t esp_bt_l2cap_init()`**

This function is called to init L2CAP module. When the operation is completed, the callback function will be called with `ESP_BT_L2CAP_INIT_EVT`. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Returns**
• ESP_OK: success
• other: failed

`esp_err_t esp_bt_l2cap_deinit (void)`
This function is called to uninit l2cap module. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_UNINIT_EVT. This function should be called after esp_bt_l2cap_init() completes successfully.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_bt_l2cap_connect (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t remote_psm, esp_bd_addr_t peer_bd_addr)`
This function makes an L2CAP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_BT_L2CAP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters
• cntl_flag -- [in] Lower 16-bit security settings mask.
• remote_psm -- [in] Remote device bluetooth Profile PSM.
• peer_bd_addr -- [in] Remote device bluetooth device address.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_bt_l2cap_start_srv (esp_bt_l2cap_cntl_flags_t cntl_flag, uint16_t local_psm)`
This function creates a L2CAP server and starts listening for an L2CAP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_BT_L2CAP_START_EVT. When the connection is established, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters
• cntl_flag -- [in] Lower 16-bit security settings mask.
• local_psm -- [in] Dynamic PSM.

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_bt_l2cap_stop_all_srv (void)`
This function stops all L2CAP servers. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Returns
• ESP_OK: success
• other: failed

`esp_err_t esp_bt_l2cap_stop_srv (uint16_t local_psm)`
This function stops a specific L2CAP server. The operation will close all active L2CAP connection first on the specific L2CAP server, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

Parameters
• local_psm -- [in] Dynamic PSM.
Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_register (void)
```

This function is used to register VFS. Only supports write, read and close. This function must be called after `esp_bt_l2cap_init()` successful and before `esp_bt_l2cap_deinit()`.

Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_unregister (void)
```

This function is used to unregister VFS. This function must be called after `esp_bt_l2cap_init()` successful and before `esp_bt_l2cap_deinit()`.

Returns

- ESP_OK: success
- other: failed

Unions

```c

Macros

**ESP_BT_L2CAP_SEC_NONE**

Security Setting Mask. Use these three mask mode:

- a. ESP_BT_L2CAP_SEC_NONE
- b. ESP_BT_L2CAP_SEC_AUTHENTICATE
- c. (ESP_BT_L2CAP_SEC_ENCRYPT|ESP_BT_L2CAP_SEC_AUTHENTICATE) No security
Chapter 2. API Reference

**ESP_BT_L2CAP_SEC_AUTHORIZE**
Authorization required

**ESP_BT_L2CAP_SEC_AUTHENTICATE**
Authentication required

**ESP_BT_L2CAP_SEC_ENCRYPT**
Encryption required

**Type Definitions**

typedef uint32_t esp_bt_l2cap_cntl_flags_t

typedef void (*esp_bt_l2cap_cb_t)(esp_bt_l2cap_cb_event_t event, esp_bt_l2cap_cb_param_t *param)

L2CAP callback function type.

**Param event** Event type

**Param param** Point to callback parameter, currently is union type

**Enumerations**
enum esp_bt_l2cap_status_t
L2CAP operation success and failure codes.

**Values:**

enumerator **ESP_BT_L2CAP_SUCCESS**
Successful operation.

enumerator **ESP_BT_L2CAP_FAILURE**
Generic failure.

enumerator **ESP_BT_L2CAP_BUSY**
Temporarily can not handle this request.

enumerator **ESP_BT_L2CAP_NO_RESOURCE**
No more resource

enumerator **ESP_BT_L2CAP_NEED_INIT**
L2CAP module shall init first

enumerator **ESP_BT_L2CAP_NEED_DEINIT**
L2CAP module shall deinit first

enumerator **ESP_BT_L2CAP_NO_CONNECTION**
Connection may have been closed

enumerator **ESP_BT_L2CAP_NO_SERVER**
No server
enum esp_bt_l2cap_cb_event_t
L2CAP callback function events.

Values:

tenumerator ESP_BT_L2CAP_INIT_EVT
      When L2CAP is initialized, the event comes

tenumerator ESP_BT_L2CAP_UNINIT_EVT
      When L2CAP is deinitialized, the event comes

tenumerator ESP_BT_L2CAP_OPEN_EVT
      When L2CAP Client connection open, the event comes

tenumerator ESP_BT_L2CAP_CLOSE_EVT
      When L2CAP connection closed, the event comes

tenumerator ESP_BT_L2CAP_START_EVT
      When L2CAP server started, the event comes

tenumerator ESP_BT_L2CAP_CL_INIT_EVT
      When L2CAP client initiated a connection, the event comes

tenumerator ESP_BT_L2CAP_SRV_STOP_EVT
      When L2CAP server stopped, the event comes

Bluetooth® SDP APIs

Overview Bluetooth SDP reference APIs.

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_sdp_api.h
- This header file can be included with:

```cpp
#include "esp_sdp_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cpp
REQUIRES bt
```

or

```cpp
PRIV_REQUIRES bt
```

Functions

```cpp
callback esp_sdp_register_callback(callback)
```

This function is called to init callbacks with SDP module.

**Parameters** callback -- [in] pointer to the init callback function.
Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_init (void)`

This function is called to init SDP module. When the operation is completed, the callback function will be called with ESP_SDP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_deinit (void)`

This function is called to de-initialize SDP module. The operation will remove all SDP records, then the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT, and the number of ESP_SDP_REMOVE_RECORD_COMP_EVT is equal to the number of SDP records. When the operation is completed, the callback function will be called with ESP_SDP_DEINIT_EVT. This function should be called after esp_sdp_init() completes successfully.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_search_record (esp_bd_addr_t bd_addr, esp_bt_uuid_t uuid)`

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SDP_SEARCH_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `bd_addr` -- [in] Remote device bluetooth device address.
- `uuid` -- [in] Service UUID of the remote device.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_create_record (esp_bluetooth_sdp_record_t *record)`

This function is called to create SDP records. When the operation is completed, the callback function will be called with ESP_SDP_CREATE_RECORD_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `record` -- [in] The SDP record to create.

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_sdp_remove_record (int record_handle)`

This function is called to remove a SDP record. When the operation is completed, the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT. This function must be called after esp_sdp_init() successful and before esp_sdp_deinit().

Parameters

- `record_handle` -- [in] The SDP record handle.

Returns

- ESP_OK: success
- other: failed

Unions

**Type Definitions**

typedef struct `bluetooth_sdp_hdr_overlay` `esp_bluetooth_sdp_hdr_overlay_t`
Some signals need additional pointers, hence we introduce a generic way to handle these pointers.

typedef struct `bluetooth_sdp_mas_record` `esp_bluetooth_sdp_mas_record_t`
Message Access Profile - Server parameters.

typedef struct `bluetooth_sdp_mns_record` `esp_bluetooth_sdp_mns_record_t`
Message Access Profile - Client (Notification Server) parameters.

typedef struct `bluetooth_sdp_pse_record` `esp_bluetooth_sdp_pse_record_t`
Phone Book Profile - Server parameters.

typedef struct `bluetooth_sdp_pce_record` `esp_bluetooth_sdp_pce_record_t`
Phone Book Profile - Client parameters.
typedef struct _bluetooth_sdp_ops_record esp_bluetooth_sdp_ops_record_t
Object Push Profile parameters.

typedef struct _bluetooth_sdp_sap_record esp_bluetooth_sdp_sap_record_t
SIM Access Profile parameters.

typedef void (*esp_sdp_cb_t)(esp_sdp_cb_event_t event, esp_sdp_cb_param_t *param)
SDP callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

### Enumerations

define esp_sdp_status_t

**Values**:

- **enumerator ESP_SDP_SUCCESS**: Successful operation.
- **enumerator ESP_SDP_FAILURE**: Generic failure.
- **enumerator ESP_SDP_NO_RESOURCE**: No more resource
- **enumerator ESP_SDP_NEED_INIT**: SDP module shall init first
- **enumerator ESP_SDP_NEED_DEINIT**: SDP module shall deinit first
- **enumerator ESP_SDP_NO_CREATE_RECORD**: No record created

define esp_sdp_cb_event_t

**Values**:

- **enumerator ESP_SDP_INIT_EVT**: When SDP is initialized, the event comes
- **enumerator ESP_SDP_DEINIT_EVT**: When SDP is deinitialized, the event comes
- **enumerator ESP_SDP_SEARCH_COMP_EVT**: When SDP search complete, the event comes
- **enumerator ESP_SDP_CREATE_RECORD_COMP_EVT**: When create SDP records complete, the event comes
When remove a SDP record complete, the event comes

tYPE

enum esp_bluetooth_sdp_types_t
SDP record type.

Values:

enumerator ESP_SDP_TYPE_RAW
Used to carry raw SDP search data for unknown UUIDs

enumerator ESP_SDP_TYPE_MAP_MAS
Message Access Profile - Server

enumerator ESP_SDP_TYPE_MAP_MNS
Message Access Profile - Client (Notification Server)

enumerator ESP_SDP_TYPE_PBAP_PSE
Phone Book Profile - Server

enumerator ESP_SDP_TYPE_PBAP_PCE
Phone Book Profile - Client

enumerator ESP_SDP_TYPE_OPP_SERVER
Object Push Profile

enumerator ESP_SDP_TYPE_SAP_SERVER
SIM Access Profile

2.3.4 Controller & VHCI

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

- This is a Bluetooth® Low Energy (Bluetooth LE) advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for Bluetooth Low Energy advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h
- This header file can be included with:

```c
#include "esp_bt.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or
Chapter 2. API Reference

The following are the functions provided in this section:

**Functions**

- **esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)**
  - Set BLE TX power Connection Tx power should only be set after connection created.
  - **Parameters**
    - `power_type` -- The type of which tx power, could set Advertising/Connection/Default and etc
    - `power_level` -- Power level(index) corresponding to absolute value(dbm)
  - **Returns**: ESP_OK - success, other - failed

- **esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)**
  - Get BLE TX power Connection Tx power should only be get after connection created.
  - **Parameters**
    - `power_type` -- The type of which tx power, could set Advertising/Connection/Default and etc
  - **Returns**: >= 0 - Power level, < 0 - Invalid

- **esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)**
  - Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.
  - **Parameters**
    - `min_power_level` -- The minimum power level
    - `max_power_level` -- The maximum power level
  - **Returns**: ESP_OK - success, other - failed

- **esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)**
  - Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.
  - **Parameters**
    - `min_power_level` -- The minimum power level
    - `max_power_level` -- The maximum power level
  - **Returns**: ESP_OK - success, other - failed

- **esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)**
  - Set default SCO datapath Should be called after controller is enabled, and before (e)SCO link is established.
  - **Parameters**
    - `data_path` -- SCO data path
  - **Returns**: ESP_OK - success, other - failed

- **esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)**
  - Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.
  - **Parameters**
    - `cfg` -- Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.
  - **Returns**: ESP_OK - success, other - failed

- **esp_err_t esp_bt_controller_deinit (void)**
  - De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.
This function should be called only once, after any other BT functions are called.

**Returns** ESP_OK - success, other - failed

### esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Parameters**

- **mode** -- the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of esp_bt_controller_init().

**Returns** ESP_OK - success, other - failed

### esp_err_t esp_bt_controller_disable (void)

Disable BT controller.

**Returns** ESP_OK - success, other - failed

### esp_bt_controller_status_t esp_bt_controller_get_status (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Returns** status value

### bool esp_vhci_host_check_send_available (void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

**Returns** true for ready to send, false means cannot send packet

### void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- **data** -- the packet point
- **len** -- the packet length

### esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

**Parameters**

- **callback** -- esp_vhci_host_callback type variable

**Returns** ESP_OK - success, ESP_FAIL - failed

### esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data
consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of \texttt{esp_BT_mem_release()} function

**Parameters** \texttt{mode} -- : the mode want to release memory

**Returns** ESP\_OK - success, other - failed

\texttt{esp\_err\_t esp\_bt\_mem\_release (esp\_bt\_mode\_t mode)}

\texttt{esp\_bt\_mem\_release()} release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling \texttt{esp\_bt\_controller\_mem\_release()}. Additionally, if the mode is set to ESP\_BT\_MODE\_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call \texttt{esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM)} before \texttt{esp\_bt\_controller\_init} or after \texttt{esp\_bt\_controller\_deinit}.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

\begin{verbatim}
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
\end{verbatim}

**Note:** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP\_BT\_MODE\_BTDM as controller is dual mode.

**Parameters** \texttt{mode} -- : the mode whose memory is to be released

**Returns** ESP\_OK - success, other - failed

\texttt{esp\_err\_t esp\_bt\_sleep\_enable (void)}

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before \texttt{esp\_bt\_controller\_enable()}

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if \texttt{CONFIG\_CTRL\_BTDM\_MODEM\_SLEEP} is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function ”\texttt{esp\_bt\_controller\_wakeup\_request}”.

**Returns**

- ESP\_OK : success
- other : failed

\texttt{esp\_err\_t esp\_bt\_sleep\_disable (void)}

disable bluetooth modem sleep

Note that this function shall not be invoked before \texttt{esp\_bt\_controller\_enable()}

---

**Chapter 2. API Reference**

---

Submit Document Feedback
If esp_bt_sleep_disable() is called, the Bluetooth controller will not be allowed to enter modem sleep;
If ORIG modem sleep mode is in use, if this function is called, the Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush (void)
```
Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached. The amount of device in the filter can be configured in menuconfig.

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Returns**
- ESP_OK: success
- other: failed

```c
void esp_wifi_bt_power_domain_on (void)
```
b Wi-Fi power domain on

```c
void esp_wifi_bt_power_domain_off (void)
```
b Wi-Fi power domain off

### Structures

```c
struct esp_bt_controller_config_t
```
Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

#### Public Members

```c
uint16_t controller_task_stack_size
```
Bluetooth controller task stack size

```c
uint8_t controller_task_prio
```
Bluetooth controller task priority

```c
uint8_t hci_uart_no
```
If use UART1/2 as HCI IO interface, indicate UART number

```c
uint32_t hci_uart_baudrate
```
If use UART1/2 as HCI IO interface, indicate UART baudrate

```c
uint8_t scan_duplicate_mode
```
scan duplicate mode

```c
uint8_t scan_duplicate_type
```
scan duplicate type
uint16_t normal_adv_size
    Normal adv size for scan duplicate

uint16_t mesh_adv_size
    Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
    Controller minimum memory value

uint32_t controller_debug_flag
    Controller debug log flag

uint8_t mode
    Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
    BLE maximum connection numbers

uint8_t bt_max_acl_conn
    BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
    SCO data path, i.e. HCI or PCM module

bool auto_latency
    BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vsEvt
    BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
    BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
    BLE low power crystal accuracy index

uint8_t pcm_role
    PCM role (master & slave)

uint8_t pcm_polar
    PCM polar trig (falling clk edge & rising clk edge)

bool hli
    Using high level interrupt or not

uint16_t dup_list_refresh_period
    Duplicate scan list refresh period
uint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
    callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
    Bluetooth mode for controller enable/disable.
    Values:

    enumerator ESP_BT_MODE_IDLE
        Bluetooth is not running

    enumerator ESP_BT_MODE_BLE
        Run BLE mode

    enumerator ESP_BT_MODE_CLASSIC_BT
        Run Classic BT mode

    enumerator ESP_BT_MODE_BTDM
        Run dual mode

enum [anonymous]
    BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
    ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
    Values:

    enumerator ESP_BLE_SCA_500PPM
        BLE SCA at 500ppm
enumerator `ESP_BLE_SCA_250PPM`
   BLE SCA at 250ppm

enumerator `ESP_BLE_SCA_150PPM`
   BLE SCA at 150ppm

enumerator `ESP_BLE_SCA_100PPM`
   BLE SCA at 100ppm

enumerator `ESP_BLE_SCA_75PPM`
   BLE SCA at 75ppm

enumerator `ESP_BLE_SCA_50PPM`
   BLE SCA at 50ppm

enumerator `ESP_BLE_SCA_30PPM`
   BLE SCA at 30ppm

enumerator `ESP_BLE_SCA_20PPM`
   BLE SCA at 20ppm

enum `esp_bt_controller_status_t`
Bluetooth controller enable/disable/initialised/de-initialised status.
Values:

enumerator `ESP_BT_CONTROLLER_STATUS_IDLE`

enumerator `ESP_BT_CONTROLLER_STATUS_INITED`

enumerator `ESP_BT_CONTROLLER_STATUS_ENABLED`

enumerator `ESP_BT_CONTROLLER_STATUS_NUM`

enum `esp_ble_power_type_t`
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.
Values:

enumerator `ESP_BLE_PWR_TYPE_CONN_HDL0`
   For connection handle 0

enumerator `ESP_BLE_PWR_TYPE_CONN_HDL1`
   For connection handle 1
enumerator `ESP_BLE_PWR_TYPE_CONN_HDL2`  
For connection handle 2

dependent `ESP_BLE_PWR_TYPE_CONN_HDL3`  
For connection handle 3

dependent `ESP_BLE_PWR_TYPE_CONN_HDL4`  
For connection handle 4

dependent `ESP_BLE_PWR_TYPE_CONN_HDL5`  
For connection handle 5

dependent `ESP_BLE_PWR_TYPE_CONN_HDL6`  
For connection handle 6

dependent `ESP_BLE_PWR_TYPE_CONN_HDL7`  
For connection handle 7

dependent `ESP_BLE_PWR_TYPE_CONN_HDL8`  
For connection handle 8

dependent `ESP_BLE_PWR_TYPE_ADV`  
For advertising

dependent `ESP_BLE_PWR_TYPE_SCAN`  
For scan

dependent `ESP_BLE_PWR_TYPE_DEFAULT`  
For default, if not set other, it will use default value

dependent `ESP_BLE_PWR_TYPE_NUM`  
TYPE numbers

eenum `esp_power_level_t`  
Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

**Values:**

dependent `ESP_PWR_LVL_N12`  
Corresponding to -12dbm

dependent `ESP_PWR_LVL_N9`  
Corresponding to -9dbm

dependent `ESP_PWR_LVL_N6`  
Corresponding to -6dbm

dependent `ESP_PWR_LVL_N3`  
Corresponding to -3dbm
enumerator `ESP_PWR_LVL_N0`
   Corresponding to 0dbm

enumerator `ESP_PWR_LVL_P3`
   Corresponding to +3dbm

enumerator `ESP_PWR_LVL_P6`
   Corresponding to +6dbm

enumerator `ESP_PWR_LVL_P9`
   Corresponding to +9dbm

enumerator `ESP_PWR_LVL_N14`
   Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator `ESP_PWR_LVL_N11`
   Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator `ESP_PWR_LVL_N8`
   Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator `ESP_PWR_LVL_N5`
   Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator `ESP_PWR_LVL_N2`
   Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator `ESP_PWR_LVL_P1`
   Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator `ESP_PWR_LVL_P4`
   Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator `ESP_PWR_LVL_P7`
   Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum `esp_sco_data_path_t`
   Bluetooth audio data transport path.
   
   **Values:**

   enumerator `ESP_SCO_DATA_PATH_HCI`
      data over HCI transport

   enumerator `ESP_SCO_DATA_PATH_PCM`
      data over PCM interface
2.3.5 ESP-BLE-MESH

**Note:** The current ESP-BLE-MESH v1.1 related code is a preview version, so the Mesh Protocol v1.1 related Structures, MACROs, and APIs involved in the code may be changed.

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *Getting Started with ESP-BLE-MESH*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH Architecture*.

**Application Examples and Demos**

Please refer to Sections *ESP-BLE-MESH Examples* and *ESP-BLE-MESH Demo Videos*.

**API Reference**

ESP-BLE-MESH APIs are divided into the following parts:

- *ESP-BLE-MESH Definitions*
- *ESP-BLE-MESH Core API Reference*
- *ESP-BLE-MESH Models API Reference*
- *ESP-BLE-MESH (v1.1) Core API Reference*

**ESP-BLE-MESH Definitions**

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

**Header File**

- `components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`
- This header file can be included with:

  ```c
  #include "esp_ble_mesh_defs.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES bt
  ```
  or

  ```cmake
  LinkerFlags -Wl,-rpath=""-Wl,-rpath=""../components/bt/esp_ble_mesh/api"
  ```
Unions

union esp_ble_mesh_prov_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

Public Members

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
provisioner_prov_read_oob_pub_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
provisioner_prov_input_num_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
provisioner_prov_input_str_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
provisioner_set_node_name_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
provisioner_add_local_app_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
provisioner_update_local_app_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param
provisioner_bind_app_key_to_model_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param
provisioner_add_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param
provisioner_update_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param
provisioner_store_node_comp_data_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param
provisioner_delete_node_with_uuid_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
provisioner_delete_node_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner
Indicate the result of Proxy Client send Solicitation PDU

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages
struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_direct_erase_settings_comp
ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous]

provisioner_open_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

cchar uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
Provisioner settings user id

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_open_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_info_comp_param
set_fast_prov_info_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_action_comp_param
set_fast_prov_action_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_heartbeat_msg_recv_param
heartbeat_msg_recv
Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param
lpn_enable_comp
Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param
lpn_disable_comp
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param lpn_poll_comp
   Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_establish_param
   lpn_friendship_establish
   Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_terminate_param
   lpn_friendship_terminate
   Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_establish_param
   frnd_friendship_establish
   Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param
   frnd_friendship_terminate
   Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_adv_pkt_param
   proxy_client_recv_adv_pkt
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connected_param
   proxy_client_connected
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnected_param
   proxy_client_disconnected
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_filter_status_param
   proxy_client_recv_filter_status
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connect_comp_param
   proxy_client_connect_comp
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnect_comp_param
   proxy_client_disconnect_comp
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_set_filter_type_comp_param
   proxy_client_set_filter_type_comp
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_add_filter_addr_comp_param
   proxy_client_add_filter_addr_comp
   Event parameter of ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_remove_filter_addr_comp_param`  
`proxy_client_remove_filter_addr_comp`  
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_directed_proxy_set_param`  
`proxy_client_directed_proxy_set_comp`  
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DIRECTED_PROXY_SET_COMP_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_server_connected_param`  
`proxy_server_connected`  
Event parameter of ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_server_disconnected_param`  
`proxy_server_disconnected`  
Event parameter of ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT

uint16_t `net_idx`  
Corresponding NetKey Index

uint16_t `ssrc`  
Solicitation SRC

uint16_t `dst`  
Solicitation DST

struct `esp_ble_mesh_prov_cb_param_t::[anonymous]`  
`proxy_client_send_solic_pdu_comp`  
ESP_BLE_MESH_PROXY_CLIENT_SEND_SOLIC_PDU_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SEND_SOLIC_PDU_COMP_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_model_sub_group_addr_comp_param`  
`model_sub_group_addr_comp`  
Event parameters of ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_model_unsub_group_addr_comp_param`  
`model_unsub_group_addr_comp`  
Event parameters of ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_deinit_mesh_comp_param`  
`deinit_mesh_comp`  
Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

```
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.
```

**Public Members**

int `err_code`  
Indicate the result of BLE Mesh deinitialization

struct `ble_mesh_deinit_mesh_comp_param`  
#include `<esp_ble_mesh_defs.h>` ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.
Public Members

```c
uint16_t lpn_addr
```

Low Power Node unicast address

```
struct __attribute__((packed)) ble_mesh_friend_friendship_terminate_param
```

#include `<esp_ble_mesh_defs.h>` ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

```c
eenum [anonymous]
```

This enum value is the reason of friendship termination on the friend node side

Values:

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted

Public Members

```c
uint16_t lpn_addr
```

Low Power Node unicast address

```c
eenum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
```

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

```
struct __attribute__((packed)) ble_mesh_heartbeat_msg_recv_param
```

#include `<esp_ble_mesh_defs.h>` ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT.
```

Public Members

```c
uint8_t link_idx
```
Index of the provisioning link

```c
struct ble_mesh_provisioner_prov_record_recv_comp_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_RECORD_RECV_COMP_EVT.
```

Public Members

```c
uint8_t status
```
Indicates whether or not the request was handled successfully

```c
uint16_t link_idx
```
Index of the provisioning link

```c
uint16_t record_id
```
Identifies the provisioning record for which the request is made

```c
uint16_t frag_offset
```
The starting offset of the requested fragment in the provisioning record data

```c
uint16_t total_len
```
Total length of the provisioning record data stored on the Provisionee

```c
uint8_t* record
```
Provisioning record data fragment

```c
struct ble_mesh_provisioner_recv_prov_records_list_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_RECV_PROV_RECORDS_LIST_EVT.
```

Public Members

```c
uint16_t link_idx
```
Index of the provisioning link

```c
uint16_t len
```
Length of message
\texttt{uint8_t* msg}

Lists the Record IDs of the provisioning records stored on the Provisionee

\textbf{Public Members}

\texttt{uint8_t dev_uuid[16]}

Device UUID of the unprovisioned device

\texttt{esp_ble_mesh_bd_addr_t addr}

Device address of the unprovisioned device

\texttt{esp_ble_mesh_addr_type_t addr_type}

Device address type

\texttt{uint16_t oob_info}

OOB Info of the unprovisioned device

\texttt{uint8_t adv_type}

Advertising type of the unprovisioned device

\texttt{esp_ble_mesh_prov_bearer_t bearer}

Bearer of the unprovisioned device

\texttt{int8_t rssi}

RSSI of the received advertising packet

\textbf{Public Members}

\texttt{uint16_t link_idx}

Index of the provisioning link

\texttt{int err_code}

Indicate the result of send Link Close message

\textbf{Public Members}

\texttt{uint16_t link_idx}

Index of the provisioning link

\texttt{int err_code}

Indicate the result of send Link Close message
uint16_t link_idx
Index of the provisioning link

int err_code
Indicate the result of send Provisioning Invite message

struct ble_mesh_provisioner_send_prov_record_req_evt_param

  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode
  Opcode of the previously sent message

esp_ble_mesh_model_t *model
  Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
  Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode
  Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
  Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
  Pointer to the context of the message
uint16_t length
Length of the received message

uint8_t *msg
Value of the received message

struct ble_mesh_model_operation_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t opcode
Opcode of the received message

esp_ble_mesh_model_t *model
Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the received message

uint16_t length
Length of the received message

uint8_t *msg
Value of the received message

struct ble_mesh_model_publish_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
Indicate the result of publishing a message

esp_ble_mesh_model_t *model
Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.
Public Members

int err_code
Indicate the result of sending a message

uint32_t opcode
Opcode of the message

esp_ble_mesh_model_t *model
Pointer to the model which sends the message

esp_ble_mesh_msg_ctxt_t *ctx
Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int err_code
Indicate the result of updating server model state

esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

bool erase_flash
Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_uar_t
Format of Unicast Address Range

Public Members

uint16_t len_present
Indicate the presence or absence of the RangeLength field
uint16_t range_start
15 least significant bits of the starting unicast address

uint8_t range_length
Number of addresses in the range (0x02 - 0xFF)

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

**Public Members**

uint16_t element_addr
Element Address, assigned during provisioning.

const uint16_t location
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t sig_model_count
SIG Model count

const uint8_t vnd_model_count
Vendor Model count

esp_ble_mesh_model_t *sig_models
SIG Models

esp_ble_mesh_model_t *vnd_models
Vendor Models

struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

**Public Members**

esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
Publish Address.

uint16_t app_idx
Publish AppKey Index.

uint16_t cred
Friendship Credentials Flag.
Chapter 2. API Reference

uint16_t send_rel
    Force reliable sending (segment acks)

uint16_t send_szmic
    Size of TransMIC when publishing a Segmented Access message

uint8_t ttl
    Publish Time to Live.

uint8_t retransmit
    Retransmit Count & Interval Steps.

uint8_t period
    Publish Period.

uint8_t period_div
    Divisor for the Period.

uint8_t fast_period
    Use FastPeriodDivisor

uint8_t count
    Retransmissions left.

uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.
    This will get correctly created when the publication context has been defined using the
    ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
    ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
    Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct
    bt_mesh_model_op in mesh_access.h
Public Members

const uint32_t opcode
   Message opcode

const size_t min_len
   Message minimum length

esp_ble_mesh_cb_t param_cb
   Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
   Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cbs in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
   Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
   Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
   16-bit model identifier

uint16_t company_id
   16-bit company identifier

uint16_t model_id
   16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
   Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
   Model ID

uint8_t element_idx
   Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
   Is the Nth model in the element
uint16_t flags
    Information about what has changed

.esp_ble_mesh_elem_t *element
    The Element to which this Model belongs

.esp_ble_mesh_model_pub_t *const pub
    Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
    AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
    Subscription List (group or virtual addresses)

.esp_ble_mesh_model_op_t *op
    Model operation context

.esp_ble_mesh_model_cbs_t *cb
    Model callback structure

void *user_data
    Model-specific user data

struct esp_ble_mesh_msg_ctx_t
    Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

**Public Members**

uint16_t net_idx
    NetKey Index of the subnet through which to send the message.

uint16_t app_idx
    AppKey Index for message encryption.

uint16_t addr
    Remote address.

uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of a received message. Not used for sending.

uint32_t recv_op
    Opcode of a received message. Not used for sending.
uint8_t recv_ttl
    Received TTL value. Not used for sending.

uint8_t recv_cred
    Security credentials of a received message. Not used for sending.

uint8_t recv_tag
    Tag of a received message. Not used for sending.

uint8_t send_rel
    Force sending reliably by using segment acknowledgement.

uint8_t send_szmic
    Size of TransMIC when sending a Segmented Access message.

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint8_t send_cred
    Security credentials used for sending the message

uint8_t send_tag
    Tag used for sending the message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

**Public Members**

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier
size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer
    Provisioning Bearer

struct esp_ble_mesh_device_delete_t
    Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

union esp_ble_mesh_device_delete_t::[anonymous] [anonymous]
    Union of Device information

uint8_t flag
    BIT0: device address; BIT1: device UUID
struct `esp_ble_mesh_prov_data_info_t`
Information of the provisioner which is going to be updated.

**Public Members**

```c
uint16_t net_idx
NetKey Index
```

```c
uint8_t flags
Flags
```

```c
uint32_t iv_index
IV Index
```

union `esp_ble_mesh_prov_data_info_t::[anonymous]` [anonymous]
Provisioning data

```c
uint8_t flag
BIT0: net_idx; BIT1: flags; BIT2: iv_index
```

struct `esp_ble_mesh_node_t`
Information of the provisioned node

**Public Members**

```c
disp_ble_mesh_bd_addr_t addr
Node device address
```

```c
disp_ble_mesh_addr_type_t addr_type
Node device address type
```

```c
uint8_t dev_uuid[16]
Device UUID
```

```c
uint16_t oob_info
Node OOB information
```

```c
uint16_t unicast_addr
Node unicast address
```

```c
uint8_t element_num
Node element number
```

```c
uint16_t net_idx
Node NetKey Index
```
**Chapter 2. API Reference**

```c
uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t *comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

**Public Members**

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
    Context of Provisioner heartbeat filter information to be set
```
Public Members

`uint16_t hb_src`
Heartbeat source address (unicast address)

`uint16_t hb_dst`
Heartbeat destination address (unicast address or group address)

`struct esp_ble_mesh_client_op_pair_t`
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

`uint32_t cli_op`
The client message opcode

`uint32_t status_op`
The server status opcode corresponding to the client message opcode

`struct esp_ble_mesh_client_t`
Client Model user data context.

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the client model. Initialized by the stack.

`uint32_t op_pair_size`
Size of the op_pair

`const esp_ble_mesh_client_op_pair_t *op_pair`
Table containing get/set message opcode and corresponding status message opcode

`uint32_t publish_status`
Callback used to handle the received unsolicited message. Initialized by the stack.

`void *internal_data`
Pointer to the internal data of client model

`void *vendor_data`
Pointer to the vendor data of client model

`uint8_t msg_role`
Role of the device (Node/Provisioner) that is going to send messages

`struct esp_ble_mesh_client_common_param_t`
Common parameters of the messages sent by Client Model.
### Public Members

```c
esp_ble_mesh_opcode_t opcode
   Message opcode
```

```c
esp_ble_mesh_model_t *model
   Pointer to the client model structure
```

```c
esp_ble_mesh_msg_ctx_t ctx
   The context used to send message
```

```c
int32_t msg_timeout
   Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0
```

```c
uint8_t msg_role
   Role of the device - Node/Provisioner
```

```c
struct esp_ble_mesh_state_transition_t
   Parameters of the server model state transition
```

### Public Functions

```c
BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
   Flag used to indicate if the transition timer has been started internally.
```

If the model which contains `esp_ble_mesh_state_transition_t` sets "set_auto_rsp" to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

```c
bool just_started
   Indicate if the state transition has just started
```

```c
uint8_t trans_time
   State transition time
```

```c
uint8_t remain_time
   Remaining time of state transition
```

```c
uint8_t delay
   Delay before starting state transition
```

```c
uint32_t quo_tt
   Duration of each divided transition step
```
uint32_t counter
    Number of steps which the transition duration is divided

uint32_t total_duration
    State transition total duration

int64_t start_timestamp
    Time when the state transition is started

struct k_delayed_work timer
    Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
    Parameters of the server model received last same set message.

Public Members

uint8_t tid
    Transaction number of the last message

uint16_t src
    Source address of the last message

uint16_t dst
    Destination address of the last message

int64_t timestamp
    Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
    Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp
    BLE Mesh Server Response Option.

i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client
    Get messages need to be replied by the application;
ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get
    messages will be replied by the server models;
iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set
    messages need to be replied by the application;
iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set
    messages will be replied by the server models;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status
    messages need to be replied by the application;
vii. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status
    messages will be replied by the server models; Response control for Client Get messages
Chapter 2. API Reference

```c
uint8_t set_auto_rsp
   Response control for Client Set messages

uint8_t status_auto_rsp
   Response control for Server Status messages
```

**Macros**

```c
ESP_BLE_MESH_SDU_MAX_LEN
   < The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT
   Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG
   The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN
   The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
   The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE
   The default value of Random Update Interval Steps

ESP_BLE_MESH_rand_UPDATE_INTERVAL_DEFAULT
   Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX
   Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL
   Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT
   Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES
```
ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_KEY_UNUSED

Internal macros used to initialize array members

ESP_BLE_MESH_KEY_UNUSED_ELT_ (IDX, __)

ESP_BLE_MESH_ADDR_UNASSIGNED_ELT_ (IDX, __)

ESP_BLE_MESH_MODEL_KEYS_UNUSED

ESP_BLE_MESH_MODEL_GROUPS_UNASSIGNED

Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY

Relay state value

ESP_BLE_MESH_RELAY_DISABLED

ESP_BLE_MESH_RELAY_ENABLED

ESP_BLE_MESH_RELAY_NOT_SUPPORTED

Beacon state value

ESP_BLE_MESH_BEACON_DISABLED

ESP_BLE_MESH_BEACON_ENABLED

ESP_BLE_MESH_PRIVATE_BEACON_DISABLE

ESP_BLE_MESH_PRIVATE_BEACON_ENABLE

GATT Proxy state value

ESP_BLE_MESH_GATT_PROXY_DISABLED

ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED

ESP_BLE_MESH_PRIVATE_GATT_PROXY_DISABLED

Node identity state value

ESP_BLE_MESH_NODE_IDENTITY_STOPPED

ESP_BLE_MESH_NODE_IDENTITY_RUNNING

ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED

Subnet Bridge state value

ESP_BLE_MESH_SUBNET_BRIDGE_DISABLED

ESP_BLE_MESH_SUBNET_BRIDGE_ENABLED

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST (addr)

ESP_BLE_MESH_ADDR_IS_GROUP (addr)

**ESP_BLE_MESH_ADDR_IS_VIRTUAL** (addr)

**ESP_BLE_MESH_ADDR_IS_RFU** (addr)

**ESP_BLE_MESH_INVALID_NODE_INDEX**

**ESP_BLE_MESH_PROV_RECORD_MAX_ID**

**ESP_BLE_MESH_TRANSMIT** (count, int_ms)

Encode transmission count & interval steps.

**Note:** For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• count -- Number of retransmissions (first transmission is excluded).</td>
</tr>
<tr>
<td>• int_ms -- Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.</td>
</tr>
</tbody>
</table>

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_TRANSMIT_COUNT** (transmit)

Decode transmit count from a transmit value.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• transmit -- Encoded transmit count &amp; interval value.</td>
</tr>
</tbody>
</table>

**Returns** Transmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_TRANSMIT_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• transmit -- Encoded transmit count &amp; interval value.</td>
</tr>
</tbody>
</table>

**Returns** Transmission interval in milliseconds.

**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)

Encode Publish Retransmit count & interval steps.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• count -- Number of retransmissions (first transmission is excluded).</td>
</tr>
<tr>
<td>• int_ms -- Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.</td>
</tr>
</tbody>
</table>

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• transmit -- Encoded Publish Retransmit count &amp; interval value.</td>
</tr>
</tbody>
</table>

**Returns** Retransmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• transmit -- Encoded Publish Retransmit count &amp; interval value.</td>
</tr>
</tbody>
</table>

**Returns** Transmission interval in milliseconds.
ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN  
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN  
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN  
Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)

ESP_BLE_MESH_MODEL_OP_2 (b0, b1)

ESP_BLE_MESH_MODEL_OP_3 (b0, cid)  
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)  
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)  
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note: This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters

- _loc -- Location Descriptor.
- _mods -- Array of SIG models.
- _vnd_mods -- Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

ESP_BLE_MESH_SEG_SZMIC_SHORT

ESP_BLE_MESH_SEG_SZMIC_LONG

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
• _name -- Variable name given to the context.
• _msg_len -- Length of the publication message.
• _role -- Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
• _opcode -- Message opcode.
• _min_len -- Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

Type Definitions
typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
    Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
    Invalid Company ID
typedef uint32_t esp_ble_mesh_cb_t
typedef uint8_t UINT8
typedef uint16_t UINT16
typedef uint32_t UINT32

typedef uint64_t UINT64

typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]

typedef uint8_t BD_ADDR[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_addr_type_t

BLE device address type.

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t

esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t

esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t

esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.
typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t. This typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode.

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t. This typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode.

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t. This typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode.

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t. This typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode.

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t.

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**
    Node add AppKey locally completion event

enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**
    Node bind AppKey to model locally completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**
    Provisioner enable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**
    Provisioner disable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**
    Provisioner receives unprovisioned device beacon event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**
    Provisioner read unprovisioned device OOB public key event
Chapter 2. API Reference

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT`
Provisioner input value for provisioning procedure event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT`
Provisioner output value for provisioning procedure event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT`
Provisioner establish a BLE Mesh link event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT`
Provisioner close a BLE Mesh link event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`
Provisioner provisioning done event

enumerator `ESP_BLE_MESH_PROVISIONER_CERT_BASED_PROV_START_EVT`
Provisioner initiate a certificate based provisioning

enumerator `ESP_BLE_MESH_PROVISIONER_RECV_PROV_RECORDS_LIST_EVT`
Provisioner receive provisioning records list event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_RECORD_RECV_COMP_EVT`
Provisioner receive provisioning record complete event

enumerator `ESP_BLE_MESH_PROVISIONER_SEND_PROV_RECORDS_GET_EVT`
Provisioner send provisioning records get to device event

enumerator `ESP_BLE_MESH_PROVISIONER_SEND_PROV_RECORD_REQUEST_EVT`
Provisioner send provisioning record request to device event

enumerator `ESP_BLE_MESH_PROVISIONER_SEND_PROV_INVITE_EVT`
Provisioner send provisioning invite to device event

enumerator `ESP_BLE_MESH_PROVISIONER_SEND_PROV_LINK_CLOSE_EVT`
Provisioner send link close to device event

enumerator `ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT`
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

enumerator `ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT`
Provisioner start to provision an unprovisioned device completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT`
Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT`
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
enumerator ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_indexused for provisioning completion event

counter ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

counter ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

counter ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

counter ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

counter ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

counter ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

counter ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

counter ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

counter ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

counter ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

counter ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

counter ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

counter ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

counter ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

counter ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event
enumerator `ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT`
Provisioner set the heartbeat filter type completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT`
Provisioner set the heartbeat filter information completion event

enumerator `ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT`
Provisioner receive heartbeat message event

enumerator `ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT`
Provisioner directly erase settings completion event

enumerator `ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner open settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT`
Provisioner open settings with user id completion event

enumerator `ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner close settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT`
Provisioner close settings with user id completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner delete settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT`
Provisioner delete settings with user id completion event

enumerator `ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT`
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator `ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT`
Set fast provisioning action completion event

enumerator `ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT`
Receive Heartbeat message event

enumerator `ESP_BLE_MESH_LPN_ENABLE_COMP_EVT`
Enable Low Power Node completion event

enumerator `ESP_BLE_MESH_LPN_DISABLE_COMP_EVT`
Disable Low Power Node completion event

enumerator `ESP_BLE_MESH_LPN_POLL_COMP_EVT`
Low Power Node send Friend Poll completion event
enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
    Low Power Node establishes friendship event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
    Low Power Node terminates friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
    Friend Node establishes friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
    Friend Node terminates friendship event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
    Proxy Client receives Network ID advertising packet event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
    Proxy Client establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
    Proxy Client terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
    Proxy Client receives Proxy Filter Status event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
    Proxy Client connect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
    Proxy Client disconnect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
    Proxy Client set filter type completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
    Proxy Client add filter address completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
    Proxy Client remove filter address completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DIRECTED_PROXY_SET_COMP_EVT
    Proxy Client directed proxy set completion event

enumerator ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
    Proxy Server establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT
    Proxy Server terminates connection successfully event
enumerator ESP_BLE_MESH_PROXY_CLIENT_SEND_SOLIC_PDU_COMP_EVT
    Proxy Client send Solicitation PDU completion event

enumerator ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model subscribes group address completion event

enumerator ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
    Local model unsubscribes group address completion event

enumerator ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
    De-initialize BLE Mesh stack completion event

enumerator ESP_BLE_MESH_PROV_EVT_MAX

def

BLEMesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

enumerator ESP_BLE_MESH_SERVER_TRANS_TIMER_START

enumerator ESP_BLE_MESH_SERVER_FLAG_MAX

def

esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

enumerator ESP_BLE_MESH_GENERIC_ONOFF_STATE

enumerator ESP_BLE_MESH_GENERIC_LEVEL_STATE

enumerator ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE

enumerator ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE

enumerator `ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE`

enumerator `ESP_BLE_MESH_SERVER_MODEL_STATE_MAX`

enum `esp_ble_mesh_model_cb_event_t`

Values:

enumerator `ESP_BLE_MESH_MODEL_OPERATION_EVT`
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator `ESP_BLE_MESH_MODEL_SEND_COMP_EVT`
User-defined models send messages completion event

enumerator `ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT`
User-defined models publish messages completion event

enumerator `ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT`
User-defined client models receive publish messages event

enumerator `ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT`
Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator `ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT`
When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator `ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT`
Server models update state value completion event

enumerator `ESP_BLE_MESH_MODEL_EVT_MAX`

\textbf{ESP-BLE-MESH Core API Reference}

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- \textit{ESP-BLE-MESH Stack Initialization}
- \textit{Reading of Local Data Information}
- \textit{Low Power Operation (Updating)}
- \textit{Send/Publish Messages, add Local AppKey, etc.}
- \textit{ESP-BLE-MESH Node/Provisioner Provisioning}
- \textit{ESP-BLE-MESH GATT Proxy Server}
ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h
- This header file can be included with:
  
  ```
#include "esp_ble_mesh_common_api.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

  ```
REQUIRES bt
  ```

  or

  ```
PRIV_REQUIRES bt
  ```

Functions

**esp_err_t esp_ble_mesh_init** *(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)*

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note:** After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

**Parameters**

- **prov** -- [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** -- [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_deinit** *(esp_ble_mesh_deinit_param_t *param)*

De-initialize BLE Mesh module.

**Note:** This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Parameters** param -- [in] Pointer to the structure of BLE Mesh deinit parameters.

**Returns** ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h
- This header file can be included with:

  ```
#include "esp_ble_mesh_local_data_operation_api.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

  ```
REQUIRES bt
  ```

  or
Chapter 2. API Reference

PRIVQUIRES bt

Functions

int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)

Get the model publish period, the unit is ms.

Returns Publish period value on success, 0 or (negative) error code from errno.h on failure.

uint16_t esp_ble_mesh_get_primary_element_address (void)

Get the address of the primary element.

Returns Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

uint16_t * esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Parameters
• model -- [in] Pointer to the model.
• group_addr -- [in] Group address.

Returns Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

esp_ble_mesh_elem_t * esp_ble_mesh_find_element (uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

Parameters element_addr -- [in] Element address.

Returns Pointer to the element on success, or NULL on failure.

uint8_t esp_ble_mesh_get_element_count (void)

Get the number of elements that have been registered.

Returns Number of elements.

esp_ble_mesh_model_t * esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Parameters
• element -- [in] Element to which the model belongs.
• company_id -- [in] A 16-bit company identifier assigned by the Bluetooth SIG.

Returns Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

esp_ble_mesh_model_t * esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

Parameters
• element -- [in] Element to which the model belongs.
• model_id -- [in] SIG model identifier.

Returns Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.
Chapter 2. API Reference

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data(void)

Get the Composition data which has been registered.

Returns Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t esp_ble_mesh_model_subscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters
• element_addr -- [in] Unicast address of the element to which the model belongs.
• group_addr -- [in] The group address to be subscribed.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_model_unsubscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters
• element_addr -- [in] Unicast address of the element to which the model belongs.
• group_addr -- [in] The subscribed group address.

Returns ESP_OK on success or error code otherwise.

const uint8_t *esp_ble_mesh_node_get_local_net_key(uint16_t net_idx)

This function is called by Node to get the local NetKey.

Parameters net_idx -- [in] NetKey index.

Returns NetKey on success, or NULL on failure.

cst uint8_t *esp_ble_mesh_node_get_local_app_key(uint16_t app_idx)

This function is called by Node to get the local AppKey.

Returns AppKey on success, or NULL on failure.

esp_err_t esp_ble_mesh_node_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

Note: This function can only be called after the device is provisioned.

Parameters
• net_key -- [in] NetKey to be added.
• net_idx -- [in] NetKey Index.

Returns ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_node_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

**Note:** The net_idx must be an existing one. This function can only be called after the device is provisioned.

**Parameters**
- `app_key` -- [in] AppKey to be added.
- `net_idx` -- [in] NetKey Index.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

**Note:** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Parameters**
- `element_addr` -- [in] Node local element address
- `company_id` -- [in] Node local company id
- `model_id` -- [in] Node local model id
- `app_idx` -- [in] Node local appkey index

**Returns** ESP_OK on success or error code otherwise.

### Low Power Operation (Updating)

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

This header file can be included with:

```
#include "esp_ble_mesh_low_power_api.h"
```

This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

**Functions**

**esp_err_t esp_ble_mesh_lpn_enable** (void)

Enable BLE Mesh device LPN functionality.

**Note:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Returns** ESP_OK on success or error code otherwise.
esp_err_t esp_ble_mesh_lpn_disable (bool force)

Disable BLE Mesh device LPN functionality.

**Parameters**
- *force* -- [in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

**Returns**
- ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_lpn_poll (void)

LPN tries to poll messages from the Friend Node.

**Note:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Returns**
- ESP_OK on success or error code otherwise.

### Send/Publish Messages, Add Local AppKey, Etc.

#### Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

**This header file can be included with:**

```c
#include "esp_ble_mesh_networking_api.h"
```

**This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:**

```c
REQUIRES bt
```

or

```c
PRIV_REQUIRES bt
```

#### Functions

**esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)**

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.
Parameters `callback` -- [in] Pointer to the callback function.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_model_msg_opcode_init(uint8_t*data, uint32_t opcode)`
Add the message opcode to the beginning of the model message before sending or publishing the model message.

Note: This API is only used to set the opcode of the message.

Parameters
- `data` -- [in] Pointer to the message data.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_client_model_init(esp_ble_mesh_model_t*model)`
Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variables within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

Parameters `model` -- [in] BLE Mesh Client model to which the message belongs.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_client_model_deinit(esp_ble_mesh_model_t*model)`
De-initialize the user-defined client model.

Note: This function shall be invoked before esp_ble_mesh_deinit() is called.

Parameters `model` -- [in] Pointer of the Client model.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t*model, esp_ble_mesh_msg_ctx_t*ctx, uint32_t opcode, uint16_t length, uint8_t*data)`
Send server model messages(such as server model status messages).

Parameters
- `model` -- [in] BLE Mesh Server Model to which the message belongs.
- `ctx` -- [in] Message context, includes keys, TTL, etc.
- `length` -- [in] Message length (exclude the message opcode).
- `data` -- [in] Parameters of Access Payload (exclude the message opcode) to be sent.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t*model, esp_ble_mesh_msg_ctx_t*ctx, uint32_t opcode, uint16_t length, uint8_t*data, int32_t msg_timeout, bool need_rsp, esp_ble_mesh_dev_role_t device_role)`
Send client model message (such as model get, set, etc).

Parameters
- `model` -- [in] BLE Mesh Client Model to which the message belongs.
- `ctx` -- [in] Message context, includes keys, TTL, etc.
- `length` -- [in] Message length (exclude the message opcode).
- `data` -- [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
• **need_rsp** -- [in] TRUE if the opcode requires the peer device to reply. FALSE otherwise.

• **device_role** -- [in] Role of the device (Node/Provisioner) that sends the message.

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note:** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Parameters**

- **length** -- [in] Message length (exclude the message opcode).
- **data** -- [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** -- [in] Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note:** Currently this API is used to update bound state value, not for all server model states.

**Parameters**

- **model** -- [in] Server model which is going to update the state.
- **type** -- [in] Server model state type.
- **value** -- [in] Server model state value.

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_local_reset(void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note:** All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.
Chapter 2. API Reference

- index -- [in] Index of the node in the node queue.
- name -- [in] Name (end by '0') to be set for the node.

Returns ESP_OK on success or error code otherwise.

const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)

This function is called to get the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters index -- [in] Index of the node in the node queue.
Returns Node name on success, or NULL on failure.

uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)

This function is called to get the node (provisioned device) index.

Parameters name -- [in] Name of the node (end by '0').
Returns Node index on success, or an invalid value (0xFFFF) on failure.

** Note:**

esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

Parameters
- unicast_addr -- [in] Element address of the node
- data -- [in] Pointer of Composition Data
- length -- [in] Length of Composition Data
Returns ESP_OK on success or error code otherwise.

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

Parameters uuid -- [in] Device UUID of the node
Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

Parameters unicast_addr -- [in] Unicast address of the node
Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)

This function is called to get the provisioned node information with the node name.

Parameters name -- [in] Name of the node (end by '0').
Returns Pointer of the node info struct or NULL on failure.

uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)

This function is called by Provisioner to get provisioned node count.

Returns Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)

This function is called by Provisioner to get the entry of the node table.

**Note:** After invoking the function to get the entry of nodes, users can use the "for" loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node's information. Before trying to read the node's information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: " const esp_ble_mesh_node_t *node = esp_ble_mesh_provisioner_get_node_table_entry(); if(node != NULL) { /* read node information */ } else { /* node not exists */ }"
**entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ...... }}**

**Returns**  
Pointer to the start of the node table.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])
```

This function is called to delete the provisioned node information with the node device uuid.

**Parameters**  
uuid -- [in] Device UUID of the node

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

**Parameters**  
unicast_addr -- [in] Unicast address of the node

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

**Note:**  
app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Parameters**  
• app_key -- [in] The app key to be set for the local BLE Mesh stack.

• net_idx -- [in] The network key index.

• app_idx -- [in] The app key index.

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

**Parameters**  
• app_key -- [in] Value of the AppKey.

• net_idx -- [in] Corresponding NetKey Index.

• app_idx -- [in] The AppKey Index

**Returns**  
ESP_OK on success or error code otherwise.

```c
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

**Parameters**  
• net_idx -- [in] Network key index.

• app_idx -- [in] Application key index.

**Returns**  
App key on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.
Note: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Parameters

- `element_addr` -- [in] Provisioner local element address
- `app_idx` -- [in] Provisioner local appkey index
- `model_id` -- [in] Provisioner local model id
- `company_id` -- [in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

Note: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Parameters

- `net_key` -- [in] The network key to be added to the Provisioner local BLE Mesh stack.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

Parameters

- `net_key` -- [in] Value of the NetKey.

Returns ESP_OK on success or error code otherwise.

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

Returns Network key on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note: If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Parameters `enable` -- [in] Enable or disable receiving heartbeat messages.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

Note: 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

   a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
Parameters type -- [in] Heartbeat filter type (acceptlist or rejectlist).
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

a. If the operation is "REMOVE", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • The filter entry with the same SRC or DST will be removed.

Note: 1. If the operation is "ADD", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   • If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   • If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Parameters
   • op -- [in] Add or REMOVE
   • info -- [in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings(void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note: This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_index(uint8_t index)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters index -- [in] Settings index.
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid(const char *uid)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters uid -- [in] Settings user id.
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_index(uint8_t index, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:**
1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

**Parameters**

- `index` -- [in] Settings index.
- `erase` -- [in] Indicate if erasing mesh information.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid(const char *uid, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:**
1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

**Parameters**

- `uid` -- [in] Settings user id.
- `erase` -- [in] Indicate if erasing mesh information.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)
```

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters**

- `index` -- [in] Settings index.

**Returns** ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char *uid)**  
This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters**  
uid -- [in] Settings user id.

**Returns**  
ESP_OK on success or error code otherwise.

**const char *esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)**  
This function is called by Provisioner to get settings user id.

**Parameters**  
index -- [in] Settings index.

**Returns**  
Setting userid on success or NULL on failure.

**uint8_t esp_ble_mesh_provisioner_get_settings_index(const char *uid)**  
This function is called by Provisioner to get settings index.

**Parameters**  
uid -- [in] Settings user id.

**Returns**  
Settings index.

**uint8_t esp_ble_mesh_provisioner_get_free_settings_count(void)**  
This function is called by Provisioner to get the number of free settings user id.

**Returns**  
Number of free settings user id.

**const uint8_t *esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)**  
This function is called to get fast provisioning application key.

**Parameters**  
• net_idx -- [in] Network key index.
• app_idx -- [in] Application key index.

**Returns**  
Application key on success, or NULL on failure.

**Type Definitions**

typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)
• event, event code of user-defined model events; param, parameters of user-defined model events

**ESP-BLE-MESH Node/Provisioner Provisioning**

**Header File**

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h
• This header file can be included with:

```c
#include "esp_ble_mesh_provisioning_api.h"
```

• This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```c
REQUIRES bt
```

or

```c
PRIV_REQUIRES bt
```
Functions

**esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)**

Register BLE Mesh provisioning callback.

Parameters

- **callback** -- [in] Pointer to the callback function.

Returns

- ESP_OK on success or error code otherwise.

**bool esp_ble_mesh_node_is_provisioned (void)**

Check if a device has been provisioned.

Returns

- TRUE if the device is provisioned, FALSE if the device is unprovisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable specific provisioning bearers to get the device ready for provisioning.

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**

Provide provisioning input OOB number.

**esp_err_t esp_ble_mesh_node_input_string (const char *string)**

Provide provisioning input OOB string.

Note:

PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Parameters

- **bearers** -- Bit-wise OR of provisioning bearers.

Returns

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Parameters

- **pub_key_x** -- [in] Unprovisioned device’s Public Key X
- **pub_key_y** -- [in] Unprovisioned device’s Public Key Y
- **private_key** -- [in] Unprovisioned device’s Private Key

Returns

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**

Provide provisioning input OOB number.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Parameters

- **number** -- [in] Number input by device.

Returns

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_input_string (const char *string)**

Provide provisioning input OOB string.
Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**  
string -- [in] String input by device.

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)
```

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Parameters**  
name -- [in] Unprovisioned device name

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device’s OOB public key.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Parameters**  
  • link_idx -- [in] The provisioning link index  
  • pub_key_x -- [in] Unprovisioned device’s Public Key X  
  • pub_key_y -- [in] Unprovisioned device’s Public Key Y

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)
```

Provide provisioning input OOB string.

This is intended to be called after the esp_ble_mesh_prov_t prov_->input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**  
  • string -- [in] String input by Provisioner.  
  • link_idx -- [in] The provisioning link index.

**Returns**  
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_->input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**  
  • number -- [in] Number input by Provisioner.
**link_idx** -- [in] The provisioning link index.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

**Note:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Parameters bearers** -- [in] Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

**Note:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Parameters bearers** -- [in] Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.

**Note:** 
1. Currently address type only supports public address and static random address.
   a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
   b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
      - In this situation, the Provisioner can set bearers with each one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled, and cannot set flags with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
   c. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
      - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added,bearers shall be set with `ESP_BLE_MESH_PROV_ADV` enabled and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
      - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with `ESP_BLE_MESH_PROV_GATT` enabled, and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
      - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
• Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

Parameters

• **add_dev** -- [in] Pointer to a struct containing the device information
• **flags** -- [in] Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(
    const uint8_t uuid[16],
    esp_ble_mesh_bd_addr_t addr,
    esp_ble_mesh_addr_type_t addr_type,
    esp_ble_mesh_prov_bearer_t bearer,
    uint16_t oob_info,
    uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Note: 1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
c. Recommend to use only one of the functions "esp_ble_mesh_provisioner_add_unprov_dev" and "esp_ble_mesh_provisioner_prov_device_with_addr" by a Provisioner.

Parameters

• **uuid** -- [in] Device UUID of the unprovisioned device
• **addr** -- [in] Device address of the unprovisioned device
• **addr_type** -- [in] Device address type of the unprovisioned device
• **bearer** -- [in] Provisioning bearer going to be used by Provisioner
• **oob_info** -- [in] OOB info of the unprovisioned device
• **unicast_addr** -- [in] Unicast address going to be allocated for the unprovisioned device

Returns Zero on success or (negative) error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

Note: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters **del_dev** -- [in] Pointer to a struct containing the device information.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
```
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Parameters**
- `match_val` -- [in] Value to be compared with the part of the device UUID.
- `match_len` -- [in] Length of the compared match value.
- `offset` -- [in] Offset of the device UUID to be compared (based on zero).
- `prov_after_match` -- [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

**Parameters** `prov_data_info` -- [in] Pointer to a struct containing net_idx or flags or iv_index.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Parameters**
- `value` -- [in] Pointer to the static oob value.
- `length` -- [in] Length of the static oob value.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```

This function is called by Provisioner to set own Primary element address.

**Note:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Parameters** `addr` -- [in] Unicast address of the Primary element of Provisioner.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```

This function is called to set provisioning data information before starting fast provisioning.
### API Reference

#### Parameters

- **fast_prov_info**  -- [in]  Pointer to a struct containing unicast address range, net_idx, etc.

#### Returns

- ESP_OK on success or error code otherwise.

#### esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)

This function is called to start/suspend/exit fast provisioning.

- **Parameters**  -- [in]  fast provisioning action (i.e. enter, suspend, exit).

- **Returns**  ESP_OK on success or error code otherwise.

#### Type Definitions

```c
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

- **Param addr**  [in]  Pointer to the unprovisioned device address.

- **Param addr_type**  [in]  Unprovisioned device address type.

- **Param adv_type**  [in]  Adv packet type(ADV_IND or ADV_NONCONN_IND).

- **Param dev_uuid**  [in]  Unprovisioned device UUID pointer.

- **Param oob_info**  [in]  OOB information of the unprovisioned device.

- **Param bearer**  [in]  Adv packet received from PB-GATT or PB-ADV bearer.

#### ESP-BLE-MESH GATT Proxy Server

- **Header File**

  ```
  #include "esp_ble_mesh_proxy_api.h"
  ```

  : This header file can be included with:

  ```
  REQUIRE bt
  ```

  or

  ```
  PRIV_REQUIRE bt
  ```

- **Functions**

  ```
  esp_err_t esp_ble_mesh_proxy_identity_enable (void)
  ```

  Enable advertising with Node Identity.

  **Note:**  This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable (void)`
Enable BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable (void)`
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_identity_enable (void)`
Enable advertising with Private Node Identity.

Note: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Private Node Identity for the next 60 seconds, and after 60s Private Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity, Network ID advertising, Proxy Private Node Identity and Private Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_identity_disable (void)`
Disable advertising with Private Node Identity.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)`
Proxy Client creates a connection with the Proxy Server.

Parameters
• `addr` -- [in] Device address of the Proxy Server.
• `addr_type` -- [in] Device address type (public or static random).
• `net_idx` -- [in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)`
Proxy Client terminates a connection with the Proxy Server.

Parameters `conn_handle` -- [in] Proxy connection handle.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)`
Proxy Client sets the filter type of the Proxy Server.

Parameters
• `conn_handle` -- [in] Proxy connection handle.
• `net_idx` -- [in] Corresponding NetKey Index.
• `filter_type` -- [in] whitelist or blacklist.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`
Proxy Client adds address to the Proxy Server filter list.
### Parameters

- **conn_handle** -- [in] Proxy connection handle.
- **net_idx** -- [in] Corresponding NetKey Index.
- **addr** -- [in] Pointer to the filter address.
- **addr_num** -- [in] Number of the filter address.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```

Proxy Client removes address from the Proxy Server filter list.

### Parameters

- **conn_handle** -- [in] Proxy connection handle.
- **net_idx** -- [in] Corresponding NetKey Index.
- **addr** -- [in] Pointer to the filter address.
- **addr_num** -- [in] Number of the filter address.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_directed_proxy_set(uint8_t conn_handle, uint16_t net_idx, uint8_t use_directed)
```

Proxy Client sets whether or not the Directed Proxy Server uses directed forwarding for Directed Proxy Client messages.

### Parameters

- **conn_handle** -- [in] Proxy connection handle.
- **net_idx** -- [in] Corresponding NetKey Index.
- **use_directed** -- [in] Whether or not to send message by directed forwarding.

### Returns
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_send_solic_pdu(uint8_t net_idx, uint16_t ssrc, uint16_t dst)
```

Proxy Client sends Solicitation PDU.

### Parameters

- **net_idx** -- [in] Corresponding NetKey Index.
- **ssrc** -- [in] Solicitation SRC, shall be one of its element address.
- **dst** -- [in] Solicitation DST (TBD).

### Returns
ESP_OK on success or error code otherwise.

### Macros

- `ESP_BLE_MESH_PROXY_CLI_DIRECTED_FORWARDING_ENABLE`
- `ESP_BLE_MESH_PROXY_CLI_DIRECTED_FORWARDING_DISABLE`

### ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- **Configuration Client/Server Models**
- **Health Client/Server Models**
- **Generic Client/Server Models**
- **Sensor Client/Server Models**
- **Time and Scenes Client/Server Models**
- **Lighting Client/Server Models**
Chapter 2. API Reference

**Note:** Definitions related to Server Models are being updated, and will be released soon.

**Configuration Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h
- This header file can be included with:
  ```
  #include "esp_ble_mesh_config_model_api.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRES bt
  ```
  or
  ```
  PRIV_REQUIRES bt
  ```

**Functions**

```
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

- **Parameters**
  - callback -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

- **Parameters**
  - callback -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

- **Parameters**
  - params -- [in] Pointer to BLE Mesh common client parameters.
  - get_state -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.
- **Returns**
  - ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.
Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

Parameters

• **params** -- [in] Pointer to BLE Mesh common client parameters.
• **set_state** -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

Unions

union esp_ble_mesh_cfg_client_get_state_t

```
#include "esp_ble_mesh_config_model_api.h"
```

For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET
ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET
ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET
ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET

the get_state parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.

Public Members

```

Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.
Public Members

`uint8_t relay`
The relay value

`uint8_t relay_retransmit`
The relay retransmit value

struct `esp_ble_mesh_cfg_net_key_add_t`
Parameters of Config NetKey Add.

Public Members

`uint16_t net_idx`
The network key index

`uint8_t net_key[16]`
The network key value

struct `esp_ble_mesh_cfg_app_key_add_t`
Parameters of Config AppKey Add.

Public Members

`uint16_t net_idx`
The network key index

`uint16_t app_idx`
The app key index

`uint8_t app_key[16]`
The app key value

struct `esp_ble_mesh_cfg_model_app_bind_t`
Parameters of Config Model App Bind.

Public Members

`uint16_t element_addr`
The element address

`uint16_t model_app_idx`
Index of the app key to bind with the model

`uint16_t model_id`
The model id
uint16_t \texttt{company\_id}  
The company id, if not a vendor model, shall set to 0xFFFF

\textbf{struct} \texttt{esp\_ble\_mesh\_cfg\_model\_pub\_set\_t}  
Parameters of Config Model Publication Set.

\textbf{Public Members}

uint16_t \texttt{element\_addr}  
The element address

uint16_t \texttt{publish\_addr}  
Value of the publish address

uint16_t \texttt{publish\_app\_idx}  
Index of the application key

bool \texttt{cred\_flag}  
Value of the Friendship Credential Flag

uint8_t \texttt{publish\_ttl}  
Default TTL value for the publishing messages

uint8_t \texttt{publish\_period}  
Period for periodic status publishing

uint8_t \texttt{publish\_retransmit}  
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t \texttt{model\_id}  
The model id

uint16_t \texttt{company\_id}  
The company id, if not a vendor model, shall set to 0xFFFF

\textbf{struct} \texttt{esp\_ble\_mesh\_cfg\_model\_sub\_add\_t}  
Parameters of Config Model Subscription Add.

\textbf{Public Members}

uint16_t \texttt{element\_addr}  
The element address

uint16_t \texttt{sub\_addr}  
The address to be added to the Subscription List
uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.

Public Members

uint16_t element_addr
    The element address

uint16_t sub_addr
    The address to be removed from the Subscription List

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t element_addr
    The element address

uint16_t sub_addr
    The address to be added to the Subscription List

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

Public Members
Struct `esp_ble_mesh_cfg_model_sub_va_delete_t`
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

- `uint16_t element_addr`
  The element address
- `uint8_t label_uuid[16]`
  The Label UUID of the virtual address to be added to the Subscription List
- `uint16_t model_id`
  The model id
- `uint16_t company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

Struct `esp_ble_mesh_cfg_model_sub_va_overwrite_t`
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

- `uint16_t element_addr`
  The element address
- `uint8_t label_uuid[16]`
  The Label UUID of the virtual address to be removed from the Subscription List
- `uint16_t model_id`
  The model id
- `uint16_t company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

Struct `esp_ble_mesh_cfg_model_pub_va_set_t`
Parameters of Config Model Publication Virtual Address Set.
Chapter 2. API Reference

**Public Members**

uint16_t `element_addr`
   The element address

uint8_t `label_uuid`[16]
   Value of the Label UUID publish address

uint16_t `publish_app_idx`
   Index of the application key

bool `cred_flag`
   Value of the Friendship Credential Flag

uint8_t `publish_ttl`
   Default TTL value for the publishing messages

uint8_t `publish_period`
   Period for periodic status publishing

uint8_t `publish_retransmit`
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t `model_id`
   The model id

uint16_t `company_id`
   The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_delete_all_t`
   Parameters of Config Model Subscription Delete All.

**Public Members**

uint16_t `element_addr`
   The element address

uint16_t `model_id`
   The model id

uint16_t `company_id`
   The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_net_key_update_t`
   Parameters of Config NetKey Update.
Public Members

`uint16_t net_idx`
The network key index

`uint8_t net_key[16]`
The network key value

struct `esp_ble_mesh_cfg_net_key_delete_t`
Parameters of Config NetKey Delete.

Public Members

`uint16_t net_idx`
The network key index

struct `esp_ble_mesh_cfg_app_key_update_t`
Parameters of Config AppKey Update.

Public Members

`uint16_t net_idx`
The network key index

`uint16_t app_idx`
The app key index

`uint8_t app_key[16]`
The app key value

struct `esp_ble_mesh_cfg_app_key_delete_t`
Parameters of Config AppKey Delete.

Public Members

`uint16_t net_idx`
The network key index

`uint16_t app_idx`
The app key index

struct `esp_ble_mesh_cfg_node_identity_set_t`
Parameters of Config Node Identity Set.

**Public Members**

```c
uint16_t net_idx
```

The network key index

```c
uint8_t identity
```

New Node Identity state

```c
struct esp_ble_mesh_cfg_model_app_unbind_t
```

Parameters of Config Model App Unbind.

**Public Members**

```c
uint16_t element_addr
```

The element address

```c
uint16_t model_app_idx
```

Index of the app key to bind with the model

```c
uint16_t model_id
```

The model id

```c
uint16_t company_id
```

The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_kr_phase_set_t
```

Parameters of Config Key Refresh Phase Set.

**Public Members**

```c
uint16_t net_idx
```

The network key index

```c
uint8_t transition
```

New Key Refresh Phase Transition

```c
struct esp_ble_mesh_cfg_net_transmit_set_t
```

Parameters of Config Network Transmit Set.

**Public Members**

```c
uint8_t net_transmit
```

Network Transmit State

```c
struct esp_ble_mesh_cfg_heartbeat_pub_set_t
```

Parameters of Config Model Heartbeat Publication Set.
**Public Members**

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t count`
Number of Heartbeat messages to be sent

`uint8_t period`
Period for sending Heartbeat messages

`uint8_t ttl`
TTL to be used when sending Heartbeat messages

`uint16_t feature`
Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`
NetKey Index

`struct esp_ble_mesh_cfg_heartbeat_sub_set_t`
Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

`uint16_t src`
Source address for Heartbeat messages

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t period`
Period for receiving Heartbeat messages

`struct esp_ble_mesh_cfg_beacon_status_cb_t`
Parameter of Config Beacon Status

**Public Members**

`uint8_t beacon`
Secure Network Beacon state value

`struct esp_ble_mesh_cfg_comp_data_status_cb_t`
Parameters of Config Composition Data Status
Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t status
StatusCode for the request message

uint16_t element_addr
Address of the element
uint16_t publish_addr
    Value of the publish address

uint16_t app_idx
    Index of the application key

bool cred_flag
    Value of the Friendship Credential Flag

uint8_t ttl
    Default TTL value for the outgoing messages

uint8_t period
    Period for periodic status publishing

uint8_t transmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
    Parameters of Config Model Subscription Status

Public Members

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t sub_addr
    Value of the address

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
    Parameters of Config NetKey Status
**Public Members**

`uint8_t status`  
Status Code for the request message

`uint16_t net_idx`  
Index of the NetKey

struct `esp_ble_mesh_cfg_app_key_status_cb_t`  
Parameters of Config AppKey Status

**Public Members**

`uint8_t status`  
Status Code for the request message

`uint16_t net_idx`  
Index of the NetKey

`uint16_t app_idx`  
Index of the application key

struct `esp_ble_mesh_cfg_mod_app_status_cb_t`  
Parameters of Config Model App Status

**Public Members**

`uint8_t status`  
Status Code for the request message

`uint16_t element_addr`  
Address of the element

`uint16_t app_idx`  
Index of the application key

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

struct `esp_ble_mesh_cfg_friend_status_cb_t`  
Parameter of Config Friend Status
Public Members

```
uint8_t friend_state
  Friend state value
```

```
struct esp_ble_mesh_cfg_hb_pub_status_cb_t
  Parameters of Config Heartbeat Publication Status
```

Public Members

```
uint8_t status
  Status Code for the request message
```

```
uint16_t dst
  Destination address for Heartbeat messages
```

```
uint8_t count
  Number of Heartbeat messages remaining to be sent
```

```
uint8_t period
  Period for sending Heartbeat messages
```

```
uint8_t ttl
  TTL to be used when sending Heartbeat messages
```

```
uint16_t features
  Features that trigger Heartbeat messages when changed
```

```
uint16_t net_idx
  Index of the NetKey
```

```
struct esp_ble_mesh_cfg_hb_sub_status_cb_t
  Parameters of Config Heartbeat Subscription Status
```

Public Members

```
uint8_t status
  Status Code for the request message
```

```
uint16_t src
  Source address for Heartbeat messages
```

```
uint16_t dst
  Destination address for Heartbeat messages
```

```
uint8_t period
  Remaining Period for processing Heartbeat messages
```
uint8_t `count`
   Number of Heartbeat messages received

uint8_t `min_hops`
   Minimum hops when receiving Heartbeat messages

uint8_t `max_hops`
   Maximum hops when receiving Heartbeat messages

struct `esp_ble_mesh_cfg_net_trans_status_cb_t`
   Parameters of Config Network Transmit Status

**Public Members**

uint8_t `net_trans_count`
   Number of transmissions for each Network PDU originating from the node

uint8_t `net_trans_step`
   Maximum hops when receiving Heartbeat messages

struct `esp_ble_mesh_cfg_model_sub_list_cb_t`
   Parameters of Config SIG/Vendor Subscription List

**Public Members**

uint8_t `status`
   Status Code for the request message

uint16_t `element_addr`
   Address of the element

uint16_t `company_id`
   Company ID

uint16_t `model_id`
   Model ID

struct `net_buf_simple *sub_addr`
   A block of all addresses from the Subscription List

struct `esp_ble_mesh_cfg_net_key_list_cb_t`
   Parameter of Config NetKey List

**Public Members**
struct net_buf_simple *net_idx
    A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
    Parameters of Config AppKey List

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t net_idx
    NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
    A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t
    Parameters of Config Node Identity Status

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t net_idx
    Index of the NetKey

uint8_t identity
    Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID
Chapter 2. API Reference

**Public Members**

```c
uint16_t model_id
  Model ID

struct net_buf_simple *app_idx
  All AppKey indexes bound to the Model
```

**Public Members**

```c
struct esp_ble_mesh_cfg_kr_phase_status_cb_t
  Parameters of Config Key Refresh Phase Status
```

- **Public Members**
  ```c
  uint8_t status
    Status Code for the request message
  
  uint16_t net_idx
    Index of the NetKey
  
  uint8_t phase
    Key Refresh Phase state
  ```

**Public Members**

```c
struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
  Parameters of Config Low Power Node PollTimeout Status
```

- **Public Members**
  ```c
  uint16_t lpn_addr
    The unicast address of the Low Power node
  
  int32_t poll_timeout
    The current value of the PollTimeout timer of the Low Power node
  ```

**Public Members**

```c
struct esp_ble_mesh_cfg_client_cb_param_t
  Configuration Client Model callback parameters
```

- **Public Members**
  ```c
  int error_code
    Appropriate error code
  
  esp_ble_mesh_client_common_param_t *params
    The client common parameters
  
  esp_ble_mesh_cfg_client_common_cb_param_t status_cb
    The config status message callback values
  ```
struct `esp_ble_mesh_state_change_cfg_mod_pub_set_t`

Configuration Server model related context.

Parameters of Config Model Publication Set

**Public Members**

- `uint16_t element_addr`
  Element Address

- `uint16_t pub_addr`
  Publish Address

- `uint16_t app_idx`
  AppKey Index

- `bool cred_flag`
  Friendship Credential Flag

- `uint8_t pub_ttl`
  Publish TTL

- `uint8_t pub_period`
  Publish Period

- `uint8_t pub_retransmit`
  Publish Retransmit

- `uint16_t company_id`
  Company ID

- `uint16_t model_id`
  Model ID

struct `esp_ble_mesh_state_change_cfg_mod_pub_va_set_t`

Parameters of Config Model Publication Virtual Address Set

**Public Members**

- `uint16_t element_addr`
  Element Address

- `uint8_t label_uuid[16]`
  Label UUID

- `uint16_t app_idx`
  AppKey Index
bool cred_flag
    Friendship Credential Flag

uint8_t pub_ttl
    Publish TTL

uint8_t pub_period
    Publish Period

uint8_t pub_retransmit
    Publish Retransmit

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t sub_addr
        Subscription Address

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t sub_addr
        Subscription Address
uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
    Parameters of Config NetKey Add

    Public Members

    uint16_t net_idx
        NetKey Index

    uint8_t net_key[16]
        NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
    Parameters of Config NetKey Update

    Public Members

    uint16_t net_idx
        NetKey Index

    uint8_t net_key[16]
        NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
    Parameter of Config NetKey Delete

    Public Members

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
    Parameters of Config AppKey Add

    Public Members

    uint16_t net_idx
        NetKey Index

    uint16_t app_idx
        AppKey Index
Chapter 2. API Reference

```c
uint8_t app_key[16]
AppKey
```

**Public Members**

```c
struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update
```

```c
uint16_t net_idx
NetKey Index
```

```c
uint16_t app_idx
AppKey Index
```

```c
uint8_t app_key[16]
AppKey
```

**Public Members**

```c
struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete
```

```c
uint16_t net_idx
NetKey Index
```

```c
uint16_t app_idx
AppKey Index
```

**Public Members**

```c
struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind
```

```c
uint16_t element_addr
Element Address
```

```c
uint16_t app_idx
AppKey Index
```

```c
uint16_t company_id
Company ID
```

```c
uint16_t model_id
Model ID
```

**Public Members**

```c
struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind
```
Public Members

*uint16_t* `element_addr`
Element Address

*uint16_t* `app_idx`
AppKey Index

*uint16_t* `company_id`
Company ID

*uint16_t* `model_id`
Model ID

**struct esp_ble_mesh_state_change_cfg_kr_phase_set_t**
Parameters of Config Key Refresh Phase Set

Public Members

*uint16_t* `net_idx`
NetKey Index

*uint8_t* `kr_phase`
New Key Refresh Phase Transition

**struct esp_ble_mesh_cfg_server_cb_param_t**
Configuration Server model callback parameters

Public Members

*esp_ble_mesh_model_t** `model`
Pointer to the server model structure

*esp_ble_mesh_msg_ctx_t* `ctx`
Context of the received message

*esp_ble_mesh_cfg_server_cb_value_t* `value`
Value of the received configuration messages

**Macros**

`ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)`
Define a new Config Server Model.

**Note:** The Config Server Model can only be included by a Primary Element.

**Parameters**

* `srv_data` -- Pointer to a unique Config Server Model user data.
Returns New Config Server Model instance.

**ESP_BLE_MESH_MODEL_CFG_CLI**(cli_data)

Define a new Config Client Model.

**Note:** The Config Client Model can only be included by a Primary Element.

**Parameters**

- cli_data -- Pointer to a unique struct `esp_ble_mesh_client_t`.

**Returns** New Config Client Model instance.

### Type Definitions

typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event, esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

- **Param event** Event type
- **Param param** Pointer to callback parameter

### Enumerations

genue esp_ble_mesh_cfg_client_cb_event_t

This enum value is the event of Configuration Client Model

**Values:**

- enumator `ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT`
- enumator `ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT`
- enumator `ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT`
- enumator `ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT`
- enumator `ESP_BLE_MESH_CFG_CLIENT_EVT_MAX`

genue esp_ble_mesh_cfg_server_cb_event_t

This enum value is the event of Configuration Server model

**Values:**

- enumator `ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT`
- enumator `ESP_BLE_MESH_CFG_SERVER_EVT_MAX`
Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h
- This header file can be included with:
  
  ```c
  #include "esp_ble_mesh_health_model_api.h"
  ```
- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE bt
  ```

Functions

**esp_err_t esp_ble_mesh_register_health_client_callback** *(esp_ble_mesh_health_client_cb_t callback)*

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Parameters** `callback` -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_health_server_callback** *(esp_ble_mesh_health_server_cb_t callback)*

Register BLE Mesh Health Server Model callback.

**Parameters** `callback` -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_client_get_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)*

This function is called to get the Health Server states using the Health Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_def.h

**Parameters**

- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `get_state` -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_client_set_state** *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)*

This function is called to set the Health Server states using the Health Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_def.h

**Parameters**

- `params` -- [in] Pointer to BLE Mesh common client parameters.
Chapter 2. API Reference

• set_state -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Parameters element -- [in] The element to which the Health Server Model belongs.

Returns ESP_OK on success or error code otherwise.

Unions

union esp_ble_mesh_health_client_get_state_t

#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t fault_get

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t

#include <esp_ble_mesh_health_model_api.h>

  Parameter of Health Attention On event

  Public Members

  esp_ble_mesh_model_t *model
    Pointer to the Health Server Model

  uint8_t time
    Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
  Parameter of Health Attention Off event

  Public Members

  esp_ble_mesh_model_t *model
    Pointer to the Health Server Model

 Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
  Define a new Health Server Model.

  Note: The Health Server Model can only be included by a Primary Element.

  Parameters
  • srv -- Pointer to the unique struct esp_ble_mesh_health_srv_t.
  • pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.

  Returns New Health Server Model instance.

ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
  Define a new Health Client Model.

  Note: This API needs to be called for each element on which the application needs to have a Health Client Model.

  Parameters
  • cli_data -- Pointer to the unique struct esp_ble_mesh_client_t.

  Returns New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
  A helper to define a health publication context

  Parameters
  • _name -- Name given to the publication context variable.
  • _max -- Maximum number of faults the element can have.
  • _role -- Role of the device which contains the model.
**ESP_BLE_MESH_HEALTH_STANDARD_TEST**

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP_BLE_MESH_NO_FAULT**

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

enumerator ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_generic_model_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```
or

```
PRIV_REQUIRES bt
```

Functions

- `esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)`

  Register BLE Mesh Generic Client Model callback.

  Parameters:
  - `callback` -- [in] Pointer to the callback function.

  Returns:
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_generic_client_get_state_t *get_state)`

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`
Chapter 2. API Reference

• **params** -- [in] Pointer to BLE Mesh common client parameters.
• **get_state** -- [in] Pointer to generic get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
• **params** -- [in] Pointer to BLE Mesh common client parameters.
• **set_state** -- [in] Pointer to generic set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Parameters** **callback** -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```c
union esp_ble_mesh_generic_client_get_state_t
    #include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

**Public Members**

esp_ble_mesh_server_recv_gen_loc_local_set_t location_local
    Generic Location Local Set/Generic Location Local Set Unack

esp_ble_mesh_server_recv_gen_user_property_set_t user_property
    Generic User Property Set/Generic User Property Set Unack

esp_ble_mesh_server_recv_gen_admin_property_set_t admin_property
    Generic Admin Property Set/Generic Admin Property Set Unack

esp_ble_mesh_server_recv_gen_manufacturer_property_set_t manu_property
    Generic Manufacturer Property Set/Generic Manufacturer Property Set Unack

union esp_ble_mesh_generic_server_cb_value_t
    #include <esp_ble_mesh_generic_model_api.h> Generic Server Model callback value union.

Public Members

esp_ble_mesh_generic_server_state_change_t state_change
    ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT

esp_ble_mesh_generic_server_recv_get_msg_t get
    ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT

esp_ble_mesh_generic_server_recv_set_msg_t set
    ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT

Structures

struct esp_ble_mesh_gen_onoff_set_t
    Bluetooth Mesh Generic Client Model Get and Set parameters structure.
    Parameters of Generic OnOff Set.
Public Members

bool op_en
    Indicate if optional parameters are included

uint8_t onoff
    Target value of Generic OnOff state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
    Parameters of Generic Level Set.

Public Members

bool op_en
    Indicate if optional parameters are included

int16_t level
    Target value of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
    Parameters of Generic Delta Set.

Public Members

bool op_en
    Indicate if optional parameters are included

int32_t level
    Delta change of Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_move_set_t`

Parameters of Generic Move Set.

**Public Members**

`bool op_en`

Indicate if optional parameters are included

`int16_t delta_level`

Delta Level step to calculate Move speed for Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_def_trans_time_set_t`

Parameter of Generic Default Transition Time Set.

**Public Members**

`uint8_t trans_time`

The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_set_t`

Parameter of Generic OnPowerUp Set.

**Public Members**

`uint8_t onpowerup`

The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_set_t`

Parameters of Generic Power Level Set.
Public Members

bool **op_en**
   Indicate if optional parameters are included

uint16_t **power**
   Target value of Generic Power Actual state

uint8_t **tid**
   Transaction ID

uint8_t **trans_time**
   Time to complete state transition (optional)

uint8_t **delay**
   Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_power_default_set_t**
   Parameter of Generic Power Default Set.

Public Members

uint16_t **power**
   The value of the Generic Power Default state

struct **esp_ble_mesh_gen_power_range_set_t**
   Parameters of Generic Power Range Set.

Public Members

uint16_t **range_min**
   Value of Range Min field of Generic Power Range state

uint16_t **range_max**
   Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_loc_global_set_t**
   Parameters of Generic Location Global Set.

Public Members

int32_t **global_latitude**
   Global Coordinates (Latitude)

int32_t **global_longitude**
   Global Coordinates (Longitude)
**GlobalAltitude**

- `int16_t global_altitude`
  Global Altitude

**Public Members**

- `int16_t local_north`
  Local Coordinates (North)

- `int16_t local_east`
  Local Coordinates (East)

- `int16_t local_altitude`
  Local Altitude

- `uint8_t floor_number`
  Floor Number

- `uint16_t uncertainty`
  Uncertainty

**User Property Get**

- `struct esp_ble_mesh_gen_user_property_get_t`
  Parameter of Generic User Property Get.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic User Property

**User Property Set**

- `struct esp_ble_mesh_gen_user_property_set_t`
  Parameters of Generic User Property Set.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic User Property

- `struct net_buf_simple *property_value`
  Raw value for the User Property

**Admin Property Get**

- `struct esp_ble_mesh_gen_admin_property_get_t`
  Parameter of Generic Admin Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`struct esp_ble_mesh_gen_admin_property_set_t`
Parameters of Generic Admin Property Set.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
Enumeration indicating user access

`struct net_buf_simple *property_value`
Raw value for the Admin Property

`struct esp_ble_mesh_gen_manufacturer_property_get_t`
Parameter of Generic Manufacturer Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`struct esp_ble_mesh_gen_manufacturer_property_set_t`
Parameters of Generic Manufacturer Property Set.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
Enumeration indicating user access

`struct esp_ble_mesh_gen_client_properties_get_t`
Parameter of Generic Client Properties Get.

Public Members

`uint16_t property_id`
A starting Client Property ID present within an element
struct esp_ble_mesh_gen_onoff_status_cb_t

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint8_t present_onoff
  Current value of Generic OnOff state

uint8_t target_onoff
  Target value of Generic OnOff state (optional)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t

Parameters of Generic Level Status.

Public Members

bool op_en
  Indicate if optional parameters are included

int16_t present_level
  Current value of Generic Level state

int16_t target_level
  Target value of the Generic Level state (optional)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t

Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
  The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_power
Current value of Generic Power Actual state

uint16_t target_power
Target value of Generic Power Actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
Status Code for the request message
uint16_t range_min
    Value of Range Min field of Generic Power Range state

uint16_t range_max
    Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
    Parameters of Generic Battery Status.

Public Members

uint32_t battery_level
    Value of Generic Battery Level state

uint32_t time_to_discharge
    Value of Generic Battery Time to Discharge state

uint32_t time_to_charge
    Value of Generic Battery Time to Charge state

uint32_t flags
    Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
    Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
    Global Coordinates (Latitude)

int32_t global_longitude
    Global Coordinates (Longitude)

int16_t global_altitude
    Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
    Parameters of Generic Location Local Status.

Public Members

int16_t local_north
    Local Coordinates (North)
int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic User Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.
**Public Members**

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`uint8_t user_access`
Enumeration indicating user access (optional)

`struct net_buf_simple *property_value`
Raw value for the Admin Property (C.1)

**Public Members**

`struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t`
Parameter of Generic Manufacturer Properties Status.

`struct net_buf_simple *property_ids`
Buffer contains a sequence of N Manufacturer Property IDs

**Public Members**

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
Enumeration indicating user access (optional)

`struct net_buf_simple *property_value`
Raw value for the Manufacturer Property (C.1)

**Public Members**

`struct esp_ble_mesh_gen_client_properties_status_cb_t`
Parameter of Generic Client Properties Status.

`struct net_buf_simple *property_ids`
Buffer contains a sequence of N Client Property IDs
struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

Public Members

int error_code
    Appropriate error code

dsp_ble_mesh_client_common_param_t *params
    The client common parameters.

dsp_ble_mesh_gen_client_status_cb_t status_cb
    The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

Public Members

uint8_t onoff
    The present value of the Generic OnOff state

uint8_t target_onoff
    The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

dsp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

dsp_ble_mesh_gen_onoff_state_t state
    Parameters of the Generic OnOff state

dsp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

dsp_ble_mesh_state_transition_t transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state
Public Members

`int16_t level`
The present value of the Generic Level state

`int16_t target_level`
The target value of the Generic Level state

`int16_t last_level`
When a new transaction starts, level should be set to last_last, and use "level + incoming delta" to calculate the target level. In another word, "last_level" is used to record "level" of the last transaction, and "last_delta" is used to record the previously received delta_level value. The last value of the Generic Level state

`int32_t last_delta`
The last delta change of the Generic Level state

`bool move_start`
Indicate if the transition of the Generic Level state has been started

`bool positive`
Indicate if the transition is positive or negative

`struct esp_ble_mesh_gen_level_srv_t`
User data of Generic Level Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_level_state_t state`
Parameters of the Generic Level state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_level`
Delta change value of level state transition

`struct esp_ble_mesh_gen_def_trans_time_state_t`
Parameter of Generic Default Transition Time state
Public Members

```
uint8_t trans_time
```

The value of the Generic Default Transition Time state

```
struct esp_ble_mesh_gen_def_trans_time_srv_t
```

User data of Generic Default Transition Time Server Model

Public Members

```
esp_ble_mesh_model_t *model
```

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```
esp_ble_mesh_gen_def_trans_time_state_t state
```

Parameters of the Generic Default Transition Time state

```
struct esp_ble_mesh_gen_onpowerup_state_t
```

Parameter of Generic OnPowerUp state

Public Members

```
uint8_t onpowerup
```

The value of the Generic OnPowerUp state

```
struct esp_ble_mesh_gen_power_onoff_srv_t
```

User data of Generic Power OnOff Server Model

Public Members

```
esp_ble_mesh_model_t *model
```

Pointer to the Generic Power OnOff Server Model. Initialized internally.

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```
esp_ble_mesh_gen_onpowerup_state_t *state
```

Parameters of the Generic OnPowerUp state

```
struct esp_ble_mesh_gen_power_onoff_setup_srv_t
```

User data of Generic Power OnOff Setup Server Model
**Public Members**

*esp_ble_mesh_model_t* `model`

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp_ble_mesh_server rsp ctrl_t* `rsp ctrl`

Response control of the server model received messages

*esp_ble_mesh_gen_onpowerup_state_t* `state`

Parameters of the Generic OnPowerUp state

**Public Members**

`struct esp_ble_mesh_gen_power_level_state_t`

Parameters of Generic Power Level state

**Public Members**

`uint16_t` `power_actual`

The present value of the Generic Power Actual state

`uint16_t` `target_power_actual`

The target value of the Generic Power Actual state

`uint16_t` `power_last`

The value of the Generic Power Last state

`uint16_t` `power_default`

The value of the Generic Power Default state

`uint8_t` `status_code`

The status code of setting Generic Power Range state

`uint16_t` `power_range_min`

The minimum value of the Generic Power Range state

`uint16_t` `power_range_max`

The maximum value of the Generic Power Range state

*struct esp_ble_mesh_gen_power_level_srv_t* `srv`

User data of Generic Power Level Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`

Pointer to the Generic Power Level Server Model. Initialized internally.

*esp_ble_mesh_server rsp ctrl_t* `rsp ctrl`

Response control of the server model received messages
esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t *last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

**Public Members**

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t
Parameters of Generic Battery state

**Public Members**

uint32_t battery_level
The value of the Generic Battery Level state

uint32_t time_to_discharge
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge
The value of the Generic Battery Time to Charge state

uint32_t battery_flags
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
Public Members

*esp_ble_mesh_model_t* `model`

Pointer to the Generic Battery Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`

Response control of the server model received messages

*esp_ble_mesh_gen_battery_state_t* `state`

Parameters of the Generic Battery state

struct `esp_ble_mesh_gen_location_state_t`

Parameters of Generic Location state

Public Members

int32_t `global_latitude`

The value of the Global Latitude field

int32_t `global_longitude`

The value of the Global Longitude field

int16_t `global_altitude`

The value of the Global Altitude field

int16_t `local_north`

The value of the Local North field

int16_t `local_east`

The value of the Local East field

int16_t `local_altitude`

The value of the Local Altitude field

uint8_t `floor_number`

The value of the Floor Number field

uint16_t `uncertainty`

The value of the Uncertainty field

struct `esp_ble_mesh_gen_location_srv_t`

User data of Generic Location Server Model

Public Members

*esp_ble_mesh_model_t* `model`

Pointer to the Generic Location Server Model. Initialized internally.
**Chapter 2. API Reference**

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* `state`
Parameters of the Generic Location state

**struct esp_ble_mesh_gen_location_setup_srv_t**
User data of Generic Location Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Location Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* `state`
Parameters of the Generic Location state

**struct esp_ble_mesh_gen_generic_property_t**
Parameters of Generic Property states

**Public Members**

uint16_t `id`
The value of User/Admin/Manufacturer Property ID

uint8_t `user_access`
The value of User Access field

uint8_t `admin_access`
The value of Admin Access field

uint8_t `manu_access`
The value of Manufacturer Access field

struct net_buf_simple `val`
The value of User/Admin/Manufacturer Property

**struct esp_ble_mesh_gen_user_prop_srv_t**
User data of Generic User Property Server Model

**Public Members**
Chapter 2. API Reference

`esp_ble_mesh_model_t *model`
Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic User Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic User Property state

`struct esp_ble_mesh_gen_admin_prop_srv_t`
User data of Generic Admin Property Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Admin Property state

`struct esp_ble_mesh_gen_manu_prop_srv_t`
User data of Generic Manufacturer Property Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state

`struct esp_ble_mesh_gen_client_prop_srv_t`
User data of Generic Client Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic Client Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`uint8_t id_count`
- Generic Client Property ID count

`uint16_t *property_ids`
- Parameters of the Generic Client Property state

```c
struct esp_ble_mesh_state_change_gen_onoff_set_t
```
- Parameter of Generic OnOff Set state change event

Public Members

`uint8_t onoff`
- The value of Generic OnOff state

```c
struct esp_ble_mesh_state_change_gen_level_set_t
```
- Parameter of Generic Level Set state change event

Public Members

`int16_t level`
- The value of Generic Level state

```c
struct esp_ble_mesh_state_change_gen_delta_set_t
```
- Parameter of Generic Delta Set state change event

Public Members

`int16_t level`
- The value of Generic Level state

```c
struct esp_ble_mesh_state_change_gen_move_set_t
```
- Parameter of Generic Move Set state change event

Public Members

`int16_t level`
- The value of Generic Level state
struct `esp_ble_mesh_state_change_gen_def_trans_time_set_t`
Parameter of Generic Default Transition Time Set state change event

**Public Members**

`uint8_t trans_time`
The value of Generic Default Transition Time state

struct `esp_ble_mesh_state_change_gen_onpowerup_set_t`
Parameter of Generic OnPowerUp Set state change event

**Public Members**

`uint8_t onpowerup`
The value of Generic OnPowerUp state

struct `esp_ble_mesh_state_change_gen_power_level_set_t`
Parameter of Generic Power Level Set state change event

**Public Members**

`uint16_t power`
The value of Generic Power Actual state

struct `esp_ble_mesh_state_change_gen_power_default_set_t`
Parameter of Generic Power Default Set state change event

**Public Members**

`uint16_t power`
The value of Generic Power Default state

struct `esp_ble_mesh_state_change_gen_power_range_set_t`
Parameters of Generic Power Range Set state change event

**Public Members**

`uint16_t range_min`
The minimum value of Generic Power Range state

`uint16_t range_max`
The maximum value of Generic Power Range state

struct `esp_ble_mesh_state_change_gen_loc_global_set_t`
Parameters of Generic Location Global Set state change event
Public Members

int32_t latitude
The Global Latitude value of Generic Location state

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state

uint8_t floor_number
The Floor Number value of Generic Location state

uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event
Chapter 2. API Reference

**Public Members**

- **uint16_t id**
  The property id of Generic Admin Property state

- **uint8_t access**
  The property access of Generic Admin Property state

- **struct net_buf_simple *value**
  The property value of Generic Admin Property state

- **struct esp_ble_mesh_state_change_gen_manu_property_set_t**
  Parameters of Generic Manufacturer Property Set state change event

**Public Members**

- **uint16_t id**
  The property id of Generic Manufacturer Property state

- **uint8_t access**
  The property value of Generic Manufacturer Property state

- **struct esp_ble_mesh_server_recv_gen_user_property_get_t**
  Context of the received Generic User Property Get message

**Public Members**

- **uint16_t property_id**
  Property ID identifying a Generic User Property

- **struct esp_ble_mesh_server_recv_gen_admin_property_get_t**
  Context of the received Generic Admin Property Get message

**Public Members**

- **uint16_t property_id**
  Property ID identifying a Generic Admin Property

- **struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t**
  Context of the received Generic Manufacturer Property message

**Public Members**

- **uint16_t property_id**
  Property ID identifying a Generic Manufacturer Property
struct esp_ble_mesh_server_recv_gen_client_properties_get_t

Context of the received Generic Client Properties Get message

**Public Members**

uint16_t property_id

A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t

Context of the received Generic OnOff Set message

**Public Members**

bool op_en

Indicate if optional parameters are included

uint8_t onoff

Target value of Generic OnOff state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t

Context of the received Generic Level Set message

**Public Members**

bool op_en

Indicate if optional parameters are included

int16_t level

Target value of Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)
### Public Members

**bool op_en**
Indicate if optional parameters are included

**int32_t delta_level**
Delta change of Generic Level state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

### Public Members

**bool op_en**
Indicate if optional parameters are included

**int16_t delta_level**
Delta Level step to calculate Move speed for Generic Level state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)
Chapter 2. API Reference

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
   Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
   The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
   Context of the received Generic Power Level Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t power
   Target value of Generic Power Actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
   Context of the received Generic Power Default Set message

Public Members

uint16_t power
   The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
   Context of the received Generic Power Range Set message
Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_recv_gen_loc_global_set_t
Context of the received Generic Location Global Set message

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
Public Members

uint16_t `property_id`
Property ID identifying a Generic User Property

struct net_buf_simple *`property_value`
Raw value for the User Property

struct `esp_ble_mesh_server_recv_gen_admin_property_set_t`
Context of the received Generic Admin Property Set message

Public Members

uint16_t `property_id`
Property ID identifying a Generic Admin Property

uint8_t `user_access`
Enumeration indicating user access

struct net_buf_simple *`property_value`
Raw value for the Admin Property

struct `esp_ble_mesh_server_recv_gen_manufacturer_property_set_t`
Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t `property_id`
Property ID identifying a Generic Manufacturer Property

uint8_t `user_access`
Enumeration indicating user access

struct `esp_ble_mesh_generic_server_cb_param_t`
Generic Server Model callback parameters

Public Members

`esp_ble_mesh_model_t` *`model`
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t` *`ctx`
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t` *`value`
Value of the received Generic Messages
Macros

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Default Transition Time Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Power OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.
**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Power Level Client Model instance.

```c
ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI(cli_pub, cli_data)
```

Define a new Generic Battery Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Battery Client Model instance.

```c
ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI(cli_pub, cli_data)
```

Define a new Generic Location Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Location Client Model instance.

```c
ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI(cli_pub, cli_data)
```

Define a new Generic Property Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Location Client Model instance.

```c
ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV(srv_pub, srv_data)
```

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note:**
1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**Returns** New Generic OnOff Server Model instance.
**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note:** 1. The Generic Level Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**Returns** New Generic Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note:** 1. The Generic Default Transition Time Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**Returns** New Generic Default Transition Time Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note:** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
   b. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

**Returns** New Generic Power OnOff Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

   a. This model shall support model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV** (srv_pub, srv_data)

Define a new Generic Power Level Server Model.

**Note:** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

**Returns** New Generic Power Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV** (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

**Note:** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.
   a. This model shall support model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

**Returns** New Generic Power Level Setup Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV** (srv_pub, srv_data)

Define a new Generic Battery Server Model.

**Note:** 1. The Generic Battery Server Model is a root model.
   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that is powered by a battery.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**Returns** New Generic Battery Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV** (srv_pub, srv_data)

Define a new Generic Location Server Model.

**Note:** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that knows its location (global or local).

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**Returns** New Generic Location Server Model instance.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_LOCATION.Setup_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note: 1. The Generic Location Setup Server model extends the Generic Location Server model.
   a. This model shall support model subscription.

Parameters
• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data -- Pointer to the unique struct esp_ble_mesh_gen_location_setup_srv_t.
Returns New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note: 1. The Generic User Property Server model is a root model.
   a. This model shall support model publication and model subscription.

Parameters
• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data -- Pointer to the unique struct esp_ble_mesh_gen_user_prop_srv_t.
Returns New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note: 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

Parameters
• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data -- Pointer to the unique struct esp_ble_mesh_gen_admin_prop_srv_t.
Returns New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

Note: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

Parameters
• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data -- Pointer to the unique struct esp_ble_mesh_gen_manu_prop_srv_t.
Returns New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note: 1. The Generic Client Property Server model is a root model.
a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Returns** New Generic Client Property Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event, esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event, esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

**Values:**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT**
- **enumerator ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX**

```c
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

**Values:**
- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT**
- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_READ**
- **enumerator ESP_BLE_MESH_GEN_USER_ACCESS_WRITE**
enum `esp_ble_mesh_gen_admin_prop_access_t`

This enum value is the access value of Generic Admin Property

Values:

- enumerator `ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP`
- enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ`
- enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE`
- enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE`

enum `esp_ble_mesh_gen_manu_prop_access_t`

This enum value is the access value of Generic Manufacturer Property

Values:

- enumerator `ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP`
- enumerator `ESP_BLE_MESH_GEN_MANU_ACCESS_READ`

enum `esp_ble_mesh_generic_server_cb_event_t`

This enum value is the event of Generic Server Model

Values:

- enumerator `ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT`
  
  i. When get_auto_rsp is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
  
  ii. When set_auto_rsp is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

- enumerator `ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT`

  When get_auto_rsp is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

- enumerator `ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT`

  When set_auto_rsp is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

- enumerator `ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX`

Sensor Client/Server Models
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h
- This header file can be included with:

```c
#include "esp_ble_mesh_sensor_model_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

**esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)**

Register BLE Mesh Sensor Client Model callback.

**Parameters**
- `callback` -- [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_common_client_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)**

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Parameters**
- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `get_state` -- [in] Pointer to sensor get message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_sensor_client_set_state (esp_ble_mesh_common_client_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)**

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Parameters**
- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `set_state` -- [in] Pointer to sensor set message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_sensor_server_callback (esp_ble_mesh_sensor_server_cb_t callback)**

Register BLE Mesh Sensor Server Model callback.

**Parameters**
- `callback` -- [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

    Parameters of Sensor Descriptor Get

Public Members

bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
  Property ID of a sensor (optional)
```

**struct esp_ble_mesh_sensor_cadence_get_t**
Parameter of Sensor Cadence Get

**Public Members**

```c
uint16_t property_id
  Property ID of a sensor
```

**struct esp_ble_mesh_sensor_cadence_set_t**
Parameters of Sensor Cadence Set

**Public Members**

```c
uint16_t property_id
  Property ID for the sensor
```

```c
uint8_t fast_cadence_period_divisor
  Divisor for the publish period
```

```c
uint8_t status_trigger_type
  The unit and format of the Status Trigger Delta fields
```

```c
struct net_buf_simple *status_trigger_delta_down
  Delta down value that triggers a status message
```

```c
struct net_buf_simple *status_trigger_delta_up
  Delta up value that triggers a status message
```

```c
uint8_t status_min_interval
  Minimum interval between two consecutive Status messages
```

```c
struct net_buf_simple *fast_cadence_low
  Low value for the fast cadence range
```

```c
struct net_buf_simple *fast_cadence_high
  Fast value for the fast cadence range
```

**struct esp_ble_mesh_sensor_settings_get_t**
Parameter of Sensor Settings Get

**Public Members**

```c
uint16_t sensor_property_id
  Property ID of a sensor
```
struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column
struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
Property for the sensor

struct net_buf_simple *sensor_cadence_value
Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor
struct net_buf_simple *sensor_setting_property_ids
A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
Parameters of Sensor Setting Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
Parameter of Sensor Status

Public Members

struct net_buf_simple *marshalled_sensor_data
Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
Parameters of Sensor Column Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status
Public Members

\textbf{uint16_t property_id}

Property identifying a sensor and the Y axis

\textbf{struct net_buf_simple *sensor_series_value}

Left values of sensor series status

\textbf{struct esp_ble_mesh_sensor_client_cb_param_t}

Sensor Client Model callback parameters

Public Members

\textbf{int error_code}

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

\textbf{esp_ble_mesh_client_common_param_t *params}

The client common parameters.

\textbf{esp_ble_mesh_sensor_client_status_cb_t status_cb}

The sensor status message callback values

\textbf{struct esp_ble_mesh_sensor_descriptor_t}

Parameters of Sensor Descriptor state

Public Members

\textbf{uint32_t positive_tolerance}

The value of Sensor Positive Tolerance field

\textbf{uint32_t negative_tolerance}

The value of Sensor Negative Tolerance field

\textbf{uint32_t sampling_function}

The value of Sensor Sampling Function field

\textbf{uint8_t measure_period}

The value of Sensor Measurement Period field

\textbf{uint8_t update_interval}

The value of Sensor Update Interval field

\textbf{struct esp_ble_mesh_sensor_setting_t}

Parameters of Sensor Setting state
Public Members

uint16_t property_id
   The value of Sensor Setting Property ID field

uint8_t access
   The value of Sensor Setting Access field

struct net_buf_simple *raw
   The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
   Parameters of Sensor Cadence state

Public Members

uint8_t period_divisor
   The value of Fast Cadence Period Divisor field

uint8_t trigger_type
   The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
   Note: The parameter "size" in trigger_delta_down, trigger_delta_up, fast_cadence_low &
   fast_cadence_high indicates the exact length of these four parameters, and they are associated
   with the Sensor Property ID. Users need to initialize the "size" precisely. The value of Status Trigger
   Delta Down field

struct net_buf_simple *trigger_delta_up
   The value of Status Trigger Delta Up field

uint8_t min_interval
   The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
   The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
   The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
   Parameters of Sensor Data state

Public Members

uint8_t format
   Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
   Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 –
   127). The value 0x7F represents a length of zero. The value of the Sensor Data format
uint8_t length
   The value of the Sensor Data length

struct net_buf_simple *raw_value
   The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
   Parameters of Sensor Series Column state

**Public Members**

struct net_buf_simple *raw_value_x
   The value of Sensor Raw Value X field

struct net_buf_simple *column_width
   The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
   The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
   Parameters of Sensor states

**Public Members**

uint16_t sensor_property_id
   The value of Sensor Property ID field

*esp_ble_mesh_sensor_descriptor_t* descriptor
   Parameters of the Sensor Descriptor state

const uint8_t setting_count
   Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

*esp_ble_mesh_sensor_setting_t* settings
   Parameters of the Sensor Setting state

*esp_ble_mesh_sensor_cadence_t* cadence
   The Sensor Cadence state may not be supported by sensors based on device properties referencing "non-scalar characteristics" such as "histograms" or "composite characteristics". Parameters of the Sensor Cadence state

*esp_ble_mesh_sensor_data_t* sensor_data
   Parameters of the Sensor Data state

*esp_ble_mesh_sensor_series_column_t* series_column
   Parameters of the Sensor Series Column state
struct esp_ble_mesh_sensor_srv_t

User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl

Response control of the server model received messages

const uint8_t state_count

Sensor state count

esp_ble_mesh_sensor_state_t *states

Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t

User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl

Response control of the server model received messages

const uint8_t state_count

Sensor state count

esp_ble_mesh_sensor_state_t *states

Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t

Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id

The value of Sensor Property ID state

uint8_t period_divisor

The value of Fast Cadence Period Divisor state
uint8_t trigger_type
The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state

uint8_t min_interval
The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message
Chapter 2. API Reference

Public Members

`uint16_t property_id`
Property ID of a sensor

`struct esp_ble_mesh_server_recv_sensor_settings_get_t`
Context of the received Sensor Settings Get message

Public Members

`uint16_t property_id`
Property ID of a sensor

`struct esp_ble_mesh_server_recv_sensor_setting_get_t`
Context of the received Sensor Setting Get message

Public Members

`uint16_t property_id`
Property ID of a sensor

`uint16_t setting_property_id`
Setting ID identifying a setting within a sensor

`struct esp_ble_mesh_server_recv_sensor_get_t`
Context of the received Sensor Get message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID for the sensor (optional)

`struct esp_ble_mesh_server_recv_sensor_column_get_t`
Context of the received Sensor Column Get message

Public Members

`uint16_t property_id`
Property identifying a sensor

`struct net_buf_simple *raw_value_x`
Raw value identifying a column
struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Sensor Server Models
Chapter 2.  API Reference

**esp_ble_mesh_msg_ctx_t**

Context of the received messages

**esp_ble_mesh_sensor_server_cb_value_t**

Value of the received Sensor Messages

**Macros**

**ESP_BLE_MESH_MODEL_SENSOR_CLI** (cli_pub, cli_data)

Define a new Sensor Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Sensor Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Sensor Client Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

**Note:** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

**Parameters**

- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

**Returns** New Sensor Server Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

**Note:** 1. The Sensor Setup Server model extends the Sensor Server model.

a. This model shall support model publication and model subscription.

**Parameters**

- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

**Returns** New Sensor Setup Server Model instance.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**

Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**

Length of Sensor Property ID
Chapter 2. API Reference

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval

**ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID**
Invalid Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN**
Length of Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN**
Length of Sensor Setting Access

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ**
Sensor Setting Access - Read

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type "uint16"
### ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

### ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

### ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

### ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

### ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

### ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)
Get format of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**Parameters**

- `_data` -- Pointer to the start of the sensor data.

**Returns** Format of the sensor data.

### ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**Parameters**

- `_data` -- Pointer to the start of the sensor data.
- `_fmt` -- Format of the sensor data.

**Returns** Length (zero-based) of the sensor data.

### ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Parameters**

- `_data` -- Pointer to the start of the sensor data.
- `_fmt` -- Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.
ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

Note: 1. The Format field is 0b0 and indicates that Format A is used.
   a. The Length field is a 1-based uint4 value (valid range 0x0–0x3F, representing range of 1–16).
   b. The Property ID is an 11-bit bit field representing 11 LSB of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Parameters
   • _len -- Length of Sensor Raw value.
   • _id -- Sensor Property ID.

Returns 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

Note: 1. The Format field is 0b1 and indicates Format B is used.
   a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
   b. The Property ID is a 16-bit bit field representing a Property ID.
   c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
   d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Parameters
   • _len -- Length of Sensor Raw value.
   • _id -- Sensor Property ID.

Returns 3-octet MPID value for sensor data with Format B.

Type Definitions
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,
   esp_ble_mesh_sensor_client_cb_param_t *param)
   Bluetooth Mesh Sensor Client Model function.
   Sensor Client Model callback function type
   Param event Event type
   Param param Pointer to callback parameter
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,
   esp_ble_mesh_sensor_server_cb_param_t *param)
   Bluetooth Mesh Sensor Server Model function.
   Sensor Server Model callback function type
   Param event Event type
   Param param Pointer to callback parameter

Enumerations
enum esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

Values:

- enumerator `ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT`
- enumerator `ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT`
- enumerator `ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT`
- enumerator `ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT`
- enumerator `ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX`

enum `esp_ble_mesh_sensor_sample_func`

This enum value is value of Sensor Sampling Function

Values:

- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_RMS`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED`
- enumerator `ESP_BLE_MESH_SAMPLE_FUNC_COUNT`

enum `esp_ble_mesh_sensor_server_cb_event_t`

This enum value is the event of Sensor Server Model

Values:

- enumerator `ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT`
  
  i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
  
  ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Unack messages are received.

- enumerator `ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT`

  When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.
enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

### Time and Scenes Client/Server Models

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h
- This header file can be included with:

  ```c
  #include "esp_ble_mesh_time_scene_model_api.h"
  ```

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE bt
  ```

  or

  ```cmake
  PRIV_REQUIRES bt
  ```

**Functions**

- **esp_err_t esp_ble_mesh_register_time_scene_client_callback**
  
  ```c
  esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)
  ```

  Register BLE Mesh Time Scene Client Model callback.

  **Parameters**
  - `callback` -- [in] Pointer to the callback function.

  **Returns**
  - ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_time_scene_client_get_state**
  
  ```c
  esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                                  esp_ble_mesh_time_scene_client_get_state_t *get_state)
  ```

  Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

  **Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

  **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  - `get_state` -- [in] Pointer to time scene get message value. Shall not be set to NULL.

  **Returns**
  - ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_time_scene_client_set_state**
  
  ```c
  esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                  esp_ble_mesh_time_scene_client_set_state_t *set_state)
  ```

  Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

  **Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`
Parameters
  • **params** -- [in] Pointer to BLE Mesh common client parameters.
  • **set_state** -- [in] Pointer to time scene set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**Parameters** callback -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

Unions

```c
union esp_ble_mesh_time_scene_client_get_state_t
#include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model get message union.
```

**Public Members**

```c

**Public Members**

```c
uint8_t tai_seconds[5]

// The current TAI time in seconds
uint8_t sub_second
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_set_t
    Parameters of Time Zone Set

    Public Members

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_set_t
    Parameters of TAI-UTC Delta Set

    Public Members

uint16_t tai_utc_delta_new
    Upcoming difference between TAI and UTC in seconds

uint16_t padding
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set

    Public Members

uint8_t time_role
    The Time Role for the element
struct esp_ble_mesh_scene_store_t
    Parameter of Scene Store

    Public Members

    uint16_t scene_number
        The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
    Parameters of Scene Recall

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t scene_number
        The number of scenes to be recalled

    uint8_t tid
        Transaction ID

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
    Parameter of Scene Delete

    Public Members

    uint16_t scene_number
        The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
    Parameter of Scheduler Action Get

    Public Members

    uint8_t index
        Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
    Parameters of Scheduler Action Set
Chapter 2. API Reference

Public Members

uint64_t index
        Index of the Schedule Register entry to set

uint64_t year
        Scheduled year for the action

uint64_t month
        Scheduled month for the action

uint64_t day
        Scheduled day of the month for the action

uint64_t hour
        Scheduled hour for the action

uint64_t minute
        Scheduled minute for the action

uint64_t second
        Scheduled second for the action

uint64_t day_of_week
        Scheduled day of the week for the action

uint64_t action
        Action to be performed at the scheduled time

uint64_t trans_time
        Transition time for this action

uint16_t scene_number
        Transition time for this action

struct esp_ble_mesh_time_status_cb_t
        Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

        Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
        The current TAI time in seconds

uint8_t sub_second
        The sub-second time in units of 1/256 second
uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
   Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
   Parameters of Time Zone Status

   Public Members

   uint8_t time_zone_offset_curr
      Current local time zone offset

   uint8_t time_zone_offset_new
      Upcoming local time zone offset

   uint8_t tai_zone_change[5]
      TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
   Parameters of TAI-UTC Delta Status

   Public Members

   uint16_t tai_utc_delta_curr
      Current difference between TAI and UTC in seconds

   uint16_t padding_1
      Always 0b0. Other values are Prohibited.

   uint16_t tai_utc_delta_new
      Upcoming difference between TAI and UTC in seconds

   uint16_t padding_2
      Always 0b0. Other values are Prohibited.

   uint8_t tai_delta_change[5]
      TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
   Parameter of Time Role Status
Public Members

```c
uint8_t time_role
The Time Role for the element
```

```c
struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status
```

Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint8_t status_code
Status code of the last operation
```

```c
uint16_t current_scene
Scene Number of the current scene
```

```c
uint16_t target_scene
Scene Number of the target scene (optional)
```

```c
uint8_t remain_time
Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status
```

Public Members

```c
uint8_t status_code
Status code for the previous operation
```

```c
uint16_t current_scene
Scene Number of the current scene
```

```c
struct net_buf_simple *scenes
A list of scenes stored within an element
```

```c
struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status
```

Public Members

```c
uint16_t schedules
Bit field indicating defined Actions in the Schedule Register
```
Chapter 2. API Reference

**struct esp_ble_mesh_scheduler_act_status_cb_t**
Parameters of Scheduler Action Status

**Public Members**

```c
uint64_t index
  Enumerates (selects) a Schedule Register entry
```

```c
uint64_t year
  Scheduled year for the action
```

```c
uint64_t month
  Scheduled month for the action
```

```c
uint64_t day
  Scheduled day of the month for the action
```

```c
uint64_t hour
  Scheduled hour for the action
```

```c
uint64_t minute
  Scheduled minute for the action
```

```c
uint64_t second
  Scheduled second for the action
```

```c
uint64_t day_of_week
  Schedule days of the week for the action
```

```c
uint64_t action
  Action to be performed at the scheduled time
```

```c
uint64_t trans_time
  Transition time for this action
```

```c
uint16_t scene_number
  Transition time for this action
```

**struct esp_ble_mesh_time_scene_client_cb_param_t**
Time Scene Client Model callback parameters

**Public Members**

```c
int error_code
  Appropriate error code
```

Public Members

*esp_ble_mesh_model_t* `model`

Pointer to the Time Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`

Response control of the server model received messages.

*esp_ble_mesh_time_state_t* `state`

Parameters of the Time state

```c
struct esp_ble_mesh_time_setup_srv_t
```

User data of Time Setup Server Model

Public Members

*esp_ble_mesh_model_t* `model`

Pointer to the Time Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`

Response control of the server model received messages.

*esp_ble_mesh_time_state_t* `state`

Parameters of the Time state

```c
struct esp_ble_mesh_scene_register_t
```

a. Scene Store is an operation of storing values of a present state of an element.
b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

```c
uint16_t scene_number
```

The value of the Scene Number

```c
uint8_t scene_type
```

The value of the Scene Type

```c
struct net_buf_simple *scene_value
```

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value
struct esp_ble_mesh_scenes_state_t

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count
    The Scenes state's scene count

esp_ble_mesh_scene_register_t * scenes
    Parameters of the Scenes state

uint16_t current_scene
    The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene
    The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code
    The status code of the last scene operation
bool in_progress
   Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t
   User data of Scene Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_scenes_state_t *state
   Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t *last
   Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
   Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t
   User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_scenes_state_t *state
   Parameters of the Scenes state

struct esp_ble_mesh_schedule_register_t
   Parameters of Scheduler Register state

Public Members

bool in_use
   Indicate if the registered schedule is in use
uint64_t **year**  
The value of Scheduled year for the action

uint64_t **month**  
The value of Scheduled month for the action

uint64_t **day**  
The value of Scheduled day of the month for the action

uint64_t **hour**  
The value of Scheduled hour for the action

uint64_t **minute**  
The value of Scheduled minute for the action

uint64_t **second**  
The value of Scheduled second for the action

uint64_t **day_of_week**  
The value of Schedule days of the week for the action

uint64_t **action**  
The value of Action to be performed at the scheduled time

uint64_t **trans_time**  
The value of Transition time for this action

uint16_t **scene_number**  
The value of Scene Number to be used for some actions

// struct esp_ble_mesh_scheduler_state_t  
// Parameters of Scheduler state

**Public Members**

const uint8_t **schedule_count**  
Scheduler count

`esp_ble_mesh_schedule_register_t` **schedules**  
Up to 16 scheduled entries

// struct esp_ble_mesh_scheduler_srv_t  
// User data of Scheduler Server Model

**Public Members**

*esp_ble_mesh_model_t* model
  
  Pointer to the Scheduler Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
  
  Response control of the server model received messages

*esp_ble_mesh_scheduler_state_t* state
  
  Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
  
  User data of Scheduler Setup Server Model

### Public Members

*esp_ble_mesh_model_t* model
  
  Pointer to the Scheduler Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
  
  Response control of the server model received messages

*esp_ble_mesh_scheduler_state_t* state
  
  Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
  
  Parameters of Time Set state change event

### Public Members

uint8_t tai_seconds[5]
  
  The current TAI time in seconds

uint8_t subsecond
  
  The sub-second time in units of 1/256 second

uint8_t uncertainty
  
  The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
  
  0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
  
  Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
  
  The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
  
  Parameters of Time Status state change event
Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of TimeZoneSet state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
Parameter of Time Role Set state change event
Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event

Public Members

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
    Parameter of Scheduler Action Set state change event

Public Members

uint64_t index
    Index of the Schedule Register entry to set

uint64_t year
    Scheduled year for the action

uint64_t month
    Scheduled month for the action

uint64_t day
    Scheduled day of the month for the action

```c
uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Scheduled day of the week for the action

uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions
```

```c
struct esp_ble_mesh_server_recv_scheduler_act_get_t
    Context of the received Scheduler Action Get message

Public Members

uint8_t index
    Index of the Schedule Register entry to get
```

```c
struct esp_ble_mesh_server_recv_time_set_t
    Context of the received Time Set message

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority
```
uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t padding
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
Context of the received Time Role Set message

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
Context of the received Scene Store message

Public Members

uint16_t scene_number
The number of scenes to be stored
struct esp_ble_mesh_server_recv_scene_recall_t
   Context of the received Scene Recall message

   **Public Members**

   bool op_en
      Indicate if optional parameters are included

   uint16_t scene_number
      The number of scenes to be recalled

   uint8_t tid
      Transaction ID

   uint8_t trans_time
      Time to complete state transition (optional)

   uint8_t delay
      Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
   Context of the received Scene Delete message

   **Public Members**

   uint16_t scene_number
      The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
   Context of the received Scheduler Action Set message

   **Public Members**

   uint64_t index
      Index of the Schedule Register entry to set

   uint64_t year
      Scheduled year for the action

   uint64_t month
      Scheduled month for the action

   uint64_t day
      Scheduled day of the month for the action
uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Schedule days of the week for the action

uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
    Context of the received Time Status message

**Public Members**

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
    Time Scene Server Model callback parameters
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t value`
Value of the received Time and Scenes Messages

Macros

**ESP_BLE_MESH_MODEL_TIME_CLI** (cli_pub, cli_data)
Define a new Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Parameters**
- cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Time Client Model instance.

**ESP_BLE_MESH_MODEL_SCENE_CLI** (cli_pub, cli_data)
Define a new Scene Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Parameters**
- cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Scene Client Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_CLI** (cli_pub, cli_data)
Define a new Scheduler Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Parameters**
- cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Scheduler Client Model instance.

**ESP_BLE_MESH_MODEL_TIME_SRV** (srv_pub, srv_data)
Time Scene Server Models related context.
Define a new Time Server Model.
Chapter 2. API Reference

**Note:** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

**Returns** New Time Server Model instance.

**ESP_BLE_MESH_MODEL_TIME_SETUP_SRV** (srv_data)
Define a new Time Setup Server Model.

**Note:** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

   a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

   b. This model does not support subscribing nor publishing.

**Parameters**
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

**Returns** New Time Setup Server Model instance.

**ESP_BLE_MESH_MODEL_SCENE_SRV** (srv_pub, srv_data)
Define a new Scene Server Model.

**Note:** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. The model may be present only on the Primary element of a node.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

**Returns** New Scene Server Model instance.

**ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV** (srv_pub, srv_data)
Define a new Scene Setup Server Model.

**Note:** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

   a. This model shall support model subscription.

   b. The model may be present only on the Primary element of a node.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**Returns** New Scene Setup Server Model instance.
**ESP_BLE_MESH_MODEL_SCHEDULER_SRV** (srv_pub, srv_data)

Define a new Scheduler Server Model.

**Note:** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

**Returns** New Scheduler Server Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV** (srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

**Note:** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**Parameters**
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**Returns** New Scheduler Setup Server Model instance.

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**

Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**

Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**

Unknown TAI of Delta Change

**ESP_BLE_MESH_TAI.utc_DELTA_MAX_VALUE**

Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**

Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**

Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**

Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**

Invalid Scene Number
**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**
Every 15 seconds of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC**
Every 20 seconds of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN**
Once of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF**
Scheduled Action - Turn Off

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON**
Scheduled Action - Turn On

**ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL**
Scheduled Action - Scene Recall
**Chapter 2. API Reference**

*ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION*
Scheduled Action - No Action

*ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE*
Scheduled Scene - No Scene

*ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX*
Maximum number of Scheduled entries

*ESP_BLE_MESH_TIME_NONE*
Time Role - None

*ESP_BLE_MESH_TIME_AUTHORITY*
Time Role - Mesh Time Authority

*ESP_BLE_MESH_TIME_RELAY*
Time Role - Mesh Time Relay

*ESP_BLE_MESH_TIME_CLIENT*
Time Role - Mesh Time Client

*ESP_BLE_MESH_SCENE_SUCCESS*
Scene operation - Success

*ESP_BLE_MESH_SCENE_REG_FULL*
Scene operation - Scene Register Full

*ESP_BLE_MESH_SCENE_NOT_FOUND*
Scene operation - Scene Not Found

**Type Definitions**

typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Param event Event type
Param param Pointer to callback parameter

**Enumerations**
enum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_lighting_model_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
REQUIRES bt
or
PRIV_REQUIRES bt

Functions

esp_err_t esp_ble_mesh_register_light_client_callback(esp_ble_mesh_light_client_cb_t callback)

Register BLE Mesh Light Client Model callback.

Parameters callback -- [in] pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_light_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_light_client_get_state_t *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters
  • params -- [in] Pointer to BLE Mesh common client parameters.
  • get_state -- [in] Pointer of light get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                             esp_ble_mesh_light_client_set_state_t *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters
  • params -- [in] Pointer to BLE Mesh common client parameters.
  • set_state -- [in] Pointer of light set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_register_lighting_server_callback(esp_ble_mesh_lighting_server_cb_t callback)

Register BLE Mesh Lighting Server Model callback.

Parameters callback -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Parameters of Light CTL Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **ctl_lightness**
Target value of light ctl lightness state

uint16_t **ctl_temperature**
Target value of light ctl temperature state

int16_t **ctl_delta_uv**
Target value of light ctl delta UV state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_set_t
Parameters of Light CTL Temperature Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **ctl_temperature**
Target value of light ctl temperature state

int16_t **ctl_delta_uv**
Target value of light ctl delta UV state
uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_set_t
    Parameters of Light CTL Temperature Range Set

Public Members

uint16_t range_min
    Value of temperature range min field of light ctl temperature range state

uint16_t range_max
    Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t
    Parameters of Light CTL Default Set

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t temperature
    Value of light temperature default state

int16_t delta_uv
    Value of light delta UV default state

struct esp_ble_mesh_light_hsl_set_t
    Parameters of Light HSL Set

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t hsl_lightness
    Target value of light hsl lightness state
struct esp_ble_mesh_light_hsl_hue_set_t
  Parameters of Light HSL Hue Set

  **Public Members**

  bool op_en
  Indicate if optional parameters are included

  uint16_t hue
  Target value of light hsl hue state

  uint8_t tid
  Transaction ID

  uint8_t trans_time
  Time to complete state transition (optional)

  uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
  Parameters of Light HSL Saturation Set

  **Public Members**

  bool op_en
  Indicate if optional parameters are included

  uint16_t saturation
  Target value of light hsl hue state
## Chapter 2. API Reference

### Public Members

- **uint8_t tid**
  - Transaction ID

- **uint8_t trans_time**
  - Time to complete state transition (optional)

- **uint8_t delay**
  - Indicate message execution delay (C.1)

### struct esp_ble_mesh_light_hsl_default_set_t

Parameters of Light HSL Default Set

#### Public Members

- **uint16_t lightness**
  - Value of light lightness default state

- **uint16_t hue**
  - Value of light hue default state

- **uint16_t saturation**
  - Value of light saturation default state

### struct esp_ble_mesh_light_hsl_range_set_t

Parameters of Light HSL Range Set

#### Public Members

- **uint16_t hue_range_min**
  - Value of hue range min field of light hsl hue range state

- **uint16_t hue_range_max**
  - Value of hue range max field of light hsl hue range state

- **uint16_t saturation_range_min**
  - Value of saturation range min field of light hsl saturation range state

- **uint16_t saturation_range_max**
  - Value of saturation range max field of light hsl saturation range state

### struct esp_ble_mesh_light_xyl_set_t

Parameters of Light xyL Set

#### Public Members
bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t xyl_x
   The target value of the Light xyL x state

uint16_t xyl_y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
   Parameters of Light xyL Default Set

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t xyl_x
   The value of the Light xyL x Default state

uint16_t xyl_y
   The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
**uint16_t xyl_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

**uint16_t xyl_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp_ble_mesh_light_lc_mode_set_t**

Parameter of Light LC Mode Set

**Public Members**

**uint8_t mode**

The target value of the Light LC Mode state

**struct esp_ble_mesh_light_lc_om_set_t**

Parameter of Light LC OM Set

**Public Members**

**uint8_t mode**

The target value of the Light LC Occupancy Mode state

**struct esp_ble_mesh_light_lc_light_onoff_set_t**

Parameters of Light LC Light OnOff Set

**Public Members**

**bool op_en**

Indicate whether optional parameters included

**uint8_t light_onoff**

The target value of the Light LC Light OnOff state

**uint8_t tid**

Transaction Identifier

**uint8_t trans_time**

Time to complete state transition (optional)

**uint8_t delay**

Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lc_property_get_t**

Parameter of Light LC Property Get
Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
Parameters of Light LC Property Set

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
Parameters of Light Lightness Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness actual state

uint16_t target_lightness
Target value of light lightness actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
Parameters of Light Lightness Linear Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness linear state

```c
uint16_t target_lightness
    Target value of light lightness linear state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_lightness_last_status_cb_t
    Parameter of Light Lightness Last Status
```

**Public Members**

```c
uint16_t lightness
    The value of the Light Lightness Last state
```

```c
struct esp_ble_mesh_light_lightness_default_status_cb_t
    Parameter of Light Lightness Default Status
```

**Public Members**

```c
uint16_t lightness
    The value of the Light Lightness default State
```

```c
struct esp_ble_mesh_light_lightness_range_status_cb_t
    Parameters of Light Lightness Range Status
```

**Public Members**

```c
uint8_t status_code
    Status Code for the request message

uint16_t range_min
    Value of range min field of light lightness range state

uint16_t range_max
    Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_light_ctl_status_cb_t
    Parameters of Light CTL Status
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

uint16_t present_ctl_lightness
    Current value of light ctl lightness state
```
Chapter 2. API Reference

```plaintext
uint16_t present_ctl_temperature
    Current value of light control temperature state

uint16_t target_ctl_lightness
    Target value of light control lightness state (optional)

uint16_t target_ctl_temperature
    Target value of light control temperature state (C.1)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
    Parameters of Light CTL Temperature Status

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_ctl_temperature
        Current value of light control temperature state

    uint16_t present_ctl_delta_uv
        Current value of light control delta UV state

    uint16_t target_ctl_temperature
        Target value of light control temperature state (optional)

    uint16_t target_ctl_delta_uv
        Target value of light control delta UV state (C.1)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
    Parameters of Light CTL Temperature Range Status

    Public Members

    uint8_t status_code
        Status code for the request message

    uint16_t range_min
        Value of temperature range min field of light control temperature range state
```
uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_status_cb_t
Parameters of Light HSL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Current value of light hsl lightness state

uint16_t hsl_hue
Current value of light hsl hue state

uint16_t hsl_saturation
Current value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
Parameters of Light HSL Target Status

Public Members

bool op_en
Indicate if optional parameters are included
Chapter 2. API Reference

```c
uint16_t hsl_lightness_target
    Target value of light hsl lightness state
```

```c
uint16_t hsl_hue_target
    Target value of light hsl hue state
```

```c
uint16_t hsl_saturation_target
    Target value of light hsl saturation state
```

```c
uint8_t remain_time
    Time to complete state transition (optional)
```

```c
struct esp_ble_mesh_light_hsl_hue_status_cb_t
    Parameters of Light HSL Hue Status
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t present_hue
    Current value of light hsl hue state
```

```c
uint16_t target_hue
    Target value of light hsl hue state (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_hsl_saturation_status_cb_t
    Parameters of Light HSL Saturation Status
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t present_saturation
    Current value of light hsl saturation state
```

```c
uint16_t target_saturation
    Target value of light hsl saturation state (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_hsl_default_status_cb_t
    Parameters of Light HSL Default Status
```
Chapter 2. API Reference

**Public Members**

```c
uint16_t lightness
  Value of light lightness default state
```

```c
uint16_t hue
  Value of light hue default state
```

```c
uint16_t saturation
  Value of light saturation default state
```

```c
struct esp_ble_mesh_light_hsl_range_status_cb_t
  Parameters of Light HSL Range Status
```

**Public Members**

```c
uint8_t status_code
  Status code for the request message
```

```c
uint16_t hue_range_min
  Value of hue range min field of light hsl hue range state
```

```c
uint16_t hue_range_max
  Value of hue range max field of light hsl hue range state
```

```c
uint16_t saturation_range_min
  Value of saturation range min field of light hsl saturation range state
```

```c
uint16_t saturation_range_max
  Value of saturation range max field of light hsl saturation range state
```

```c
struct esp_ble_mesh_light_xyl_status_cb_t
  Parameters of Light xyL Status
```

**Public Members**

```c
bool op_en
  Indicate whether optional parameters included
```

```c
uint16_t xyl_lightness
  The present value of the Light xyL Lightness state
```

```c
uint16_t xyl_x
  The present value of the Light xyL x state
```

```c
uint16_t xyl_y
  The present value of the Light xyL y state
```
uint8_t **remain_time**
Time to complete state transition (optional)

```c
struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xYL Target Status
```

**Public Members**

```c
bool op_en
    Indicate whether optional parameters included
```

```c
uint16_t target_xyl_lightness
    The target value of the Light xYL Lightness state
```

```c
uint16_t target_xyl_x
    The target value of the Light xYL x state
```

```c
uint16_t target_xyl_y
    The target value of the Light xYL y state
```

```c
uint8_t **remain_time**
Time to complete state transition (optional)
```

```c
struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xYL Default Status
```

**Public Members**

```c
uint16_t lightness
    The value of the Light Lightness Default state
```

```c
uint16_t xyl_x
    The value of the Light xYL x Default state
```

```c
uint16_t xyl_y
    The value of the Light xYL y Default state
```

```c
struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xYL Range Status
```

**Public Members**

```c
uint8_t **status_code**
    Status Code for the requesting message
```
uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t mode
The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t mode
The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t present_light_onoff
The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status
Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_light_client_cb_param_t`
Lighting Client Model callback parameters

Public Members

`int error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_light_client_status_cb_t status_cb`
The light status message callback values

`struct esp_ble_mesh_light_lightness_state_t`
Parameters of Light Lightness state

Public Members

`uint16_t lightness_linear`
The present value of Light Lightness Linear state

`uint16_t target_lightness_linear`
The target value of Light Lightness Linear state

`uint16_t lightness_actual`
The present value of Light Lightness Actual state

`uint16_t target_lightness_actual`
The target value of Light Lightness Actual state

`uint16_t lightness_last`
The value of Light Lightness Last state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint8_t status_code`
The status code of setting Light Lightness Range state
uint16_t lightness_range_min
The minimum value of Light Lightness Range state

uint16_t lightness_range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t *last
Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
Chapter 2. API Reference

```c
esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
The present value of Light CTL Lightness state

uint16_t target_lightness
The target value of Light CTL Lightness state

uint16_t temperature
The present value of Light CTL Temperature state

uint16_t target_temperature
The target value of Light CTL Temperature state

int16_t delta_uv
The present value of Light CTL Delta UV state

int16_t target_delta_uv
The target value of Light CTL Delta UV state

uint8_t status_code
The status code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t temperature_default
The value of Light CTL Temperature Default state

int16_t delta_uv_default
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_setup_srv_t`
User data of Light CTL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.
**esp_ble_mesh_server_rsp_ctrl_t**

Response control of the server model received messages

**esp_ble_mesh_light_ctl_state_t**

Parameters of the Light CTL state

**esp_ble_mesh_last_msg_info_t**

Parameters of the last received set message

**esp_ble_mesh_state_transition_t**

Parameters of state transition

**int32_t tt_delta_temperature**

Delta change value of temperature state transition

**int32_t tt_delta_delta_uv**

Delta change value of delta uv state transition

**struct esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

**Public Members**

**uint16_t lightness**

The present value of Light HSL Lightness state

**uint16_t target_lightness**

The target value of Light HSL Lightness state

**uint16_t hue**

The present value of Light HSL Hue state

**uint16_t target_hue**

The target value of Light HSL Hue state

**uint16_t saturation**

The present value of Light HSL Saturation state

**uint16_t target_saturation**

The target value of Light HSL Saturation state

**uint16_t lightness_default**

The value of Light Lightness Default state

**uint16_t hue_default**

The value of Light HSL Hue Default state
```c
uint16_t saturation_default
    The value of Light HSL Saturation Default state

uint8_t status_code
    The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
    The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
    The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
    The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
    The maximum value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_light_hsl_srv_t
    Userdata of Light HSL Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
    Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition
```

```c
struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`struct esp_ble_mesh_light_hsl_hue_srv_t`
User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state
Chapter 2. API Reference

```c

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

struct esp_ble_mesh_light_xyl_state_t
Parameters of Light xyl state

Public Members
```

```c

uint16_t lightness
The present value of Light xyl Lightness state

uint16_t target_lightness
The target value of Light xyl Lightness state

uint16_t x
The present value of Light xyl x state

uint16_t target_x
The target value of Light xyl x state

uint16_t y
The present value of Light xyl y state

uint16_t target_y
The target value of Light xyl y state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t x_default
The value of Light xyl x Default state

uint16_t y_default
The value of Light xyl y Default state

uint8_t status_code
The status code of setting Light xyl x & y Range state

uint16_t x_range_min
The minimum value of Light xyl x Range state
```
Chapter 2. API Reference

```
uint16_t x_range_max
    The maximum value of Light xyL x Range state

uint16_t y_range_min
    The minimum value of Light xyL y Range state

uint16_t y_range_max
    The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
    User data of Light xyL Server Model

    **Public Members**

    *esp_ble_mesh_model_t* model
        Pointer to the Lighting xyL Server Model. Initialized internally.

    *esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
        Response control of the server model received messages

    *esp_ble_mesh_light_xyl_state_t* state
        Parameters of the Light xyL state

    *esp_ble_mesh_last_msg_info_t* last
        Parameters of the last received set message

    *esp_ble_mesh_state_transition_t* transition
        Parameters of state transition

    int32_t tt_delta_lightness
        Delta change value of lightness state transition

    int32_t tt_delta_x
        Delta change value of x state transition

    int32_t tt_delta_y
        Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
    User data of Light xyL Setup Server Model

    **Public Members**

    *esp_ble_mesh_model_t* model
        Pointer to the Lighting xyL Setup Server Model. Initialized internally.
```
**Public Members**

`uint32_t mode`
- 0b0 The controller is turned off.
- The binding with the Light Lightness state is disabled.
- 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

`uint32_t occupancy_mode`
- The value of Light LC Occupancy Mode state

`uint32_t light_onoff`
- The present value of Light LC Light OnOff state

`uint32_t target_light_onoff`
- The target value of Light LC Light OnOff state

`uint32_t occupancy`
- The value of Light LC Occupancy state

`uint32_t ambient_luxlevel`
- The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`
- Light LC Linear Output = \(\max((\text{Lightness Out})^2/65535, \text{Regulator Output})\)
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

**Public Members**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.
uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
**ambient_luxlevel_standby**

A `uint16_t` state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**regulator_kiu**

A `float` state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**regulator_kid**

A `float` state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**regulator_kpu**

A `float` state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**regulator_kpd**

A `float` state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**regulator_accuracy**

A `int8_t` state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**set_occupancy_to_1_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

**Public Members**

**fade_on**

The value of transition time of Light LC Time Fade On

**fade**

The value of transition time of Light LC Time Fade
The value of transition time of Light LC Time Fade Standby Auto

The value of transition time of Light LC Time Fade Standby Manual

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

The value of Light LC state machine state

Timer of Light LC state machine

Parameters of Light Lightness controller

Parameters of Light LC state

Parameters of Light LC Property state

Parameters of Light LC state machine

User data of Light LC Server Model

Pointer to the Lighting LC Server Model. Initialized internally.

Response control of the server model received messages

Parameters of the Light controller

Parameters of the last received set message
Chapter 2. API Reference

```

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event

uint16_t 
**hue_range_min**
Value of hue range min field of light hsl hue range state

uint16_t 
**hue_range_max**
Value of hue range max field of light hsl hue range state

uint16_t 
**saturation_range_min**
Value of saturation range min field of light hsl saturation range state

uint16_t 
**saturation_range_max**
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyL Set message

**Public Members**
bool op_en
   Indicate whether optional parameters included

uint16_t lightness
   The target value of the Light xyL Lightness state

uint16_t x
   The target value of the Light xyL x state

uint16_t y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
   Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t x
   The value of the Light xyL x Default state

uint16_t y
   The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
   Context of the received Light xyL Range Set message

Public Members

uint16_t x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
`uint16_t y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

`struct esp_ble_mesh_server_recv_light_lc_mode_set_t`

Context of the received Light LC Mode Set message

**Public Members**

`uint8_t mode`

The target value of the Light LC Mode state

`struct esp_ble_mesh_server_recv_light_lc_om_set_t`

Context of the received Light OM Set message

**Public Members**

`uint8_t mode`

The target value of the Light LC Occupancy Mode state

`struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t`

Context of the received Light LC Light OnOff Set message

**Public Members**

`bool op_en`

Indicate whether optional parameters included

`uint8_t light_onoff`

The target value of the Light LC Light OnOff state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_light_lc_property_set_t`

Context of the received Light LC Property Set message
Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_server_recv_sensor_status_t`
Context of the received Sensor Status message

Public Members

`struct net_buf_simple *data`
Value of sensor data state (optional)

`struct esp_ble_mesh_lighting_server_cb_param_t`
Lighting Server Model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Lighting Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_lighting_server_cb_value_t value`
Value of the received Lighting Messages

Macros

`ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)`
Define a new Light Lightness Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Light Lightness Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)`
Define a new Light CTL Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Chapter 2. API Reference

Parameters
• cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.
Returns New Light CTL Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI` (cli_pub, cli_data)
Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters
• cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.
Returns New Light HSL Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI` (cli_pub, cli_data)
Define a new Light xyL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters
• cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.
Returns New Light xyL Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_LC_CLI` (cli_pub, cli_data)
Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters
• cli_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• cli_data -- Pointer to the unique struct `esp_ble_mesh_client_t`.
Returns New Light LC Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV` (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

Parameters
• srv_pub -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data -- Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`. 
Chapter 2. API Reference

**Returns** New Light Lightness Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

**Note:** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
   a. This model shall support model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

**Returns** New Light Lightness Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (srv_pub, srv_data)
Define a new Light CTL Server Model.

**Note:** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**Returns** New Light CTL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

**Note:** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**Returns** New Light CTL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

**Note:** 1. The Light CTL Temperature Server model extends the Generic Level Server model.
   a. This model shall support model publication and model subscription.
Chapter 2. API Reference

Parameters
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

Returns New Light CTL Temperature Server Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV` (srv_pub, srv_data)

Define a new Light HSL Server Model.

Note: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Parameters
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

Returns New Light HSL Server Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV` (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

Note: 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

   a. This model shall support model subscription.

Parameters
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

Returns New Light HSL Setup Server Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV` (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

Note: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

   a. This model shall support model publication and model subscription.

Parameters
- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

Returns New Light HSL Hue Server Model instance.
**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

**Note:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**Returns** New Light HSL Saturation Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** (srv_pub, srv_data)
Define a new Light xYL Server Model.

**Note:** 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**Returns** New Light xYL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV** (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.

**Note:** 1. The Light xYL Setup Server model extends the Light xYL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**Returns** New Light xYL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** (srv_pub, srv_data)
Define a new Light LC Server Model.

**Note:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`. 
Returns New Light LC Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV** *(srv_pub, srv_data)*

Define a new Light LC Setup Server Model.

**Note:** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   a. This model shall support model publication and model subscription.
   b. This model may be used to configure setup parameters for the Light LC Server model.

**Parameters**

- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Returns** New Light LC Setup Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Param event** Event type  
**Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Param event** Event type  
**Param param** Pointer to callback parameter

**Enumerations**

**enum esp_ble_mesh_light_client_cb_event_t**

This enum value is the event of Lighting Client Model

**Values:**

- enumerator **ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**
- enumerator **ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**
- enumerator **ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**
- enumerator **ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**
- enumerator **ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

**enum esp_ble_mesh_lc_state_t**

This enum value is the Light LC State Machine states

**Values:**

...
enumerator **ESP_BLE_MESH_LC_OFF**

enumerator **ESP_BLE_MESH_LC_STANDBY**

enumerator **ESP_BLE_MESH_LC_FADE_ON**

enumerator **ESP_BLE_MESH_LC_RUN**

enumerator **ESP_BLE_MESH_LC_FADE**

enumerator **ESP_BLE_MESH_LC_PROLONG**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_AUTO**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL**

enum **esp_ble_mesh_lighting_server_cb_event_t**

This enum value is the event of Lighting Server Model

**Values:**

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

### ESP-BLE-MESH (v1.1) Core API Reference

**Note:** This section is a preview version, so the related structures, macros, and APIs may be changed.

This section contains ESP-BLE-MESH v1.1 Core related APIs, event types, event parameters, etc.

This API reference covers 10 components:
Remote Provisioning

**Header File**

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_rpr_model_api.h
- This header file can be included with:

```c
#include "esp_ble_mesh_rpr_model_api.h"
```
- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakelists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

**Functions**

- `esp_err_t esp_ble_mesh_register_rpr_client_callback (esp_ble_mesh_rpr_client_cb_t callback)`
  Register BLE Mesh Remote Provisioning Client model callback.
  
  **Parameters**
  - `callback` -- [in] Pointer to the callback function.
  
  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_rpr_client_send (esp_ble_mesh_client_common_param_t *params,
  esp_ble_mesh_rpr_client_msg_t *msg)`
  Get the value of Remote Provisioning Server model state with the corresponding get message.
  
  **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  
  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_rpr_client_action (esp_ble_mesh_rpr_client_act_type_t type,
  esp_ble_mesh_rpr_client_act_param_t *param)`
  Remote Provisioning Client model perform related actions, e.g. start remote provisioning.
  
  **Parameters**
  - `type` -- [in] Type of the action to be performed.
  - `param` -- [in] Parameters of the action to be performed.
  
  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_register_rpr_server_callback (esp_ble_mesh_rpr_server_cb_t callback)`
  Register BLE Mesh Remote Provisioning Server model callback.
  
  **Parameters**
  - `callback` -- [in] Pointer to the callback function.
  
  **Returns**
  - ESP_OK on success or error code otherwise.
Unions

union `esp_ble_mesh_rpr_client_cb_param_t`  
#include <esp_ble_mesh_rpr_model_api.h> Remote Provisioning Client model callback parameters

**Public Members**

int **err_code**  
Result of sending a message  
Result of starting remote provisioning

`esp_ble_mesh_client_common_param_t *params`  
Client common parameters

struct `esp_ble_mesh_rpr_client_cb_param_t::[anonymous]` **send**  
Event parameters of sending messages Event parameters of sending messages

`esp_ble_mesh_rpr_client_recv_cb_t` **val**  
Parameters of received status message

struct `esp_ble_mesh_rpr_client_cb_param_t::[anonymous]::[anonymous]` **recv**  
Event parameters of receiving messages Event parameters of receiving messages

`esp_ble_mesh_rpr_client_act_evt_t / sub_evt`  
Event type of the performed action

`esp_ble_mesh_model_t *model`  
Pointer of Remote Provisioning Client

`uint16_t rpr_srv_addr`  
Unicast address of Remote Provisioning Server

struct `esp_ble_mesh_rpr_client_cb_param_t::[anonymous]::[anonymous]` **start_rpr_comp**  
ESP_BLE_MESH_START_RPR_COMP_SUB_EVT.  
Event parameter of ESP_BLE_MESH_START_RPR_COMP_SUB_EVT

struct `esp_ble_mesh_rpr_client_cb_param_t::[anonymous]` **act**  
Event parameters of performed actions Event parameters of performed actions

struct `esp_ble_mesh_rpr_client_cb_param_t::[anonymous]` **link_open**  
ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT.  
Event parameters of ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT

`uint8_t reason`  
Reason of closing provisioning link
struct esp_ble_mesh_rpr_client_cb_param_t::[anonymous] link_close

ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT.
Event parameters of ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT

uint8_t nppi
NPPI Procedure

uint16_t index
Index of the provisioned node

uint8_t uuid[16]
Device UUID

uint16_t unicast_addr
Primary element address

uint8_t element_num
Element number

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_rpr_client_cb_param_t::[anonymous] prov

ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT.
Event parameters of ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT

union esp_ble_mesh_rpr_server_cb_param_t

#include <esp_ble_mesh_rpr_model_api.h> Remote Provisioning Server model related context.
Remote Provisioning Server model callback value union

Public Members

esp_ble_mesh_model_t *model
Pointer to the server model structure

uint8_t scan_items_limit
Maximum number of scanned items to be reported

uint8_t timeout
Time limit for a scan (in seconds)
Time limit for extended scan (in seconds)
Time limit for opening a link (in seconds)

uint8_t uuid[16]
Device UUID (All ZERO if not present)
Device UUID (ZERO if not present)
### Chapter 2. API Reference

**uint16_t net_idx**

NetKey Index used by Remote Provisioning Client

**uint16_t rpr_cli_addr**

Unicast address of Remote Provisioning Client

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] scan_start**

ESP_BLE_MESH_RPR_SERVER_SCAN_START_EVT.

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] scan_stop**

ESP_BLE_MESH_RPR_SERVER_SCAN_STOP_EVT.

**uint8_t ad_type_filter_count**

Number of AD Types in the ADTypeFilter field

**uint8_t *ad_type_filter**

List of AD Types to be reported

**uint8_t index**

Index of the extended scan instance

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] ext_scan_start**

ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_START_EVT.

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] ext_scan_stop**

ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_STOP_EVT.

**uint8_t status**

Status of Link Open procedure

**uint8_t nppi**

Node Provisioning Protocol Interface

Provisioning bearer link close reason code

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] link_open**

ESP_BLE_MESH_RPR_SERVER_LINK_OPEN_EVT.

**bool close_by_device**

Indicate if the link is closed by the Unprovisioned Device

**uint8_t reason**

Provisioning bearer link close reason code

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] link_close**

ESP_BLE_MESH_RPR_SERVER_LINK_CLOSE_EVT.

**struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] prov_comp**

ESP_BLE_MESH_RPR_SERVER_PROV_COMP_EVT. TODO: Duplicate with Link Close event?
Structures

struct esp_ble_mesh_rpr_scan_start_t
Remote Provisioning Server model context Parameters of Remote Provisioning Scan Start

Public Members

uint8_t scan_items_limit
Maximum number of scanned items to be reported

uint8_t timeout
Time limit for a scan (in seconds)

bool uuid_en
Indicate if Device UUID is present

uint8_t uuid[16]
Device UUID (Optional)

struct esp_ble_mesh_rpr_ext_scan_start_t
Parameters of Remote Provisioning Extended Scan Start

Public Members

uint8_t ad_type_filter_count
Number of AD Types in the ADTypeFilter field

uint8_t ad_type_filter[16]
List of AD Types to be reported. Minimum is 1, maximum is 16

bool uuid_en
Indicate if Device UUID is present

uint8_t uuid[16]
Device UUID (Optional)

uint8_t timeout
Time limit for a scan (in seconds) (C.1)

struct esp_ble_mesh_rpr_link_open_t
Parameters of Remote Provisioning Link Open

Public Members

bool uuid_en
Indicate if Device UUID is present
uint8_t uuid[16]
    Device UUID (Optional)

bool timeout_en
    Indicate if Link open timeout is present

uint8_t timeout
    Link open timeout in seconds (C.1)

uint8_t nppi
    Node Provisioning Protocol Interface (C.2)

struct esp_ble_mesh_rpr_link_close_t
    Parameters of Remote Provisioning Link Close

**Public Members**

uint8_t reason
    Provisioning bearer link close reason code

struct esp_ble_mesh_rpr_client_start_rpr_t
    Parameters of starting remote provisioning

**Public Members**

*esp_ble_mesh_model_t* model
    Pointer of Remote Provisioning Client

uint16_t rpr_srv_addr
    Unicast address of Remote Provisioning Server

struct esp_ble_mesh_rpr_scan_caps_status_t
    Parameters of Remote Provisioning Scan Capabilities Status

**Public Members**

uint8_t max_scan_items
    The maximum number of UUIDs that can be reported during scanning

uint8_t active_scan
    Indication if active scan is supported

struct esp_ble_mesh_rpr_scan_status_t
    Parameters of Remote Provisioning Scan Status
Chapter 2. API Reference

Public Members

```c
uint8_t status
    Status for the requesting message
```

```c
uint8_t rpr_scanning
    The Remote Provisioning Scan state value
```

```c
uint8_t scan_items_limit
    Maximum number of scanned items to be reported
```

```c
uint8_t timeout
    Time limit for a scan (in seconds)
```

```c
struct esp_ble_mesh_rpr_scan_report_t
    Parameters of Remote Provisioning Scan Report
```

Public Members

```c
int8_t rssi
    An indication of received signal strength measured in dBm
```

```c
uint8_t uuid[16]
    Device UUID
```

```c
uint16_t oob_info
    OOB information
```

```c
uint32_t uri_hash
    URI Hash (Optional)
```

```c
struct esp_ble_mesh_rpr_ext_scan_report_t
    Parameters of Remote Provisioning Extended Scan Report
```

Public Members

```c
uint8_t status
    Status for the requesting message
```

```c
uint8_t uuid[16]
    Device UUID
```

```c
bool oob_info_en
    Indicate if OOB Information is present
```

```c
uint16_t oob_info
    OOB Information (Optional)
```
struct net_buf_simple *adv_structures
  Concatenated list of AD Structures (C.1)

struct esp_ble_mesh_rpr_link_status_t
  Parameters of Remote Provisioning Link Status

  **Public Members**

  uint8_t status
  Status for the requesting message

  uint8_t rpr_state
  Remote Provisioning Link state

struct esp_ble_mesh_rpr_link_report_t
  Parameters of Remote Provisioning Link Report

  **Public Members**

  uint8_t status
  Status of the provisioning bearer or the NPPI

  uint8_t rpr_state
  Remote Provisioning Link state

  bool reason_en
  Indicate if Link close Reason code is present

  uint8_t reason
  Link close Reason code (Optional)

**Macros**

Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_RPR_SRV (srv_data)**
Define a new Remote Provisioning Server model.

**Note:** If supported, the model shall be supported by a primary element and may be supported by any secondary element.

**Parameters**
- **srv_data** -- Pointer to a unique Remote Provisioning Server model user_data.

**Returns**
New Remote Provisioning Server model instance.

**ESP_BLE_MESH_MODEL_RPR_CLI (cli_data)**
Define a new Remote Provisioning Client model.

**Note:** If supported, the model shall be supported by a primary element and may be supported by any secondary element.

**Parameters**
- **cli_data** -- Pointer to a unique Remote Provisioning Client model user_data.

**Returns**
New Remote Provisioning Client model instance.

**Type Definitions**

typedef void (*esp_ble_mesh_rpr_client_cb_t)(esp_ble_mesh_rpr_client_cb_event_t event, esp_ble_mesh_rpr_client_cb_param_t *param)
Remote Provisioning client and server model functions.

**Param event** Event type
**Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_rpr_server_cb_t)(esp_ble_mesh_rpr_server_cb_event_t event, esp_ble_mesh_rpr_server_cb_param_t *param)
Remote Provisioning Server model callback function type.

**Param event** Event type
**Param param** Pointer to callback parameter

**Enumerations**

defined esp_ble_mesh_rpr_client_act_type_t
This enum value is the action of Remote Provisioning Client model

**Values:**

**enumerator** ESP_BLE_MESH_RPR_CLIENT_ACT_START_RPR

**enumerator** ESP_BLE_MESH_RPR_CLIENT_ACT_MAX

defined esp_ble_mesh_rpr_client_act_evt_t
This enum value is the event type of the performed action

**Values:**
Chapter 2. API Reference

enumerator **ESP_BLE_MESH_START_RPR_COMP_SUB_EVT**

**enum esp_ble_mesh_rpr_client_cb_event_t**

This enum value is the event of Remote Provisioning Client model

*Values:*

enumerator **ESP_BLE_MESH_RPR_CLIENT_SEND_COMP_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_SEND_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_RECV_RSP_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_RECV_PUB_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_ACT_COMP_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT**

enumerator **ESP_BLE_MESH_RPR_CLIENT_EVT_MAX**

**enum esp_ble_mesh_rpr_server_cb_event_t**

This enum value is the event of Remote Provisioning Server model

*Values:*

enumerator **ESP_BLE_MESH_RPR_SERVER_SCAN_START_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_SCAN_STOP_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_START_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_STOP_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_LINK_OPEN_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_LINK_CLOSE_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_PROV_COMP_EVT**

enumerator **ESP_BLE_MESH_RPR_SERVER_EVT_MAX**

Header File

- components/bt.esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_df_model_api.h
- This header file can be included with:
  ```
  #include "esp_ble_mesh_df_model_api.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRES bt
  or
  PRIV_REQUIRES bt
  ```

Functions

- **esp_err_t esp_ble_mesh_register_df_client_callback (esp_ble_mesh_df_client_cb_t callback)**
  
  Register BLE Mesh Directed Forwarding Configuration Client model callback.
  
  **Parameters**
  
  callback -- [in] Pointer to the callback function.

  **Returns**
  
  ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_register_df_server_callback (esp_ble_mesh_df_server_cb_t callback)**
  
  Register BLE Mesh Directed Forwarding Configuration Server model callback.
  
  **Parameters**
  
  callback -- [in] Pointer to the callback function.

  **Returns**
  
  ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_df_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_df_client_get_t *get)**
  
  Get the value of Directed Forwarding Configuration Server model state with the corresponding get message.
  
  **Parameters**
  
  - params -- [in] Pointer to BLE Mesh common client parameters.
  - get -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside.

  **Returns**
  
  ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_df_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_df_client_set_t *set)**
  
  Set the value of Directed Forwarding Configuration Server model state with the corresponding set message.
  
  **Parameters**
  
  - params -- [in] Pointer to BLE Mesh common client parameters.
  - set -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside.

  **Returns**
  
  ESP_OK on success or error code otherwise.

Unions

- **union esp_ble_mesh_df_client_get_t**
  
  #include <esp_ble_mesh_df_model_api.h> Directed Forwarding Configuration Client model get message union.

uint16_t `net_idx`
NetKey Index

uint16_t `filter_mask`
Filter to be applied to the Forwarding Table entries

uint16_t `start_index`
Start offset to read in units of Forwarding Table entries

uint16_t `path_origin`
Primary element address of the Path Origin

uint16_t `dst`
Destination address

bool `include_id`
Indicate whether or not the Forwarding Table Update Identifier is present

uint16_t `update_id`
Last saved Forwarding Table Update Identifier (Optional)

struct `esp_ble_mesh_forwarding_table_deps_get_t`
Parameters of Forwarding Table Dependents Get.
**Public Members**

`uint16_t net_idx`
NetKey Index

`uint16_t dep_list_mask`
Filter applied to the lists of unicast address ranges for dependent nodes

`uint16_t fixed_path_flag`
Indicate whether or not to return the unicast address ranges of dependent nodes in a fixed path entry

`uint16_t start_index`
Start offset in units of unicast address ranges

`uint16_t path_origin`
Primary element address of the Path Origin

`uint16_t dst`
Destination address

`bool include_id`
Indicate whether or not the Forwarding Table Update Identifier is present

`uint16_t update_id`
Last saved Forwarding Table Update Identifier (Optional)

**struct esp_ble_mesh_wanted_lanes_get_t**
Parameters of Wanted Lanes Get.

**Public Members**

`uint16_t net_idx`
NetKey Index

**struct esp_ble_mesh_wanted_lanes_set_t**
Parameters of Wanted Lanes Set.

**Public Members**

`uint16_t net_idx`
NetKey Index

`uint8_t wanted_lanes`
New Wanted Lanes state

**struct esp_ble_mesh_two_way_path_get_t**
Parameters of Two Way Path Get.
Public Members

```c
uint16_t net_idx
    NetKey Index
```

struct `esp_ble_mesh_two_way_path_set_t`
Parameters of Two Way Path Set.

Public Members

struct `esp_ble_mesh_path_echo_interval_get_t`
Parameters of Path Echo Interval Get.

Public Members

```c
uint16_t net_idx
    NetKey Index
```

```c
uint8_t unicast_echo_interval
    New Unicast Echo Interval state or indication of no state change
```

```c
uint8_t multicast_echo_interval
    New Multicast Echo Interval state or indication of no state change
```

struct `esp_ble_mesh_directed_net_transmit_set_t`
Parameters of Directed Network Transmit Set.

Public Members

```c
uint8_t net_transmit
    New Directed Network Transmit state
```
Chapter 2. API Reference

struct `esp_ble_mesh_directed_relay_retransmit_set_t`
Parameters of Directed Relay Retransmit Set.

**Public Members**

uint8_t `relay_retransmit`
New Directed Relay Retransmit state

struct `esp_ble_mesh_rssi_threshold_set_t`
Parameters of RSSI Threshold Set.

**Public Members**

uint8_t `rssi_margin`
New RSSI Margin state

struct `esp_ble_mesh_directed_publish_policy_get_t`
Parameters of Directed Publish Policy Get.

**Public Members**

uint16_t `element_addr`
Address of the element

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID

struct `esp_ble_mesh_directed_publish_policy_set_t`
Parameters of Directed Publish Policy Set.

**Public Members**

uint8_t `direct_pub_policy`
New Directed Publish Policy state

uint16_t `element_addr`
Address of the element

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID
struct `esp_ble_mesh_path_discovery_timing_ctl_set_t`
Parameters of Path Discovery Timing Control Set.

**Public Members**

- `uint16_t path_monitor_interval`
  New Path Monitoring Interval state
- `uint16_t path_disc_retry_interval`
  New Path Discovery Retry Interval state
- `uint8_t path_disc_interval`
  New Path Discovery Interval state
- `uint8_t lane_disc_guard_interval`
  New Lane Discovery Guard Interval state

struct `esp_ble_mesh_directed_ctl_net_transmit_set_t`
Parameters of Directed Control Network Transmit Set.

**Public Members**

- `uint8_t net_transmit`
  New Directed Control Network Transmit Count state

struct `esp_ble_mesh_directed_ctl_relay_retransmit_set_t`
Parameters of Directed Control Relay Retransmit Set.

**Public Members**

- `uint8_t relay_retransmit`
  New Directed Control Relay Retransmit Count state

struct `esp_ble_mesh_directed_control_status_t`
Parameters of Directed Control Status.

**Public Members**

- `uint8_t status`
  Status code for the requesting message
- `uint16_t net_idx`
  NetKey Index
- `uint8_t directed_forwarding`
  Current Directed Forwarding state
```c
uint8_t directed_relay
    Current Directed Relay state

uint8_t directed_proxy
    Current Directed Proxy state

uint8_t directed_proxy_use_default
    Current Directed Proxy Use Directed Default state or 0xFF

uint8_t directed_friend
    Current Directed Friend state

struct esp_ble_mesh_path_metric_status_t
    Parameters of Path Metric Status.

    Public Members

    uint8_t status
        Status code for the requesting message

    uint16_t net_idx
        NetKey Index

    uint8_t path_metric_type
        Current Path Metric Type state

    uint8_t path_lifetime
        Current Path Lifetime state

struct esp_ble_mesh_discovery_table_caps_status_t
    Parameters of Discovery Table Capabilities Status.

    Public Members

    uint8_t status
        Status code for the requesting message

    uint16_t net_idx
        NetKey Index

    uint8_t max_concurr_init
        Current Max Concurrent Init state

    uint8_t max_disc_entries
        Max Discovery Table Entries Count state

struct esp_ble_mesh_forwarding_table_status_t
    Parameters of Forwarding Table Status.
```
Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint16_t path_origin
Primary element address of the Path Origin

uint16_t dst
Destination address

struct esp_ble_mesh_forwarding_table_deps_status_t
Parameters of Forwarding Table Dependent Status.

Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint16_t path_origin
Primary element address of the Path Origin

uint16_t dst
Destination address

struct esp_ble_mesh_forwarding_table_entries_cnt_status_t
Parameters of Forwarding Table Entries Count Status.

Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint16_t update_id
Current Forwarding Table Update Identifier state

uint16_t fixed_entry_cnt
Number of fixed path entries in the Forwarding Table
struct esp_ble_mesh_forwarding_table_entry_t
Parameters of Forwarding Table Entry.

Public Members

uint16_t fixed_path_flag
Indicates whether the table entry is a fixed path entry or a non-fixed path entry

uint16_t unicast_dst_flag
Indicates whether or not the destination of the path is a unicast address

uint16_t bw_path_validated_flag
Indicates whether or not the backward path has been validated

uint16_t bearer_twd_path_origin_ind
Indicates the presence or absence of the Bearer_Toward_Path_Origin field

uint16_t bearer_twd_path_target_ind
Indicates the presence or absence of the Bearer_Toward_Path_Target field

uint16_t dep_origin_list_size_ind
Indicates the size of the Dependent_Origin_List field

uint16_t dep_target_list_size_ind
Indicates the size of the Dependent_Target_List field

uint8_t lane_counter
Number of lanes in the path

uint16_t path_remaining_time
Path lifetime remaining

uint8_t path_origin_forward_number
Forwarding number of the Path Origin

esp_ble_mesh_uar_t path_origin
Path Origin unicast address range

uint16_t dep_origin_list_size
Current number of entries in the list of dependent nodes of the Path Origin

uint16_t bearer_twd_path_origin
Index of the bearer toward the Path Origin
**esp_ble_mesh_uar_t**  
Path Target unicast address range

**uint16_t**  
`multicast_dst`  
Multicast destination address

**uint16_t**  
`dep_target_list_size`  
Current number of entries in the list of dependent nodes of the Path Target

**uint16_t**  
`bearer_twd_path_target`  
Index of the bearer toward the Path Target

**struct esp_ble_mesh_forwarding_table_entries_status_t**  
Parameters of Forwarding Table Entries Status.

**Public Members**

**uint8_t**  
`status`  
Status code for the requesting message

**uint16_t**  
`net_idx`  
NetKey Index

**uint16_t**  
`filter_mask`  
Filter applied to the Forwarding Table entries

**uint16_t**  
`start_index`  
Start offset in units of Forwarding Table entries

**uint16_t**  
`path_origin`  
Primary element address of the Path Origin

**uint16_t**  
`dst`  
Destination address

**bool**  
`include_id`  
Indicate whether or not the Forwarding Table Update Identifier is present

**uint16_t**  
`update_id`  
Current Forwarding Table Update Identifier state

**uint8_t**  
`entry_list_size`  
Current number of entries in the list of Forwarding Table entries

**esp_ble_mesh_forwarding_table_entry_t**  
`*entry_list`  
List of Forwarding Table entries

**struct esp_ble_mesh_forwarding_table_deps_get_status_t**  
Parameters of Forwarding Table Dependents Get Status.
Public Members

uint8_t `status`
   Status code for the requesting message

uint16_t `net_idx`
   NetKey Index

uint16_t `dep_list_mask`
   Filter applied to the lists of unicast address ranges for dependent nodes

uint16_t `fixed_path_flag`
   Flag indicating whether or not to return the unicast address ranges of dependent nodes in a fixed path entry

uint16_t `start_index`
   Start offset in units of unicast address ranges

uint16_t `path_origin`
   Primary element address of the Path Origin

uint16_t `dst`
   Destination address

bool `include_id`
   Indicate whether or not the Forwarding Table Update Identifier is present

uint16_t `update_id`
   Current Forwarding Table Update Identifier state

uint8_t `dep_origin_uar_list_size`
   Number of unicast address ranges in the Dependent_Origin_Unicast_Addr_Range_List field

uint8_t `dep_target_uar_list_size`
   Number of unicast address ranges in the Dependent_Target_Unicast_Addr_Range_List field

`esp_ble_mesh_uar_t` *`dep_origin_uar_list`
   List of unicast address ranges of dependent nodes of the Path Origin

`esp_ble_mesh_uar_t` *`dep_target_uar_list`
   List of unicast address ranges of dependent nodes of the Path Target

struct `esp_ble_mesh_wanted_lanes_status_t`
   Parameters of Wanted Lanes Status.

Public Members
uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint8_t wanted_lanes
Current Wanted Lanes state

struct esp_ble_mesh_two_way_path_status_t
Parameters of Two Way Path Status.

Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint8_t two_way_path
Current Two Way Path state

struct esp_ble_mesh_path_echo_interval_status_t
Parameters of Path Echo Interval Status.

Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint8_t unicast_echo_interval
Current Unicast Echo Interval state

uint8_t multicast_echo_interval
Current Multicast Echo Interval state

struct esp_ble_mesh_directed_net_transmit_status_t
Parameters of Directed Network Transmit Status.

Public Members
uint8_t net_transmit
    Current Directed Network Transmit state

struct esp_ble_mesh_directed_relay_retransmit_status_t
    Parameters of Directed Relay Retransmit Status.

Public Members

uint8_t relay_retransmit
    Current Directed Relay Retransmit state

struct esp_ble_mesh_rssi_threshold_status_t
    Parameters of RSSI Threshold Status.

Public Members

uint8_t default_rssi_threshold
    Default RSSI Threshold state

uint8_t rssi_margin
    Current RSSI Margin state

struct esp_ble_mesh_directed_paths_status_t
    Parameters of Directed Paths Status.

Public Members

uint16_t directed_node_paths
    Directed Node Paths state

uint16_t directed_relay_paths
    Directed Relay Paths state

uint16_t directed_proxy_paths
    Directed Proxy Paths state

uint16_t directed_friend_paths
    Directed Friend Paths state

struct esp_ble_mesh_directed_pub_policy_status_t
    Parameters of Directed Publish Policy Status.

Public Members

uint8_t status
    Status code for the requesting message
uint8_t \texttt{directed\_pub\_policy}  
Current Directed Publish Policy state

uint16_t \texttt{element\_addr}  
Address of the element

uint16_t \texttt{company\_id}  
Company ID

uint16_t \texttt{model\_id}  
Model ID

\textbf{Public Members}

uint16_t \texttt{path\_monitor\_interval}  
Current Path Monitoring Interval state

uint16_t \texttt{path\_disc\_retry\_interval}  
Current Path Discovery Retry Interval state

uint8_t \texttt{path\_disc\_interval}  
Current Path Discovery Interval state

uint8_t \texttt{lane\_disc\_guard\_interval}  
Current Lane Discovery Guard Interval state

\textbf{Public Members}

uint8_t \texttt{net\_transmit}  
Current Directed Control Network Transmit state

\textbf{Public Members}

uint8_t \texttt{relay\_retransmit}  
Current Directed Control Relay Retransmit state

\textbf{Public Members}

Result of sending Directed Forwarding Configuration Client messages
Public Members

int err_code
Result of sending a message

struct esp_ble_mesh_df_client_cb_param_t
Directed Forwarding Configuration Client model callback parameters

Public Members

esp_ble_mesh_client_common_param_t *params
Client common parameters, used by all events.

esp_ble_mesh_df_client_send_cb_t send
Result of sending a message

esp_ble_mesh_df_client_recv_cb_t recv
Parameters of received status message

union esp_ble_mesh_df_client_cb_param_t::[anonymous] [anonymous]
Union of DF Client callback

struct esp_ble_mesh_df_server_table_change_t
Parameters of directed forwarding table entry change

Public Members

esp_ble_mesh_df_table_action_t action
Action of directed forwarding table

esp_ble_mesh_uar_t path_origin
Primary element address of the Path Origin

esp_ble_mesh_uar_t path_target
Primary element address of the Path Target

esp_ble_mesh_uar_t *dep_origin_data
List of the primary element addresses of the dependent nodes of the Path Origin

uint32_t dep_origin_num
Number of entries in the Dependent_Origin_List field of the message

esp_ble_mesh_uar_t *dep_target_data
List of the primary element addresses of the dependent nodes of the Path Target

uint32_t dep_target_num
Number of entries in the Dependent_Target_List field of the message
**fixed_path**
Indicates whether the table entry is a fixed path entry or a non-fixed path entry.

**bw_path_validate**
Indicates whether or not the backward path has been validated.

**path_not_ready**
Flag indicating whether or not the path is ready for use.

**forward_number**
Forwarding number of the Path Origin; If the entry is associated with a fixed path, the value is 0.

**lane_counter**
Number of lanes discovered; if the entry is associated with a fixed path, the value is 1.

**df_table_entry_add_remove**
Structure of directed forwarding table add and remove.

**dummy**
Event not used currently.

**df_table_entry_change**
Structure of directed forwarding table entry change.

**df_table_info**
Union of directed forwarding table information.

**df_table_info**
Union of directed forwarding table information.

**Public Members**

**esp_mesh_model_t *model**
Pointer to the server model structure.

**ctx**
Context of the received message.

**value**
Value of the received configuration messages.

**Macros**

ESP_BLE_MESH_MODEL_DF_SRV (srv_data)

Define a new Directed Forwarding Configuration Server model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

---

**Parameters**

- **srv_data** -- Pointer to a unique Directed Forwarding Configuration Server model user_data.

**Returns** New Directed Forwarding Configuration Server model instance.

ESP_BLE_MESH_MODEL_DF_CLI (cli_data)

Define a new Directed Forwarding Configuration Client model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

---

**Parameters**

- **cli_data** -- Pointer to a unique Directed Forwarding Configuration Client model user_data.

**Returns** New Directed Forwarding Configuration Client model instance.
Chapter 2. API Reference

**Type Definitions**

typedef void (*esp_ble_mesh_df_client_cb_t)(esp_ble_mesh_df_client_cb_event_t event, esp_ble_mesh_df_client_cb_param_t *param)

  Bluetooth Mesh Directed Forwarding Configuration client and server model functions.

  Directed Forwarding Configuration Client model callback function type

    **Param event**  Event type
    **Param param**  Pointer to callback parameter

typedef void (*esp_ble_mesh_df_server_cb_t)(esp_ble_mesh_df_server_cb_event_t event, esp_ble_mesh_df_server_cb_param_t *param)

  Directed Forwarding Configuration Server model callback function type.

    **Param event**  Event type
    **Param param**  Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_df_client_cb_event_t

  This enum value is the event of Directed Forwarding Configuration Client model

  **Values:**

  enumerator ESP_BLE_MESH_DF_CLIENT_SEND_COMP_EVT
  enumerator ESP_BLE_MESH_DF_CLIENT_SEND_TIMEOUT_EVT
  enumerator ESP_BLE_MESH_DF_CLIENT_RECV_GET_RSP_EVT

enumerator ESP_BLE_MESH_DF_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_DF_SERVER_TABLE_CHANGE_EVT
enumerator ESP_BLE_MESH_DF_SERVER_EVT_MAX

Subnet Bridge Configuration

Header File
- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_brc_model_api.h
- This header file can be included with:
  ```
  #include "esp_ble_mesh_brc_model_api.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRE bt
  ```

Functions

`esp_err_t esp_ble_mesh_register_brc_client_callback (esp_ble_mesh_brc_client_cb_t *callback)`
Register BLE Mesh Bridge Configuration Client model callback.

Parameters
- `callback -- [in]` Pointer to the callback function.

Returns
- `ESP_OK` on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_brc_server_callback (esp_ble_mesh_brc_server_cb_t *callback)`
Register BLE Mesh Bridge Configuration Server model callback.

Parameters
- `callback -- [in]` Pointer to the callback function.

Returns
- `ESP_OK` on success or error code otherwise.

`esp_err_t esp_ble_mesh_brc_client_send (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_brc_client_msg_t *msg)`
Get/Set the value of Bridge Configuration Server model state with the corresponding message.

Parameters
- `params -- [in]` Pointer to BLE Mesh common client parameters.
- `msg -- [in]` Pointer to Bridge Configuration Client message.

Returns
- `ESP_OK` on success or error code otherwise.

Unions

`union esp_ble_mesh_brc_client_msg_t`

`#include <esp_ble_mesh_brc_model_api.h>` Bridge Configuration Client model message union.

Parameters of Bridged Subnets List

**Public Members**

uint16_t `bridge_filter`
Filter applied to the set of pairs of NetKey Indexes

uint16_t `bridge_net_idx`
NetKey Index used for filtering or ignored

uint8_t `bridge_start_idx`
Start offset in units of bridges

uint8_t `bridged_entry_list_size`
Num of pairs of NetKey Indexes

`esp_ble_mesh_bridge_net_idx_pair_entry_t *net_idx_pair`
Filtered set of N pairs of NetKey Indexes

struct `esp_ble_mesh_bridged_addr_list_entry_t`
Bridged_Addresses_List entry format

**Public Members**

uint8_t `bridge_direction`
Allowed directions for bridged traffic

uint16_t `bridge_addr_1`
Address of the node in the first subnet

uint16_t `bridge_addr_2`
Address of the node in the second subnet

struct `esp_ble_mesh_bridging_table_list_t`
Parameters of Bridging Table List

**Public Members**

uint8_t `status`
Status Code for the requesting message
Chapter 2. API Reference

uint16_t bridge_net_idx_1
    NetKey Index of the first subnet

uint16_t bridge_net_idx_2
    NetKey Index of the second subnet

uint16_t bridge_start_idx
    Start offset in units of Bridging Table state entries

uint16_tbridged_addr_list_size
    Num of pairs of entry

*esp_ble_mesh Bridged_addr_list_entry_t* bridged_addr_list
    List of bridged addresses and allowed traffic directions

struct esp_ble_mesh_bridging_table_size_status_t
    Parameters of Bridging Table Size Status

**Public Members**

uint16_t bridging_table_size
    Bridging Table Size state

struct esp_ble_mesh_brc_client_send_cb_t
    Result of sending Bridge Configuration Client messages

**Public Members**

int err_code
    Result of sending a message

struct esp_ble_mesh_brc_client_cb_param_t
    Bridge Configuration Client model callback parameters

**Public Members**

*esp_ble_mesh_client_common_param_t* params
    Client common parameters, used by all events.

*esp_ble_mesh_brc_client_send_cb_t* send
    Result of sending a message

*esp_ble_mesh_brc_client_recv_cb_t* recv
    Parameters of received status message
union esp_ble_mesh_brc_client_cb_param_t::[anonymous] [anonymous]
Union of Bridge Configuration Client callback

struct esp_ble_mesh_state_change_bridging_table_add_t
Bridge Configuration Server model related context.
Parameters of Bridging Table Add

Public Members

uint8_t bridge_direction
   Allowed directions for the bridged traffic

uint16_t bridge_net_idx_1
   NetKey Index of the first subnet

ESP_BLE_MESH_MODEL_OP_BRIDGING_TABLE_SIZE_GET
ESP_BLE_MESH_MODEL_OP_BRIDGING_TABLE_SIZE_STATUS
ESP_BLE_MESH_MODEL_BRC_SRV (srv_data)
```
Define a new Bridge Configuration Server model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

* `srv_data` -- Pointer to a unique Bridge Configuration Server model user_data.

**Returns** New Bridge Configuration Server model instance.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_BRC_CLI (cli_data)**
Define a new Bridge Configuration Client model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**
- *cli_data* -- Pointer to a unique Bridge Configuration Client model user_data.

**Returns**  New Bridge Configuration Client model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_brc_client_cb_t)(esp_ble_mesh_brc_client_cb_event_t event, esp_ble_mesh_brc_client_cb_param_t *param)

Bluetooth Mesh Bridge Configuration client and server model functions.
Bridge Configuration Client model callback function type

  **Param event**  Event type
  **Param param**  Pointer to callback parameter

typedef void (*esp_ble_mesh_brc_server_cb_t)(esp_ble_mesh_brc_server_cb_event_t event, esp_ble_mesh_brc_server_cb_param_t *param)

Bridge Configuration Server model callback function type.

  **Param event**  Event type
  **Param param**  Pointer to callback parameter
```

**Enumerations**

```c
enum esp_ble_mesh_brc_client_cb_event_t

This enum value is the event of Bridge Configuration Client model

  **Values:**

  enumerator ESP_BLE_MESH_BRC_CLIENT_SEND_COMP_EVT
  enumerator ESP_BLE_MESH_BRC_CLIENT_SEND_TIMEOUT_EVT
  enumerator ESP_BLE_MESH_BRC_CLIENT_RECV_RSP_EVT
  enumerator ESP_BLE_MESH_BRC_CLIENT_RECV_PUB_EVT
  enumerator ESP_BLE_MESH_BRC_CLIENT_EVT_MAX

enum esp_ble_mesh_brc_server_cb_event_t

This enum value is the event of Bridge Configuration Server model

  **Values:**

  enumerator ESP_BLE_MESH_BRC_SERVER_STATE_CHANGE_EVT
  enumerator ESP_BLE_MESH_BRC_SERVER_EVT_MAX
```

Mesh Private Beacon

Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_prb_model_api.h
- This header file can be included with:

```c
#include "esp_ble_mesh_prb_model_api.h"
```

- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

```c
esp_err_t esp_ble_mesh_register_prb_client_callback(esp_ble_mesh_prb_client_cb_t callback)
```

Register BLE Mesh Private Beacon Client Model callback.

Parameters
- `callback` -- [in] Pointer to the callback function.

Returns
- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_prb_server_callback(esp_ble_mesh_prb_server_cb_t callback)
```

Register BLE Mesh Private Beacon Server Model callback.

Parameters
- `callback` -- [in] Pointer to the callback function.

Returns
- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_prb_client_send(esp_ble_mesh_client_common_param_t *params,
                                     esp_ble_mesh_prb_client_msg_t *msg)
```

Get/Set the value of Private Beacon Server Model states using the corresponding messages of Private Beacon Client Model.

Parameters
- `params` -- [in] Pointer to BLE Mesh common client parameters.

Returns
- ESP_OK on success or error code otherwise.

Unions

```c

ESP_BLE_MESH_MODEL_PRB_SRV (srv_data)
Define a new Private Beacon Server Model.

Note: The Private Beacon Server Model can only be included by a Primary Element.

Parameters
• **srv_data** -- Pointer to a unique Private Beacon Server Model user_data.

**ESP_BLE_MESH_MODEL_PRB_CLI** (cli_data)
Define a new Private Beacon Client Model.

**Note:** The Private Beacon Client Model can only be included by a Primary Element.

**Parameters**

• **cli_data** -- Pointer to a unique struct `esp_ble_mesh_client_t`.

Returns: New Private Beacon Client Model instance.

**Type Definitions**

typedef void (*`esp_ble_mesh_prb_client_cb_t`)(`esp_ble_mesh_prb_client_cb_event_t` event,
`esp_ble_mesh_prb_client_cb_param_t` *param)

Bluetooth Mesh Private Beacon Client and Server Model functions.

Private Beacon Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

typedef void (*`esp_ble_mesh_prb_server_cb_t`)(`esp_ble_mesh_prb_server_cb_event_t` event,
`esp_ble_mesh_prb_server_cb_param_t` *param)

Private Beacon Server Model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

**Enumerations**

enum `esp_ble_mesh_prb_client_cb_event_t`

This enum value is the event of Private Beacon Client Model

**Values:**

enumerator **ESP_BLE_MESH_PRB_CLIENT_SEND_COMP_EVT**

enumerator **ESP_BLE_MESH_PRB_CLIENT_SEND_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_PRB_CLIENT_RECV_RSP_EVT**

enumerator **ESP_BLE_MESH_PRB_CLIENT_RECV_PUB_EVT**

enumerator **ESP_BLE_MESH_PRB_CLIENT_EVT_MAX**

enum `esp_ble_mesh_prb_server_cb_event_t`

This enum value is the event of Private Beacon Server model

**Values:**

enumerator **ESP_BLE_MESH_PRB_SERVER_STATE_CHANGE_EVT**

enumerator **ESP_BLE_MESH_PRB_SERVER_EVT_MAX**
On-Demand Private Proxy

Functions

```c
esp_err_t esp_ble_mesh_register_odp_client_callback(esp_ble_mesh_odp_client_cb_t callback)
```

Register BLE Mesh On-Demand Private Proxy Config Client model callback.

- **Parameters**
  - `callback` -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_odp_client_send(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_odp_client_msg_t *msg)
```

Get the value of On-Demand Private Proxy Config Server model state with the corresponding get message.

- **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  - `msg` -- [in] Pointer to On-Demand Private Proxy Config Client message.
- **Returns**
  - ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_odp_server_callback(esp_ble_mesh_odp_server_cb_t callback)
```

Register BLE Mesh On-Demand Private Proxy Config Server model callback.

- **Parameters**
  - `callback` -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

Macros

ESP_BLE_MESH_MODEL_OP_OD_PRIV_PROXY_GET
ESP_BLE_MESH_MODEL_OP_OD_PRIV_PROXY_SET
ESP_BLE_MESH_MODEL_OP_OD_PRIV_PROXY_STATUS
ESP_BLE_MESH_MODEL_ODP_SRV(srv_data)

Define a new On-Demand Private Proxy Config Server model.

Note: The On-Demand Private Proxy Server model is used to represent the ability to enable advertising with Private Network Identity type of a node. This model extends the Mesh Private Beacon Server model. When this model is present on an element, the corresponding Solicitation PDU RPL Configuration Server model shall also be present. The model shall be supported by a primary element and shall not be supported by any secondary elements.

Parameters
• srv_data -- Pointer to a unique On-Demand Private Proxy Config Server model user_data.

Returns New On-Demand Private Proxy Config Server model instance.

ESP_BLE_MESH_MODEL_ODP_CLI(cli_data)

Define a new On-Demand Private Proxy Config Client model.

Note: The model shall be supported by a primary element and shall not be supported by any secondary elements.

Parameters
• cli_data -- Pointer to a unique On-Demand Private Proxy Config Client model user_data.

Returns New On-Demand Private Proxy Config Client model instance.

Type Definitions

typedef void (*esp_ble_mesh_odp_client_cb_t)(esp_ble_mesh_odp_client_cb_event_t event, esp_ble_mesh_odp_client_cb_param_t *param)

Bluetooth Mesh On-Demand Private Proxy Config client and server model functions.

On-Demand Private Proxy Config Client model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_odp_server_cb_t)(esp_ble_mesh_odp_server_cb_event_t event, esp_ble_mesh_odp_server_cb_param_t *param)

On-Demand Private Proxy Config Server model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations
Chapter 2. API Reference

enum esp_ble_mesh_odp_client_cb_event_t
This enum value is the event of On-Demand Private Proxy Config Client model

Values:

enumerator ESP_BLE_MESH_ODP_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_ODP_CLIENT_SEND_TIMEOUT_EVT

Functions

`esp_err_t esp_ble_mesh_register_sar_client_callback (esp_ble_mesh_sar_client_cb_t callback)`
Register BLE Mesh SAR Configuration Client model callback.

Parameters

- callback -- [in] Pointer to the callback function.

Returns

- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sar_client_send (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sar_client_msg_t *msg)`
Get the value of SAR Configuration Server model state with the corresponding get message.

Parameters

- params -- [in] Pointer to BLE Mesh common client parameters.
- msg -- [in] Pointer to SAR Configuration Client message.
Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_sar_server_callback (esp_ble_mesh_sar_server_cb_t callback)
```

Register BLE Mesh SAR Configuration Server model callback.

**Parameters**

- `callback` -- [in] Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

ESP_BLE_MESH_MODEL_OP_SAR_RECEIVER_SET
ESP_BLE_MESH_MODEL_OP_SAR_RECEIVER_STATUS
ESP_BLE_MESH_MODEL_SAR_SRV (srv_data)

Define a new SAR Configuration Server model.

Note: If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

Parameters

• srv_data -- Pointer to a unique SAR Configuration Server model user_data.

Returns New SAR Configuration Server model instance.

ESP_BLE_MESH_MODEL_SAR_CLI (cli_data)

Define a new SAR Configuration Client model.

Note: If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

Parameters

• cli_data -- Pointer to a unique SAR Configuration Client model user_data.

Returns New SAR Configuration Client model instance.

Type Definitions
typedef void (*esp_ble_mesh_sar_client_cb_t)(esp_ble_mesh_sar_client_cb_event_t event, esp_ble_mesh_sar_client_cb_param_t *param)

Bluetooth Mesh SAR Configuration client and server model functions.

SAR Configuration Client model callback function type

Param event Event type
Param param Pointer to callback parameter
typedef void (*esp_ble_mesh_sar_server_cb_t)(esp_ble_mesh_sar_server_cb_event_t event, esp_ble_mesh_sar_server_cb_param_t *param)

SAR Configuration Server model callback function type.

Param event Event type
Param param Pointer to callback parameter
Enumerations

enum esp_ble_mesh_sar_client_cb_event_t
This enum value is the event of SAR Configuration Client model
Values:

enumerator ESP_BLE_MESH_SAR_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_SAR_CLIENT_SEND_TIMEOUT_EVT
enumerator ESP_BLE_MESH_SAR_CLIENT_RECV_RSP_EVT
enumerator ESP_BLE_MESH_SAR_CLIENT_RECV_PUB_EVT
enumerator ESP_BLE_MESH_SAR_CLIENT_EVT_MAX

enum esp_ble_mesh_sar_server_cb_event_t
This enum value is the event of SAR Configuration Server model
Values:

enumerator ESP_BLE_MESH_SAR_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_SAR_SERVER_EVT_MAX

Solicitation PDU RPL Configuration

Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_srpl_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_srpl_model_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```

Functions

`esp_err_t esp_ble_mesh_register_srpl_client_callback(esp_ble_mesh_srpl_client_cb_t callback)`
Register BLE Mesh Solicitation PDU RPL Configuration Client model callback.

Parameters

- `callback` -- [in] Pointer to the callback function.

Returns

- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_srpl_client_send(esp_ble_mesh_client_common_param_t *params,
                                        esp_ble_mesh_srpl_client_msg_t *msg)`
Set the value of Solicitation PDU RPL Configuration Server model state with the corresponding set message.

Parameters
• **params** -- [in] Pointer to BLE Mesh common client parameters.
  • **msg** -- [in] Pointer to Solicitation PDU RPL Configuration Client message.

**Returns**
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_srpl_server_callback(esp_ble_mesh_srpl_server_cb_t callback)
```

Register BLE Mesh Solicitation PDU RPL Configuration Server model callback.

**Parameters**
callback -- [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

**Unions**

union `esp_ble_mesh_srpl_client_msg_t`
```
#include <esp_ble_mesh_srpl_model_api.h> Solicitation PDU RPL Configuration Client model message union.
```

**Public Members**

**ESP_BLE_MESH_MODEL_OP_SRPL_ITEMS_CLEAR_UNACK**

**ESP_BLE_MESH_MODEL_OP_SRPL_ITEMS_STATUS**

**ESP_BLE_MESH_MODEL_SRPL_SRV (srv_data)**
Define a new Solicitation PDU RPL Configuration Server model.

**Note:** The Solicitation PDU RPL Configuration Server model extends the On-Demand Private Proxy Server model. If the model is supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

- **srv_data** -- Pointer to a unique Solicitation PDU RPL Configuration Server model user_data.

**Returns** New Solicitation PDU RPL Configuration Server model instance.

**ESP_BLE_MESH_MODEL_SRPL_CLI (cli_data)**
Define a new Solicitation PDU RPL Configuration Client model.

**Note:** If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

**Parameters**

- **cli_data** -- Pointer to a unique Solicitation PDU RPL Configuration Client model user_data.

**Returns** New Solicitation PDU RPL Configuration Client model instance.
Type Definitions

typedef void (*esp_ble_mesh_srpl_client_cb_t)(esp_ble_mesh_srpl_client_cb_event_t event, esp_ble_mesh_srpl_client_cb_param_t *param)

Bluetooth Mesh Solicitation PDU RPL Configuration client and server model functions.

Solicitation PDU RPL Configuration Client model callback function type

**Param event** Event type
**Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_srpl_server_cb_t)(esp_ble_mesh_srpl_server_cb_event_t event, esp_ble_mesh_srpl_server_cb_param_t *param)

Solicitation PDU RPL Configuration Server model callback function type.

**Param event** Event type
**Param param** Pointer to callback parameter

Enumerations

enum esp_ble_mesh_srpl_client_cb_event_t

This enum value is the event of Solicitation PDU RPL Configuration Client model

Values:

enumerator ESP_BLE_MESH_SRPL_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_SRPL_CLIENT_SEND_TIMEOUT_EVT
enumerator ESP_BLE_MESH_SRPL_CLIENT_RECV_RSP_EVT
enumerator ESP_BLE_MESH_SRPL_CLIENT_RECV_PUB_EVT
enumerator ESP_BLE_MESH_SRPL_CLIENT_EVT_MAX

enum esp_ble_mesh_srpl_server_cb_event_t

This enum value is the event of Solicitation PDU RPL Configuration Server model

Values:

enumerator ESP_BLE_MESH_SRPL_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_SRPL_SERVER_EVT_MAX

Opcodes Aggregator

Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_agg_model_api.h
- This header file can be included with:

```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
Functions

```c
esp_err_t esp_ble_mesh_register_agg_client_callback (esp_ble_mesh_agg_client_cb_t callback)
```

Register BLE Mesh Opcodes Aggregator Client model callback.

**Parameters**
- `callback` -- [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_agg_client_send (esp_ble_mesh_client_common_param_t *params,
                                       esp_ble_mesh_agg_client_msg_t *msg)
```

Set the value of Opcodes Aggregator Server model state with the corresponding set message.

**Parameters**
- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `msg` -- [in] Pointer to Opcodes Aggregator Client message.

**Returns**
- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_agg_server_callback (esp_ble_mesh_agg_server_cb_t callback)
```

Register BLE Mesh Opcodes Aggregator Server model callback.

**Parameters**
- `callback` -- [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

Unions

```c
union esp_ble_mesh_agg_client_msg_t
#include <esp_ble_mesh_agg_model_api.h> Opcodes Aggregator Client model message union.

```

```c
ESP_BLE_MESH_AGG_ITEM_LENGTH_FORMAT_LONG
```

```c
ESP_BLE_MESH_MODEL_AGG_SRV (srv_data)
```

Define a new Opcodes Aggregator Server model.

**Note:** If supported, the Opcodes Aggregator Server model shall be supported by a primary element.

**Parameters**

- `srv_data` -- Pointer to a unique Opcodes Aggregator Server model user_data.

**Returns**

New Opcodes Aggregator Server model instance.

```c
ESP_BLE_MESH_MODEL_AGG_CLI (cli_data)
```

Define a new Opcodes Aggregator Client model.

**Note:** If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

**Parameters**

- `cli_data` -- Pointer to a unique Opcodes Aggregator Client model user_data.

**Returns**

New Opcodes Aggregator Client model instance.
Type Definitions

typedef void (*)esp_ble_mesh_agg_client_cb_t(esp_ble_mesh_agg_client_cb_event_t event, esp_ble_mesh_agg_client_cb_param_t *param)

Bluetooth Mesh Opcodes Aggregator client and server model functions.

Opcodes Aggregator Client model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*)esp_ble_mesh_agg_server_cb_t(esp_ble_mesh_agg_server_cb_event_t event, esp_ble_mesh_agg_server_cb_param_t *param)

Opcodes Aggregator Server model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum esp_ble_mesh_agg_client_cb_event_t

This enum value is the event of Opcodes Aggregator Client model

Values:

enumerator ESP_BLE_MESH_AGG_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_AGG_CLIENT_SEND_TIMEOUT_EVT
enumerator ESP_BLE_MESH_AGG_CLIENT_RECV_RSP_EVT
enumerator ESP_BLE_MESH_AGG_CLIENT_RECV_PUB_EVT
enumerator ESP_BLE_MESH_AGG_CLIENT_EVT_MAX

enum esp_ble_mesh_agg_server_cb_event_t

This enum value is the event of Opcodes Aggregator Server model

Values:

enumerator ESP_BLE_MESH_AGG_SERVER_RECV_MSG_EVT
enumerator ESP_BLE_MESH_AGG_SERVER_EVT_MAX

Large Composition Data

Header File

• This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
REQUIRES bt
or
PRIV_REQUIRES bt

Functions

esp_err_t esp_ble_mesh_register_lcd_client_callback (esp_ble_mesh_lcd_client_cb_t callback)
Register BLE Mesh Large Composition Data Client model callback.

Parameters callback -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_lcd_client_send (esp_ble_mesh_client_common_param_t *params,
                                         esp_ble_mesh_lcd_client_msg_t *msg)
Get the value of Large Composition Data Server model state with the corresponding get message.

Parameters

• params -- [in] Pointer to BLE Mesh common client parameters.
• msg -- [in] Pointer to Large Composition Data Client message.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_register_lcd_server_callback (esp_ble_mesh_lcd_server_cb_t callback)
Register BLE Mesh Large Composition Data Server model callback.

Parameters callback -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

ESP_BLE_MESH_MODEL_LCD_SRV (srv_data)

Define a new Large Composition Data Server model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

- srv_data -- Pointer to a unique Large Composition Data Server model user_data.

**Returns** New Large Composition Data Server model instance.
Define a new Large Composition Data Client model.

**Note:** If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

**Parameters**
- `cli_data` -- Pointer to a unique Large Composition Data Client model user_data.

**Returns** New Large Composition Data Client model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_lcd_client_cb_t)(esp_ble_mesh_lcd_client_cb_event_t event, esp_ble_mesh_lcd_client_cb_param_t *param)
```

Large Composition Data client and server model functions.

- Large Composition Data Client model callback function type
- `Param event` Event type
- `Param param` Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lcd_server_cb_t)(esp_ble_mesh_lcd_server_cb_event_t event, esp_ble_mesh_lcd_server_cb_param_t *param)
```

Large Composition Data Server model callback function type.

- `Param event` Event type
- `Param param` Pointer to callback parameter

**Enumerations**

2.3.6 NimBLE-based Host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and Bluetooth® SIG qualifiable Bluetooth Low Energy (Bluetooth LE) stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including Bluetooth Low Energy Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.
Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For Bluetooth Low Energy Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks_INITIALIZATION
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

This header file can be included with:

```
#include "esp_nimble_hci.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

```c
esp_err_t esp_nimble_hci_init(void)
```

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Returns
Chapter 2. API Reference

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

\texttt{esp_err_t esp_nimble_hci_deinit} (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

\textbf{Note:} This function should be called after the NimBLE host is deinitialized.

\textbf{Returns}
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

\textbf{Macros}

\texttt{BLE_HCI_UART_H4_NONE}

\texttt{BLE_HCI_UART_H4_CMD}

\texttt{BLE_HCI_UART_H4_ACL}

\texttt{BLE_HCI_UART_H4_SCO}

\texttt{BLE_HCI_UART_H4_EVT}

ESP-IDF currently supports two host stacks. The Bluez based stack (default) supports classic Bluetooth as well as Bluetooth Low Energy (Bluetooth LE). On the other hand, Apache NimBLE based stack is Bluetooth Low Energy only. For users to make a choice:

- For usecases involving classic Bluetooth as well as Bluetooth Low Energy, Bluez should be used.
- For Bluetooth Low Energy-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF)

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

\section{2.4 Error Codes Reference}

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see \textit{Error Handling}.

\texttt{ESP_FAIL} (-1): Generic \texttt{esp_err_t} code indicating failure

\texttt{ESP_OK} (0): \texttt{esp_err_t} value indicating success (no error)
**ESP_ERR_NO_MEM** (*0x101*): Out of memory

**ESP_ERR_INVALID_ARG** (*0x102*): Invalid argument

**ESP_ERR_INVALID_STATE** (*0x103*): Invalid state

**ESP_ERR_INVALID_SIZE** (*0x104*): Invalid size

**ESP_ERR_NOT_FOUND** (*0x105*): Requested resource not found

**ESP_ERR_NOT_SUPPORTED** (*0x106*): Operation or feature not supported

**ESP_ERR_TIMEOUT** (*0x107*): Operation timed out

**ESP_ERR_INVALID_RESPONSE** (*0x108*): Received response was invalid

**ESP_ERR_INVALID_CRC** (*0x109*): CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION** (*0x10a*): Version was invalid

**ESP_ERR_INVALID_MAC** (*0x10b*): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (*0x10c*): Operation has not fully completed

**ESP_ERR_NOT_ALLOWED** (*0x10d*): Operation is not allowed

**ESP_ERR_NVS_BASE** (*0x1100*): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (*0x1101*): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (*0x1102*): A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (*0x1103*): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (*0x1104*): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (*0x1105*): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (*0x1106*): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (*0x1107*): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (*0x1108*): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (*0x1109*): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (*0x110a*): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (*0x110b*): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (*0x110c*): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (*0x110d*): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (*0x110e*): Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (*0x110f*): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (*0x1110*): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (*0x1111*): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (*0x1112*): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (*0x1113*): XTS configuration setting failed
ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114): XTS configuration not found
ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version
ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized
ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt
ESP_ERR_NVS_CONTENT_DIFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison
ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.
ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes
ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn't fit into RTC memory reserved for the ULP
ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)
ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence roll back is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVS (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_TWT_FULL (0x3017): no available flow id
ESP_ERR_WIFI_TWT_SETUP_TIMEOUT (0x3018): Timeout of receiving twt setup response frame, timeout times can be set during twt setup
ESP_ERR_WIFI_TWT_SETUP_TXFAIL (0x3019): TWT setup frame tx failed
ESP_ERR_WIFI_TWT_SETUP_REJECT (0x301a): The twt setup request was rejected by the AP
ESP_ERR_WIFI_DISCARD (0x301b): Discard frame
ESP_ERR_WIFI_ROC_IN_PROGRESS (0x301c): ROC op is in progress
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_ESPNOW_CHAN (0x306d): Channel error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Acked
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_DPP_AUTH_TIMEOUT (0x309a): DPP Auth response was not recieved in time
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
ESP_ERR_MESH_WIFI_NOT_START (0x4001)
ESP_ERR_MESH_NOT_INIT (0x4002)

ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED (0x500c)
ESP_ERR_ESP_NETIF_DHCPS_START_FAILED (0x500d)
ESP_ERR_FLASH_BASE (0x6000): Starting number of flash error codes
ESP_ERR_FLASH_OP_FAIL (0x6001)
ESP_ERR_FLASH_OP_TIMEOUT (0x6002)
ESP_ERR_FLASH_NOT_INITIALIZED (0x6003)
ESP_ERR_FLASH_UNSUPPORTED_HOST (0x6004)
ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)
ESP_ERR_FLASH_PROTECTED (0x6006)
ESP_ERR_HTTP_BASE (0x7000): Starting number of HTTP error codes
ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection
ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server
ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme
ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn’t been established yet
ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t
ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008): Read FIN from peer and the connection closed
ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes
ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn’t be resolved upon tls connection
ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket
ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family
ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8006): new connection in esp_tls_low_level_conn connection timeouted
ESP_ERR_ESP_TLS_SE_FAILED (0x8007)
ESP_ERR_ESP_TLS_TCP_CLOSED_FIN (0x8008)
ESP_ERR_MBEDTLS_CERT_PARTLY_OK (0x8010): mbedtls parse certificates was partly successful
ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED (0x8011): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED (0x8012): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED (0x8013): mbedtls api returned error

ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)
ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes
ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out
ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)
ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer
ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed
ESP_ERR_NVS_SEC_BASE (0xf000): Starting number of error codes
ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND (0xf001): HMAC Key required to generate the NVS encryption keys not found
ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED (0xf002): Provided eFuse block for HMAC key generation is already in use
ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED (0xf003): Failed to generate/write the HMAC key to eFuse
ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED (0xf004): Failed to derive the NVS encryption keys based on the HMAC-based scheme

2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview  ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection.

CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bitrate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7-</td>
<td></td>
</tr>
<tr>
<td>257 bytes</td>
<td>4 bytes</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
• Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
• Random Value: The Random Value filed is used to prevents relay attacks.
• Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0-250 bytes</td>
</tr>
</tbody>
</table>

• Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
• Length: The length is the total length of Organization Identifier, Type, Version and Body.
• Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
• Type: The Type field is set to the value (4) indicating ESP-NOW.
• Version: The Version field is set to the version of ESP-NOW.
• Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

**Security** ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The Wi-Fi device maintains a Primary Master Key (PMK) and several Local Master Keys (LMKs, each paired device has one LMK). The lengths of both PMK and LMK are 16 bytes.

• PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
• LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW.

When `esp_now_deinit()` is called, all of the information of paired devices are deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device does not exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.
If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once at a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESP-NOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32 is configured as station. Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time. If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

**Application Examples**

- Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_now.h`
- This header file can be included with:

  ```
  #include "esp_now.h"
  ```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_wifi
  ```

  or

  ```
  PRIV_REQUIRES esp_wifi
  ```

**Functions**

`esp_err_t esp_now_init(void)`

Initialize ESPNOW function.

**Returns**

- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error
**esp_err_t esp_now_deinit (void)**
De-initialize ESPNOW function.

**Returns**
- ESP_OK : succeed

**esp_err_t esp_now_get_version (uint32_t *version)**
Get the version of ESPNOW.

**Parameters**
- **version** -- ESPNOW version

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

**esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)**
Register callback function of receiving ESPNOW data.

**Parameters**
- **cb** -- callback function of receiving ESPNOW data

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

**esp_err_t esp_now_unregister_recv_cb (void)**
Unregister callback function of receiving ESPNOW data.

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)**
Register callback function of sending ESPNOW data.

**Parameters**
- **cb** -- callback function of sending ESPNOW data

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

**esp_err_t esp_now_unregister_send_cb (void)**
Unregister callback function of sending ESPNOW data.

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)**
Send ESPNOW data.

**Attention**
1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

**Parameters**
- **peer_addr** -- peer MAC address
- **data** -- data to send
- **len** -- length of data

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_INTERNAL: internal error
• ESP_ERR_ESPNOW_NO_MEM: out of memory, when this happens, you can delay a while before sending the next data
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
• ESP_ERR_ESPNOW_IF: current Wi-Fi interface doesn't match that of peer
• ESP_ERR_ESPNOW_CHAN: current Wi-Fi channel doesn't match that of peer

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`
Add a peer to peer list.

Parameters peer -- peer information

Returns
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full
• ESP_ERR_ESPNOW_NO_MEM: out of memory
• ESP_ERR_ESPNOW_EXIST: peer has existed

`esp_err_t esp_now_del_peer (const uint8_t *peer_addr)`
Delete a peer from peer list.

Parameters peer_addr -- peer MAC address

Returns
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

`esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)`
Modify a peer.

Parameters peer -- peer information

Returns
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full

`esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)`
Config ESPNOW rate of specified interface.

**Deprecated:**
please use `esp_now_set_peer_rate_config()` instead.

**Attention** 1. This API should be called after `esp_wifi_start()`.
**Attention** 2. This API only work when not use Wi-Fi 6 and `esp_now_set_peer_rate_config()` not called.

Parameters
• `ifx` -- Interface to be configured.
• `rate` -- Phy rate to be configured.

Returns
• ESP_OK: succeed
• others: failed
### esp_err_t esp_now_set_peer_rate_config

**Declaration:**

```c
esp_err_t esp_now_set_peer_rate_config(const uint8_t* peer_addr, esp_now_rate_config_t* config)
```

**Description:**

Set ESPNOW rate config for each peer.

**Attention:** 1. This API should be called after esp_wifi_start() and esp_now_init().

**Parameters**

- `peer_addr` -- peer MAC address
- `config` -- rate config to be configured.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERROR_ESPNOW_INTERNAL`: internal error

### esp_err_t esp_now_get_peer

**Declaration:**

```c
esp_err_t esp_now_get_peer(const uint8_t* peer_addr, esp_now_peer_info_t* peer)
```

**Description:**

Get a peer whose MAC address matches `peer_addr` from peer list.

**Parameters**

- `peer_addr` -- peer MAC address
- `peer` -- peer information

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

### esp_err_t esp_now_fetch_peer

**Declaration:**

```c
esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t* peer)
```

**Description:**

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- `from_head` -- fetch from head of list or not
- `peer` -- peer information

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

### bool esp_now_is_peer_exist

**Declaration:**

```c
bool esp_now_is_peer_exist(const uint8_t* peer_addr)
```

**Description:**

Peer exists or not.

**Parameters**

- `peer_addr` -- peer MAC address

**Returns**

- `true`: peer exists
- `false`: peer not exists

### esp_err_t esp_now_get_peer_num

**Declaration:**

```c
esp_err_t esp_now_get_peer_num(esp_now_peer_num_t* num)
```

**Description:**

Get the number of peers.

**Parameters**

- `num` -- number of peers

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument

### esp_err_t esp_now_set_pmk

**Declaration:**

```c
esp_err_t esp_now_set_pmk(const uint8_t* pmk)
```

**Description:**

Set the primary master key.
Attention 1. primary master key is used to encrypt local master key

Parameters pmk -- primary master key

Returns
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
```
Set wake window for esp_now to wake up in interval unit.

Attention 1. This configuration could work at connected status. When
ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at
disconnected status.

Attention 2. Default value is the maximum.

Parameters window -- Milliseconds would the chip keep waked each interval, from 0 to 65535.

Returns
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

```c
struct esp_now_peer_info
```
ESPNOW peer information parameters.

Public Members

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
```
ESPNOW peer MAC address that is also the MAC address of station or softap

```c
uint8_t lmk[ESP_NOW_KEY_LEN]
```
ESPNOW peer local master key that is used to encrypt data

```c
uint8_t channel
```
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel
which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

```c
wifi_interface_t ifidx
```
Wi-Fi interface that peer uses to send/receive ESPNOW data

```c
bool encrypt
```
ESPNOW data that this peer sends/receives is encrypted or not

```c
void *priv
```
ESPNOW peer private data

```c
struct esp_now_peer_num
```
Number of ESPNOW peers which exist currently.
Public Members

```c
int total_num
Total number of ESPnow peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM
```

```c
int encrypt_num
Number of encrypted ESPnow peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
```

```c
struct esp_now_recv_info
ESPnow packet information.
```

Public Members

```c
uint8_t *src_addr
Source address of ESPnow packet
```

```c
uint8_t *des_addr
Destination address of ESPnow packet
```

```c
wifi_pkt_rx_ctrl_t *rx_ctrl
Rx control info of ESPnow packet
```

```c
struct esp_now_rate_config
ESPnow rate config.
```

Public Members

```c
wifi_phy_mode_t phymode
ESPnow phymode of specified interface
```

```c
wifi_phy_rate_t rate
ESPnow rate of specified interface
```

```c
bool ersu
ESPnow using ersu send frame
```

```c
bool dcm
ESPnow using dcm rate to send frame
```

Macros

```c
ESP_ERR_ESPNOW_BASE
ESPnow error number base.
```

```c
ESP_ERR_ESPNOW_NOT_INIT
ESPnow is not initialized.
```
**Chapter 2. API Reference**

**ESP_ERR_ESPNOW_ARG**
Invalid argument

**ESP_ERR_ESPNOW_NO_MEM**
Out of memory

**ESP_ERR_ESPNOW_FULL**
ESPNOW peer list is full

**ESP_ERR_ESPNOW_NOT_FOUND**
ESPNOW peer is not found

**ESP_ERR_ESPNOW_INTERNAL**
Internal error

**ESP_ERR_ESPNOW_EXIST**
ESPNOW peer has existed

**ESP_ERR_ESPNOW_IF**
Interface error

**ESP_ERR_ESPNOW_CHAN**
Channel error

**ESP_NOW_ETH_ALEN**
Length of ESPNOW peer MAC address

**ESP_NOW_KEY_LEN**
Length of ESPNOW peer local master key

**ESP_NOW_MAX_TOTAL_PEER_NUM**
Maximum number of ESPNOW total peers

**ESP_NOW_MAX_ENCRYPT_PEER_NUM**
Maximum number of ESPNOW encrypted peers

**ESP_NOW_MAX_DATA_LEN**
Maximum length of ESPNOW data which is sent very time

**Type Definitions**

```c
typedef struct esp_now_peer_info esp_now_peer_info_t
    ESPNOW peer information parameters.
```

```c
typedef struct esp_now_peer_num esp_now_peer_num_t
    Number of ESPNOW peers which exist currently.
```

```c
typedef struct esp_now_recv_info esp_now_recv_info_t
    ESPNOW packet information.
```

Chapter 2. API Reference

typedef struct esp_now_rate_config esp_now_rate_config_t
    ESPNOW rate config.

typedef void (*esp_now_recv_cb_t)(const esp_now_recv_info_t *esp_now_info, const uint8_t *data, int data_len)
    Callback function of receiving ESPNOW data.

    **Attention** esp_now_info is a local variable, it can only be used in the callback.

    - **Param esp_now_info** received ESPNOW packet information
    - **Param data** received data
    - **Param data_len** length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
    Callback function of sending ESPNOW data.

    - **Param mac_addr** peer MAC address
    - **Param status** status of sending ESPNOW data (succeed or fail)

Enumerations

enum esp_now_send_status_t
    Status of sending ESPNOW data.

    **Values:**

    - enumerator ESP_NOW_SEND_SUCCESS Send ESPNOW data successfully
    - enumerator ESP_NOW_SEND_FAIL Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self-Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e., the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.
**System Events**  An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

![ESP-WIFI-MESH System Events Delivery](image)

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contains handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH**  The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.
Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application**  
The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

**Initialize Mesh**  
The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
```

**Configuring an ESP-WIFI-MESH**  
ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_func_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
```
Chapter 2. API Reference

(continued from previous page)

```c
/* mesh ID */
memcpy((
    uint8_t
)*&
    cfg.mesh_id,
    MESH_ID,
    6);

/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;

/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((
    uint8_t
)*&
    cfg.router.ssid,
    CONFIG_MESH_ROUTER_SSID,
    cfg.router.ssid_len);

cfg.router.password = CONFIG_MESH_ROUTER_PASSWD;
    strlen(CONFIG_MESH_ROUTER_PASSWD));

/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((
    uint8_t
)*&
    cfg.mesh_ap.password,
    CONFIG_MESH_AP_PASSWD,
    strlen(CONFIG_MESH_AP_PASSWD));

ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self-Organized Networking  Self-organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self-organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self-organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self-organized networking is enabled so as not to interfere with ESP-WIFI-MESH.

Toggling Self-Organized Networking  Self-organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self-organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self-organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self-organized networking.

Disabling Self-Organized Networking  The following code snippet demonstrates how to disable self-organized networking.

```c
// Disable self-organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self-organized networking.

- If the node was previously connected to other nodes, it will remain connected.
• If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
• If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self-Organized Networking**  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self-organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self-organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
               |              | • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             | Y            | • A root node already connected to router will stay connected.  
               |              | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
               |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             | Y            | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self-organized networking.

```c
//Enable self-organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self-organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Chapter 2. API Reference

Calling Wi-Fi API There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self-organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of esp_mesh_set_self_organized() which disable and enable self-organized networking. The following code snippet demonstrates how an application can safely call esp_wifi_scan_start() whilst using ESP-WIFI-MESH.

```c
//Disable self-organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self-organized networking if still connected
esp_mesh_set_self_organized(1, 0);

... 

//Re-enable self-organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self-organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Do not select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up an ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h
- This header file can be included with:

  ```c
  #include "esp_mesh.h"
  ```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES esp_wifi
  ```

  or
Chapter 2. API Reference

PRIV_REQUIRES esp_wifi

Functions

`esp_err_t esp_mesh_init (void)`

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit (void)`

Mesh de-initialization.

- Release resources and stop the mesh

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start (void)`

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop (void)`

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
• Restore Wi-FisoftAP to default settings if Wi-Fi dual mode is enabled.
• Set Wi-Fi Power Saver type to WIFI_PS_NONE.

Returns
• ESP_OK
• ESP_FAIL

`esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)`

Send a packet over the mesh network.

• Send a packet to any device in the mesh network.
• Send a packet to external IP network.

Attention This API is not reentrant.

Parameters
• `to` -- [in] the address of the final destination of the packet
  
  – If the packet is to the root, set this parameter to NULL.
  
  – If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.

• `data` -- [in] pointer to a sending mesh packet
  
  – Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  
  – Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  
  – Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

• `flag` -- [in] bitmap for data sent
  
  – Speed up the route search
    
    – If the packet is to the root and "to" parameter is NULL, set this parameter to 0.
    
    – If the packet is to an internal device, MESH_DATA_P2P should be set.
    
    – If the packet is to the root ("to" parameter isn't NULL) or to external IP network, MESH_DATA_TODS should be set.
    
    – If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  
  – Specify whether this API is block or non-block, block by default
    
    – If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  
  – In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

• `opt` -- [in] options
  
  – In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  
  – Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

• `opt_count` -- [in] option count
Currently, this API only takes one option, so opt_count is only supported to be 1.

Returns

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)
```

Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Parameters**

- `time_ms` -- [in] blocking time of esp_mesh_send(), unit: ms

**Returns**

- ESP_OK

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queues should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**

- `from` -- [out] the address of the original source of the packet
- `data` -- [out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- `timeout_ms` -- [in] wait time if a packet isn’t immediately available (0: no wait, port_MAX_DELAY: wait forever)
- `flag` -- [out] bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- `opt` -- [out] options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- `opt_count` -- [in] option count desired to receive
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network.
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

Flag could be `MESH_DATA_TODS`.

**Attention** This API is only called by the root.

**Parameters**
- `from` -- [out] the address of the original source of the packet
- `to` -- [out] the address contains remote IP address and port (IPv4:PORT)
- `data` -- [out] pointer to the received packet
- `timeout_ms` -- [in] wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
- `flag` -- [out] bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- `opt` -- [out] options desired to receive
- `opt_count` -- [in] option count desired to receive

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

`esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)`

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with
same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters**
config -- [in] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Parameters**
config -- [out] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters**
router -- [in] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Parameters**
router -- [out] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters**
id -- [in] pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```
Get mesh network ID.

**Parameters**
id -- [out] pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
**esp_err_t esp_mesh_set_type(mesh_type_t type)**

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters**
- **type** -- [in] device type

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**mesh_type_t esp_mesh_get_type(void)**

Get device type over mesh network.

**Attention**
This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns**
- mesh type

**esp_err_t esp_mesh_set_max_layer(int max_layer)**

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention**
This API shall be called before mesh is started.

**Parameters**
- **max_layer** -- [in] max layer value

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**int esp_mesh_get_max_layer(void)**

Get max layer value.

**Returns**
- max layer value

**esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)**

Set mesh softAP password.

**Attention**
This API shall be called before mesh is started.

**Parameters**
- **pwd** -- [in] pointer to the password
- **len** -- [in] password length

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
**esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)**
Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** authmode -- [in] authentication mode

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**
Get mesh softAP authentication mode.

**Returns** authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** connections -- [in] the number of max connections

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**int esp_mesh_get_ap_connections (void)**
Get mesh max connection configuration.

**Returns** the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**
Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

**int esp_mesh_get_layer (void)**
Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**
Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Parameters** bssid -- [out] pointer to parent BSSID

**Returns**
Chapter 2. API Reference

- ESP_OK
- ESP_FAIL

bool esp_mesh_is_root (void)

Return whether the device is the root node of the network.

Returns true/false

esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

Parameters
- enable -- [in] enable or disable self-organized networking
- select_parent -- [in] Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

Returns
- ESP_OK
- ESP_FAIL

bool esp_mesh_get_self_organized (void)

Return whether enable self-organized networking or not.

Returns true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Parameters
- vote -- [in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
• **reason** -- [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

**Returns**

• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

`esp_err_t esp_mesh_set_vote_percentage(float percentage)`

Set vote percentage threshold for approval of being a root (default: 0.9)

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters**

**percentage** -- [in] vote percentage threshold

**Returns**

• ESP_OK
• ESP_FAIL

`float esp_mesh_get_vote_percentage(void)`

Get vote percentage threshold for approval of being a root.

**Returns** percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)`

Set mesh softAP associate expired time (default: 10 seconds)

• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters**

**seconds** -- [in] the expired time

**Returns**

• ESP_OK
• ESP_FAIL

`int esp_mesh_get_ap_assoc_expire(void)`

Get mesh softAP associate expired time.

**Returns** seconds

`int esp_mesh_get_total_node_num(void)`

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns** total number of devices (including the root)

`int esp_mesh_get_routing_table_size(void)`

Get the number of devices in this device's sub-network (including self)

**Returns** the number of devices over this device's sub-network (including self)
**esp_err_t esp_mesh_get_routing_table** *(mesh_addr_t *mac, int len, int *size)*

Get routing table of this device's sub-network (including itself)

**Parameters**
- **mac** -- [out] pointer to routing table
- **len** -- [in] routing table size (in bytes)
- **size** -- [out] pointer to the number of devices in routing table (including itself)

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**esp_err_t esp_mesh_post_toDS_state** *(bool reachable)*

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Parameters** reachable -- [in] this state represents whether the root is able to access external IP network

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_get_tx_pending** *(mesh_tx_pending_t *pending)*

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** pending -- [out] pointer to the TX pending

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_get_rx_pending** *(mesh_rx_pending_t *pending)*

Return the number of packets available in the queue waiting to be received by applications.

**Parameters** pending -- [out] pointer to the RX pending

**Returns**
- ESP_OK
- ESP_FAIL

**int esp_mesh_available_txupQ_num** *(const mesh_addr_t *addr, uint32_t *xseqno_in)*

Return the number of packets could be accepted from the specified address.

**Parameters**
- **addr** -- [in] self address or an associate children address
- **xseqno_in** -- [out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

**esp_err_t esp_mesh_set_xon_qsize** *(int qsize)*

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: \( \text{wnd} = \frac{\text{xon_qsize}}{2 \times \text{max_connection} + 1} \). However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

**Attention** This API shall be called before mesh is started.

**Parameters** qsize -- [in] default:32 (min:16)

**Returns**
- ESP_OK
- ESP_FAIL
int esp_mesh_get_xon_qsize (void)
Get queue size.

**Returns**  the number of queue

*esp_err_t* esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.

**Parameters**  allowed -- [in] allow or not

**Returns**
- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

*bool* esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.

**Returns**  true/false

*esp_err_t* esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
Set group ID addresses.

**Parameters**
- addr -- [in] pointer to new group ID addresses
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

*esp_err_t* esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
Delete group ID addresses.

**Parameters**
- addr -- [in] pointer to deleted group ID address
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_group_num (void)
Get the number of group ID addresses.

**Returns**  the number of group ID addresses

*esp_err_t* esp_mesh_get_group_list (mesh_addr_t *addr, int num)
Get group ID addresses.

**Parameters**
- addr -- [out] pointer to group ID addresses
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

*bool* esp_mesh_is_my_group (const mesh_addr_t *addr)
Check whether the specified group address is my group.

**Returns**  true/false

*esp_err_t* esp_mesh_set_capacity_num (int num)
Set mesh network capacity (max:1000, default:300)

**Attention**  This API shall be called before mesh is started.
**Parameters**  
num -- [in] mesh network capacity  

**Returns**  
- ESP_OK  
- ESP_ERR_MESH_NOT_ALLOWED  
- ESP_MESH_ERR_ARGUMENT

```c
int esp_mesh_get_capacity_num (void)
```

Get mesh network capacity.

**Returns**  
mesh network capacity

`esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)`

Set mesh IE crypto functions.

**Attention**  
This API can be called at any time after mesh is configured.

**Parameters**  
crypto_funcs -- [in] crypto functions for mesh IE  
- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

**Returns**  
- ESP_OK

`esp_err_t esp_mesh_set_ie_crypto_key (const char* key, int len)`

Set mesh IE crypto key.

**Attention**  
This API can be called at any time after mesh is configured.

**Parameters**  
- key -- [in] ASCII crypto key  
- len -- [in] length in bytes, range: 8~64

**Returns**  
- ESP_OK  
- ESP_MESH_ERR_ARGUMENT

`esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)`

Get mesh IE crypto key.

**Parameters**  
- key -- [out] ASCII crypto key  
- len -- [in] length in bytes, range: 8~64

**Returns**  
- ESP_OK  
- ESP_MESH_ERR_ARGUMENT

`esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)`

Set delay time before starting root healing.

**Parameters**  
delay_ms -- [in] delay time in milliseconds

**Returns**  
- ESP_OK

```c
int esp_mesh_get_root_healing_delay (void)
```

Get delay time before network starts root healing.

**Returns**  
delay time in milliseconds

`esp_err_t esp_mesh_fix_root (bool enable)`

Enable network Fixed Root Setting.
• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Parameters** enable -- [in] enable or not
**Returns**
• ESP_OK

**bool esp_mesh_is_root_fixed(void)**
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the "flag" value in parent networking IE.

**Returns** true/false

**esp_err_t esp_mesh_set_parent** (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Parameters**
• **parent** -- [in] parent configuration, the SSID and the channel of the parent are mandatory.
  • If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
• **parent_mesh_id** -- [in] parent mesh ID,
  • If this value is not set, the original mesh ID is used.
• **my_type** -- [in] mesh type
  • MESH_STA is not supported.
  • If the parent set for the device is the same as the router in the network configuration, then *my_type* shall set MESH_ROOT and *my_layer* shall set MESH_ROOT_LAYER.
• **my_layer** -- [in] mesh layer
  • *my_layer* of the device may change after joining the network.
  • If *my_type* is set MESH_NODE, *my_layer* shall be greater than MESH_ROOT_LAYER.
  • If *my_type* is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

**Returns**
• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

**esp_err_t esp_mesh_scan_get_ap_ie_len** (int *len)
Get mesh networking IE length of one AP.

**Parameters** len -- [out] mesh networking IE length
**Returns**
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_INVALID_ARG
• ESP_ERR_WIFI_FAIL
**esp_err_t esp_mesh_scan_get_ap_record** (wifi_ap_record_t *ap_record, void *buffer)

Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See "manual_networking" example.

**Parameters**
- `ap_record` -- [out] pointer to one AP record
- `buffer` -- [out] pointer to the mesh networking IE of this AP

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

**esp_err_t esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_get_subnet_nodes_num** (const mesh_addr_t *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**
- `child_mac` -- [in] an associated child address of this device
- `nodes_num` -- [out] pointer to the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**esp_err_t esp_mesh_get_subnet_nodes_list** (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

**Parameters**
- `child_mac` -- [in] an associated child address of this device
- `nodes` -- [out] pointer to nodes in the subnet of a specific child
- `nodes_num` -- [in] the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**esp_err_t esp_mesh_disconnect** (void)

Disconnect from current parent.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_connect** (void)

Connect to current parent.

**Returns**
- ESP_OK

**esp_err_t esp_mesh_flush_scan_result** (void)

Flush scan result.

**Returns**
• ESP_OK

```c
esp_err_t esp_mesh_switch_channel(const uint8_t* new_bssid, int csa_newchan, int csa_count)
```

Causes the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention**  This API is only called by the root.

**Parameters**

- **new_bssid** -- [in] the new router BSSID if the router changes
- **csa_newchan** -- [in] the new channel number to which the whole network is moving
- **csa_count** -- [in] channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**

- ESP_OK

```c
esp_err_t esp_mesh_get_router_bssid(uint8_t* router_bssid)
```

Get the router BSSID.

**Parameters**  **router_bssid** -- [out] pointer to the router BSSID

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG

```c
int64_t esp_mesh_get_tsf_time(void)
```

Get the TSF time.

**Returns**  the TSF time

```c
esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)
```

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention**  This API shall be called before mesh is started.

**Parameters**  **topo** -- [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

**Returns**

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_mesh_topology_t esp_mesh_get_topology(void)
```

Get mesh topology.

**Returns**  MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_err_t esp_mesh_enable_ps(void)
```

Enable mesh Power Save function.

**Attention**  This API shall be called before mesh is started.
Chapter 2. API Reference

Returns
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

`esp_err_t esp_mesh_disable_ps (void)`
Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

bool `esp_mesh_is_ps_enabled (void)`
Check whether the mesh Power Save function is enabled.

Returns true/false

bool `esp_mesh_is_device_active (void)`
Check whether the device is in active state.

• If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

`esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)`
Set the device duty cycle and type.

• The range of dev_duty values is 1 to 100. The default value is 10.
• dev_duty = 100, the PS will be stopped.
• dev_duty is better to not less than 5.
• dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
• If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
• If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters
• `dev_duty` -- [in] device duty cycle
• `dev_duty_type` -- [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

Returns
• ESP_OK
• ESP_FAIL

`esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)`
Get device duty cycle and type.

Parameters
Chapter 2. API Reference

- **dev_duty** -- [out] device duty cycle
- **dev_duty_type** -- [out] device PS duty cycle type

**Returns**
- ESP_OK

`esp_err_t esp_mesh_set_network_duty_cycle` (int `nwk_duty`, int `duration_mins`, int `applied_rule`)

Set the network duty cycle, duration and rule.

- The range of `nwk_duty` values is 1 to 100. The default value is 10.
- `nwk_duty` is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the `nwk_duty` is known as a NWK-DUTY-MASTER.
- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to (-1).
- If `applied_rule` is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A `nwk_duty` with `duration_mins` set to (-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to (-1); (3)`applied_rule` shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

**Parameters**
- `nwk_duty` -- [in] network duty cycle
- `duration_mins` -- [in] duration (unit: minutes)
- `applied_rule` -- [in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_get_network_duty_cycle` (int *`nwk_duty`, int *`duration_mins`, int *`dev_duty_type`, int *`applied_rule`)

Get the network duty cycle, duration, type and rule.

**Parameters**
- `nwk_duty` -- [out] current network duty cycle
- `duration_mins` -- [out] the duration of current `nwk_duty`
- `dev_duty_type` -- [out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- `applied_rule` -- [out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

**Returns**
- ESP_OK
int esp_mesh_get_running_active_duty_cycle (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns the running active duty cycle

esp_err_t esp_mesh_ps_duty_signaling (int fwd_times)

Duty signaling.

Parameters

fwd_times -- [in] the times of forwarding duty signaling packets

Returns

• ESP_OK

Unions

union mesh_addr_t

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t addr[6]

mac address

mip_t mip

mip address

union mesh_event_info_t

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t channel_switch

channel switch

mesh_event_child_connected_t child_connected

child connected

mesh_event_child_disconnected_t child_disconnected

child disconnected
mesh_event_routing_table_change_t routing_table
    routing table change

mesh_event_connected_t connected
    parent connected

mesh_event_disconnected_t disconnected
    parent disconnected

mesh_event_no_parent_found_t no_parent
    no parent found

mesh_event_layer_change_t layer_change
    layer change

mesh_event_toDS_state_t toDS_state
    toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
    vote started

mesh_event_root_address_t root_addr
    root address

mesh_event_root_switch_req_t switch_req
    root switch request

mesh_event_root_conflict_t root_conflict
    other powerful root

mesh_event_root_fixed_t root_fixed
    fixed root

mesh_event_scan_done_t scan_done
    scan done

mesh_event_network_state_t network_state
    network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
    network found that can join

mesh_event_router_switch_t router_switch
    new router information

mesh_event_ps_duty_t ps_duty
    PS duty information
union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()

Structures

struct mip_t
IP address and port.

Public Members

esp_ip4_addr_t ip4
IP address

uint16_t port
port

struct mesh_event_channel_switch_t
Channel switch information.

Public Members

uint8_t channel
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

wifi_event_sta_connected_t connected
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
layer

uint8_t duty
parent duty
struct mesh_event_no_parent_found_t

   No parent found information.

   Public Members

   int scan_times
      scan times being through

struct mesh_event_layer_change_t

   Layer change information.

   Public Members

   uint16_t new_layer
      new layer

struct mesh_event_vote_started_t

   vote started information

   Public Members

   int reason
      vote reason, vote could be initiated by children or by the root itself

   int attempts
      max vote attempts before stopped

mesh_addr_t rc_addr
   root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t

   find a mesh network that this device can join

   Public Members

   uint8_t channel
      channel number of the new found network

   uint8_t router_bssid[6]
      router BSSID

struct mesh_event_root_switch_req_t

   Root switch request information.
**Public Members**

*int* **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh_addr_t* **rc_addr**

the address of root switch requester

struct **mesh_event_root_conflict_t**

Other powerful root address.

**Public Members**

*int8_t* **rssi**

rssi with router

*uint16_t* **capacity**

the number of devices in current network

*uint8_t* **addr[6]**

other powerful root address

struct **mesh_event_routing_table_change_t**

Routing table change.

**Public Members**

*uint16_t* **rt_size_new**

the new value

*uint16_t* **rt_size_change**

the changed value

struct **mesh_event_root_fixed_t**

Root fixed.

**Public Members**

*bool* **is_fixed**

status

struct **mesh_event_scan_done_t**

Scan done event information.
Public Members

uint8_t number
    the number of APs scanned

struct mesh_event_network_state_t
    Network state information.

Public Members

bool is_rootless
    whether current mesh network has a root

struct mesh_event_ps_duty_t
    PS duty information.

Public Members

uint8_t duty
    parent or child duty

    mesh_event_child_connected_t child_connected
    child info

struct mesh_opt_t
    Mesh option.

Public Members

uint8_t type
    option type

uint16_t len
    option length

uint8_t *val
    option value

struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv()
uint16_t size
data size

*mesh_proto_t* proto
data protocol

*mesh_tos_t* tos
data type of service

struct *mesh_router_t*
Router configuration.

**Public Members**

uint8_t ssid[32]
SSID

uint8_t ssid_len
length of SSID

uint8_t bssid[6]
BSSID, if this value is specified, users should also specify "allow_router_switch".

uint8_t password[64]
password

bool allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct *mesh_ap_cfg_t*
Mesh softAP configuration.

**Public Members**

uint8_t password[64]
mesh softAP password

uint8_t max_connection
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t nonmesh_max_connection
max non-mesh connections
**struct mesh_cfg_t**

Mesh initialization configuration.

**Public Members**

- `uint8_t channel`
  
  channel, the mesh network on

- `bool allow_channel_switch`

  if this value is set, when "fail" (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

- `mesh_addr_t mesh_id`

  mesh network identification

- `mesh_router_t router`

  router configuration

- `mesh_ap_cfg_t mesh_ap`

  mesh softAP configuration

- `const mesh_crypto_funcs_t * crypto_funcs`

  crypto functions

**struct mesh_vote_t**

Vote.

**Public Members**

- `float percentage`

  vote percentage threshold for approval of being a root

- `bool is_rc_specified`

  if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

- `mesh_rc_config_t config`

  vote address configuration

**struct mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

- `int to_parent`

  to parent queue
int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue

int broadcast
broadcast and multicast queue

struct mesh_rx_pending_t
The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
to external DS

int toSelf
to self

Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn't started

ESP_ERR_MESH_NOT_INIT
mesh isn't initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn't configured
Chapter 2. API Reference

ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error
**ESP_ERR_MESH_DISCARD_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP_ERR_MESH_DISCARD**

discard the packet

**ESP_ERR_MESH_VOTING**

vote in progress

**ESP_ERR_MESH_XMIT**

XMIT

**ESP_ERR_MESH_QUEUE_READ**

error in reading queue

**ESP_ERR_MESH_PS**

mesh PS is not specified as enable or disable

**ESP_ERR_MESH_RECV_RELEASE**

release esp_mesh_recv_toDS

**MESH_DATA_ENC**

Flags bitmap for esp_mesh_send() and esp_mesh_recv()

data encrypted (Unimplemented)

**MESH_DATA_P2P**

point-to-point delivery over the mesh network

**MESH_DATA_FROMDS**

receive from external IP network

**MESH_DATA_TODS**

identify this packet is target to external IP network

**MESH_DATA_NONBLOCK**

esp_mesh_send() non-block

**MESH_DATA_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH_DATA_GROUP**

identify this packet is target to a group address

**MESH_OPT_SEND_GROUP**

Option definitions for esp_mesh_send() and esp_mesh_recv()

data transmission by group; used with esp_mesh_send() and shall have payload
**MESH_OPT_RECV_DS_ADDR**
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

**MESH_ASSOC_FLAG_MAP_ASSOC**
Flag of mesh networking IE.
Mesh AP doesn’t detect children leave yet

**MESH_ASSOC_FLAG_VOTE_IN_PROGRESS**
station in vote, set when root vote start, clear when connect to router or when root switch

**MESH_ASSOC_FLAG_STA_VOTED**
station vote done, set when connect to router

**MESH_ASSOC_FLAG_NETWORK_FREE**
no root in current network

**MESH_ASSOC_FLAG_STA_VOTE_EXPIRE**
the voted address is expired, means the voted device lose the chance to be root

**MESH_ASSOC_FLAG_ROOTS_FOUND**
roots conflict is found, means that thre are at least two roots in the mesh network

**MESH_ASSOC_FLAG_ROOT_FIXED**
the root is fixed in the mesh network

**MESH_PS_DEVICE_DUTY_REQUEST**
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT()**

---

**Type Definitions**
typedef `mesh_addr_t mesh_event_root_address_t`  
Root address.
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
  Parent disconnected information.

typedf wifi_event_ap_staconnected_t mesh_event_child_connected_t
  Child connected information.

typedf wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
  Child disconnected information.

typedf wifi_event_sta_connected_t mesh_event_router_switch_t
  New router information.

**Enumerations**

enum mesh_event_id_t
  Enumerated list of mesh event id.
  
  *Values:*

  enumerator MESH_EVENT_STARTED
    mesh is started

  enumerator MESH_EVENT_STOPPED
    mesh is stopped

  enumerator MESH_EVENT_CHANNEL_SWITCH
    channel switch

  enumerator MESH_EVENT_CHILD_CONNECTED
    a child is connected on softAP interface

  enumerator MESH_EVENT_CHILD_DISCONNECTED
    a child is disconnected on softAP interface

  enumerator MESH_EVENT_ROUTING_TABLE_ADD
    routing table is changed by adding newly joined children

  enumerator MESH_EVENT_ROUTING_TABLE_REMOVE
    routing table is changed by removing leave children

  enumerator MESH_EVENT_PARENT_CONNECTED
    parent is connected on station interface

  enumerator MESH_EVENT_PARENT_DISCONNECTED
    parent is disconnected on station interface

  enumerator MESH_EVENT_NO_PARENT_FOUND
    no parent found
enumerator **MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with esp_mesh_post_tods_state().

enumerator **MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_ROOT_FIXED**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.
enumerator **MESH_EVENT_PS_PARENT_DUTY**  
parent duty

denumerator **MESH_EVENT_PS_CHILD_DUTY**  
child duty

denumerator **MESH_EVENT_PS_DEVICE_DUTY**  
device duty

denumerator **MESH_EVENT_MAX**

enum **mesh_type_t**  
Device type.  
Values:

denumerator **MESH_IDLE**  
hasn’t joined the mesh network yet

denumerator **MESH_ROOT**  
the only sink of the mesh network. Has the ability to access external IP network

denumerator **MESH_NODE**  
intermediate device. Has the ability to forward packets over the mesh network

denumerator **MESH_LEAF**  
has no forwarding ability

denumerator **MESH_STA**  
connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**  
Protocol of transmitted application data.  
Values:

denumerator **MESH_PROTO_BIN**  
binary

denumerator **MESH_PROTO_HTTP**  
HTTP protocol

denumerator **MESH_PROTO_JSON**  
JSON format

denumerator **MESH_PROTO_MQTT**  
MQTT protocol

denumerator **MESH_PROTO_AP**  
IP network mesh communication of node’s AP interface
enumerator **MESH_PROTO_STA**
   IP network mesh communication of node's STA interface

enum **mesh_tos_t**
   For reliable transmission, mesh stack provides three type of services.
   **Values:**

   enumerator **MESH_TOS_P2P**
   provide P2P (point-to-point) retransmission on mesh stack by default

   enumerator **MESH_TOS_E2E**
   provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

   enumerator **MESH_TOS_DEF**
   no retransmission on mesh stack

enum **mesh_vote_reason_t**
   Vote reason.
   **Values:**

   enumerator **MESH_VOTE_REASON_ROOT_INITIATED**
   vote is initiated by the root

   enumerator **MESH_VOTE_REASON_CHILD_INITIATED**
   vote is initiated by children

enum **mesh_disconnect_reason_t**
   Mesh disconnect reason code.
   **Values:**

   enumerator **MESH_REASON_CYCLIC**
   cyclic is detected

   enumerator **MESH_REASON_PARENT_IDLE**
   parent is idle

   enumerator **MESH_REASON_LEAF**
   the connected device is changed to a leaf

   enumerator **MESH_REASON_DIFF_ID**
   in different mesh ID

   enumerator **MESH_REASON_ROOTS**
   root conflict is detected

   enumerator **MESH_REASON_PARENT_STOPPED**
   parent has stopped the mesh
enumerator MESH_REASON_SCAN_FAIL
    scan fail
enumerator MESH_REASON_IE_UNKNOWN
    unknown IE
enumerator MESH_REASON_WAIVE_ROOT
    waive root
enumerator MESH_REASON_PARENT_WORSE
    parent with very poor RSSI
enumerator MESH_REASON_EMPTY_PASSWORD
    use an empty password to connect to an encrypted parent
enumerator MESH_REASON_PARENT_UNENCRYPTED
    connect to an unencrypted parent/router

enum esp_mesh_topology_t
    Mesh topology.
    Values:
    enumerator MESH_TOPO_TREE
        tree topology
    enumerator MESH_TOPO_CHAIN
        chain topology

enum mesh_event_toDS_state_t
    The reachability of the root to a DS (distribute system)
    Values:
    enumerator MESH_TODS_UNREACHABLE
        the root isn’t able to access external IP network
    enumerator MESH_TODS_REACHABLE
        the root is able to access external IP network

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile application to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check *Provisioning API.*
Connect ESP32 to the target AP using SmartConfig: wifi/smart_config.

**Header File**
- components/esp_wifi/include/esp_smartconfig.h
- This header file can be included with:
  ```
  #include "esp_smartconfig.h"
  ```
- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_wifi
  ```
  or
  ```
  PRIV_REQUIRES esp_wifi
  ```

**Functions**

```c
const char *esp_smartconfig_get_version (void)
```
Get the version of SmartConfig.

**Returns**
- SmartConfig version const char.

```c
esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
```
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention**
- This API can be called in station or softAP-station mode.
- Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

**Parameters**
- `config` -- pointer to smartconfig start configure structure

**Returns**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_smartconfig_stop (void)
```
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention**
- Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

**Returns**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
```
Set timeout of SmartConfig process.

**Attention**
- Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Parameters**
- `time_s` -- range 15s~255s, offset:45s.
Returns

- ESP_OK: succeed
- others: fail

`esp_err_t esp_smartconfig_set_type(smartconfig_type_t type)`

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Parameters**
- **type** -- Choose from the `smartconfig_type_t`.

**Returns**
- ESP_OK: succeed
- others: fail

`esp_err_t esp_smartconfig_fast_mode(bool enable)`

Set mode of SmartConfig. default normal mode.

**Attention**
1. Please call it before API `esp_smartconfig_start`.
2. Fast mode have corresponding APP(phone).
3. Two mode is compatible.

**Parameters**
- **enable** -- false-disable(default); true-enable;

**Returns**
- ESP_OK: succeed
- others: fail

`esp_err_t esp_smartconfig_get_rvd_data(uint8_t* rvd_data, uint8_t len)`

Get reserved data of ESPTouch v2.

**Parameters**
- **rvd_data** -- reserved data
- **len** -- length of reserved data

**Returns**
- ESP_OK: succeed
- others: fail

**Structures**

`struct smartconfig_event_got_ssid_pswd_t`

Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

- `uint8_t ssid[32]`
  - SSID of the AP. Null terminated string.

- `uint8_t password[64]`
  - Password of the AP. Null terminated string.

- `bool bssid_set`
  - whether set MAC address of target AP or not.
Chapter 2. API Reference

uint8_t bssid[6]
   MAC address of target AP.

smartconfig_type_t type
   Type of smartconfig(ESPTouch or AirKiss).

uint8_t token
   Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
   IP address of cellphone.

struct smartconfig_start_config_t
   Configure structure for esp_smartconfig_start

Public Members

bool enable_log
   Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
   Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
   ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT() 

Enumerations

enum smartconfig_type_t
   Values:

   enumerator SC_TYPE_ESPTOUCH
      protocol: ESPTouch

   enumerator SC_TYPE_AIRKISS
      protocol: AirKiss

   enumerator SC_TYPE_ESPTOUCH_AIRKISS
      protocol: ESPTouch and AirKiss

   enumerator SC_TYPE_ESPTOUCH_V2
      protocol: ESPTouch v2

enum smartconfig_event_t
   Smartconfig event declarations
   Values:
enumerator SC_EVENT_SCAN_DONE
Station smartconfig has finished to scan for APs

enumerator SC_EVENT_FOUND_CHANNEL
Station smartconfig has found the channel of the target AP

enumerator SC_EVENT_GOT_SSID_PSWD
Station smartconfig got the SSID and password

enumerator SC_EVENT_SEND_ACK_DONE
Station smartconfig has sent ACK to cellphone

**Wi-Fi**

**Introduction**  The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Station/AP-coexistence mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples**  Several application examples demonstrating the functionality of Wi-Fi library are provided in wifi directory of ESP-IDF repository. Please check the README for more details.

**API Reference**

**Header File**
- components/esp_wifi/include/esp_wifi.h
- This header file can be included with:

  ```
  #include "esp_wifi.h"
  ```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

  ```
  REQUIRE esp_wifi
  ```

  or

  ```
  PRIV_REQUIRE esp_wifi
  ```

**Functions**

```
esp_err_t esp_wifi_init (const wifi_init_config_t *config)
```

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.
Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field 'magic' of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Parameters **config** -- pointer to WiFi initialized configuration structure; can point to a temporary variable.

Returns
- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

```c
esp_err_t esp_wifi_deinit (void)
```
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_mode (wifi_mode_t mode)
```
Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP, station+soft-AP or NAN.
The default mode is station mode.

Parameters **mode** -- WiFi operating mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code esp_err.h

```c
esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)
```
Get current operating mode of WiFi.

Parameters **mode** -- [out] store current WiFi mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_start (void)
```
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it creates station control block and starts station If mode is WIFI_MODE_AP, it creates soft-AP control block and starts soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and starts soft-AP and station If mode is WIFI_MODE_NAN, it creates NAN control block and starts NAN.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors
**esp_err_t esp_wifi_stop (void)**

Stop WiFi. If mode is WIFI_MODE_STA, it stops station and frees station control block. If mode is WIFI_MODE_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI_MODE_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI_MODE_NAN, it stops NAN and frees NAN control block.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_restore (void)**

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
- esp_wifi_set_bandwidth
- esp_wifi_set_protocol
- esp_wifi_set_config related
- esp_wifi_set_mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_connect (void)**

Connect WiFi station to the AP.

**Attention** 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
**Attention** 2. If station interface is connected to an AP, call esp_wifi_disconnect to disconnect.
**Attention** 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE.
**Attention** 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure_retry_cnt' feature in the 'wifi_sta_config_t'. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode error
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect (void)**

Disconnect WiFi station from the AP.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

**esp_err_t esp_wifi_clear_fast_connect (void)**

Currently this API is just an stub API.

**Returns**
- ESP_OK: succeed
• others: fail

`esp_err_t esp_wifi_deauth_sta(uint16_t aid)`
deauthenticate all stations or associated id equals to aid

**Parameters**
- `aid` -- when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

`esp_err_t esp_wifi_scan_start(const wifi_scan_config_t *config, bool block)`
Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory. And then can be freed in esp_wifi_scan_get_ap_records(), esp_wifi_scan_get_ap_record() or esp_wifi_clear_ap_list(), so call any one to free the memory once the scan is done.

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**
- `config` -- configuration settings for scanning, if set to NULL default settings will be used of which default values are show_hidden:false, scan_type:active, scan_time.active.min:0, scan_time.active.max:120 milliseconds, scan_time.passive:360 milliseconds
- `block` -- if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

`esp_err_t esp_wifi_scan_stop(void)`
Stop the scan in process.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

`esp_err_t esp_wifi_scan_get_ap_num(uint16_t *number)`
Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters**
- `number` -- [out] store number of APs found in last scan

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t** esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)

Get AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list.

**Parameters**
- **number** -- [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** -- wifi_ap_record_t array to hold the found APs

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**esp_err_t** esp_wifi_scan_get_ap_record (wifi_ap_record_t *ap_record)

Get one AP record from the scanned AP list.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one AP record from the scanned AP list each time. This API will free the memory of one AP record, if the user doesn’t get all records in the scanned AP list, then needs to call esp_wifi_clear_ap_list() to free the remaining memory.

**Parameters**
- **ap_record** -- [out] pointer to one AP record

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: scan APs is NULL, means all AP records fetched or no AP found

**esp_err_t** esp_wifi_clear_ap_list (void)

Clear AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list. When the obtained AP list fails, AP records must be cleared, otherwise it may cause memory leakage.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t** esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters**
- **ap_info** -- the wifi_ap_record_t to hold AP information, sta can get the connected ap's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode
Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

```
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)
```
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters**
- `type` -- power save type

**Returns**
- ESP_OK: succeed

```
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
```
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters**
- `type` -- [out] store current power save type

**Returns**
- ESP_OK: succeed

```
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
```
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N). if CONFIG_SOC_WIFI_HE_SUPPORT, the default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11AX).

**Attention** Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnax or LR mode

**Parameters**
- `ifx` -- interfaces
- `protocol_bitmap` -- WiFi protocol bitmap

**Returns**
- ESP_OK: succeed
- ESP.ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP.ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

```
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Parameters**
- `ifx` -- interface
- `protocol_bitmap` -- [out] store current WiFi protocol bitmap of interface ifx

**Returns**
- ESP_OK: succeed
- ESP.ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP.ERR_WIFI_IF: invalid interface
- ESP.ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
**Attention** 2. WIFI_BW_HT40 is supported only when the interface support 11N
Chapter 2. API Reference

Parameters

• \texttt{ifx} -- interface to be configured
• \texttt{bw} -- bandwidth

Returns

• ESP\_OK: succeed
• ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
• ESP\_ERR\_WIFI\_IF: invalid interface
• ESP\_ERR\_INVALID\_ARG: invalid argument
• others: refer to error codes in esp\_err.h

\texttt{esp\_err\_t esp\_wifi\_get\_bandwidth} (wifi\_interface\_t ifx, wifi\_bandwidth\_t *bw)

Get the bandwidth of specified interface.

\textbf{Attention} 1. API return false if try to get a interface that is not enable

Parameters

• \texttt{ifx} -- interface to be configured
• \texttt{bw} -- \texttt{[out]} store bandwidth of interface ifx

Returns

• ESP\_OK: succeed
• ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
• ESP\_ERR\_WIFI\_IF: invalid interface
• ESP\_ERR\_INVALID\_ARG: invalid argument

\texttt{esp\_err\_t esp\_wifi\_set\_channel} (uint8\_t primary, wifi\_second\_chan\_t second)

Set primary/secondary channel of device.

\textbf{Attention} 1. This API should be called after esp\_wifi\_start() and before esp\_wifi\_stop()
\textbf{Attention} 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
\textbf{Attention} 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs
\textbf{Attention} 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above
\textbf{Attention} 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp\_wifi\_set\_config() to store the channel info in NVS.

Parameters

• \texttt{primary} -- for HT20, primary is the channel number, for HT40, primary is the primary channel
• \texttt{second} -- for HT20, second is ignored, for HT40, second is the second channel

Returns

• ESP\_OK: succeed
• ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
• ESP\_ERR\_WIFI\_IF: invalid interface
• ESP\_ERR\_INVALID\_ARG: invalid argument
• ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

\texttt{esp\_err\_t esp\_wifi\_get\_channel} (uint8\_t *primary, wifi\_second\_chan\_t *second)

Get the primary/secondary channel of device.

\textbf{Attention} 1. API return false if try to get a interface that is not enable
Parameters

- **primary** -- store current primary channel
- **second** -- [out] store current second channel

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_country(const wifi_country_t *country)
```

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is "01" (world safe mode) \{.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO\}.

**Attention** 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is \{.cc="US", .schan=1, .nchan=11\} and the country info of the AP to which the station is connected is \{.cc="JP", .schan=1, .nchan=14\} then the country info that will be used is \{.cc="JP", .schan=1, .nchan=14\}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, \{.cc="US", .schan=1, .nchan=11\} in the example.

**Attention** 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

```c
esp_err_t esp_wifi_get_country(wifi_country_t *country)
```

get the current country info

**Parameters** country -- country info

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of WiFi station, soft-AP or NAN interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

**Parameters**

- **ifx** -- interface
• **mac** -- the MAC address

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```
Get mac of specified interface.

**Parameters**
- **ifx** -- interface
- **mac** -- [out] store mac of the interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```
Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters**
- **cb** -- callback

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```
Enable the promiscuous mode.

**Parameters**
- **en** -- false - disable, true - enable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```
Get the promiscuous mode.

**Parameters**
- **en** -- [out] store the current status of promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```
Enable the promiscuous mode packet type filter.

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC

**Parameters**
- **filter** -- the packet type filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
**esp_err_t esp_wifi_get_promiscuous_filter** (wifi_promiscuous_filter_t *filter)

Get the promiscuous filter.

**Parameters**
- **filter** -- [out] store the current status of promiscuous filter

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_promiscuous_ctrl_filter** (const wifi_promiscuous_filter_t *filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note:** The default filter is to filter none control packet.

**Parameters**
- **filter** -- the subtype of the control packet filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_get_promiscuous_ctrl_filter** (wifi_promiscuous_filter_t *filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters**
- **filter** -- [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_config** (wifi_interface_t interface, wifi_config_t *conf)

Set the configuration of the STA, AP or NAN.

**Attention**
1. This API can be called only when specified interface is enabled, otherwise, API fail
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.
4. The configuration will be stored in NVS for station and soft-AP

**Parameters**
- **interface** -- interface
- **conf** -- station, soft-AP or NAN configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

**esp_err_t esp_wifi_get_config** (wifi_interface_t interface, wifi_config_t *conf)

Get configuration of specified interface.

**Parameters**
- **interface** -- interface
• **conf** -- [out] station or soft-AP configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

```c
esp_err_t esp_wifi_ap_get_sta_list (wifi_stas_list_t *sta)
```

Get STAs associated with soft-AP.

**Attention**  SSC only API

**Parameters**  sta -- [out] station list ap can get the connected sta's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)
```

Get AID of STA connected with soft-AP.

**Parameters**
- **mac** -- STA's mac address
- **aid** -- [out] Store the AID corresponding to STA mac

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_set_storage (wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

**Attention**  1. The default value is WIFI_STORAGE_FLASH

**Parameters**  storage -- : storage type

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

**Parameters**
- **enable** -- If true, specified IE is enabled. If false, specified IE is removed.
- **type** -- Information Element type. Determines the frame type to associate with the IE.
- **idx** -- Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
• **vnd ie** -- Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init()
- **ESP_ERR_INVALID_ARG**: Invalid argument, including if first byte of vnd ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- **ESP_ERR_NO_MEM**: Out of memory

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

**Parameters**
- **cb** -- Callback function
- **ctx** -- Context argument, passed to callback function.

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```

Set maximum transmitting power after WiFi start.

**Attention**
1. Maximum power before wifi startup is limited by PHY init data bin.
2. The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.
3. Mapping Table \{Power, max_tx_power\} = \{18, 2\}, \{20, 5\}, \{28, 7\}, \{34, 8\}, \{44, 11\}, \{52, 13\}, \{56, 14\}, \{60, 15\}, \{66, 16\}, \{72, 18\}, \{80, 20\}.
4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
5. Relationship between set value and actual value. As follows: \{set value range, actual value\} = \{[8, 19], 8\}, \{[20, 27], 20\}, \{[28, 33], 28\}, \{[34, 43], 34\}, \{[44, 51], 44\}, \{[52, 55], 52\}, \{[56, 59], 56\}, \{[60, 65], 60\}, \{[66, 71], 66\}, \{[72, 79], 72\}, \{[80, 84], 80\}.

**Parameters**
- **power** -- Maximum WiFi transmitting power.

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument, e.g. parameter is out of range

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```

Get maximum transmitting power after WiFi start.

**Parameters**
- **power** -- Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention**
1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.
### Parameters
- **mask** -- WiFi event mask.

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

#### esp_err_t esp_wifi_get_event_mask(uint32_t *mask)
Get mask of WiFi events.

### Parameters
- **mask** -- WiFi event mask.

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

#### esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

### Parameters
- **ifx** -- interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** -- raw ieee80211 buffer
- **len** -- the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** -- indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_INVALID_ARG is returned.

### Returns
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

#### esp_err_t esp_wifi_set_csi_rx_cb(wifi_csi_cb_t cb, void *ctx)
Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

### Parameters
- **cb** -- callback
- **ctx** -- context argument, passed to callback function

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

#### esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)
Set CSI data configuration.

return
Chapter 2. API Reference

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- **ESP_ERR_INVALID_ARG**: invalid argument

**Parameters config** -- configuration

```c
esp_err_t esp_wifi_set_csi(bool en)
```

Enable or disable CSI.

**Returns**

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- **ESP_ERR_INVALID_ARG**: invalid argument

**Parameters en** -- true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

**Parameters config** -- Antenna GPIO configuration.

**Returns**

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

```c
esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)
```

Get current antenna GPIO configuration.

**Parameters config** -- Antenna GPIO configuration.

**Returns**

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument, e.g. parameter is NULL

```c
esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)
```

Set antenna configuration.

**Parameters config** -- Antenna configuration.

**Returns**

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

```c
esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)
```

Get current antenna configuration.

**Parameters config** -- Antenna configuration.

**Returns**

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument, e.g. parameter is NULL
Chapter 2. API Reference

```c
int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)
```
Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters**
- `interface` -- The interface whose tsf_time is to be retrieved.

**Returns**
- 0 or the TSF time

```c
esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)
```
Set the inactive time of the STA or AP.

**Attention**
1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
3. The inactive time configuration is not stored into flash

**Parameters**
- `ifx` -- interface to be configured.
- `sec` -- Inactive time. Unit seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

```c
esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)
```
Get inactive time of specified interface.

**Parameters**
- `ifx` -- Interface to be configured.
- `sec` -- Inactive time. Unit seconds.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_stats_dump (uint32_t modules)
```
Dump WiFi statistics.

**Parameters**
- `modules` -- statistic modules to be dumped

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)
```
Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

**Attention** If the user wants to receive another WIFI_EVENT_STA_BSS_RSSI_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.
**Parameters** `rssi` -- threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.
**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Parameters** `cfg` -- FTM Initiator session configuration

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_end_session(void)
```

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)
```

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters** `offset_cm` -- T1 Offset to be added in centimeters

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)
```

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Parameters**
- `ifx` -- Interface to be configured.
- `disable` -- true means disable 11b rate while false means enable 11b rate.

**Returns**
- ESP_OK: succeed
- others: failed
**esp_err_t** esp_wifi_connectionless_module_set_wake_interval(uint16_t wake_interval)

Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.
**Attention** 2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
**Attention** 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)
**Attention** 5. Recommend to configure interval to ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE to get stable performance at coexistence mode.

**Parameters**

- **wake_interval** -- Milliseconds after would the chip wake up, from 1 to 65535.

**esp_err_t** esp_wifi_force_wakeup_acquire(void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state (RF opened) to be able to receive packets.

**Attention** Please pair the use of esp_wifi_force_wakeup_acquire with esp_wifi_force_wakeup_release.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t** esp_wifi_force_wakeup_release(void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state (RF closed) if no more use of radio.

**Attention** Please pair the use of esp_wifi_force_wakeup_acquire with esp_wifi_force_wakeup_release.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t** esp_wifi_set_country_code(const char* country, bool ieee80211d_enabled)

configure country

**Attention** 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
**Attention** 2. When ieee80211d_enabled is disabled, then the configured country info is used always.
**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
**Attention** 4. The country configuration is stored into flash.
**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
**Attention** 6. Supported country codes are "01" (world safe mode) "AT", "AU", "BE", "BG", "BR", "CA", "CH", "CN", "CY", "CZ", "DE", "DK", "EE", "ES", "FI", "FR", "GB", "GR", "HK", "HR", "HU",
Chapter 2. API Reference

"IE","IN","IS","IT","JP","KR","LI","LT","LU","LV","MT","MX","NL","NO","NZ","PL","PT","RO","SE","SI","SK","TW","US"

**Attention** 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention** 8. The default country is '01' (world safe mode) and iee80211d_enabled is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ''.

**Parameters**
- **country** -- the configured country ISO code
- **ieee80211d_enabled** -- 802.11d is enabled or not

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country_code(char *country)
```

get the current country code

**Parameters**
- **country** -- country code

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Parameters**
- **ifx** -- Interface to be configured.
- **rate** -- Phy rate to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_disable_pmf_config(wifi_interface_t ifx)
```

Disable PMF configuration for specified interface.

**Attention** This API should be called after esp_wifi_set_config() and before esp_wifi_start().

**Parameters**
- **ifx** -- Interface to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_sta_get_aid(uint16_t *aid)
```

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters**
- **aid** -- [out] store the aid

**Returns**
- ESP_OK: succeed
**esp_err_t esp_wifi_sta_get_negotiated_phymode (wifi_phy_mode_t* phymode)**

Get the negotiated phymode after connection.

**Parameters** phymode -- [out] store the negotiated phymode.

**Returns**
- ESP_OK: succeed

**esp_err_t esp_wifi_set_dynamic_cs (bool enabled)**

Config dynamic carrier sense.

**Attention** This API should be called after esp_wifi_start().

**Parameters** enabled -- Dynamic carrier sense is enabled or not.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_sta_get_rssi (int *rssi)**

Get the rssi information of AP to which the device is associated with.

**Attention** 1. This API should be called after station connected to AP.
2. Use this API only in WIFI_MODE_STA or WIFI_MODE_APSTA mode.

**Parameters** rssi -- store the rssi info received from last beacon.

**Returns**
- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

**Structures**

*struct wifi_init_config_t*

WiFi stack configuration parameters passed to esp_wifi_init call.

**Public Members**

*wifi_osi_funcs_t *osi_funcs*

WiFi OS functions

*wpa_crypto_funcs_t wpa_crypto_funcs*

WiFi station crypto functions when connect

*int static_rx_buf_num*

WiFi static RX buffer number

*int dynamic_rx_buf_num*

WiFi dynamic RX buffer number

*int tx_buf_type*

WiFi TX buffer type
int **static tx_buf_num**
WiFi static TX buffer number

int **dynamic tx_buf_num**
WiFi dynamic TX buffer number

int **rx_mgmt_buf_type**
WiFi RX MGMT buffer type

int **rx_mgmt_buf_num**
WiFi RX MGMT buffer number

int **cache tx_buf_num**
WiFi TX cache buffer number

int **csi_enable**
WiFi channel state information enable flag

int **ampdu_rx_enable**
WiFi AMPDU RX feature enable flag

int **ampdu_tx_enable**
WiFi AMPDU TX feature enable flag

int **amsdu_tx_enable**
WiFi AMSDU TX feature enable flag

int **nvs_enable**
WiFi NVS flash enable flag

int **nano_enable**
Nano option for printf/scan family enable flag

int **rx_ba_win**
WiFi Block Ack RX window size

int **wifi_task_core_id**
WiFi Task Core ID

int **beacon_max_len**
WiFi softAP maximum length of the beacon

int **mgmt_sbuf_num**
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t **feature_caps**
Enables additional WiFi features and capabilities
bool sta_disconnected_pm
WiFi Power Management for station at disconnected status

int espnow_max_encrypt_num
Maximum encrypt number of peers supported by espnow

int magic
WiFi init magic number, it should be the last field

**Macros**

ESP_ERR_WIFI_NOT_INIT
WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
WiFi interface error

ESP_ERR_WIFI_MODE
WiFi mode error

ESP_ERR_WIFI_STATE
WiFi internal state error

ESP_ERR_WIFI_CONN
WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state(RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK
    The caller would block

ESP_ERR_WIFI_NOT_CONNECT
    Station still in disconnect status

ESP_ERR_WIFI_POST
    Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
    Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
    Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
    The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
    The WiFi TX is disallowed

ESP_ERR_WIFI_TWT_FULL
    no available flow id

ESP_ERR_WIFI_TWT_SETUP_TIMEOUT
    Timeout of receiving twt setup response frame, timeout times can be set during twt setup

ESP_ERR_WIFI_TWT_SETUP_TXFAIL
    TWT setup frame tx failed

ESP_ERR_WIFI_TWT_SETUP_REJECT
    The twt setup request was rejected by the AP

ESP_ERR_WIFI_DISCARD
    Discard frame

ESP_ERR_WIFI_ROC_IN_PROGRESS
    ROC op is in progress

**Type Definitions**

typedef struct *wifi_osi_funcs_t wifi_osi_funcs_t

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef struct *wifi_sta_list_t wifi_sta_list_t

Forward declare wifi_sta_list_t. The definition depends on the target device that implements esp_wifi.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

| Each time a CSI data is received, the callback function will be called. |

**Param ctx** context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

**Header File**

- components/esp_wifi/include/esp_wifi_types.h

This header file can be included with:

```
#include "esp_wifi_types.h"
```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

**Type Definitions**

typedef struct *wifi_csi_config_t wifi_csi_config_t

typedef struct *wifi_pkt_rx_ctrl_t wifi_pkt_rx_ctrl_t
Chapter 2. API Reference

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_eap_client.h

This header file can be included with:

```c
#include "esp_eap_client.h"
```

This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or

```cmake
PRIV_REQUIRES wpa_supplicant
```

**Functions**

- **esp_err_t esp_wifi_sta_enterprise_enable**(void)

Enable EAP authentication (WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

**Returns**

- ESP_OK: EAP authentication enabled successfully.
- ESP_ERR_NO_MEM: Failed to enable EAP authentication due to memory allocation failure.

- **esp_err_t esp_wifi_sta_enterprise_disable**(void)

Disable EAP authentication (WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using esp_wifi_set_config().

**Returns**

- ESP_OK: EAP authentication disabled successfully.
- ESP_ERR_INVALID_STATE: EAP client is in an invalid state for disabling.

- **esp_err_t esp_eap_client_set_identity**(const unsigned char *identity, int len)

Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

**Parameters**

- **identity** -- [in] Pointer to the identity data.
- **len** -- [in] Length of the identity data (limited to 1~127 bytes).

**Returns**

- ESP_OK: The identity was set successfully.
- ESP_ERR_INVALID.initState: EAP client is in an invalid state for disabling.
- ESP_ERR_INVALID_ARG: Invalid argument (len <= 0 or len >= 128).
- ESP_ERR_NO_MEM: Memory allocation failure.
void esp_eap_client_clear_identity (void)
    Clear the previously set identity for PEAP/TTLS authentication.
    This function clears the identity that was previously set for the EAP client. After calling this function, the EAP
client will no longer use the previously configured identity during the authentication process.

esp_err_t esp_eap_client_set_username (const unsigned char *username, int len)
    Set username for PEAP/TTLS authentication method.
    This function sets the username to be used during PEAP/TTLS authentication.

    Parameters
    • username -- [in] Pointer to the username data.
    • len -- [in] Length of the username data (limited to 1~127 bytes).
    Returns
    • ESP_OK: The username was set successfully.
    • ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
    • ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_username (void)
    Clear username for PEAP/TTLS method.
    This function clears the previously set username for the EAP client.

esp_err_t esp_eap_client_set_password (const unsigned char *password, int len)
    Set password for PEAP/TTLS authentication method.
    This function sets the password to be used during PEAP/TTLS authentication.

    Parameters
    • password -- [in] Pointer to the password data.
    • len -- [in] Length of the password data (len > 0).
    Returns
    • ESP_OK: The password was set successfully.
    • ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
    • ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_password (void)
    Clear password for PEAP/TTLS method.
    This function clears the previously set password for the EAP client.

esp_err_t esp_eap_client_set_new_password (const unsigned char *new_password, int len)
    Set a new password for MSCHAPv2 authentication method.
    This function sets the new password to be used during MSCHAPv2 authentication. The new password is
used to substitute the old password when an eap-mschapv2 failure request message with error code ER-
ROR_PASSWD_EXPIRED is received.

    Parameters
    • new_password -- [in] Pointer to the new password data.
    • len -- [in] Length of the new password data.
    Returns
    • ESP_OK: The new password was set successfully.
    • ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
    • ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_new_password (void)
    Clear new password for MSCHAPv2 method.
    This function clears the previously set new password for the EAP client.
**esp_err_t esp_eap_client_set_ca_cert** (const unsigned char *ca_cert, int ca_cert_len)

Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

**Parameters**
- **ca_cert** -- [in] Pointer to the CA certificate data.
- **ca_cert_len** -- [in] Length of the CA certificate data.

**Returns**
- ESP_OK: The CA certificate was set successfully.

**void esp_eap_client_clear_ca_cert** (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

**esp_err_t esp_eap_client_set_certificate_and_key** (const unsigned char *client_cert, int client_cert_len, const unsigned char *private_key, int private_key_len, const unsigned char *private_key_password, int private_key_passwd_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client_cert, private_key, and private_key_password should be zero-terminated.

**Parameters**
- **client_cert** -- [in] Pointer to the client certificate data.
- **client_cert_len** -- [in] Length of the client certificate data.
- **private_key** -- [in] Pointer to the private key data.
- **private_key_len** -- [in] Length of the private key data (limited to 1~4096 bytes).
- **private_key_password** -- [in] Pointer to the private key password data (optional).
- **private_key_passwd_len** -- [in] Length of the private key password data (can be 0 for no password).

**Returns**
- ESP_OK: The certificate, private key, and password (if provided) were set successfully.

**void esp_eap_client_clear_certificate_and_key** (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

**esp_err_t esp_eap_client_set_disable_time_check** (bool disable)

Set EAP client certificates time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

**Parameters**
- **disable** -- [in] True to disable EAP client certificates time check, false to enable it.

**Returns**
- ESP_OK: The EAP client certificates time check setting was updated successfully.
**esp_err_t esp_eap_client_get_disable_time_check**(bool *disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

**Parameters**

| disable | [out] Pointer to a boolean variable to store the disable status. |

**Returns**

- ESP_OK: The status of EAP client certificates time check was retrieved successfully.

**esp_err_t esp_eap_client_set_ttls_phase2_method**(esp_eap_ttls_phase2_types type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.

**Parameters**

| type | [in] The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP). |

**Returns**

- ESP_OK: The EAP-TTLS phase 2 method was set successfully.

**esp_err_t esp_eap_client_set_suiteb_192bit_certification**(bool enable)

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

**Parameters**

| enable | [in] True to enable 192-bit Suite-B certification checks, false to disable it. |

**Returns**

- ESP_OK: The 192-bit Suite-B certification checks were set successfully.

**esp_err_t esp_eap_client_set_pac_file**(const unsigned char *pac_file, int pac_file_len)

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client's credentials.

**Attention**

1. For files read from the file system, length has to be decremented by 1 byte.
2. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

**Parameters**

| pac_file | [in] Pointer to the PAC file buffer. |
| pac_file_len | [in] Length of the PAC file buffer. |

**Returns**

- ESP_OK: The PAC file for EAP-FAST authentication was set successfully.

**esp_err_t esp_eap_client_set_fast_params**(esp_eap_fast_config config)

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

**Attention**

1. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

**Parameters**

| config | [in] Configuration structure with Fast Provisioning parameters. |

**Returns**

- ESP_OK: The parameters for EAP-FAST Phase 1 authentication were set successfully.

**esp_err_t esp_eap_client_use_default_cert_bundle**(bool use_default_bundle)

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.
Parameters use_default_bundle -- [in] True to use the default certificate bundle, false to use a custom bundle.

Returns

- ESP_OK: The option to use the default certificate bundle was set successfully.

Structures

struct esp_eap_fast_config
Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).

This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

Public Members

int fast_provisioning
Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int fast_max_pac_list_len
Maximum length of the PAC (Protected Access Credential) list

bool fast_pac_format_binary
Set to true for binary format PAC, false for ASCII format PAC

Enumerations

enum esp_eap_ttls_phase2_types
Enumeration of phase 2 authentication types for EAP-TTLS.

This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.

Values:

enumerator ESP_EAP_TTLS_PHASE2_EAP
EAP (Extensible Authentication Protocol)

enumerator ESP_EAP_TTLS_PHASE2_MSCHAPV2
MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

enumerator ESP_EAP_TTLS_PHASE2_MSCHAP
MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

enumerator ESP_EAP_TTLS_PHASE2_PAP
PAP (Password Authentication Protocol)

enumerator ESP_EAP_TTLS_PHASE2_CHAP
CHAP (Challenge Handshake Authentication Protocol)
**Header File**

- `components/wpa_supplicant/esp_supplicant/include/esp_wps.h`
- This header file can be included with:

```c
#include "esp_wps.h"
```
- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

**or**

```cmake
PRIV_REQUIRES wpa_supplicant
```

**Functions**

`esp_err_t esp_wifi_wps_enable (const esp_wps_config_t *config)`

Enable Wi-Fi WPS function.

**Parameters**
- `config` -- WPS config to be used in connection

**Returns**
- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wpstype is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_FAIL` : wps initialization fails

`esp_err_t esp_wifi_wps_disable (void)`

Disable Wi-Fi WPS function and release resource it taken.

**Returns**
- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on

`esp_err_t esp_wifi_wps_start (int timeout_ms)`

Start WPS session.

**Attention**
- WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters**
- `timeout_ms` -- deprecated: This argument's value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See wifi_event_t enum for more info.

**Returns**
- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wpstype is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_ERR_WIFI_WPS_SM` : wps state machine is not initialized
- `ESP_FAIL` : wps initialization fails

`esp_err_t esp_wifi_ap_wps_enable (const esp_wps_config_t *config)`

Enable Wi-Fi AP WPS function.

**Attention**
- WPS can only be used when softAP is enabled.

**Parameters**
- `config` -- wps configuration to be used.

**Returns**
- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wpstype is invalid
Chapter 2. API Reference

- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on
- ESP_FAIL: wps initialization fails

```c
esp_err_t esp_wifi_ap_wps_disable(void)
```

Disable Wi-Fi SoftAP WPS function and release resource it taken.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on

```c
esp_err_t esp_wifi_ap_wps_start(const unsigned char *pin)
```

WPS starts to work.

**Attention** WPS can only be used when softAP is enabled.

**Parameters**

- **pin** -- : Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during `esp_wifi_ap_wps_enable()` and reported in WIFI_EVENT_AP_WPS_RG_PIN

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_TYPE: wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM: wps state machine is not initialized
- ESP_FAIL: wps initialization fails

**Structures**

```c
struct wps_factory_information_t
```

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

**Public Members**

- `char manufacturer[WPS_MAX_MANUFACTURER_LEN]`
  
Manufacturer of the device. If empty, the default manufacturer is used.

- `char model_number[WPS_MAX_MODEL_NUMBER_LEN]`
  
Model number of the device. If empty, the default model number is used.

- `char model_name[WPS_MAX_MODEL_NAME_LEN]`
  
Model name of the device. If empty, the default model name is used.

- `char device_name[WPS_MAX_DEVICE_NAME_LEN]`
  
Device name. If empty, the default device name is used.

```c
struct esp_wps_config_t
```

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.
Chapter 2. API Reference

Public Members

```c
wps_type_t wps_type
    The type of WPS to be used (PBC or PIN).
```

```c
wps_factory_information_t factory_info
    Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.
```

```c
char pin[PIN_LEN]
    WPS PIN (Personal Identification Number) used when wps_type is set to WPS_TYPE_PIN.
```

Macros

```c
ESP_ERR_WIFI_REGISTRAR
    WPS registrar is not supported
```

```c
ESP_ERR_WIFI_WPS_TYPE
    WPS type error
```

```c
ESP_ERR_WIFI_WPS_SM
    WPS state machine is not initialized
```

```c
WPS_MAX_MANUFACTURER_LEN
    Maximum length of the manufacturer name in WPS information
```

```c
WPS_MAX_MODEL_NUMBER_LEN
    Maximum length of the model number in WPS information
```

```c
WPS_MAX_MODEL_NAME_LEN
    Maximum length of the model name in WPS information
```

```c
WPS_MAX_DEVICE_NAME_LEN
    Maximum length of the device name in WPS information
```

```c
PIN_LEN
    The length of the WPS PIN (Personal Identification Number).
```

```c
WPS_CONFIG_INIT_DEFAULT(type)
    Initialize a default WPS configuration structure with specified WPS type.
```

This macro initializes a `esp_wps_config_t` structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

```c
Parameters
    • type -- The WPS type to be used (PBC or PIN).

Returns
    An initialized `esp_wps_config_t` structure with the specified WPS type and default values.
```

Type Definitions

typedef enum wps_type_t
    Enumeration of WPS (Wi-Fi Protected Setup) types.
Enumerations

enum wps_type

Enumeration of WPS (Wi-Fi Protected Setup) types.

Values:

enumerator WPS_TYPE_DISABLE
    WPS is disabled

enumerator WPS_TYPE_PBC
    WPS Push Button Configuration method

enumerator WPS_TYPE_PIN
    WPS PIN (Personal Identification Number) method

enumerator WPS_TYPE_MAX
    Maximum value for WPS type enumeration

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_rrm.h

This header file can be included with:

```c
#include "esp_rrm.h"
```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or

```cmake
PRIV_REQUIRES wpa_supplicant
```

Functions

`int esp_rrm_send_neighbor_rep_request (neighbor_rep_request_cb cb, void *cb_ctx)`

Send Radio measurement neighbor report request to connected AP.

Parameters

- `cb` -- callback function for neighbor report
- `cb_ctx` -- callback context

Returns

- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

`bool esp_rrm_is_rrm_supported_connection (void)`

Check RRM capability of connected AP.

Returns

- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

Type Definitions
typedef void (*neighbor_rep_request_cb)(void *ctx, const uint8_t *report, size_t report_len)

Callback function type to get neighbor report.

Param ctx  neighbor report context
Param report neighbor report
Param report_len neighbor report length
Return
  • void

Header File

• components/wpa_supplicant/esp_supplicant/include/esp_wnm.h
• This header file can be included with:
  
```
#include "esp_wnm.h"
```

• This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

Functions

int esp_wnm_send_bss_transition_mgm_query (enum btm_query_reason query_reason, const char *btm_candidates, int cand_list)

Send bss transition query to connected AP.

Parameters
  • query_reason -- reason for sending query
  • btm_candidates -- btm candidates list if available
  • cand_list -- whether candidate list to be included from scan results available in supplicant’s cache.

Returns
  • 0: success
  • -1: AP does not support BTM
  • -2: station not connected to AP

bool esp_wnm_is_btm_supported_connection (void)

Check bss trastion capability of connected AP.

Returns
  • true: AP supports BTM
  • false: AP does not support BTM or station not connected to AP

Enumerations

enum btm_query_reason
  
enum btm_query_reason: Reason code for sending btm query

Values:

enumerator REASON_UNSPECIFIED

enumerator REASON_FRAME LOSS
Chapter 2. API Reference

enumerator **REASON_DELAY**

enumerator **REASON_BANDWIDTH**

enumerator **REASON_LOAD_BALANCE**

enumerator **REASON_RSSI**

enumerator **REASON_RETRANSMISSIONS**

enumerator **REASON_INTERFERENCE**

enumerator **REASON_GRAY_ZONE**

enumerator **REASON_PREMIUM_AP**

Header File

- `components/wpa_supplicant/esp_supplicant/include/esp_mbo.h`
- This header file can be included with:

  ```c
  #include "esp_mbo.h"
  ```
- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

  ```c
  REQUIRES wpa_supplicant
  ```
  or

  ```c
  PRIV_REQUIRES wpa_supplicant
  ```

Functions

**int esp_mbo_update_non_pref_chan (struct non_pref_chan_s *non_pref_chan)**

Update channel preference for MBO IE.

Parameters

- `non_pref_chan` -- Non preference channel list

Returns

- 0: success else failure

Structures

**struct non_pref_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

Public Members

**enum non_pref_chan_reason reason**

Reason for the channel being non-preferred
Chapter 2. API Reference

```
uint8_t oper_class
    Operating class of the channel

uint8_t chan
    Channel number

uint8_t preference
    Preference level of the channel

struct non_pref_chan_s
    Structure representing a list of non-preferred channels in a wireless network.
    This structure encapsulates information about a list of non-preferred channels including
    the number of non-preferred channels and an array of structures representing individual
    non-preferred channels.

Public Members

size_t non_pref_chan_num
    Number of non-preferred channels in the list

struct non_pref_chan chan[
    Array of structures representing individual non-preferred channels

Enumerations

c enum non_pref_chan_reason
    Enumeration of reasons for a channel being non-preferred in a wireless network.
    This enumeration defines various reasons why a specific channel might be considered non-preferred
    in a wireless network configuration.
    Values:

    enumerator NON_PREF_CHAN_REASON_UNSPECIFIED
        Unspecified reason for non-preference

    enumerator NON_PREF_CHAN_REASON_RSSI
        Non-preferred due to low RSSI (Received Signal Strength Indication)

    enumerator NON_PREF_CHAN_REASON_EXT_INTERFERENCE
        Non-preferred due to external interference

    enumerator NON_PREF_CHAN_REASON_INT_INTERFERENCE
        Non-preferred due to internal interference

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning
protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration
of Wi-Fi Devices. With Easy Connect, adding a new device to a network is as simple as scanning a QR Code. This reduces
complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like Wi-Fi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added.

Easy Connect brings many benefits in the user experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™.

Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect, no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h
- This header file can be included with:

```c
#include "esp_dpp.h"
```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or

```cmake
PRIV_REQUIRES wpa_supplicant
```

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```

Initialize DPP Supplicant.

- Starts DPP Supplicant and initializes related Data Structures.

- return

  - ESP_OK: Success
  - ESP_FAIL: Failure

- **Parameters**

  | evt_cb | Callback function to receive DPP related events |

```c
esp_err_t esp_supp_dpp_deinit (void)
```

De-initialize DPP Supplicant.
Chapter 2. API Reference

Frees memory from DPP Supplicant Data Structures.

**Returns**
- ESP_OK: Success

```c
esp_err_t esp_supp_dpp_bootstrap_gen
    (const char* chan_list, esp_supp_dpp_bootstrap_t type, const char* key, const char* info)
```

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**
- **chan_list** -- List of channels device will be available on for listening
- **type** -- Bootstrap method type, only QR Code method is supported for now.
- **key** -- (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** -- (Optional) Ancillary Device Information like Serial Number

**Returns**
- ESP_OK: Success
- ESP_FAIL: Failure

```c
esp_err_t esp_supp_dpp_start_listen
    (void)
```

Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
esp_err_t esp_supp_dpp_stop_listen
    (void)
```

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Failure

**Macros**

`ESP_DPP_AUTH_TIMEOUT_SECS`

Generic failure during DPP Operation

`ESP_ERR_DPP_TX_FAILURE`

DPP Frame Tx failed OR not Aced

`ESP_ERR_DPP_INVALID_ATTR`

Encountered invalid DPP Attribute
**ESP_ERR_DPP_AUTH_TIMEOUT**

DPP Auth response was not received in time

**Type Definitions**

typedef enum *dpp_bootstrap_type* esp_supp_dpp_bootstrap_t

Types of Bootstrap Methods for DPP.

typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)

Callback function for receiving DPP Events from Supplicant.

| Callback function will be called with DPP related information. |

- **Param** `evt` DPP event ID
- **Param** `data` Event data payload

**Enumerations**

enum *dpp_bootstrap_type*

Types of Bootstrap Methods for DPP.

**Values:**

- enumerator `DPP_BOOTSTRAP_QR_CODE`  
  QR Code Method
- enumerator `DPP_BOOTSTRAP_PKEX`  
  Proof of Knowledge Method
- enumerator `DPP_BOOTSTRAP_NFC_URI`  
  NFC URI record Method

enum *esp_supp_dpp_event_t*

Types of Callback Events received from DPP Supplicant.

**Values:**

- enumerator `ESP_SUPP_DPP_URI_READY`  
  URI is ready through Bootstrapping
- enumerator `ESP_SUPP_DPP_CFG_RECV'D`  
  Config received via DPP Authentication
- enumerator `ESP_SUPP_DPP_PDR_RECV'D`  
  Peer Discovery Response is received
- enumerator `ESP_SUPP_DPP_FAIL`  
  DPP Authentication failure
Wi-Fi Aware™ (NAN)

Wi-Fi Aware™ or NAN (Neighbor Awareness Networking) is a protocol that allows Wi-Fi devices to discover services in their proximity. Typically, location-based services are based on querying servers for information about the environment and the location knowledge is based on GPS or other location reckoning techniques. However, NAN does not require real-time connection to servers, GPS or other geo-location, but instead uses direct device-to-device Wi-Fi to discover and exchange information. NAN scales effectively in dense Wi-Fi environments and complements the connectivity of Wi-Fi by providing information about people and services in the proximity.

Multiple NAN devices which are in the vicinity form a NAN cluster which allows them to communicate with each other. Devices within a NAN cluster can advertise (Publish method) or look for (Subscribe method) services using NAN Service Discovery protocols. Matching of services is done by service name, once a match is found, a device can either send a message or establish an IPv6 Datapath with the peer.

ESP32 supports Wi-Fi Aware in standalone mode with support for both Service Discovery and Datapath. Wi-Fi Aware is still an evolving protocol. Please refer to Wi-Fi Alliance’s official page on Wi-Fi Aware for more information. Many Android smartphones with Android 8 or higher support Wi-Fi Aware. Refer to Android’s developer guide on Wi-Fi Aware Wi-Fi Aware for more information.

Application Example A pair of examples for a Publisher-Subscriber use case: wifi/wifi_aware/nan_publisher and wifi/wifi_aware/nan_subscriber. A user interactive console example to explore full functionality of Wi-Fi Aware: wifi/wifi_aware/nan_console. Please check the README for more details in respective example directories.

API Reference

Header File

- components/esp_wifi/wifi_apps/include/esp_nan.h
- This header file can be included with:

```c
#include "esp_nan.h"
```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_wifi
```

or

```cmake
PRIV_REQUIRES esp_wifi
```

Functions

**esp_err_t esp_wifi_nan_start (const wifi_nan_config_t *nan_cfg)**

Start NAN Discovery with provided configuration.

**Attention** This API should be called after esp_wifi_init().

**Parameters** nan_cfg -- NAN related parameters to be configured.

**Returns**

- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_nan_stop (void)**

Stop NAN Discovery, end NAN Services and Datapaths.

**Returns**
• ESP_OK: succeed
• others: failed

uint8_t esp_wifi_nan_publish_service(const wifi_nan_publish_cfg_t *publish_cfg, bool ndp_resp_needed)

Start Publishing a service to the NAN Peers in vicinity.

**Attention**  This API should be called after esp_wifi_nan_start().

**Parameters**
• publish_cfg -- Configuration parameters for publishing a service.
• ndp_resp_needed -- Setting this true will require user response for every NDP Req using esp_wifi_nan_datapath_resp API.

**Returns**
• non-zero: Publish service identifier
• zero: failed

uint8_t esp_wifi_nan_subscribe_service(const wifi_nan_subscribe_cfg_t *subscribe_cfg)

Subscribe for a service within the NAN cluster.

**Attention**  This API should be called after esp_wifi_nan_start().

**Parameters** subscribe_cfg -- Configuration parameters for subscribing for a service.

**Returns**
• non-zero: Subscribe service identifier
• zero: failed

`esp_err_t esp_wifi_nan_send_message(wifi_nan_followup_params_t *fup_params)`

Send a follow-up message to the NAN Peer with matched service.

**Attention**  This API should be called after a NAN service is discovered due to a match.

**Parameters** fup_params -- Configuration parameters for sending a Follow-up message.

**Returns**
• ESP_OK: succeed
• others: failed

`esp_err_t esp_wifi_nan_cancel_service(uint8_t service_id)`

Cancel a NAN service.

**Parameters** service_id -- Publish/Subscribe service id to be cancelled.

**Returns**
• ESP_OK: succeed
• others: failed

`uint8_t esp_wifi_nan_datapath_req(wifi_nan_datapath_req_t *req)`

Send NAN Datapath Request to a NAN Publisher with matched service.

**Attention**  This API should be called by the Subscriber after a match occurs with a Publisher.

**Parameters** req -- NAN Datapath Request parameters.

**Returns**
• non-zero NAN Datapath identifier: If NAN datapath req was accepted by publisher
• zero: If NAN datapath req was rejected by publisher or a timeout occurs
**esp_err_t esp_wifi_nan_datapath_resp**

(wifi_nan_datapath_resp_t*resp)

Respond to a NAN Datapath request with Accept or Reject.

**Attention** This API should be called if ndp_resp_needed is set True by the Publisher and a WIFI_EVENT_NDP_INDICATION event is received due to an incoming NDP request.

**Parameters**
- **resp** -- NAN Datapath Response parameters.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_nan_datapath_end**

(wifi_nan_datapath_end_req_t*req)

Terminate a NAN Datapath.

**Parameters**
- **req** -- NAN Datapath end request parameters.

**Returns**
- ESP_OK: succeed
- others: failed

**void esp_wifi_nan_get_ipv6_linklocal_from_mac**

(ip6_addr_t*ip6, uint8_t*mac_addr)

Get IPv6 Link Local address using MAC address.

**Parameters**
- **ip6** -- [out] Derived IPv6 Link Local address.
- **mac_addr** -- [in] Input MAC Address.

**esp_err_t esp_wifi_nan_get_own_svc_info**

(uint8_t*own_svc_id, char*svc_name, int*num_peer_records)

brief Get own Service information from Service ID OR Name.

**Attention** If service information is to be fetched from service name, set own_svc_id as zero.

**Parameters**
- **own_svc_id** -- [inout] As input, it indicates Service ID to search for. As output, it indicates Service ID of the service found using Service Name.
- **svc_name** -- [inout] As input, it indicates Service Name to search for. As output, it indicates Service Name of the service found using Service ID.
- **num_peer_records** -- [out] Number of peers discovered by corresponding service.

**Returns**
- ESP_OK: succeed
- ESP_FAIL: failed

**esp_err_t esp_wifi_nan_get_peer_records**

(int*num_peer_records, uint8_t own_svc_id, struct nan_peer_record*peer_record)

brief Get a list of Peers discovered by the given Service.

**Parameters**
- **num_peer_records** -- [inout] As input param, it stores max peers peer_record can hold. As output param, it specifies the actual number of peers this API returns.
- **own_svc_id** -- Service ID of own service.
- **peer_record** -- [out] Pointer to first peer record.

**Returns**
- ESP_OK: succeed
- ESP_FAIL: failed

**esp_err_t esp_wifi_nan_get_peer_info**

(char *svc_name, uint8_t *peer_mac, struct nan_peer_record*peer_info)

brief Find Peer's Service information using Peer MAC and optionally Service Name.
### Parameters
- **svc_name** -- Service Name of the published/subscribed service.
- **peer_mac** -- Peer's NAN Management Interface MAC address.
- **peer_info** -- [out] Peer's service information structure.

### Returns
- ESP_OK: succeed
- ESP_FAIL: failed

### Structures

```c
struct nan_peer_record
Parameters of a peer service record
```

#### Public Members

- **uint8_t peer_svc_id**
  Identifier of Peer's service

- **uint8_t own_svc_id**
  Identifier of own service associated with Peer

- **uint8_t peer_nmi[6]**
  Peer's NAN Management Interface address

- **uint8_t peer_svc_type**
  Peer's service type (Publish/Subscribe)

- **uint8_t ndp_id**
  Specifies if the peer has any active datapath

- **uint8_t peer_ndi[6]**
  Peer's NAN Data Interface address, only valid when ndp_id is non-zero

### Macros

- **WIFI_NAN_CONFIG_DEFAULT()**
- **NDP_STATUS_ACCEPTED**
- **NDP_STATUS_REJECTED**
- **NAN_MAX_PEERS_RECORD**
- **ESP_NAN_PUBLISH**
- **ESP_NAN_SUBSCRIBE**

Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the `mesh` directory of ESP-IDF examples.
2.5.2 Ethernet

Overview

ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc Control of Ethernet Driver

Basic Ethernet Concepts

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling appears as shown below:

![Ethernet Data Frame Format](image)

Fig. 4: Ethernet Data Frame Format
Preamble and Start-of-Frame Delimiter The preamble contains seven bytes of $55H$. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence $10101011$ (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will be automatically generated or stripped from the packets.

Destination Address The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e., FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

Source Address The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see MAC Address Allocation.

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

Type/Length The type/length field is a 2-byte field. If the value in this field is $<= 1500$ (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is $>= 1536$, it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = $0800H$
- IPv6 = $86DDH$
- ARP = $0806H$

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

Payload The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets violates Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

Padding and FCS The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally automatically
generates a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They are not supported in ESP-IDF.

**Configure MAC and PHY**  The Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface), etc.

One of the obvious differences between MII and RMII is signal consumption. MII usually costs up to 18 signals, while the RMII interface can reduce the consumption to 9.

**Note:** ESP-IDF only supports the RMII interface. Therefore, always set `eth_esp32_emac_config_t::interface` to `eth_data_interface_t::EMAC_DATA_INTERFACE_RMII` or always select `CONFIG_ETH_PHY_INTERFACE_RMII` in the Kconfig option `CONFIG_ETH_PHY_INTERFACE`.

In RMII mode, both the receiver and transmitter signals are referenced to the REF_CLK. REF_CLK must be stable during any access to PHY and MAC. Generally, there are three ways to generate the REF_CLK depending on the PHY device in your design:

- Some PHY chips can derive the REF_CLK from its externally connected 25 MHz crystal oscillator (as seen the option a in the picture). In this case, you should configure `eth_mac_clock_config_t::clock_mode` of `eth_esp32_emac_config_t::clock_config` to `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`.
- Some PHY chip uses an externally connected 50MHz crystal oscillator or other clock sources, which can also be used as the REF_CLK for the MAC side (as seen the option b in the picture). In this case, you still need to configure `eth_mac_clock_config_t::clock_mode` of `eth_esp32_emac_config_t::clock_config` to `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`.
- Some EMAC controllers can generate the REF_CLK using an internal high-precision PLL (as seen the option c in the picture). In this case, you should configure `eth_mac_clock_config_t::clock_mode` of `eth_esp32_emac_config_t::clock_config` to `emac_rmii_clock_mode_t::EMAC_CLK_OUT`.

**Note:** The REF_CLK can be also configured via Project Configuration when `eth_esp32_emac_config_t::clock_config::mode` of `eth_esp32_emac_config_t::clock_config` is set to `emac_rmii_clock_mode_t::EMAC_CLK_DEFAULT`. Choose appropriately `CONFIG_ETH_RMII_CLK_INPUT` or `CONFIG_ETH_RMII_CLK_OUTPUT` option under `CONFIG_ETH_RMII_CLK_MODE` configuration based on your design as discussed above.

**Warning:** If the RMII clock mode is configured to `emac_rmii_clock_mode_t::EMAC_CLK_OUT` (or `CONFIG_ETH_RMII_CLK_OUTPUT` is selected), then GPIO0 can be used to output the REF_CLK signal. See `emac_rmii_clock_gpio_t::EMAC_APP1_CLK_OUT_GPIO` or `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0` for more information.

What is more, if you are not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock signal. See `emac_rmii_clock_gpio_t::EMAC_CLK_OUT_GPIO0` and `emac_rmii_clock_gpio_t::EMAC_CLK_OUT_180_GPIO` for more information.
Fig. 5: Ethernet RMII Interface
If the RMII clock mode is configured to `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN` (or `CONFIG_ETH_RMII_CLK_INPUT` is selected), then GPIO0 is the only choice to input the REF_CLK signal. Please note that GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power-up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround for this issue is disabling the REF_CLK in hardware by default so that the strapping pin is not interfered by other signals in the boot stage. Then, re-enable the REF_CLK in the Ethernet driver installation stage.

The ways to disable the REF_CLK signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
- Force the PHY device to reset status (as the case a in the picture). This could fail for some PHY device (i.e., it still outputs signals to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of REF_CLK in your hardware design! Keep the trace as short as possible. Keep it away from RF devices and inductor elements.

Note: Signals used in the data plane are fixed to specific GPIOs via IO_MUX, they can not be modified to other GPIOs. Signals used in the control plane can be routed to any free GPIOs via Matrix. Please refer to ESP32-Ethernet-Kit for hardware design example.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.
- `eth_esp32_emac_config_t::smi_mdc_gpio_num` and `eth_esp32_emac_config_t::smi_mdio_gpio_num`: the GPIO number used to connect the SMI signals.
- `eth_esp32_emac_config_t::interface`: configuration of MAC Data interface to PHY (MII/RMII).
- `eth_esp32_emac_config_t::clock_config`: configuration of EMAC Interface clock (REF_CLK mode and GPIO number in case of RMII).

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver starts negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.
Chapter 2. API Reference

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

Create MAC and PHY Instance  The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

Internal EMAC + External PHY

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default common MAC configuration
eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // apply default vendor-specific MAC configuration
esp32_emac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO used for MDC signal
esp32_emac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // alter the GPIO used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&esp32_emac_config, &mac_config); // create MAC instance

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
// ESP-IDF officially supports several different Ethernet PHY chip driver
// esp_eth_phy_t *phy = esp_eth_phy_new_rtl8201(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);
```

Optional Runtime MAC Clock Configuration  EMAC REF_CLK can be optionally configured from the user application code.

```c
eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // apply default vendor-specific MAC configuration

// ...

esp32_emac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
esp32_emac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
esp32_emac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number used to input/output EMAC REF_CLK
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&esp32_emac_config, &mac_config); // create MAC instance
```

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
```

(continues on next page)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
  .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
  .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
  .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
  .quadwp_io_num = -1,
  .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
  .mode = 0,
  .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
  .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
  .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
--SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

Note:
• When creating MAC and PHY instances for SPI-Ethernet modules (e.g., DM9051), the constructor function
  must have the same suffix (e.g., esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051).
  This is because we don’t have other choices but the integrated PHY.
• The SPI device configuration (i.e., spi_device_interface_config_t) may slightly differ for other Ethernet modules
  or to meet SPI timing on specific PCB. Please check out your module’s specs and the examples in ESP-IDF.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some
additional high-level configurations (i.e., not specific to either MAC or PHY) in esp_eth_config_t:
• esp_eth_config_t::mac: instance that created from MAC generator (e.g.,
  esp_eth_mac_new_esp32()).
• esp_eth_config_t::phy: instance that created from PHY generator (e.g.,
  esp_eth_phy_new_ip101()).
• esp_eth_config_t::check_link_period_ms: Ethernet driver starts an OS timer to check the link
  status periodically, this field is used to set the interval, in milliseconds.
• esp_eth_config_t::stack_input: In most Ethernet IoT applications, any Ethernet frame received
  by a driver should be passed to the upper layer (e.g., TCP/IP stack). This field is set to a function that
  is responsible to deal with the incoming frames. You can even update this field at runtime via function
  esp_eth_update_input_path() after driver installation.
• esp_eth_config_t::on_lowlevel_init_done and esp_eth_config_t::on_lowlevel_deinit_done:
  These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized
  or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro ETH_DEFAULT_CONFIG.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver...
```

```
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get...
```

```
esp_eth_driver_install(&config, &eth_handle); // install driver
```
The Ethernet driver also includes an event-driven model, which sends useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHernet_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
                    addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
```

`esp_event_loop_create_default();` // create a default event loop that runs in the background
`esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);` // register Ethernet event handler (to deal with user-specific stuff when events like link up/down happened)

Start Ethernet Driver After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

Connect Driver to TCP/IP Stack Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we are still on level 2 (i.e., Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it is infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to LwIP.

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to Network Interface.
{    ip_event_got_ip_t *event = {ip_event_got_ip_t *}; event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP:"); IPSTR, IP2STR(&ip_info->ip);
    ESP_LOGI(TAG, "ETHMASK:"); IPSTR, IP2STR(&ip_info->netmask);
    ESP_LOGI(TAG, "ETHGW:"); IPSTR, IP2STR(&ip_info->gw);
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet driver
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

Warning: It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e., register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user’s handlers.

Misc Control of Ethernet Driver The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: esp_eth_stop()
- Update Ethernet data input path: esp_eth_update_input_path()
- Misc get/set of Ethernet driver attributes: esp_eth_ioctl()

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

Flow Control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The Ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with
the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing that should be kept in mind is that the pause frame ability is advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: `ethernet/basic`
- Ethernet iperf example: `ethernet/iperf`
- Ethernet to Wi-Fi AP "router": `network/eth2ap`
- Wi-Fi station to Ethernet "bridge": `network/sta2eth`
- Most protocol examples should also work for Ethernet: `protocols`

### Advanced Topics

#### Custom PHY Driver

There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user's actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called "MII Management Interface" to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by `esp_eth/src/esp_eth_phy_802_3.c` in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, but it just requires more effort. You will have to define all PHY management functions.

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the `esp_eth/src/esp_eth_phy_802_3.c`. However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

**Steps to create a custom PHY driver:**

1. Define vendor-specific registry layout based on the PHY datasheet. See `esp_eth/src/esp_eth_phy_ip101.c` as an example.
2. Prepare derived PHY management object info structure which:
   - must contain at least parent IEEE 802.3 `phy_802_3_t` object
   - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See `esp_eth/src/esp_eth_phy_ksz80xx.c` as an example.
3. Define chip-specific management call-back functions.
4. Initialize chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via IDF Component Registry.

Header File

- components/hal/include/hal/eth_types.h
- This header file can be included with:

```
#include "hal/eth_types.h"
```

Enumerations

```c
enum eth_data_interface_t
    Ethernet interface.

    Values:

    enumerator EMAC_DATA_INTERFACE_RMII
        Reduced Media Independent Interface

    enumerator EMAC_DATA_INTERFACE_MII
        Media Independent Interface
```

```c
enum eth_link_t
    Ethernet link status.

    Values:

    enumerator ETH_LINK_UP
        Ethernet link is up

    enumerator ETH_LINK_DOWN
        Ethernet link is down
```

```c
enum eth_speed_t
    Ethernet speed.

    Values:

    enumerator ETH_SPEED_10M
        Ethernet speed is 10Mbps

    enumerator ETH_SPEED_100M
        Ethernet speed is 100Mbps

    enumerator ETH_SPEED_MAX
        Max speed mode (for checking purpose)
```

```c
enum eth_duplex_t
    Ethernet duplex mode.

    Values:

    enumerator ETH_DUPLEX_HALF
        Ethernet is in half duplex
```
enumerator **ETH_DUPLEX_FULL**
    Ethernet is in full duplex

**enum** **eth_checksum_t**
Ethernet Checksum.

*Values:*

enumerator **ETH_CHECKSUM_SW**
    Ethernet checksum calculate by software

enumerator **ETH_CHECKSUM_HW**
    Ethernet checksum calculate by hardware

**enum** **eth_mac_dma_burst_len_t**
Internal ethernet EMAC's DMA available burst sizes.

*Values:*

enumerator **ETH_DMA_BURST_LEN_32**

enumerator **ETH_DMA_BURST_LEN_16**

enumerator **ETH_DMA_BURST_LEN_8**

enumerator **ETH_DMA_BURST_LEN_4**

enumerator **ETH_DMA_BURST_LEN_2**

enumerator **ETH_DMA_BURST_LEN_1**

• This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

#### `esp_eth_driver_install`

**Function:**

```c
esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
```

**Install Ethernet driver.**

**Parameters**

- `config` -- `[in]` configuration of the Ethernet driver
- `out_hdl` -- `[out]` handle of Ethernet driver

**Returns**

- ESP_OK: install `esp_eth` driver successfully
- ESP_ERR_INVALID_ARG: install `esp_eth` driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install `esp_eth` driver failed because there’s no memory for driver
- ESP_FAIL: install `esp_eth` driver failed because some other error occurred

#### `esp_eth_driver_uninstall`

**Function:**

```c
esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)
```

**Uninstall Ethernet driver.**

**Parameters**

- `hdl` -- `[in]` handle of Ethernet driver

**Returns**

- ESP_OK: uninstall `esp_eth` driver successfully
- ESP_ERR_INVALID_ARG: uninstall `esp_eth` driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall `esp_eth` driver failed because it has more than one reference
- ESP_FAIL: uninstall `esp_eth` driver failed because some other error occurred

#### `esp_eth_start`

**Function:**

```c
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```

**Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)**

**Parameters**

- `hdl` -- `[in]` handle of Ethernet driver

**Returns**

- ESP_OK: start `esp_eth` driver successfully
- ESP_ERR_INVALID_ARG: start `esp_eth` driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start `esp_eth` driver failed because driver has started already
- ESP_FAIL: start `esp_eth` driver failed because some other error occurred

#### `esp_eth_stop`

**Function:**

```c
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```

**Stop Ethernet driver.**

**Parameters**

- `hdl` -- `[in]` handle of Ethernet driver

**Returns**

- ESP_OK: stop `esp_eth` driver successfully
- ESP_ERR_INVALID_ARG: stop `esp_eth` driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop `esp_eth` driver failed because driver has already started
- ESP_FAIL: stop `esp_eth` driver failed because some other error occurred

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.
**Note:** This function does the opposite operation of `esp_eth_start`.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver

**Returns**
- `ESP_OK`: stop esp_eth driver successfully
- `ESP_ERR_INVALID_ARG`: stop esp_eth driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: stop esp_eth driver failed because driver has not started yet
- `ESP_FAIL`: stop esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note:** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver
- `stack_input` -- [in] function pointer, which does the actual process on incoming packets
- `priv` -- [in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**
- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

```
esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)
```

General Transmit.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver
- `buf` -- [in] buffer of the packet to transfer
- `length` -- [in] length of the buffer to transfer

**Returns**
- `ESP_OK`: transmit frame buffer successfully
- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

```
esp_err_t esp_eth_transmit_vargs(esp_eth_handle_t hdl, uint32_t argc, ...)
```

Special Transmit with variable number of arguments.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver
- `argc` -- [in] number variable arguments
- `...` -- variable arguments

**Returns**
- `ESP_OK`: transmit successfull
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
Chapter 2. API Reference

- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void* data)`
MISC IO function of Ethernet driver.

The following common IO control commands are supported:

- ETH_CMD_S_MAC_ADDR sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH_CMD_G_MAC_ADDR gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH_CMD_S_PHY_ADDR sets PHY address in range of <0-31>, data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- ETH_CMD_G_PHY_ADDR gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- ETH_CMD_S_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH_CMD_G_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- ETH_CMD_S_SPEED sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_FLOWCTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_DUPLEX_MODE sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

Parameters

- hdl -- [in] handle of Ethernet driver
- cmd -- [in] IO control command
- data -- [inout] address of data for set command or address where to store the data when used with get command

Returns

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

`esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)`
Increase Ethernet driver reference.
Note: Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver

**Returns**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

```c
esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
```
Decrease Ethernet driver reference.

**Parameters**
- `hdl` -- [in] handle of Ethernet driver

**Returns**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Structures**

```c
struct esp_eth_config_t
```
Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```
Ethernet MAC object.

```c
esp_eth_phy_t *phy
```
Ethernet PHY object.

```c
uint32_t check_link_period_ms
```
Period time of checking Ethernet link status.

```c
esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t*buffer, uint32_t length, void *priv)
```
Input frame buffer to user's stack.

**Param**
- `eth_handle` [in] handle of Ethernet driver
- `buffer` [in] frame buffer that will get input to upper stack
- `length` [in] length of the frame buffer

**Return**
- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

```c
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

**Param**
- `eth_handle` [in] handle of Ethernet driver

**Return**
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization
**esp_err_t** (*on_lowlevel_deinit_done*)(**esp_eth_handle_t** eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth_handle** [in] handle of Ethernet driver

**Return**
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

**esp_err_t** (*read_phy_reg*)(**esp_eth_handle_t** eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

**Param eth_handle** [in] handle of Ethernet driver
**Param phy_addr** [in] PHY chip address (0~31)
**Param phy_reg** [in] PHY register index code
**Param reg_value** [out] PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**esp_err_t** (*write_phy_reg*)(**esp_eth_handle_t** eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

**Param eth_handle** [in] handle of Ethernet driver
**Param phy_addr** [in] PHY chip address (0~31)
**Param phy_reg** [in] PHY register index code
**Param reg_value** [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**struct esp_eth_phy_reg_rwlock_data_t**

Data structure to Read/Write PHY register via ioctl API.

**Public Members**

**uint32_t** reg_addr

PHY register address
uint32_t *reg_value_p

Pointer to a memory where the register value is read/written

**Macros**

ETH_DEFAULT_CONFIG (emac, ephy)

Default configuration for Ethernet driver.

**Type Definitions**

typedef void *esp_eth_handle_t

Handle of Ethernet driver.

**Enumerations**

enum esp_eth_io_cmd_t

Command list for ioctl API.

*Values:*

enumerator ETH_CMD_G_MAC_ADDR

Get MAC address

enumerator ETH_CMD_S_MAC_ADDR

Set MAC address

enumerator ETH_CMD_G_PHY_ADDR

Get PHY address

enumerator ETH_CMD_S_PHY_ADDR

Set PHY address

enumerator ETH_CMD_G_AUTONEGO

Get PHY Auto Negotiation

enumerator ETH_CMD_S_AUTONEGO

Set PHY Auto Negotiation

enumerator ETH_CMD_G_SPEED

Get Speed

enumerator ETH_CMD_S_SPEED

Set Speed

enumerator ETH_CMD_S_PROMISCUOUS

Set promiscuous mode

enumerator ETH_CMD_S_FLOW_CTRL

Set flow control
enumerator ETH_CMD_G_DUPLEX_MODE
   Get Duplex mode

enumerator ETH_CMD_S_DUPLEX_MODE
   Set Duplex mode

enumerator ETH_CMD_S_PHY LOOPBACK
   Set PHY loopback

enumerator ETH_CMD_READ_PHY_REG
   Read PHY register

enumerator ETH_CMD_WRITE_PHY_REG
   Write PHY register

enumerator ETH_CMD_CUSTOM_MAC_CMDS

enumerator ETH_CMD_CUSTOM_PHY_CMDS

Header File

- components/esp_eth/include/esp_eth_com.h
- This header file can be included with:

```c
#include "esp_eth_com.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

or

```cmake
PRIV_REQUIRES esp_eth
```

Structures

struct esp_eth_mediator_s
   Ethernet mediator.

Public Members

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred
**esp_err_t** (*phy_reg_write*)

Write PHY register.

PARAMs:
- eth [in] mediator of Ethernet driver
- phy_addr [in] PHY Chip address (0~31)
- phy_reg [in] PHY register index code
- reg_value [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

**esp_err_t** (*stack_input*)

Deliver packet to upper stack.

PARAMs:
- eth [in] mediator of Ethernet driver
- buffer [in] packet buffer
- length [in] length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

**esp_err_t** (*on_state_changed*)

Callback on Ethernet state changed.

PARAMs:
- eth [in] mediator of Ethernet driver
- state [in] new state
- args [in] optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Type Definitions**

typedef struct **esp_eth_mediator_s** **esp_eth_mediator_t**

Ethernet mediator.

**Enumerations**

eenum **esp_eth_state_t**

Ethernet driver state.

**Values**:

- enumerator **ETH_STATE_LLINIT**
  Low level init done

- enumerator **ETH_STATE_DEINIT**
  Deinit done

- enumerator **ETH_STATE_LINK**
  Link status changed

- enumerator **ETH_STATE_SPEED**
  Speed updated
enumerator **ETH_STATE_DUPLEX**
    Duplex updated

enumerator **ETH_STATE_PAUSE**
    Pause ability updated

eenum **eth_event_t**
    Ethernet event declarations.
    
    Values:
    
    enumerator **ETHERNET_EVENT_START**
        Ethernet driver start
    
    enumerator **ETHERNET_EVENT_STOP**
        Ethernet driver stop
    
    enumerator **ETHERNET_EVENT_CONNECTED**
        Ethernet got a valid link
    
    enumerator **ETHERNET_EVENT_DISCONNECTED**
        Ethernet lost a valid link

**Header File**

- components/esp_eth/include/esp_eth_mac.h
- This header file can be included with:

```c
#include "esp_eth_mac.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```
REQUIRES esp_eth
```

or
```
PRIV_REQUIRES esp_eth
```

**Functions**

```c
esp_eth_mac_t *esp_eth_mac_new_esp32 (
    const eth_esp32_emac_config_t *esp32_config,
    const eth_mac_config_t *config)
```

Create ESP32 Ethernet MAC instance.

**Parameters**

- `esp32_config` -- EMAC specific configuration
- `config` -- Ethernet MAC configuration

**Returns**

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

**Unions**

```c
union eth_mac_clock_config_t
```

```
#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.
```
Public Members

```c
struct eth_mac_clock_config_t::[anonymous] mii
    EMAC MII Clock Configuration
```

```c
emac_rmii_clock_mode_t clock_mode
    RMII Clock Mode Configuration
```

```c
emac_rmii_clock_gpio_t clock_gpio
    RMII Clock GPIO Configuration
```

```c
struct eth_mac_clock_config_t::[anonymous] rmii
    EMAC RMII Clock Configuration
```

Structures

```c
struct esp_eth_mac_s
    Ethernet MAC.
```

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
    Set mediator for Ethernet MAC.
```

- **Param** mac [in] Ethernet MAC instance
- **Param** eth [in] Ethernet mediator

- **Return**
  - ESP_OK: set mediator for Ethernet MAC successfully
  - ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

```c
esp_err_t (*init)(esp_eth_mac_t *mac)
    Initialize Ethernet MAC.
```

- **Param** mac [in] Ethernet MAC instance

- **Return**
  - ESP_OK: initialize Ethernet MAC successfully
  - ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
  - ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*deinit)(esp_eth_mac_t *mac)
    Deinitialize Ethernet MAC.
```

- **Param** mac [in] Ethernet MAC instance

- **Return**
  - ESP_OK: deinitialize Ethernet MAC successfully
  - ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
    Start Ethernet MAC.
```

- **Param** mac [in] Ethernet MAC instance

- **Return**
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

**esp_err_t (**stop**(esp_eth_mac_t *mac)**)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**
• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some other error occurred

**esp_err_t (**transmit**(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)**)

Transmit packet from Ethernet MAC.

**Note:** Returned error codes may differ for each specific MAC chip.

**Param mac [in]** Ethernet MAC instance
**Param buf [in]** packet buffer to transmit
**Param length [in]** length of packet

**Return**
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred

**esp_err_t (**transmit_vargs**(esp_eth_mac_t *mac, uint32_t argc, va_list args)**)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

**Note:** Returned error codes may differ for each specific MAC chip.

**Param mac [in]** Ethernet MAC instance
**Param argc [in]** number variable arguments
**Param args [in]** variable arguments

**Return**
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred

**esp_err_t (**receive**(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)**)

Receive packet from Ethernet MAC.

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note:** Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.
**esp_err_t** (*read_phy_reg*) (esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

- **Param mac** [in] Ethernet MAC instance
- **Param phy_addr** [in] PHY chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value

**Return**

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**esp_err_t** (*write_phy_reg*) (esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

- **Param mac** [in] Ethernet MAC instance
- **Param phy_addr** [in] PHY chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [in] PHY register value

**Return**

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**esp_err_t** (*set_addr*) (esp_eth_mac_t *mac, uint8_t *addr)

Set MAC address.

- **Param mac** [in] Ethernet MAC instance
- **Param addr** [in] MAC address

**Return**

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

**esp_err_t** (*get_addr*) (esp_eth_mac_t *mac, uint8_t *addr)

Get MAC address.

- **Param mac** [in] Ethernet MAC instance
- **Param addr** [out] MAC address

**Return**

- ESP_OK: get MAC address successfully
• ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
• ESP_FAIL: get MAC address failed because some other error occurred

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```
Set speed of MAC.

**Param mac** [in] Ethernet MAC instance
**Param speed** [in] MAC speed

**Return**
• ESP_OK: set MAC speed successfully
• ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
• ESP_FAIL: set MAC speed failed because some other error occurred

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

**Param mac** [in] Ethernet MAC instance
**Param duplex** [in] MAC duplex

**Return**
• ESP_OK: set MAC duplex mode successfully
• ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
• ESP_FAIL: set MAC duplex failed because some other error occurred

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

**Param mac** [in] Ethernet MAC instance
**Param link** [in] Link status

**Return**
• ESP_OK: set link status successfully
• ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
• ESP_FAIL: set link status failed because some other error occurred

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

**Param mac** [in] Ethernet MAC instance
**Param enable** [in] set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**
• ESP_OK: set promiscuous mode successfully
• ESP_FAIL: set promiscuous mode failed because some error occurred

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```
Enable flow control on MAC layer or not.

**Param mac** [in] Ethernet MAC instance
**Param enable** [in] set true to enable flow control; set false to disable flow control

**Return**
• ESP_OK: set flow control successfully
• ESP_FAIL: set flow control failed because some error occurred

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```
Set the PAUSE ability of peer node.

**Param mac** [in] Ethernet MAC instance
**Param ability** [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
Chapter 2. API Reference

- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

```
esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
```

Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

**Param mac** [in] Ethernet MAC instance

**Param cmd** [in] IO control command

**Param data** [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```
esp_err_t (*del)(esp_eth_mac_t *mac)
```

Free memory of Ethernet MAC.

**Param mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

```
struct eth_mac_config_t
```

Configuration of Ethernet MAC object.

**Public Members**

```
uint32_t sw_reset_timeout_ms
```

Software reset timeout value (Unit: ms)

```
uint32_t rx_task_stack_size
```

Stack size of the receive task

```
uint32_t rx_task_prio
```

Priority of the receive task

```
uint32_t flags
```

Flags that specify extra capability for mac driver

```
struct eth_esp32_emac_config_t
```

EMAC specific configuration.
Public Members

int smi_mdc_gpio_num
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int smi_mdio_gpio_num
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

eth_data_interface_t interface
EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t clock_config
EMAC Interface clock configuration

eth_mac_dma_burst_len_t dma_burst_len
EMAC DMA burst length for both Tx and Rx

struct eth_spi_custom_driver_config_t
Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user’s custom SPI driver.

Public Members

void *config
Custom driver specific configuration data used by init() function.

Note: Type and its content is fully under user's control

void *(*init)(const void *spi_config)
Custom driver SPI Initialization.

Note: return type and its content is fully under user's control

Param spi_config [in] Custom driver specific configuration
Return
• spi_ctx: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
• NULL: driver initialization failed

esp_err_t (*deinit)(void *spi_ctx)
Custom driver De-initialization.

Param spi_ctx [in] a pointer to driver specific context structure
Return
• ESP_OK: driver de-initialization was successful
• ESP_FAIL: driver de-initialization failed
• any other failure codes are allowed to be used to provide failure isolation
**esp_err_t** (*read*)(void *spi_ctx, uint32_t cmd, uint32_t addr, void *data, uint32_t data_len)

Custom driver SPI read.

**Note:** The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spi_ctx</td>
<td>[in] a pointer to driver specific context structure</td>
</tr>
<tr>
<td>cmd</td>
<td>[in] command</td>
</tr>
<tr>
<td>addr</td>
<td>[in] register address</td>
</tr>
<tr>
<td>data</td>
<td>[out] read data</td>
</tr>
<tr>
<td>data_len</td>
<td>[in] read data length in bytes</td>
</tr>
</tbody>
</table>

**Return**
- ESP_OK: read was successful
- ESP_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

**esp_err_t** (*write*)(void *spi_ctx, uint32_t cmd, uint32_t addr, const void *data, uint32_t data_len)

Custom driver SPI write.

**Note:** The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spi_ctx</td>
<td>[in] a pointer to driver specific context structure</td>
</tr>
<tr>
<td>cmd</td>
<td>[in] command</td>
</tr>
<tr>
<td>addr</td>
<td>[in] register address</td>
</tr>
<tr>
<td>data</td>
<td>[in] data to write</td>
</tr>
<tr>
<td>data_len</td>
<td>[in] length of data to write in bytes</td>
</tr>
</tbody>
</table>

**Return**
- ESP_OK: write was successful
- ESP_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

**Macros**

**ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**

MAC driver can work when cache is disabled

**ETH_MAC_FLAG_PIN_TO_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH_MAC_DEFAULT_CONFIG ()**

Default configuration for Ethernet MAC object.

**ETH_ESP32_EMAC_DEFAULT_CONFIG ()**

Default ESP32's EMAC specific configuration.

**ETH_DEFAULT_SPI**

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

**Type Definitions**
typedef struct esp_eth_mac_s esp_eth_mac_t

  Ethernet MAC.

Enumerations

enum emac_rmii_clock_mode_t
  RMII Clock Mode Options.
  Values:

  enumerator EMAC_CLK_DEFAULT
    Default values configured using Kconfig are going to be used when "Default" selected.

  Note: May not be supported on all targets.

  enumerator EMAC_CLK_EXT_IN
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

  Note: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

  enumerator EMAC_CLK_OUT
    Output RMII Clock from internal (A/M)PLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

Enum emac_rmii_clock_gpio_t
  RMII Clock GPIO number Options for ESP32.
  Values:

  enumerator EMAC_CLK_IN_GPIO
    MAC will get RMII clock from outside at this GPIO.

  Note: ESP32 only supports GPIO0 to input the RMII clock.

  enumerator EMAC_APPL_CLK_OUT_GPIO
    Output RMII Clock from internal APLL Clock available at GPIO16.

  Note: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

  enumerator EMAC_CLK_OUT_GPIO
    Output RMII Clock from internal APLL Clock available at GPIO16.
enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

**Header File**

- components/esp_eth/include/esp_eth_phy.h
- This header file can be included with:

  ```
  #include "esp_eth_phy.h"
  ```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_eth
  ```

  or

  ```
  PRIV_REQUIRES esp_eth
  ```

**Functions**

```python
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
```

Create a PHY instance of IP101.

**Parameters**

- **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```python
esp_eth_phy_t *esp_eth_phy_new_rtl8201 (const eth_phy_config_t *config)
```

Create a PHY instance of RTL8201.

**Parameters**

- **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```python
esp_eth_phy_t *esp_eth_phy_new_lan87xx (const eth_phy_config_t *config)
```

Create a PHY instance of LAN87xx.

**Parameters**

- **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```python
esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)
```

Create a PHY instance of DP83848.

**Parameters**

- **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```python
esp_eth_phy_t *esp_eth_phy_new_ksz80xx (const eth_phy_config_t *config)
```

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters**

- **config** -- [in] configuration of PHY
Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct esp_eth_phy_s

Ethernet PHY.

Public Members

\[
\text{esp_err_t}(*\text{set}\_\text{mediator})(\text{esp_eth_phy_t} *\text{phy}, \text{esp_eth_mediator_t} *\text{mediator})
\]

Set mediator for PHY.

- **Param phy** [in] Ethernet PHY instance
- **Param mediator** [in] mediator of Ethernet driver

**Return**

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

\[
\text{esp_err_t}(*\text{reset})(\text{esp_eth_phy_t} *\text{phy})
\]

Software Reset Ethernet PHY.

- **Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

\[
\text{esp_err_t}(*\text{reset}\_\text{hw})(\text{esp_eth_phy_t} *\text{phy})
\]

Hardware Reset Ethernet PHY.

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

\[
\text{esp_err_t}(*\text{init})(\text{esp_eth_phy_t} *\text{phy})
\]

Initialize Ethernet PHY.

- **Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

\[
\text{esp_err_t}(*\text{deinit})(\text{esp_eth_phy_t} *\text{phy})
\]

Deinitialize Ethernet PHY.

- **Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred
\begin{verbatim}

esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
Configure auto negotiation.

    Param phy [in] Ethernet PHY instance
    Param cmd [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
    Param autonego_en_stat [out] Address where to store current status of auto negotiation configuration

Return
    • ESP_OK: restart auto negotiation successfully
    • ESP_FAIL: restart auto negotiation failed because some error occurred
    • ESP_ERR_INVALID_ARG: invalid command

esp_err_t (*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.

    Param phy [in] Ethernet PHY instance

Return
    • ESP_OK: get Ethernet PHY link status successfully
    • ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (*set_link)(esp_eth_phy_t *phy, eth_link_t link)
Set Ethernet PHY link status.

    Param phy [in] Ethernet PHY instance
    Param link [in] new link status

Return
    • ESP_OK: set Ethernet PHY link status successfully
    • ESP_FAIL: set Ethernet PHY link status failed because some error occurred

esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.

    Param phy [in] Ethernet PHY instance
    Param enable [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY

Return
    • ESP_OK: control Ethernet PHY power successfully
    • ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
Set PHY chip address.

    Param phy [in] Ethernet PHY instance
    Param addr [in] PHY chip address

Return
    • ESP_OK: set Ethernet PHY address successfully
    • ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
Get PHY chip address.

    Param phy [in] Ethernet PHY instance
    Param addr [out] PHY chip address

Return
    • ESP_OK: get Ethernet PHY address successfully
    • ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument
\end{verbatim}
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
Advertise pause function supported by MAC layer.

Param phy [in] Ethernet PHY instance
Param addr [out] Pause ability
Return
• ESP_OK: Advertise pause ability successfully
• ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
Sets the PHY to loopback mode.

Param phy [in] Ethernet PHY instance
Param enable [in] enables or disables PHY loopback
Return
• ESP_OK: PHY instance loopback mode has been configured successfully
• ESP_FAIL: PHY instance loopback configuration failed because some error occurred

esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
Sets PHY speed mode.

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance
Param speed [in] Speed mode to be set
Return
• ESP_OK: PHY instance speed mode has been configured successfully
• ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
Sets PHY duplex mode.

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance
Param duplex [in] Duplex mode to be set
Return
• ESP_OK: PHY instance duplex mode has been configured successfully
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)
Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl
to cover specifics of PHY chip.

Note: This function may not be assigned when the PHY chip supports only most common set of configuration options.

Param phy [in] Ethernet PHY instance
**Chapter 2. API Reference**

**Param cmd [in]** IO control command

**Param data [inout]** address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

```c
struct eth_phy_config_t
```

Ethernet PHY configuration.

**Public Members**

```c
int32_t phy_addr
```

PHY address, set -1 to enable PHY address detection at initialization stage

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset

**Macros**

```c
ESP_ETH_PHY_ADDR_AUTO
```

**ETH_PHY_DEFAULT_CONFIG ()**

Default configuration for Ethernet PHY object.

**Type Definitions**

```c
typedef struct esp_eth_phy_s esp_eth_phy_t
```

Ethernet PHY.

**Enumerations**

```c
enum eth_phy_autoneg_cmd_t
```

Auto-negotiation control commands.

**Values:**
enumerator **ESP_ETH_PHY_AUTONEGO_RESTART**

enumerator **ESP_ETH_PHY_AUTONEGO_EN**

enumerator **ESP_ETH_PHY_AUTONEGO_DIS**

enumerator **ESP_ETH_PHY_AUTONEGO_G_STAT**

**Header File**

- components/esp_eth/include/esp_eth_phy_802_3.h
- This header file can be included with:

```
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

**Functions**

`esp_err_t esp_eth_phy_802_3_set_mediator(phy_802_3_t *phy_802_3, esp_eth_mediator_t *eth)`

Set Ethernet mediator.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `eth` -- Ethernet mediator pointer

**Returns**
- ESP_OK: Ethernet mediator set successfully
- ESP_ERR_INVALID_ARG: if `eth` is NULL

`esp_err_t esp_eth_phy_802_3_reset(phy_802_3_t *phy_802_3)`

Reset PHY.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object info structure

**Returns**
- ESP_OK: Ethernet PHY reset successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t esp_eth_phy_802_3_autonego_ctrl(phy_802_3_t *phy_802_3, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)`

Control autonegotiation mode of Ethernet PHY.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `cmd` -- autonegotiation command enumeration
- `autonego_en_stat` -- [out] autonegotiation enabled flag

**Returns**
- ESP_OK: Ethernet PHY autonegotiation configured successfully
- ESP_FAIL: Ethernet PHY autonegotiation configuration fail because some error occurred
- ESP_ERR_INVALID_ARG: invalid value of `cmd`

`esp_err_t esp_eth_phy_802_3_pwrctl(phy_802_3_t *phy_802_3, bool enable)`

Power control of Ethernet PHY.
Chapter 2. API Reference

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `enable` -- set true to power ON Ethernet PHY, set false to power OFF Ethernet PHY

Returns
• ESP_OK: Ethernet PHY power down mode set successfully
• ESP_FAIL: Ethernet PHY power up or power down failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_addr (phy_802_3_t *phy_802_3, uint32_t addr)
```

Set Ethernet PHY address.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `addr` -- new PHY address

Returns
• ESP_OK: Ethernet PHY address set

```c
esp_err_t esp_eth_phy_802_3_get_addr (phy_802_3_t *phy_802_3, uint32_t *addr)
```

Get Ethernet PHY address.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `addr` -- [out] Ethernet PHY address

Returns
• ESP_OK: Ethernet PHY address read successfully
• ESP_ERR_INVALID_ARG: addr pointer is NULL

```c
esp_err_t esp_eth_phy_802_3_advertise_pause_ability (phy_802_3_t *phy_802_3, uint32_t ability)
```

Advertise pause function ability.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `ability` -- enable or disable pause ability

Returns
• ESP_OK: pause ability set successfully
• ESP_FAIL: Advertise pause function ability failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_loopback (phy_802_3_t *phy_802_3, bool enable)
```

Set Ethernet PHY loopback mode.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `enable` -- set true to enable loopback; set false to disable loopback

Returns
• ESP_OK: Ethernet PHY loopback mode set successfully
• ESP_FAIL: Ethernet PHY loopback configuration failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_speed (phy_802_3_t *phy_802_3, eth_speed_t speed)
```

Set Ethernet PHY speed.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `speed` -- new speed of Ethernet PHY link

Returns
• ESP_OK: Ethernet PHY speed set successfully
• ESP_FAIL: Set Ethernet PHY speed failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_duplex (phy_802_3_t *phy_802_3, eth_duplex_t duplex)
```

Set Ethernet PHY duplex mode.

Parameters
• `phy_802_3` -- IEEE 802.3 PHY object infrastructure
• `duplex` -- new duplex mode for Ethernet PHY link

---

Espressif Systems

Submit Document Feedback
Returns

- ESP_OK: Ethernet PHY duplex mode set successfully
- ESP_ERR_INVALID_STATE: unable to set duplex mode to Half if loopback is enabled
- ESP_FAIL: Set Ethernet PHY duplex mode failed because some error occurred

esp_err_t esp_eth_phy_802_3_set_link (phy_802_3_t *phy_802_3, eth_link_t link)
Set Ethernet PHY link status.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure
- link -- new link status

Returns

- ESP_OK: Ethernet PHY link set successfully

esp_err_t esp_eth_phy_802_3_init (phy_802_3_t *phy_802_3)
Initialize Ethernet PHY.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure

Returns

- ESP_OK: Ethernet PHY initialized successfully

esp_err_t esp_eth_phy_802_3_deinit (phy_802_3_t *phy_802_3)
Power off Ethernet PHY.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure

Returns

- ESP_OK: Ethernet PHY powered off successfully

esp_err_t esp_eth_phy_802_3_del (phy_802_3_t *phy_802_3)
Delete Ethernet PHY infrastructure.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure

Returns

- ESP_OK: Ethernet PHY infrastructure deleted

esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)
Perform hardwarereset with specific reset pin assertion time.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure
- reset_assert_us -- Hardware reset pin assertion time

Returns

- ESP_OK: reset Ethernet PHY successfully

esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)
Detect PHY address.

Parameters

- eth -- Mediator of Ethernet driver
- detected_addr -- [out] a valid address after detection

Returns

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)
Performs basic PHY chip initialization.

Parameters

- phy_802_3 -- IEEE 802.3 PHY object infrastructure

---

Note: It should be called as the first function in PHY specific driver instance
Returns

- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)`

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

### Parameters

- `phy_802_3` -- IEEE 802.3 PHY object info structure

### Returns

- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t *oui)`

Reads raw content of OUI field.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `oui` -- [out] OUI value

**Returns**

- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid `oui` argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t *model, uint8_t *rev)`

Reads manufacturer’s model and revision number.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `model` -- [out] Manufacturer’s model number (can be NULL when not required)
- `rev` -- [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**

- ESP_OK: Manufacturer’s info read successfully
- ESP_FAIL: Manufacturer’s info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_get_mmd_addr (phy_802_3_t *phy_802_3, uint8_t *devaddr, uint16_t *mmd_addr)`

Reads MDIO device’s internal address register.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- [out] Current address stored in device’s register

**Returns**

- ESP_OK: Address register read successfully
- ESP_FAIL: Address register read failed because of some error occurred
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```c
esp_err_t esp_eth_phy_802_3_set_mmd_addr (phy_802_3_t *phy_802_3, uint8_t devaddr, uint16_t mmd_addr)
```

Write to DIO device's internal address register.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object inforstructure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- [out] New value of MDIO device's address register value

**Returns**
- ESP_OK: Address register written to successfully
- ESP_FAIL: Address register write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```c
esp_err_t esp_eth_phy_802_3_read_mmd_data (phy_802_3_t *phy_802_3, uint8_t devaddr, esp_eth_phy_802_3_mmd_func_t function, uint32_t *data)
```

Read data of MDIO device's memory at address register.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object inforstructure
- `devaddr` -- Address of MDIO device
- `function` -- MMD function
- `data` -- [out] Data read from the device's memory

**Returns**
- ESP_OK: Memory read successfully
- ESP_FAIL: Memory read failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

```c
esp_err_t esp_eth_phy_802_3_write_mmd_data (phy_802_3_t *phy_802_3, uint8_t devaddr, esp_eth_phy_802_3_mmd_func_t function, uint32_t data)
```

Write data to MDIO device's memory at address register.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object inforstructure
- `devaddr` -- Address of MDIO device
- `function` -- MMD function
- `data` -- [out] Data to write to the device's memory

**Returns**
- ESP_OK: Memory written successfully
- ESP_FAIL: Memory write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

```c
esp_err_t esp_eth_phy_802_3_read_mmd_register (phy_802_3_t *phy_802_3, uint8_t devaddr, uint16_t mmd_addr, uint32_t *data)
```

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and read contents to *data.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object inforstructure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- Address of MDIO device register
- `data` -- [out] Data read from the device's memory

**Returns**
- ESP_OK: Memory read successfully
- ESP_FAIL: Memory read failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```
esp_err_t esp_eth_phy_802_3_write_mmd_register(phy_802_3_t *phy_802_3, uint8_t devaddr, uint16_t mmd_addr, uint32_t data)
```

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and write data.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- Address of MDIO device register
- `data` -- [out] Data to write to the device’s memory

**Returns**
- ESP_OK: Memory written to successfully
- ESP_FAIL: Memory write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```
inline phy_802_3_t *esp_eth_phy_into_phy_802_3 (esp_eth_phy_t *phy)
```

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy` -- Ethernet PHY instance

**Returns**
- `phy_802_3_t`*
  - address to parent IEEE 802.3 PHY object infostructure

```
esp_err_t esp_eth_phy_802_3_obj_config_init (phy_802_3_t *phy_802_3, const eth_phy_config_t *config)
```

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy_802_3` -- Address to IEEE 802.3 PHY object infostructure
- `config` -- Configuration of the IEEE 802.3 PHY object

**Returns**
- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid config argument

**Structures**

```
struct phy_802_3_t
```

IEEE 802.3 PHY object infostructure.

**Public Members**

```
esp_eth_phy_t parent
```

Parent Ethernet PHY instance

```
extp_eth_mediator_t *eth
```

Mediator of Ethernet driver

```
int addr
```

PHY address

```
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)
uint32_t **autonego_timeout_ms**
Auto-negotiation timeout value (Unit: ms)

*eth_link_t** link_status
Current Link status

int reset_gpio_num
Reset GPIO number, -1 means no hardware reset

**Enumerations**

enum esp_eth_phy_802_3_mmd_func_t
IEEE 802.3 MMD modes enumeration.
Values:

enumerator MMD_FUNC_ADDRESS

eenumerator MMD_FUNC_DATA_NOINCR

eenumerator MMD_FUNC_DATA_RWINCR

eenumerator MMD_FUNC_DATA_WINCR

**Header File**

- components/esp_eth/include/esp_eth_netif_glue.h
- This header file can be included with:

```cpp
#include "esp_eth_netif_glue.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

or

```cmake
PRIV_REQUIRES esp_eth
```

**Functions**

`esp_eth_netif_glue_handle_t esp_eth_new_netif_glue (esp_eth_handle_t eth_hdl)`
Create a netif glue for Ethernet driver.

**Note:** Netif glue is used to attach io driver to TCP/IP netif

**Parameters**

- eth_hdl -- Ethernet driver handle

**Returns**
- glue object, which inherits esp_netif_driver_base_t

`esp_err_t esp_eth_del_netif_glue (esp_eth_netif_glue_handle_t eth_netif_glue)`
Delete netif glue of Ethernet driver.

**Parameters**

- eth_netif_glue -- netif glue

**Returns**
- ESP_OK: delete netif glue successfully
Chapter 2. API Reference

Type Definitions

typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t

Handle of netif glue - an intermediate layer between netif and Ethernet driver.
Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

2.5.3 Thread

Thread

Introduction

Thread is an IP-based mesh networking protocol. It is based on the 802.15.4 physical and MAC layer.

Application Examples

The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`
- The Thread Border Router `openthread/ot_br`
- The Thread Radio Co-Processor `openthread/ot_rcp`

API Reference

For manipulating the Thread network, the OpenThread API shall be used. The OpenThread API docs can be found at the OpenThread API docs.

ESP-IDF provides extra APIs for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- `components/openthread/include/esp_openthread.h`

This header file can be included with:

```c
#include "esp_openthread.h"
```

This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```

Functions

```c
esp_err_t esp_openthread_init (const esp_openthalunknown

Initializes the full OpenThread stack.

Note: The OpenThread instance will also be initialized in this function.

Parameters

- `init_config` -- [in] The initialization configuration.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized
**esp_err_t esp_openthread_auto_start (otOperationalDatasetTlvs *datasetTlvs)**

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters**

- **datasetTlvs** -- [in] The operational dataset (TLV encoded), if it’s NULL, the function will generate the dataset based on the configurations from kconfig.

**Returns**

- ESP_OK on success
- ESP_FAIL on failures

**esp_err_t esp_openthread_launch_mainloop (void)**

Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

**esp_err_t esp_openthread_deinit (void)**

This function performs OpenThread stack and platform driver deinitialization.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

**otInstance *esp_openthread_get_instance (void)**

This function acquires the underlying OpenThread instance.

**Note:** This function can be called on other tasks without lock.

**Returns**

- The OpenThread instance pointer

**Header File**

- components/openthread/include/esp_openthread_types.h
- This header file can be included with:

```c
#include "esp_openthread_types.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```

**Structures**

**struct esp_openthread_role_changed_event_t**

OpenThread role changed event data.
Public Members

otDeviceRole previous_role
Previous Thread role

otDeviceRole current_role
Current Thread role

struct esp_openthread_mainloop_context_t
This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t
The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

gpio_num_t rx_pin
UART RX pin

gpio_num_t tx_pin
UART TX pin

struct esp_openthread_spi_host_config_t
The spi port config for OpenThread.
Public Members

`spi_host_device_t host_device`
SPI host device

`spi_dma_chan_t dma_channel`
DMA channel

`spi_bus_config_t spi_interface`
SPI bus

`spi_device_interface_config_t spi_device`
SPI peripheral device

`gpio_num_t intr_pin`
SPI interrupt pin

struct `esp_openthread_spi_slave_config_t`
The spi slave config for OpenThread.

Public Members

`spi_host_device_t host_device`
SPI host device

`spi_bus_config_t bus_config`
SPI bus config

`spi_slave_interface_config_t slave_config`
SPI slave config

`gpio_num_t intr_pin`
SPI interrupt pin

struct `esp_openthread_radio_config_t`
The OpenThread radio configuration.

Public Members

`esp_openthread_radio_mode_t radio_mode`
The radio mode

`esp_openthread_uart_config_t radio_uart_config`
The uart configuration to RCP

`esp_openthread_spi_host_config_t radio_spi_config`
The spi configuration to RCP
struct `esp_openthread_host_connection_config_t`

The OpenThread host connection configuration.

**Public Members**

`esp_openthread_host_connection_mode_t host_connection_mode`

The host connection mode

`esp_openthread_uart_config_t host_uart_config`

The uart configuration to host

`usb_serial_jtag_driver_config_t host_usb_config`

The usb configuration to host

`esp_openthread_spi_slave_config_t spi_slave_config`

The spi configuration to host

struct `esp_openthread_port_config_t`

The OpenThread port specific configuration.

**Public Members**

`const char *storage_partition_name`

The partition for storing OpenThread dataset

`uint8_t netif_queue_size`

The packet queue size for the network interface

`uint8_t task_queue_size`

The task queue size

struct `esp_openthread_platform_config_t`

The OpenThread platform configuration.

**Public Members**

`esp_openthread_radio_config_t radio_config`

The radio configuration

`esp_openthread_host_connection_config_t host_config`

The host connection configuration

`esp_openthread_port_config_t port_config`

The port configuration
Type Definitions

typedef void (*esp_openthread_rcp_failure_handler)(void)

Enumerations

enum esp_openthread_event_t
  OpenThread event declarations.

Values:

enumerator OPENTHREAD_EVENT_START
  OpenThread stack start

enumerator OPENTHREAD_EVENT_STOP
  OpenThread stack stop

enumerator OPENTHREAD_EVENT_DETACHED
  OpenThread detached

enumerator OPENTHREAD_EVENT_ATTACHED
  OpenThread attached

enumerator OPENTHREAD_EVENT_ROLE_CHANGED
  OpenThread role changed

enumerator OPENTHREAD_EVENT_IF_UP
  OpenThread network interface up

enumerator OPENTHREAD_EVENT_IF_DOWN
  OpenThread network interface down

enumerator OPENTHREAD_EVENT_GOT_IP6
  OpenThread stack added IPv6 address

enumerator OPENTHREAD_EVENT_LOST_IP6
  OpenThread stack removed IPv6 address

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN
  OpenThread stack joined IPv6 multicast group

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE
  OpenThread stack left IPv6 multicast group

enumerator OPENTHREAD_EVENT_TREL_ADD_IP6
  OpenThread stack added TREL IPv6 address

enumerator OPENTHREAD_EVENT_TREL_REMOVE_IP6
  OpenThread stack removed TREL IPv6 address
enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**
OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD_EVENT_SET_DNS_SERVER**
OpenThread stack set DNS server

enum **esp_openthread_radio_mode_t**
The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**
Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**
UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**
SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_MAX**
Using for parameter check

enum **esp_openthread_host_connection_mode_t**
How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**
Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**
CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_CLI_USB**
CLI USB connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**
RCP UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_SPI**
RCP SPI connection to the host

enumerator **HOST_CONNECTION_MODE_MAX**
Using for parameter check

**Header File**

- components/openthread/include/esp_openthread_lock.h
- This header file can be included with:
#include "esp_openthread_lock.h"

• This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

## Functions

**esp_err_t esp_openthread_lock_init (void)**

This function initializes the OpenThread API lock.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void esp_openthread_lock_deinit (void)**

This function deinitializes the OpenThread API lock.

**bool esp_openthread_lock_acquire (TickType_t block_ticks)**

This function acquires the OpenThread API lock.

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

**Parameters** `block_ticks` [in] The maximum number ofRTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void esp_openthread_lock_release (void)**

This function releases the OpenThread API lock.

**bool esp_openthread_task_switching_lock_acquire (TickType_t block_ticks)**

This function acquires the OpenThread API task switching lock.

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it’s not allowed, since the previous OpenThread API lock is not released yet. This task_switching lock allows the OpenThread API can be called in this case.

**Note:** Please use esp_openthread_lock_acquire() for normal cases.

**Parameters** `block_ticks` [in] The maximum number ofRTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void esp_openthread_task_switching_lock_release (void)**

This function releases the OpenThread API task switching lock.
Header File

- components/openthread/include/esp_openthread_netif_glue.h
- This header file can be included with:

```c
#include "esp_openthread_netif_glue.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```

Functions

**void** `esp_openthread_netif_glue_init` (**const** `esp_openthread_platform_config_t` *config*)

This function initializes the OpenThread network interface glue.

**Parameters**
- `config` -- [in] The platform configuration.

**Returns**
- glue pointer on success
- NULL on failure

**void** `esp_openthread_netif_glue_deinit` (**void**)

This function deinitializes the OpenThread network interface glue.

**esp_netif_t** `esp_openthread_get_netif` (**void**)

This function acquires the OpenThread netif.

**Returns**
- The OpenThread netif or NULL if not initialized.

Macros

**ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD** (**)

Default configuration reference of OT esp-netif.

**ESP_NETIF_DEFAULT_OPENTHREAD** (**)

Header File

- components/openthread/include/esp_openthread_border_router.h
- This header file can be included with:

```c
#include "esp_openthread_border_router.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```

Functions

**void** `esp_openthread_set_backbone_netif` (**esp_netif_t** *backbone_netif*)

Sets the backbone interface used for border routing.

**Note:** This function must be called before esp_openthread_init
### Chapter 2. API Reference

#### Parameters

**backbone_netif** -- [in] The backbone network interface (WiFi or ethernet)

#### esp_err_t esp_openthread_border_router_init (void)

Initializes the border router features of OpenThread.

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FAIL on other failures

#### esp_err_t esp_openthread_border_router_deinit (void)

Deinitializes the border router features of OpenThread.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FAIL on other failures

#### esp_netif_t *esp_openthread_get_backbone_netif (void)

Gets the backbone interface of OpenThread border router.

**Returns**

The backbone interface or NULL if border router not initialized.

#### void esp_openthread_register_rtp_failure_handler (esp_openthread_rtp_failure_handler handler)

Registers the callback for RCP failure.

#### esp_err_t esp_openthread_rtp_deinit (void)

Deinitializes the connection to RCP.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if fail to deinitialize RCP

#### esp_err_t esp_openthread_rtp_init (void)

Initializes the connection to RCP.

**Returns**

- ESP_OK on success
- ESP_FAIL if fail to initialize RCP

**Thread** is an IPv6-based mesh networking technology for IoT.

Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

### 2.5.4 ESP-NETIF

**ESP-NETIF**

The purpose of the ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This allows applications to choose between IP stacks in the future.
- The APIs it provides are thread-safe, even if the underlying TCP/IP stack APIs are not.
ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation-agnostic and allows different implementations.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to components/esp_netif_stack/README.md.

Some ESP-NETIF API functions are intended to be called by application code, for example, to get or set interface IP addresses, and configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called by the default network event handlers.

**ESP-NETIF Architecture**

![Diagram of ESP-NETIF Architecture](continues on next page)
Data and Event Flow in the Diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagate to the driver, user code, and network stack
- User settings and runtime configuration

ESP-NETIF Interaction

A) User Code, Boilerplate  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and is outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure it with
   - ESP-NETIF specific options (flags, behavior, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - Use default handlers for common interfaces defined in IO drivers; or define a specific handler for customized behavior or new interfaces
   - Register handlers for app-related events (such as IP lost or acquired)

B) Interaction with network interfaces using ESP-NETIF API

1) Gets and sets TCP/IP-related parameters (DHCP, IP, etc)
2) Receives IP events (connect or disconnect)
3) Controls application lifecycle (set interface up or down)

B) Communication Driver, IO Driver, and Media Driver  Communication driver plays these two important roles in relation to ESP-NETIF:

1) Event handlers: Defines behavior patterns of interaction with ESP-NETIF (e.g., ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input or output functions to use ESP-NETIF transmit, receive, and free receive buffer
   - Installs driver_transmit to the appropriate ESP-NETIF object so that outgoing packets from the network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to the network stack

C) ESP-NETIF  ESP-NETIF serves as an intermediary between an IO driver and a network stack, connecting the packet data path between the two. It provides a set of interfaces for attaching a driver to an ESP-NETIF object at runtime and configures a network stack during compiling. Additionally, a set of APIs is provided to control the network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface can be divided into six groups:
1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input or Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters API for basic network interface properties
5) Network stack abstraction API: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
   • **SNTP API**
6) Driver conversion utilities API

**D) Network Stack** The network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is a mechanism in ESP-IDF used to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from the user application. Its typical usage in the embedded world might be the implementation of non-IP-related protocols, e.g., PTP, Wake on LAN. Note that only Ethernet (IEEE 802.3) is currently supported.

From a user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS, which provides file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). To learn more, refer to **Virtual Filesystem Component**.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configurations can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as a generic entry point to the Layer 2 infrastructure. What is important is then the specific configuration of the particular file descriptor. It can be configured to give access to a specific Network Interface identified by `if_key` (e.g., `ETH_DEF`) and to filter only specific frames based on their type (e.g., Ethernet type in the case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with the IP stack and so the IP-related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though this option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from the perspective of the user’s application, as it only gets access to the frame types it is interested in, and the remaining traffic is either passed to other L2 TAP file descriptors or to the IP stack.

**ESP-NETIF L2 TAP Interface Usage Manual**

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

`open()` Once the ESP-NETIF L2 TAP is registered, it can be opened at path name "/dev/net/tap". The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with a different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with the `O_NONBLOCK` file status flag to make sure the `read()` does not block. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned, and `errno` is set to indicate the error.
ioctl()  The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior to its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- **L2TAP_S_INTF_DEVICE** - bounds the file descriptor to a specific Network Interface that is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- **L2TAP_S_DEVICE_DRV_HNDL** - is another way to bound the file descriptor to a specific Network Interface. In this case, the Network interface is identified directly by IO Driver handle (e.g., `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- **L2TAP_S_RCV_FILTER** - sets the filter to frames with the type to be passed to the file descriptor. In the case of Ethernet frames, the frames are to be filtered based on the Length and Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field, and all frames with values in interval <0, 0x05DC> at that field are passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by the user's application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames that are equal to the set value are to be passed to the file descriptor.

All above-set configuration options have a getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to a specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to make `L2TAP_S_RCV_FILTER` option available.

**Note:** VLAN-tagged frames are currently not recognized. If the user needs to process VLAN-tagged frames, they need a set filter to be equal to the VLAN tag (i.e., 0x8100 or 0x88A8) and process the VLAN-tagged frames in the user application.

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when the user's application does not require the usage of an IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **EACCES** - options change is denied in this state (e.g., file descriptor has not been bounded to Network interface yet).
- **EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptors on that same Network interface.
- **ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.
- **ENOSYS** - unsupported operation, passed configuration option does not exist.

**fcntl()**  `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with the file descriptor:

- **F_GETFD** - the function returns the file descriptor flags, and the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **ENOSYS** - unsupported command.
read()  Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on the actual state of the `O_NONBLOCK` file status flag. When the file status flag is set to blocking, the read operation waits until a frame is received and the context is switched to other tasks. When the file status flag is set to non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX QUEUE_SIZE` Kconfig option. Once the number of queued frames reached a configured threshold, the newly arrived frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when the size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EAGAIN - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

write()  A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. The user's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of an Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header, and user data. The length of these fields is as follows:

<table>
<thead>
<tr>
<th>Destination MAC</th>
<th>Source MAC</th>
<th>Type/Length</th>
<th>Payload (protocol header/data)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 B</td>
<td>6 B</td>
<td>2 B</td>
<td>0-1486 B</td>
</tr>
</tbody>
</table>

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when the size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EBADMSG - The Ethernet type of the frame is different from the file descriptor configured filter.
* EIO - Network interface not available or busy.

close()  Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread-safe and can be called from a different task than the file descriptor is actually used. If such a situation occurs and one task is blocked in the I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with an error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.

select()  Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to make the `select()` function available.

SNTP API  You can find a brief introduction to SNTP in general, its initialization code, and basic modes in Section SNTP Time Synchronization in System Time.
This section provides more details about specific use cases of the SNTP service, with statically configured servers, or use the DHCP-provided servers, or both. The workflow is usually very simple:

1) Initialize and configure the service using `esp_netif_sntp_init()`. This operations can only be called once (unless the SNTP service has been destroyed by `esp_netif_sntp_deinit()`)

2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.

3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).

4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

### Basic Mode with Statically Defined Server(s)

Initialize the module with the default configuration after connecting to the network. Note that it is possible to provide multiple NTP servers in the configuration struct:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2, ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"));
esp_netif_sntp_init(&config);
```

**Note:** If we want to configure multiple SNTP servers, we have to update the lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

### Use DHCP-Obtained SNTP Server(s)

First of all, we have to enable the lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and without the NTP server:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offer from the DHCP
esp_netif_sntp_init(&config);
```

Then, once we are connected, we could start the service using:

```c
esp_netif_sntp_start();
```

**Note:** It is also possible to start the service during initialization (default `config.start=true`). This would likely to cause the initial SNTP request to fail (since we are not connected yet) and lead to some back-off time for subsequent requests.

### Use Both Static and Dynamic Servers

Very similar to the scenario above (DHCP provided SNTP server), but in this configuration, we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when the DHCP-provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining a DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep the DHCP provided server at index 0, and the statically configured server at index 1).

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start the SNTP service explicitly
=>(after connecting)
```

(continues on next page)
config.server_from_dhcp = true;  // accept the NTP offers from DHCP
config.renew_servers_after_new_IP = true;  // let esp-netif update the configured SNTP server(s) after receiving the DHCP lease
config.index_of_first_server = 1;  // updates from server num 1, leaving server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP;  // IP event on which we refresh the configuration

Then we start the service normally with esp_netif_sntp_start().

ESP-NETIF Programmer's Manual  Please refer to the following example to understand the initialization process of the default interface:

- Wi-Fi Station: wifi/getting_started/station/main/station_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
- L2 TAP: protocols/l2tap/main/l2tap_main.c
- Wi-Fi Access Point: wifi/getting_started/softAP/main/softap_example_main.c

For more specific cases, please consult this guide: ESP-NETIF Custom I/O Driver.

Wi-Fi Default Initialization  The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- esp_netif_create_default_wifi_sta()
- esp_netif_create_default_wifi_ap()

Please note that these functions return the esp_netif handle, i.e., a pointer to a network interface object allocated and configured with default settings, as a consequence, which means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using esp_netif_destroy_default_wifi().
- These default interfaces must not be created multiple times unless the created handle is deleted using esp_netif_destroy().
- When using Wi-Fi in AP+STA mode, both these interfaces have to be created.

API Reference

Header File

- components/esp_netif/include/esp_netif.h
- This header file can be included with:

```
#include "esp_netif.h"
```

- This header file is a part of the API provided by the esp_netif component. To declare that your component depends on esp_netif, add the following to your CMakeLists.txt:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```
**Functions**

`esp_err_t esp_netif_init (void)`

Initialize the underlying TCP/IP stack.

**Note:** This function should be called exactly once from application code, when the application starts up.

**Returns**
- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit (void)`

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Returns**
- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new (const esp_netif_config_t *esp_netif_config)`

Creates an instance of a new esp-netif object based on provided config.

**Parameters**
- `esp_netif_config` -- [in] pointer to esp-netif configuration

**Returns**
- pointer to esp-netif object on success
- NULL otherwise

void `esp_netif_destroy (esp_netif_t *esp_netif)`

Destroys the esp_netif object.

**Parameters**
- `esp_netif` -- [in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`

Configures driver related options of esp_netif object.

**Parameters**
- `esp_netif` -- [inout] pointer to the object to be configured
- `driver_config` -- [in] pointer esp-netif io driver related configuration

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

`esp_err_t esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**
- `esp_netif` -- [inout] pointer to esp_netif object to be attached
- `driver_handle` -- [in] pointer to the driver handle

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's post_attach callback failed

**esp_err_t esp_netif_receive** *(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)*

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**
- `esp_netif` -- *in* Handle to esp-netif instance
- `buffer` -- *in* Received data
- `len` -- *in* Length of the data frame
- `eb` -- *in* Pointer to internal buffer (used in Wi-Fi driver)

**Returns**
- ESP_OK

void **esp_netif_action_start** *(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` -- *in* Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void **esp_netif_action_stop** *(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IO driver stop event.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` -- *in* Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void **esp_netif_action_connected** *(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IO driver connected event.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` -- *in* Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void **esp_netif_action_disconnected** *(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IO driver disconnected event.
Note: This API can be directly used as event handler

Parameters
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void `esp_netif_action_got_ip` (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void `esp_netif_action_join_ip6_multicast_group` (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group join.

Note: This API can be directly used as event handler

Parameters
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void `esp_netif_action_leave_ip6_multicast_group` (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group leave.

Note: This API can be directly used as event handler

Parameters
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

void `esp_netif_action_add_ip6_address` (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 address added by the underlying stack.

Note: This API can be directly used as event handler
Chapter 2. API Reference

Parameters
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

```c
void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note:** This API can be directly used as event handler

```c
esp_err_t esp_netif_set_default_netif (esp_netif_t *esp_netif)
```

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK on success

```c
esp_netif_t *esp_netif_get_default_netif (void)
```

Getter function of the default netif.

This API returns the selected default netif.

**Returns**
- Handle to esp-netif instance of the default netif.

```c
esp_err_t esp_netif_join_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to join a IPv6 multicast group.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `addr` -- [in] The multicast group to join

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

```c
esp_err_t esp_netif_leave_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to leave a IPv6 multicast group.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `addr` -- [in] The multicast group to leave

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM
`esp_err_t esp_netif_set_mac(esp_netif_t *esp_netif, uint8_t mac[])`

Set the mac address for the interface instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `mac` -- [in] Desired mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

`esp_err_t esp_netif_get_mac(esp_netif_t *esp_netif, uint8_t mac[])`

Get the mac address for the interface instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `mac` -- [out] Resultant mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

`esp_err_t esp_netif_set_hostname(esp_netif_t *esp_netif, const char *hostname)`

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

`esp_err_t esp_netif_get_hostname(esp_netif_t *esp_netif, const char **hostname)`

Get interface hostname.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `hostname` -- [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

`bool esp_netif_is_netif_up(esp_netif_t *esp_netif)`

Test if supplied interface is up or down.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- true - Interface is up
- false - Interface is down

`esp_err_t esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.
Chapter 2. API Reference

Parameters
- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

Returns
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

### esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Parameters
- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

Returns
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

### esp_err_t esp_netif_set_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note:** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Parameters
- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [in] IP information to set on the specified interface

Returns
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

### esp_err_t esp_netif_set_old_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEMEVENT ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Parameters
• esp_netif -- [in] Handle to esp-netif instance
• ip_info -- [in] Store the old IP information for the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)
```
Get net interface index from network stack implementation.

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

**Parameters**
- esp_netif -- [in] Handle to esp-netif instance

**Returns**
implementation specific index of interface represented with supplied esp_netif

```c
esp_err_t esp_netif_get_netif_impl_name (esp_netif_t *esp_netif, char *name)
```
Get net interface name from network stack implementation.

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Parameters**
- esp_netif -- [in] Handle to esp-netif instance
- name -- [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_napt_enable (esp_netif_t *esp_netif)
```
Enable NAPT on an interface.

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

**Parameters**
- esp_netif -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

```c
esp_err_t esp_netif_napt_disable (esp_netif_t *esp_netif)
```
Disable NAPT on an interface.

**Parameters**
- esp_netif -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

```c
esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```
Set or Get DHCP server option.

**Parameters**
Chapter 2. API Reference

- esp_netif -- [in] Handle to esp-netif instance
- opt_op -- [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- opt_id -- [in] Option index to get or set, must be one of the supported enum values.
- opt_val -- [inout] Pointer to the option parameter.
- opt_len -- [in] Length of the option parameter.

Returns:
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

Parameters:
- esp_netif -- [in] Handle to esp-netif instance
- opt_op -- [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- opt_id -- [in] Option index to get or set, must be one of the supported enum values.
- opt_val -- [inout] Pointer to the option parameter.
- opt_len -- [in] Length of the option parameter.

Returns:
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

Note: The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

Parameters:
- esp_netif -- [in] Handle to esp-netif instance

Returns:
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)

Stop DHCP client (only if enabled in interface object)

Note: Calling action_netif_stop() will also stop the DHCP Client if it is running.

Parameters:
- esp_netif -- [in] Handle to esp-netif instance

Returns:
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP client status.
Parameters
• `esp_netif` -- [in] Handle to esp-netif instance
• `status` -- [out] If successful, the status of DHCP client will be returned in this argument.

Returns
• ESP_OK

Get DHCP Server status.

Parameters
• `esp_netif` -- [in] Handle to esp-netif instance
• `status` -- [out] If successful, the status of the DHCP server will be returned in this argument.

Returns
• ESP_OK

Start DHCP server (only if enabled in interface object)

Parameters `esp_netif` -- [in] Handle to esp-netif instance

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Stop DHCP server (only if enabled in interface object)

Parameters `esp_netif` -- [in] Handle to esp-netif instance

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

Parameters
• `esp_netif` -- [in] Handle to esp-netif instance
• `num` -- [in] Number of clients with specified MAC addresses in the array of pairs
• `mac_ip_pair` -- [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

Returns
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
• ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the DHCP server itself.
This function can override it by setting server type ESP_NETIF_DNS_MAIN.
Other DNS Server types are not supported for the DHCP server.
To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `type` -- [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -- [in] DNS Server address to set

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `type` -- [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -- [out] DNS Server result is written here on success

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.
This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `if_ip6` -- [out] IPv6 information will be returned in this argument if successful.

**Returns**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.
Chapter 2. API Reference

Parameters
• **esp_netif** -- [in] Handle to esp-netif instance
• **if_ip6** -- [out] IPv6 information will be returned in this argument if successful.

Returns
• **ESP_OK**
• **ESP_FAIL** If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
```

Get all IPv6 addresses of the specified interface.

Parameters
• **esp_netif** -- [in] Handle to esp-netif instance
• **if_ip6** -- [out] Array of IPv6 addresses will be copied to the argument

Returns
number of returned IPv6 addresses

```c
esp_err_t esp_netif_add_ip6_address (esp_netif_t *esp_netif, const esp_ip6_addr_t addr, bool preferred)
```

Cause the TCP/IP stack to add an IPv6 address to the interface.

Parameters
• **esp_netif** -- [in] Handle to esp-netif instance
• **addr** -- [in] The address to be added
• **preferred** -- [in] The preferred status of the address

Returns
• **ESP_OK**
• **ESP_ERR_ESP_NETIF_INVALID_PARAMS**
• **ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED**
• **ESP_ERR_NO_MEM**

```c
esp_err_t esp_netif_remove_ip6_address (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to remove an IPv6 address from the interface.

Parameters
• **esp_netif** -- [in] Handle to esp-netif instance
• **addr** -- [in] The address to be removed

Returns
• **ESP_OK**
• **ESP_ERR_ESP_NETIF_INVALID_PARAMS**
• **ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED**
• **ESP_ERR_NO_MEM**

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```

Sets IPv4 address to the specified octets.

Parameters
• **addr** -- [out] IP address to be set
• **a** -- the first octet (127 for IP 127.0.0.1)
• **b** --
• **c** --
• **d** --

```c
char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
```

Converts numeric IP address into decimal dotted ASCII representation.

Parameters
• **addr** -- ip address in network order to convert
• **buf** -- target buffer where the string is stored
• **buflen** -- length of buf

Returns
either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small
### esp_ip4addr_aton

```c
uint32_t esp_ip4addr_aton(const char *addr)
```

Ascii internet address interpretation routine. The value returned is in network order.

**Parameters**
- `addr` -- IP address in ascii representation (e.g. "127.0.0.1")

**Returns**
- `ip` address in network order

### esp_netif_str_to_ip4

```c
esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)
```

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

**Parameters**
- `src` -- [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- `dst` -- [out] Address of the target esp_ip4_addr_t structure to receive converted address

**Returns**
- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

### esp_netif_str_to_ip6

```c
esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)
```

Converts Ascii internet IPv6 address into esp_ip6_addr_t. Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1"

**Parameters**
- `src` -- [in] IPv6 address in ascii representation (e.g. "2001:0db8:85a3:0000:0000:0000:0002:0001")
- `dst` -- [out] Address of the target esp_ip6_addr_t structure to receive converted address

**Returns**
- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

### esp_netif_get_io_driver

```c
esp_netif_t esp_netif_get_io_driver(esp_netif_t *esp_netif)
```

Gets media driver handle for this esp-netif instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- `opaque pointer of related IO driver`

### esp_netif_get_handle_from_ifkey

```c
esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)
```

Searches over a list of created objects to find an instance with supplied if key.

**Parameters**
- `if_key` -- Textual description of network interface

**Returns**
- `Handle to esp-netif instance`

### esp_netif_get_flags

```c
esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)
```

Returns configured flags for this interface.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- `Configuration flags`

### esp_netif_get_ifkey

```c
const char *esp_netif_get_ifkey(esp_netif_t *esp_netif)
```

Returns configured interface key for this esp-netif instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- `Textual description of related interface`

### esp_netif_get_desc

```c
const char *esp_netif_get_desc(esp_netif_t *esp_netif)
```

Returns configured interface type for this esp-netif instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- `Enumerated type of this interface, such as station, AP, ethernet`

### esp_netif_get_route_prio

```c
int esp_netif_get_route_prio(esp_netif_t *esp_netif)
```

Returns configured routing priority number.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
Returns  Integer representing the instance's route-prio, or -1 if invalid paramters

```c
int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
```
Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance  
- `event_type` -- (either get or lost IP)

**Returns**  specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event_type is not known

```c
esp_netif_t* esp_netif_next(esp_netif_t *esp_netif)
```
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Note:** This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather that within a single iteration. Therefore it is recommended to iterate over the interfaces inside `esp_netif_tcpip_exec()`

**Note:** This API is deprecated. Please use `esp_netif_nextUnsafe()` directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using `esp_netif_tcpip_exec()`, or use `esp_netif_find_if()` to search in the list of netifs with defined predicate.

```c
esp_netif_t* esp_netif_nextUnsafe(esp_netif_t *esp_netif)
```
Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using `esp_netif_tcpip_exec()`, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance  

**Returns**  First netif from the list if supplied parameter is NULL, next one otherwise

```c
esp_netif_t* esp_netif_find_if(esp_netif_find_predicate_t fn, void *ctx)
```
Return a netif pointer for the first interface that meets criteria defined by the callback.

**Parameters**
- `fn` -- Predicate function returning true for the desired interface  
- `ctx` -- Context pointer passed to the predicate, typically a descriptor to compare with

**Returns**  valid netif pointer if found, NULL if not

```c
size_t esp_netif_get_nr_of_ifs(void)
```
Returns number of registered esp_netif objects.

**Returns**  Number of esp_netifs

```c
void esp_netif_netstack_buf_ref(void *netstack_buf)
```
Increase the reference counter of net stack buffer

**Parameters**
- `netstack_buf` -- [in] the net stack buffer

```c
void esp_netif_netstack_buf_free(void *netstack_buf)
```
Free the net stack buffer

**Parameters**
- `netstack_buf` -- [in] the net stack buffer

```c
esp_err_t esp_netif_tcpip_exec(esp_netif_callback_fn fn, void *ctx)
```
Utility to execute the supplied callback in TCP/IP context.

**Parameters**
Chapter 2. API Reference

- **fn** -- Pointer to the callback
- **ctx** -- Parameter to the callback

**Returns** The error code (esp_err_t) returned by the callback

**Type Definitions**

typedef bool (*esp_netif_find_predicate_t)(esp_netif_t *netif, void *ctx)

Predicate callback for `esp_netif_find_if()` used to find interface which meets defined criteria.

typedef esp_err_t (*esp_netif_callback_fn)(void *ctx)

TCP/IP thread safe callback used with `esp_netif_tcpip_exec()`

**Header File**

- components/esp_netif/include/esp_netif_sntp.h
- This header file can be included with:

  ```
  #include "esp_netif_sntp.h"
  ```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakelists.txt:

  ```
  REQUIREES esp_netif
  ```

  or

  ```
  PRIV_REQUIREES esp_netif
  ```

**Functions**

`esp_err_t esp_netif_sntp_init(const esp_sntp_config_t *config)`

Initialize SNTP with supplied config struct.

**Parameters**

- **config** -- Config struct

**Returns** ESP_OK on success

`esp_err_t esp_netif_sntp_start(void)`

Start SNTP service if it wasn’t started during init (config.start = false) or restart it if already started.

**Returns** ESP_OK on success

`void esp_netif_sntp_deinit(void)`

Deinitialize esp_netif SNTP module.

`esp_err_t esp_netif_sntp_sync_wait(TickType_t tout)`

Wait for time sync event.

**Parameters**

- **tout** -- Specified timeout in RTOS ticks

**Returns**

- ESP_TIMEOUT if sync event didn’t came within the timeout
- ESP_ERR_NO_FINISHED if the sync event came, but we’re in smooth update mode and still in progress (SNTP_SYNC_STATUS_IN_PROGRESS) ESP_OK if time sync’ed

`esp_err_t esp_netif_sntp_reachability(unsigned int index, unsigned int *reachability)`

Returns SNTP server’s reachability shift register as described in RFC 5905.

**Parameters**

- **index** -- Index of the SERVER
- **reachability** -- reachability shift register

**Returns** ESP_OK on success, ESP_ERR_INVALID_STATE if SNTP not initialized ESP_ERR_INVALID_ARG if invalid arguments
Structures

struct esp_sntp_config
    SNTP configuration struct.

Public Members

bool smooth_sync
    set to true if smooth sync required

bool server_from_dhcp
    set to true to request NTP server config from DHCP

bool wait_for_sync
    if true, we create a semaphore to signal time sync event

bool start
    set to true to automatically start the SNTP service

double incoming_time
    set to the time the incoming time is observed

double offset
    set to the time offset from the observed incoming time

double skew
    set to the time skew from the observed incoming time

double age
    set to the age of the observed incoming time

size_t index_of_first_server
    refresh server list after this server (if renew_servers_after_new_IP=true)

size_t num_of_servers
    number of preconfigured NTP servers

const char *servers[1]
    list of servers

Macros

ESP_SNTP_SERVER_LIST("")
    Utility macro for providing multiple servers in parentheses.

ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE (servers_in_list, list_of_servers)
    Default configuration to init SNTP with multiple servers.

    Parameters
        • servers_in_list -- Number of servers in the list
        • list_of_servers -- List of servers (use ESP_SNTP_SERVER_LIST("")

ESP_NETIF_SNTP_DEFAULT_CONFIG (server)
    Default configuration with a single server.
Chapter 2. API Reference

Type Definitions

typedef void (*esp_sntp_time_cb_t)(struct timeval *tv)
    Time sync notification function.

typedef struct esp_sntp_config esp_sntp_config_t
    SNTP configuration struct.

Header File

- components/esp_netif/include/esp_netif_types.h
- This header file can be included with:

```
#include "esp_netif_types.h"
```

- This header file is a part of the API provided by the esp_netif component. To declare that your component depends on esp_netif, add the following to your CMakeLists.txt:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

Structures

struct esp_netif_dns_info_t
    DNS server info.

    Public Members

    `esp_ip_addr_t ip`
    IPv4 address of DNS server

struct esp_netif_ip_info_t
    Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

    Public Members

    `esp_ip4_addr_t ip`
    Interface IPV4 address

    `esp_ip4_addr_t netmask`
    Interface IPV4 netmask

    `esp_ip4_addr_t gw`
    Interface IPV4 gateway address

struct esp_netif_ip6_info_t
    IPV6 IP address information.
Public Members

`esp_ip6_addr_t ip`
Interface IPV6 address

struct `ip_event_got_ip_t`
Event structure for IP_EVENT_GOT_IP event.

Public Members

`esp_netif_t *esp_netif`
Pointer to corresponding esp-netif object

`esp_netif_ip_info_t ip_info`
IP address, netmask, gateway IP address

bool `ip_changed`
Whether the assigned IP has changed or not

struct `ip_event_got_ip6_t`
Event structure for IP_EVENT_GOT_IP6 event

Public Members

`esp_netif_t *esp_netif`
Pointer to corresponding esp-netif object

`esp_netif_ip6_info_t ip6_info`
IPv6 address of the interface

int `ip_index`
IPv6 address index

struct `ip_event_add_ip6_t`
Event structure for ADD_IP6 event

Public Members

`esp_ip6_addr_t addr`
The address to be added to the interface

bool `preferred`
The default preference of the address

struct `ip_event_ap_staipassigned_t`
Event structure for IP_EVENT_AP_STAIPASSIGNED event
**Public Members**

```c
esp_netif_t *esp_netif
```

Pointer to the associated netif handle

```c
esp_ip4_addr_t ip
```

IP address which was assigned to the station

```c
uint8_t mac[6]
```

MAC address of the connected client

```c
struct bridgeif_config
```

LwIP bridge configuration

**Public Members**

```c
uint16_t max_fdb_dyn_entries
```

maximum number of entries in dynamic forwarding database

```c
uint16_t max_fdb_sta_entries
```

maximum number of entries in static forwarding database

```c
uint8_t max_ports
```

maximum number of ports the bridge can consist of

```c
struct esp_netif_inherent_config
```

ESP-netif inherent config parameters.

**Public Members**

```c
esp_netif_flags_t flags
```

flags that define esp-netif behavior

```c
uint8_t mac[6]
```

initial mac address for this interface

```c
const esp_netif_ip_info_t *ip_info
```

initial ip address for this interface

```c
uint32_t get_ip_event
```

event id to be raised when interface gets an IP

```c
uint32_t lost_ip_event
```

event id to be raised when interface losts its IP

```c
const char *if_key
```

string identifier of the interface
const char *if_desc
   textual description of the interface

int route_prio
   numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t *bridge_info
   LwIP bridge configuration

struct esp_netif_driver_base_s
   ESP-netif driver base handle.

Public Members

esp_err_t (*post_attach)(esp_netif_t *netif, esp_netif_iedriver_handle h)
   post attach function pointer

esp_netif_t *netif
   netif handle

struct esp_netif_driver_ifconfig
   Specific IO driver configuration.

Public Members

esp_netif_iedriver_handle handle
   io-driver handle

esp_err_t (*transmit)(void *h, void *buffer, size_t len)
   transmit function pointer

esp_err_t (*transmit_wrap)(void *h, void *buffer, size_t len, void *netstack_buffer)
   transmit wrap function pointer

void (*driver_free_rx_buffer)(void *h, void *buffer)
   free rx buffer function pointer

struct esp_netif_config
   Generic esp_netif configuration.

Public Members

const esp_netif_inherent_config_t *base
   base config
const esp_netif_driver_ifconfig_t *driver
    driver config

const esp_netif_netstack_config_t *stack
    stack config

struct esp_netif_pair_mac_ip_t
    DHCP client's addr info (pair of MAC and IP address)

Public Members

uint8_t mac[6]
    Clients MAC address

    esp_ip4_addr_t ip
    Clients IP address

Macros

ESP_ERR_ESP_NETIF_BASE
    Definition of ESP-NETIF based errors.

ESP_ERR_ESP_NETIF_INVALID_PARAMS

ESP_ERR_ESP_NETIF_IF_NOT_READY

ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED

ESP_ERR_ESP_NETIF_NO_MEM

ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED

ESP_ERR_ESP_NETIF_DRIVER.Attach_FAILED

ESP_ERR_ESP_NETIF_INIT_FAILED

ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED

ESP_ERR_ESP_NETIF_MLD6_FAILED

ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
Chapter 2. API Reference

ESP_ERR_ESP_NETIF_DHCPS_START_FAILED

ESP_NETIF_BR_FLOOD
  Definition of ESP-NETIF bridge control.

ESP_NETIF_BR_DROP

ESP_NETIF_BR_FDW_CPU

Type Definitions

typedef struct esp_netif_obj esp_netif_t

typedef enum esp_netif_flags esp_netif_flags_t

typedef enum esp_netif_ip_event_type esp_netif_ip_event_type_t

typedef struct bridgeif_config bridgeif_config_t
  LwIP bridge configuration

typedef struct esp_netif_inherent_config esp_netif_inherent_config_t
  ESP-netif inherent config parameters.

typedef struct esp_netif_config esp_netif_config_t

typedef void *esp_netif_iodriver_handle
  IO driver handle type.

typedef struct esp_netif_driver_base_s esp_netif_driver_base_t
  ESP-netif driver base handle.

typedef struct esp_netif_driver_ifconfig esp_netif_driver_ifconfig_t

typedef struct esp_netif_netstack_config esp_netif_netstack_config_t
  Specific L3 network stack configuration.

typedef esp_err_t (*esp_netif_receive_t)(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
  ESP-NETIF Receive function type.

Enumerations

denum esp_netif_dns_type_t
  Type of DNS server.

  Values:

    enumerator ESP_NETIF_DNS_MAIN
      DNS main server address
enumerator **ESP_NETIF_DNS_BACKUP**
DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_FALLBACK**
DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_MAX**

enum **esp_netif_dhcp_status_t**
Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP_NETIF_DHCP_INIT**
DHCP client/server is in initial state (not yet started)

enumerator **ESP_NETIF_DHCP_STARTED**
DHCP client/server has been started

enumerator **ESP_NETIF_DHCP_STOPPED**
DHCP client/server has been stopped

enumerator **ESP_NETIF_DHCP_STATUS_MAX**

enum **esp_netif_dhcp_option_mode_t**
Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP_NETIF_OP_START**

enumerator **ESP_NETIF_OP_SET**
Set option

enumerator **ESP_NETIF_OP_GET**
Get option

enumerator **ESP_NETIF_OP_MAX**

enum **esp_netif_dhcp_option_id_t**
Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP_NETIF_SUBNET_MASK**
Network mask

enumerator **ESP_NETIF_DOMAIN_NAME_SERVER**
Domain name server
enumerator `ESP_NETIF_ROUTER_SOLICITATION_ADDRESS`
  Solicitation router address

enumerator `ESP_NETIF_REQUESTED_IP_ADDRESS`
  Request specific IP address

enumerator `ESP_NETIF_IP_ADDRESSLEASE_TIME`
  Request IP address lease time

enumerator `ESP_NETIF_IP_REQUEST_RETRY_TIME`
  Request IP address retry counter

enumerator `ESP_NETIF_VENDOR_CLASS_IDENTIFIER`
  Vendor Class Identifier of a DHCP client

enumerator `ESP_NETIF_VENDOR_SPECIFIC_INFO`
  Vendor Specific Information of a DHCP server

enum `ip_event_t`
  IP event declarations

  Values:

  enumerator `IP_EVENT_STA_GOT_IP`
    station got IP from connected AP

  enumerator `IP_EVENT_STA_LOST_IP`
    station lost IP and the IP is reset to 0

  enumerator `IP_EVENT_AP_STAIPASSIGNED`
    soft-AP assign an IP to a connected station

  enumerator `IP_EVENT_GOT_IP6`
    station or ap or ethernet interface v6IP addr is preferred

  enumerator `IP_EVENT_ETH_GOT_IP`
    ethernet got IP from connected AP

  enumerator `IP_EVENT_ETH_LOST_IP`
    ethernet lost IP and the IP is reset to 0

  enumerator `IP_EVENT_PPP_GOT_IP`
    PPP interface got IP

  enumerator `IP_EVENT_PPP_LOST_IP`
    PPP interface lost IP

enum `esp_netif_flags`
  Values:
enumerator ESP_NETIF_DHCP_CLIENT
enumerator ESP_NETIF_DHCP_SERVER
enumerator ESP_NETIF_FLAG_AUTOUP
enumerator ESP_NETIF_FLAG_GARP
enumerator ESP_NETIF_FLAG_EVENT_IP_MODIFIED
enumerator ESP_NETIF_FLAG_IS_PPP
enumerator ESP_NETIF_FLAG_IS_BRIDGE
enumerator ESP_NETIF_FLAG_MLDV6_REPORT

enum esp_netif_ip_event_type

Values:
enumerator ESP_NETIF_IP_EVENT_GOT_IP
enumerator ESP_NETIF_IP_EVENT_LOST_IP

PRIV_REQUIRES esp_netif
```

Functions

```c
esp_ip6_addr_type_t esp_netif_ip6_get_addr_type (esp_ip6_addr_t *ip6_addr)
```
Get the IPv6 address type.

Parameters
- `ip6_addr` -- [in] IPv6 type

Returns
IPv6 type in form of enum esp_ip6_addr_type_t

```c
static inline void esp_netif_ip_addr_copy (esp_ip_addr_t *dest, const esp_ip_addr_t *src)
```
Copy IP addresses.

Parameters
- `dest` -- [out] destination IP
- `src` -- [in] source IP

Submit Document Feedback

or

```
PRIV_REQUIRES esp_netif
```

Functions

esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

Parameters config -- L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tapis used when this parameter is NULL.

Returns esp_err_t

• ESP_OK on success

esp_err_t esp_vfs_l2tap_intf_unregister (const char *base_path)

Removes L2 TAP virtual filesystem driver.

Parameters base_path -- Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tapis used when this parameter is NULL.

Returns esp_err_t

• ESP_OK on success

esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void *buff, size_t *size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

Parameters

• driver_handle -- handle of driver at which the frame was received
• buff -- received L2 frame
Chapter 2. API Reference

- **size** -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** esp_err_t
- ESP_OK is always returned

**Structures**

struct l2tap_vfs_config_t
L2Tap VFS config parameters.

**Public Members**

const char *`base_path`
vfs base path

**Macros**

L2TAP_VFS_DEFAULT_PATH
L2TAP_VFS_CONFIG_DEFAULT()

**Type Definitions**

typedef void *l2tap_iodriver_handle

**Enumerations**

enum l2tap_ioctl_opt_t

**Values:**

enumerator L2TAP_S_RCV_FILTER
enumerator L2TAP_G_RCV_FILTER
enumerator L2TAP_S_INTF_DEVICE
enumerator L2TAP_G_INTF_DEVICE
enumerator L2TAP_S_DEVICE_DRV_HNDL
enumerator L2TAP_G_DEVICE_DRV_HNDL

**Wi-Fi Default API Reference**

**Header File**

- This header file can be included with:

```c
#include "esp_wifi_default.h"
```
This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_wifi
```

or

```cmake
PRIV_REQUIRES esp_wifi
```

## Functions

**esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)**

Attaches wifi station interface to supplied netif.

**Parameters**

- `esp_netif` -- instance to attach the wifi station to

**Returns**

- ESP_OK on success
- ESP_FAIL if attach failed

**esp_err_t esp_netifAttach_wifi_ap(esp_netif_t *esp_netif)**

Attaches wifi soft AP interface to supplied netif.

**Parameters**

- `esp_netif` -- instance to attach the wifi AP to

**Returns**

- ESP_OK on success
- ESP_FAIL if attach failed

**esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)**

Sets default wifi event handlers for STA interface.

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)**

Sets default wifi event handlers for AP interface.

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_nan_handlers(void)**

Sets default wifi event handlers for NAN interface.

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void *esp_netif)**

Clears default wifi event handlers for supplied network interface.

**Parameters**

- `esp_netif` -- instance of corresponding if object

**Returns**

- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_netif_t *esp_netif_create_default_wifi_ap(void)**

Creates default WIFI AP. In case of any init error this API aborts.

**Returns**

- pointer to esp-netif instance

---

**Note:** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)
Chapter 2. API Reference

```c
esp_netif_t *esp_netif_create_default_wifi_sta (void)

Creates default WIFI STA. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

Returns pointer to esp-netif instance
```

```c
esp_netif_t *esp_netif_create_default_wifi_nan (void)

Creates default WIFI NAN. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

Returns pointer to esp-netif instance
```

```c
void esp_netif_destroy_default_wifi (void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_...() API.

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

Parameters esp_netif -- [in] object to detach from WiFi and destroy
```

```c
esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, const esp_netif_inherent_config_t *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Parameters
  * wifi_if -- [in] type of wifi interface
  * esp_netif_config -- [in] inherent esp-netif configuration pointer

Returns pointer to esp-netif instance
```

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Parameters
  * p_netif_sta -- [out] pointer where the resultant STA interface is saved (if non NULL)
  * p_netif_ap -- [out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success
```
2.5.5 IP Network Layer

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with ESP-NETIF connection capabilities.

By convention, the I/O driver has to register itself as an ESP-NETIF driver, and thus holds a dependency on ESP-NETIF component and is responsible for providing data path functions, post-attach callback and in most cases, also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet Input/Output   According to the diagram shown in the ESP-NETIF Architecture part, the following three API functions for the packet data path must be defined for connecting with ESP-NETIF:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e., they get called from ESP-NETIF (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post Attach Callback A final part of the network interface initialization consists of attaching the ESP-NETIF instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_---driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_iodriver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related ESP-NETIF instance

As a result, the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;       /* base structure reserved as...
    esp_netif_iodriver_t *driver;       /* implementation */
    esp_netif_iodriver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`.

So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between ESP-NETIF and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
}
```

(continues on next page)
Default Handlers  I/O drivers also typically provide default definitions of lifecycle behavior of related network interfaces based on state transitions of I/O drivers. For example driver start -> network start, etc.

An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_->EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_->EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network Stack Connection  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the ESP-NETIF, specifically from its TCP/IP stack connecting layer.

Note that ESP-IDF provides several network stack configurations for the most common network interfaces, such as for the Wi-Fi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set.

The following API reference outlines these network stack interaction with the ESP-NETIF:

Header File

- `components/esp_netif/include/esp_netif_net_stack.h`
- This header file can be included with:

```c
#include "esp_netif_net_stack.h"
```
- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:

```c
REQUIRES esp_netif

or

PRIV_REQUIRES esp_netif
```

Functions

- `esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)`
  Returns esp-netif handle.

  Parameters:
  - `dev` -- [in] opaque ptr to network interface of specific TCP/IP stack

- `void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`
  Returns network stack specific implementation handle.

  Parameters:
  - `esp_netif` -- [in] Handle to esp-netif instance

  Returns:
  - handle to related network stack netif handle
esp_err_t esp_netif_set_link_speed(esp_netif_t *esp_netif, uint32_t speed)
Set link-speed for the specified network interface.

Parameters
• esp_netif -- [in] Handle to esp-netif instance
• speed -- [in] Link speed in bit/s

Returns ESP_OK on success

esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)
Outputs function calls from the TCP/IP stack to the media to be transmitted.
This function gets called from network stack to output packets to IO driver.

Parameters
• esp_netif -- [in] Handle to esp-netif instance
• data -- [in] Data to be transmitted
• len -- [in] Length of the data frame

Returns ESP_OK on success, an error passed from the I/O driver otherwise

esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
Outputs function calls from the TCP/IP stack to the media to be transmitted.
This function gets called from network stack to output packets to IO driver.

Parameters
• esp_netif -- [in] Handle to esp-netif instance
• data -- [in] Data to be transmitted
• len -- [in] Length of the data frame
• netstack_buf -- [in] net stack buffer

Returns ESP_OK on success, an error passed from the I/O driver otherwise

void esp_netif_free_rx_buffer(void *esp_netif, void *buffer)
Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to
deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters
• esp_netif -- [in] Handle to esp-netif instance
• buffer -- [in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application
Protocols.

2.6 Peripherals API

2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver
Chapter 2. API Reference

**Introduction**

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pins.

ESP32 has two ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC oneshot mode conversion.

**Functional Overview**

The following sections of this document cover the typical steps to install and operate an ADC:

- **Resource Allocation** - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- **Unit Configuration** - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- **Read Conversion Result** - covers how to get ADC conversion raw result.
- **Hardware Limitations** - describes the ADC-related hardware limitations.
- **Power Management** - covers power management-related information.
- **IRAM Safe** - describes tips on how to read ADC conversion raw results when the cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**

The ADC oneshot mode driver is implemented based on ESP32 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If set to 0, the driver will fallback to using a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

**Create an ADC Unit Handle Under Normal Oneshot Mode**

```c
adc_oneshot_unit_handle_t adc1_handle;
dac_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```
Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(adcl_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to TRM > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number, check datasheet to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

**Configure Two ADC Channels**

```c
adc_oneshot_chan_cfg_t config = {
  .bitwidth = ADC_BITWIDTH_DEFAULT,
  .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, EXAMPLE_ADC1_CHAN0, &config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, EXAMPLE_ADC1_CHAN1, &config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see Hardware Limitations. This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return ESP_ERR_TIMEOUT. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{\text{out}} = \frac{D_{\text{out}} \times V_{\text{max}}}{D_{\text{max}}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V_{\text{out}}</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>D_{\text{out}}</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>V_{\text{max}}</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to TRM &gt; On-Chip Sensor and Analog Signal Processing.</td>
</tr>
<tr>
<td>D_{\text{max}}</td>
<td>Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$, where bitwidth is the :cpp:member:<code>::adc_oneshot_chan_cfg_t::bitwidth</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc Analog to Digital Converter (ADC) Calibration Driver.
Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.

- ADC2 is also used by Wi-Fi. `adc_oneshot_read()` has provided protection between the Wi-Fi driver and ADC oneshot mode driver.

- ESP32-DevKitC: GPIO0 cannot be used in oneshot mode, because the DevKit has used it for auto-flash.

- ESP-WROVER-KIT: GPIO 0, 2, 4, and 15 cannot be used due to external connections for different purposes.

Power Management  When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe  By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like `Illegal Instruction` or `Load/Store Prohibited`.

Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see `IRAM Safe` for more details.

Application Examples

- ADC oneshot mode example: `peripherals/adc/oneshot_read`.
API Reference

Header File

- components/hal/include/hal/adc_types.h
- This header file can be included with:

```c
#include "hal/adc_types.h"
```

Structures

`struct adc_digi_pattern_config_t`

ADC digital controller pattern configuration.

**Public Members**

- `uint8_t atten`
  - Attenuation of this ADC channel.
- `uint8_t channel`
  - ADC channel.
- `uint8_t unit`
  - ADC unit.
- `uint8_t bit_width`
  - ADC output bit width.

`struct adc_digi_output_data_t`

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

**Note:** ESP32: Only type1 is valid. ADC2 does not support DMA mode.

**Note:** ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

**Public Members**

- `uint16_t data`
  - ADC real output data info. Resolution: 12 bit.
- `uint16_t channel`
  - ADC channel index info.
  - ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.
struct adc_digi_output_data_t::[anonymous]::[anonymous] type1
ADC type1

uint16_t unit
ADC unit index info. 0: ADC1; 1: ADC2.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
When the configured output format is 11bit.

uint16_t val
Raw data value

Type Definitions

typedef soc_periph_adc_digi_clk_src_t adc_oneshot_clk_src_t
Clock source type of oneshot mode which uses digital controller.

typedef soc_periph_adc_digi_clk_src_t adc_continuous_clk_src_t
Clock source type of continuous mode which uses digital controller.

Enumerations

enum adc_unit_t
ADC unit.
Values:

enumerator ADC_UNIT_1
SAR ADC 1.

enumerator ADC_UNIT_2
SAR ADC 2.

enum adc_channel_t
ADC channels.
Values:

enumerator ADC_CHANNEL_0
ADC channel.

enumerator ADC_CHANNEL_1
ADC channel.

enumerator ADC_CHANNEL_2
ADC channel.

enumerator ADC_CHANNEL_3
ADC channel.
enumerator ADC_CHANNEL_4
ADC channel.

enumerator ADC_CHANNEL_5
ADC channel.

enumerator ADC_CHANNEL_6
ADC channel.

enumerator ADC_CHANNEL_7
ADC channel.

enumerator ADC_CHANNEL_8
ADC channel.

enumerator ADC_CHANNEL_9
ADC channel.

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator ADC_ATTEN_DB_0
No input attenuation, ADC can measure up to approx.

enumerator ADC_ATTEN_DB_2_5
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator ADC_ATTEN_DB_6
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator ADC_ATTEN_DB_12
The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator ADC_ATTEN_DB_11
This is deprecated, it behaves the same as ADC_ATTEN_DB_12

enum adc_bitwidth_t
Values:

enumerator ADC_BITWIDTH_DEFAULT
Default ADC output bits, max supported width will be selected.

enumerator ADC_BITWIDTH_9
ADC output width is 9Bit.

enumerator ADC_BITWIDTH_10
ADC output width is 10Bit.
enumerator **ADC_BITWIDTH_11**
ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**
ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**
ADC output width is 13Bit.

enum **adc_ulp_mode_t**
*Values:*

enumerator **ADC_ULP_MODE_DISABLE**
ADC ULP mode is disabled.

enumerator **ADC_ULP_MODE_FSM**
ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**
ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**
ADC digital controller (DMA mode) work mode.
*Values:*

enumerator **ADC_CONV_SINGLE_UNIT_1**
Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**
Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ....

enum **adc_digi_output_format_t**
ADC digital controller (DMA mode) output data format option.
*Values:*

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**
See **adc_digi_output_data_t.type1**

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**
See **adc_digi_output_data_t.type2**
enum **adc_digi_iir_filter_t**  
ADC IIR Filter ID.  
*Values:*  
enumerator **ADC_DIGI_IIR_FILTER_0**  
Filter 0.  
enumerator **ADC_DIGI_IIR_FILTER_1**  
Filter 1.  

enum **adc_digi_iir_filter_coeff_t**  
IIR Filter Coefficient.  
*Values:*  
enumerator **ADC_DIGI_IIR_FILTER_COEFF_2**  
The filter coefficient is 2.  
enumerator **ADC_DIGI_IIR_FILTER_COEFF_4**  
The filter coefficient is 4.  
enumerator **ADC_DIGI_IIR_FILTER_COEFF_8**  
The filter coefficient is 8.  
enumerator **ADC_DIGI_IIR_FILTER_COEFF_16**  
The filter coefficient is 16.  
enumerator **ADC_DIGI_IIR_FILTER_COEFF_64**  
The filter coefficient is 64.  

enum **adc_monitor_id_t**  
ADC monitor (continuous mode) ID.  
*Values:*  
enumerator **ADC_MONITOR_0**  
The monitor index 0.  
enumerator **ADC_MONITOR_1**  
The monitor index 1.  

enum **adc_monitor_mode_t**  
Monitor config/event mode type.  
*Values:*  
enumerator **ADC_MONITOR_MODE_HIGH**  
ADC raw_result > threshold value, monitor interrupt will be generated.  
enumerator **ADC_MONITOR_MODE_LOW**  
ADC raw_result < threshold value, monitor interrupt will be generated.
Header File

- components/esp_adc/include/esp_adc/adc_oneshot.h
- This header file can be included with:

```c
#include "esp_adc/adc_oneshot.h"
```

- This header file is a part of the API provided by the esp_adc component. To declare that your component depends on esp_adc, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```

or

```cmake
PRIV_REQUIRES esp_adc
```

Functions

**esp_err_t adc_oneshot_new_unit** (const adc_oneshot_unit_init_cfg_t *init_config, adc_oneshot_unit_handle_t *ret_unit)

Create a handle to a specific ADC unit.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `init_config` -- [in] Driver initial configurations
- `ret_unit` -- [out] ADC unit handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use
- ESP_FAIL: Clock source isn’t initialised correctly

**esp_err_t adc_oneshot_config_channel** (adc_oneshot_unit_handle_t handle, adc_channel_t channel, const adc_oneshot_chan_cfg_t *config)

Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `handle` -- [in] ADC handle
- `channel` -- [in] ADC channel to be configured
- `config` -- [in] ADC configurations

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

**esp_err_t adc_oneshot_read** (adc_oneshot_unit_handle_t handle, adc_channel_t chan, int *out_raw)

Get one ADC conversion raw result.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Note:** This API should NOT be called in an ISR context
Parameters
- **handle** -- [in] ADC handle
- **chan** -- [in] ADC channel
- **out_raw** -- [out] ADC conversion raw result

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit(adc_oneshot_unit_handle_t handle)
```
Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide

Parameters
- **handle** -- [in] ADC handle

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn’t in use

```c
esp_err_t adc_oneshot_io_to_channel(int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)
```
Get ADC channel from the given GPIO number.

Parameters
- **io_num** -- [in] GPIO number
- **unit_id** -- [out] ADC unit
- **channel** -- [out] ADC channel

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_oneshot_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *const io_num)
```
Get GPIO number from the given ADC channel.

Parameters
- **unit_id** -- [in] ADC unit
- **channel** -- [in] ADC channel
- **io_num** -- [out] GPIO number
- - -- ESP_OK: On success
- - ESP_ERR_INVALID_ARG: Invalid argument

```c
esp_err_t adc_oneshot_get_calibrated_result(adc_oneshot_unit_handle_t handle,
                                          adc_cali_handle_t cali_handle, adc_channel_t chan,
                                          int *cali_result)
```
Convenience function to get ADC calibrated result.

This is an all-in-one function which does:
- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

Parameters
- **handle** -- [in] ADC oneshot handle, you should call adc_oneshot_new_unit() to get this handle
- **cali_handle** -- [in] ADC calibration handle, you should call adc_cali_create_scheme_x() in adc_cali_scheme.h to create a handle
Chapter 2. API Reference

• chan -- [in] ADC channel
• cali_result -- [out] Calibrated ADC result (in mV)

Returns
• ESP_OK Other return errors from adc_oneshot_read() and adc_cali_raw_to_voltage()

Structures

struct adc_oneshot_unit_init_cfg_t
ADC oneshot driver initial configurations.

Public Members

ADC unit.

adc_oneshot_clk_src_t clk_src
Clock source.

adc_ulp_mode_t ulp_mode
ADC controlled by ULP, see adc_ulp_mode_t

struct adc_oneshot_chan_cfg_t
ADC channel configurations.

Public Members

ADC attenuation.

ADC conversion result bits.

Type Definitions

typedef struct adc_oneshot_unit_ctx_t *adc_oneshot_unit_handle_t
Type of ADC unit handle for oneshot mode.

2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pads. Additionally, the Direct Memory Access (DMA) functionality is utilized to efficiently retrieve ADC conversion results.

ESP32 has two ADC unit(s), which can be used in scenarios like:
• Generate one-shot ADC conversion result
• Generate continuous ADC conversion results
This guide introduces ADC continuous mode conversion.

**Driver Concepts**  ADC continuous mode conversion is made up of multiple conversion frames.

- **Conversion Frame**: One conversion frame contains multiple conversion results. Conversion frame size is configured in `adc_continuous_new_handle()` in bytes.
- **Conversion Result**: One conversion result contains multiple bytes, see `SOC_ADC_DIGI_RESULT_BYTES`. Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel, and raw data.

**Functional Overview**

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from a group of ADC channels continuously:

- **Resource Allocation**: covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations**: describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control**: describes ADC control functions.
- **Register Event Callbacks**: describes how to hook user-specific code to an ADC continuous mode event callback function.
- **Read Conversion Result**: covers how to get ADC conversion result.
- **Hardware Limitations**: describes the ADC-related hardware limitations.
- **Power Management**: covers power management-related information.
- **IRAM Safe**: covers the IRAM safe functions.
- **Thread Safety**: lists which APIs are guaranteed to be thread-safe by the driver.

**Resource Allocation**  The ADC continuous mode driver is implemented based on ESP32 SAR ADC module. Different ESP targets might have different numbers of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size`: set the maximum size of the pool in bytes, and the driver saves ADC conversion result into the pool. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size`: set the size of the ADC conversion frame, in bytes.
- `adc_continuous_handle_cfg_t::flags`: set the flags that can change the driver's behavior.
  - `flush_pool`: auto flush the pool when it's full.

After setting up the above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the I2S0 peripheral is in use. See **Hardware Limitations** for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.
Chapter 2. API Reference

Initialize the ADC Continuous Mode Driver

```c
adc_continuous_handle_cfg_t adc_config = {
  .max_store_buf_size = 1024,
  .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_continuous_deinit());
```

ADC Configurations After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`: number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`: list of configs for each ADC channel that will be used, see the description below.
- `adc_continuous_config_t::sample_freq_hz`: expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`: continuous conversion mode.
- `adc_continuous_config_t::format`: conversion output format.

Set `adc_digi_pattern_config_t` with the following process:

- `adc_digi_pattern_config_t::atten`: ADC attenuation. Refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.
- `adc_digi_pattern_config_t::channel`: the IO corresponding ADC channel number. See the note below.
- `adc_digi_pattern_config_t::unit`: the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`: the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number, check TRM to acquire the ADC IOs. Besides, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you should not call this API at this moment.

See ADC continuous mode example `peripherals/adc/continuous_read` to see configuration codes.

ADC Control

**Start and Stop** Calling `adc_continuous_start()` makes the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results.

On the contrary, calling `adc_continuous_stop()` stops the ADC conversion.

```c
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t`.

- `adc_continuous_evt_cbs_t::on_conv_done`: this is invoked when one conversion frame finishes.
- `adc_continuous_evt_cbs_t::on_pool_ovf`: this is invoked when the internal pool is full. Newer conversion results will be discarded.
As the above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logic should not appear in these callbacks. The callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()` by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Especially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions are not in the internal RAM. Check the error log for more details. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, it indicates that the ADC continuous mode driver is started, and you should not add a callback at this moment.

**Conversion Done Event** When the driver completes a conversion, it triggers the `adc_continuous_evt_cbs_t::on_conv_done` event and fills the event data. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver will not fill in the event data. This usually happens because the speed to read data from the pool by calling `adc_continuous_read()` is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

Function `adc_continuous_read()` tries to read the expected length of conversion results each time.

- When calling `adc_continuous_read()`, you can request to read a conversion result of the specified length. Sometimes, however, the actual available conversion results may be less than the requested length, in which case the function still moves the data from the internal pool into the buffer you provided. Therefore, to learn the number of conversion results actually moved into the buffer, please check the value of `out_length`.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there are still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, newly generated results will be lost. Next time when `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` to indicate this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from the above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$ V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} $$

where:
<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$, where the bitwidth is the <code>adc_digi_pattern_config_t::bit_width</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to *Analog to Digital Converter (ADC) Calibration Driver*.

**Hardware Limitations**

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or one-shot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator (RNG) uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by Wi-Fi. `adc_continuous_start()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses I2S0 peripheral as hardware DMA FIFO. Therefore, if I2S0 is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4, and 15 cannot be used due to external connections for different purposes.

**Power Management**

When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise, the power management will be out of action.

**IRAM Safe**

All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, the driver's internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety**

ADC continuous mode driver APIs are not guaranteed to be thread-safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

**Application Examples**

- ADC continuous mode example: `peripherals/adc/continuous_read`.

**API Reference**

**Header File**

- `components/esp_adc/include/esp_adc/adc_continuous.h`
- This header file can be included with:
#include "esp_adc/adc_continuous.h"

• This header file is a part of the API provided by the esp_adc component. To declare that your component depends on esp_adc, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```

or

```cmake
PRIV_REQUIRES esp_adc
```

## Functions

### `esp_err_t adc_continuous_new_handle` ([const `adc_continuous_handle_cfg_t` *hdl_config], `adc_continuous_handle_t` *ret_handle)

Initialize ADC continuous driver and get a handle to it.

**Parameters**

- `hdl_config` -- [in] Pointer to ADC initilization config. Refer to `adc_continuous_handle_cfg_t`.
- `ret_handle` -- [out] ADC continuous mode driver handle

**Returns**

- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND: No free interrupt found with the specified flags
- ESP_ERR_NO_MEM: If out of memory
- ESP_OK: On success

### `esp_err_t adc_continuous_config` ([`adc_continuous_handle_t` handle], [const `adc_continuous_config_t` *config])

Set ADC continuous mode required configurations.

**Parameters**

- `handle` -- [in] ADC continuous mode driver handle
- `config` -- [in] Refer to `adc_digi_config_t`.

**Returns**

- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

### `esp_err_t adc_continuous_register_event_callbacks` ([`adc_continuous_handle_t` handle], [const `adc_continuous_evt_cbs_t` *cbs], void *user_data)

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

**Parameters**
• **handle** -- [in] ADC continuous mode driver handle
• **cbs** -- [in] Group of callback functions
• **user_data** -- [in] User data, which will be delivered to the callback functions directly

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

```c
esp_err_t adc_continuous_start (adc_continuous_handle_t handle)
```

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_read (adc_continuous_handle_t handle, uint8_t*buf, uint32_t length_max, uint32_t*out_length, uint32_t timeout_ms)
```

Read bytes from ADC under continuous mode.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle
- **buf** -- [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See the subsection Driver Backgrounds in this header file to learn about this concept.
- **length_max** -- [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** -- [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** -- [in] Time to wait for data via this API, in millisecond.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT: Operation timed out
- ESP_OK: On success

```c
esp_err_t adc_continuous_stop (adc_continuous_handle_t handle)
```

Stop the ADC. After this, the hardware stops working.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_deinit (adc_continuous_handle_t handle)
```

Deinitialize the ADC continuous driver.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_flush_pool (adc_continuous_handle_t handle)
```

Flush the driver internal pool.

**Note:** This API is not supposed to be called in an ISR context

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle
Returns

- ESP_ERR_INVALID_STATE: Driver state is invalid, you should call this API when it's in init state
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_OK: On success

`esp_err_t adc_continuous_io_to_channel(int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)`

Get ADC channel from the given GPIO number.

Parameters

- `io_num` -- [in] GPIO number
- `unit_id` -- [out] ADC unit
- `channel` -- [out] ADC channel

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

`esp_err_t adc_continuous_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *const io_num)`

Get GPIO number from the given ADC channel.

Parameters

- `unit_id` -- [in] ADC unit
- `channel` -- [in] ADC channel
- `io_num` -- [out] GPIO number

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

Structures

`struct adc_continuous_handle_cfg_t`  
ADC continuous mode driver initial configurations.

Public Members

`uint32_t max_store_buf_size`  
Max length of the conversion results that driver can store, in bytes.

`uint32_t conv_frame_size`  
Conversion frame size, in bytes. This should be in multiples of `SOC_ADC_DIGI_DATA_BYTES_PER_CONV`.

`uint32_t flush_pool`  
Flush the internal pool when the pool is full.

`struct adc_continuous_handle_cfg_t::[anonymous] flags`  
Driver flags.

`struct adc_continuous_config_t`  
ADC continuous mode driver configurations.
Public Members

uint32_t pattern_num
   Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
   List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
   The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available sampling frequency range

adc_digi_convert_mode_t conv_mode
   ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
   ADC DMA conversion output format, see adc_digi_output_format_t.

struct adc_continuous_evt_data_t
   Event data structure.

---

Note: The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t *conv_frame_buffer
   Pointer to conversion result buffer for one conversion frame.

uint32_t size
   Conversion frame size.

struct adc_continuous_evt_cbs_t
   Group of ADC continuous mode callbacks.

---

Note: These callbacks are all running in an ISR environment.

---

Note: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

adc_continuous_callback_t on_conv_done
   Event callback, invoked when one conversion frame is done. See the subsection Driver Backgrounds in this header file to learn about the conversion frame concept.
adc_continuous_callback_t on_pool_ovf

Event callback, invoked when the internal pool is full.

Macros

ADC_MAX_DELAY

ADC read max timeout value, it may make the adc_continuous_read block forever if the OS supports.

Type Definitions

typedef struct adc_continuous_ctx_t *adc_continuous_handle_t

Type of adc continuous mode driver handle.

typedef bool (*adc_continuous_callback_t)(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data)

Prototype of ADC continuous mode event callback.

Parameter:
- handle [in] ADC continuous mode driver handle
- edata [in] Pointer to ADC continuous mode event data
- user_data [in] User registered context, registered when in
  adc_continuous_register_event_callbacks()

Return: Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

In ESP32, the digital-to-analog converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32 is 1100 mV. However, the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- **Calibration Scheme Creation** - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- **Result Conversion** - covers how to convert ADC raw result to calibrated result.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Minimize Noise** - describes a general way to minimize the noise.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Calibration Scheme Creation**

The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver's point of view, an ADC calibration scheme is created for an ADC calibration handle adc_cali_handle_t.

adc_cali_check_scheme() can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.
If you use your custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, bit width of ADC raw result.

There is also a configuration `adc_cali_line_fitting_config_t::default_vref`. Normally this can be simply set to 0. Line Fitting scheme does not rely on this value. However, if the Line Fitting scheme required eFuse bits are not burned on your board, the driver will rely on this value to do the calibration.

You can use `adc_cali_scheme_line_fitting_check_efuse()` to check the eFuse bits. Normally the Line Fitting scheme eFuse value is `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP` or `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF`. This means the Line Fitting scheme uses calibration parameters burned in the eFuse to do the calibration.

When the Line Fitting scheme eFuse value is `ADC_CALI_LINE_FITTING_EFUSE_VAL_DEFAULT_VREF`, you need to set the `esp_adc_cali_line_fitting_init::default_vref`. Default vref is an estimate of the ADC reference voltage provided as a parameter during calibration.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
  .unit_id = unit,
  .atten = atten,
  .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

**Delete Line Fitting Scheme**

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**Note:** If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

**Result Conversion** After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

**Get Voltage**

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_calif_create, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_,
->ADC_CHAN, voltage[0][0]);
```
Thread Safety  The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE` - disable this to decrease the code size, if the calibration eFuse value is not set to `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP`.
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE` - disable this to decrease the code size, if the calibration eFuse value is not set to `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF`.
- `CONFIG_ADC_CAL_LUT_ENABLE` - disable this to decrease the code size, if you do not calibrate the ADC raw results under `ADC_ATTEN_DB_12`.

Minimize Noise  The ESP32 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

Fig. 6: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

```

### Functions

**esp_err_t** `adc_cali_check_scheme` *(adc_cali_scheme_ver_t *scheme_mask)*

Check the supported ADC calibration scheme.

- **Parameters**
  - `scheme_mask` -- [out] Supported ADC calibration scheme(s)

- **Returns**
  - ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument
  - ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

**esp_err_t** `adc_cali_raw_to_voltage` *(adc_cali_handle_t handle, int raw, int *voltage)*

Convert ADC raw data to calibrated voltage.

- **Parameters**
  - `handle` -- [in] ADC calibration handle
  - `raw` -- [in] ADC raw data
  - `voltage` -- [out] Calibrated ADC voltage (in mV)

- **Returns**
  - ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument
  - ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered

### Type Definitions

typedef struct adc_cali_scheme_t *adc_cali_handle_t

ADC calibration handle.

### Enumerations

enum **adc_cali_scheme_ver_t**

ADC calibration scheme.

- **Values**:
  - `ADC_CALI_SCHEME_VER_LINE_FITTING` Line fitting scheme.
  - `ADC_CALI_SCHEME_VER_CURVE_FITTING` Curve fitting scheme.

  PRIV_REQUIRES esp_adc
  ```

2.6.4 Clock Tree

The clock subsystem of ESP32 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

Introduction

This section lists definitions of ESP32’s supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

Root Clocks Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32's root clocks are listed in `soc_root_clk_t`:

- **Internal 8 MHz RC Oscillator (RC_FAST)**
  - This RC oscillator generates a about 8.5 MHz clock signal output as the `RC_FAST_CLK`. The about 8.5 MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`. The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.

- **External 2 ~ 40 MHz Crystal (XTAL)**

- **Internal 150 kHz RC Oscillator (RC_SLOW)**
  - This RC oscillator generates a about 150kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.

- **External 32 kHz Crystal - optional (XTAL32K)**
  - The clock source for this `XTAL32K_CLK` can be either a 32 kHz crystal connecting to the `32K_XP` and `32K_XN` pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the `32K_XN` pin. Additionally, a 1 nF capacitor must be placed between the `32K_XP` pin and ground. In this case, the `32K_XP` pin cannot be used as a GPIO pin. `XTAL32K_CLK` can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to RTC Timer Clock Sources.
Module Clocks  ESP32’s available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

API Reference

Header File

- `components/soc/esp32/include/soc/clk_tree_defs.h`
- This header file can be included with:

  ```
  #include "soc/clk_tree_defs.h"
  ```

Macros

- `SOC_CLK_RC_FAST_FREQ_APPROX` Approximate RC_FAST_CLK frequency in Hz
- `SOC_CLK_RC_SLOW_FREQ_APPROX` Approximate RC_SLOW_CLK frequency in Hz
- `SOC_CLK_RC_FAST_D256_FREQ_APPROX` Approximate RC_FAST_D256_CLK frequency in Hz
- `SOC_CLK_XTAL32K_FREQ_APPROX` Approximate XTAL32K_CLK frequency in Hz
- `SOC_GPTIMER_CLKS` Array initializer for all supported clock sources of GPTimer.

  The following code can be used to iterate all possible clocks:

  ```
  soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
  for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
  }
  ```

- `SOC_LCD_CLKS` Array initializer for all supported clock sources of LCD.
- `SOC_RMT_CLKS` Array initializer for all supported clock sources of RMT.
- `SOC_UART_CLKS` Array initializer for all supported clock sources of UART.
SOC_MCPWM_TIMER_CLKS
Array initializer for all supported clock sources of MCPWM Timer.

SOC_MCPWM_CAPTURE_CLKS
Array initializer for all supported clock sources of MCPWM Capture Timer.

SOC_MCPWM_CARRIER_CLKS
Array initializer for all supported clock sources of MCPWM Carrier.

SOC_I2S_CLKS
Array initializer for all supported clock sources of I2S.

SOC_I2C_CLKS
Array initializer for all supported clock sources of I2C.

SOC_SPI_CLKS
Array initializer for all supported clock sources of SPI.

SOC_SDM_CLKS
Array initializer for all supported clock sources of SDM.

SOC_DAC_DIGI_CLKS
Array initializer for all supported clock sources of DAC digital controller.

SOC_DAC_COSINE_CLKS
Array initializer for all supported clock sources of DAC cosine wave generator.

SOC_TWAI_CLKS
Array initializer for all supported clock sources of TWAI.

SOC_ADC_DIGI_CLKS
Array initializer for all supported clock sources of ADC digital controller.

SOC_ADC_RTC_CLKS
Array initializer for all supported clock sources of ADC RTC controller.

SOC_MWDT_CLKS
Array initializer for all supported clock sources of MWDT.

SOC_LEDC_CLKS
Array initializer for all supported clock sources of LEDC.

SOC_SDMMC_CLKS
Array initializer for all supported clock sources of SDMMC.

Enumerations
enum `soc_root_clk_t`

Root clock.

Values:

- Enumerator `SOC_ROOT_CLK_INT_RC_FAST`
  Internal 8MHz RC oscillator
- Enumerator `SOC_ROOT_CLK_INT_RC_SLOW`
  Internal 150kHz RC oscillator
- Enumerator `SOC_ROOT_CLK_EXT_XTAL`
  External 2~40MHz crystal
- Enumerator `SOC_ROOT_CLK_EXT_XTAL32K`
  External 32kHz crystal/clock signal

enum `soc_cpu_clk_src_t`

CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

- Enumerator `SOC_CPU_CLK_SRC_XTAL`
  Select XTAL_CLK as CPU_CLK source
- Enumerator `SOC_CPU_CLK_SRC_PLL`
  Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)
- Enumerator `SOC_CPU_CLK_SRC_RC_FAST`
  Select RC_FAST_CLK as CPU_CLK source
- Enumerator `SOC_CPU_CLK_SRC_APLL`
  Select APLL_CLK as CPU_CLK source
- Enumerator `SOC_CPU_CLK_SRC_INVALID`
  Invalid CPU_CLK source

enum `soc_rtc_slow_clk_src_t`

RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

- Enumerator `SOC_RTC_SLOW_CLK_SRC_RC_SLOW`
  Select RC_SLOW_CLK as RTC_SLOW_CLK source
Chapter 2. API Reference

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8m_d256 in TRM and reg. description) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

**Note:** Enum values are matched with the register field values on purpose

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D4**
Select XTAL_D4_CLK (may referred as XTAL_CLK_DIV_4) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D4**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

enum **soc_xtal_freq_t**
Possible main XTAL frequency options on the target.

**Note:** Enum values equal to the frequency value in MHz

**Note:** Not all frequency values listed here are supported in IDF. Please check SOC_XTAL_SUPPORT_XXX in soc_caps.h for the supported ones.

**Values:**

enumerator **SOC_XTAL_FREQ_AUTO**
Automatic XTAL frequency detention

enumerator **SOC_XTAL_FREQ_24M**
24MHz XTAL

enumerator **SOC_XTAL_FREQ_26M**
26MHz XTAL
Chapter 2. API Reference

enumerator **SOC_XTAL_FREQ_40M**
   40MHz XTAL

enum **soc_module_clk_t**
   Supported clock sources for modules (CPU, peripherals, RTC, etc.)

   **Note:** enum starts from 1, to save 0 for special purpose

   **Values:**

   enumerator **SOC_MOD_CLK_CPU**
      CPU_CLK can be sourced from XTAL, PLL, RC_FAST, or APLL by configuring soc_cpu_clk_src_t

   enumerator **SOC_MOD_CLK_RTC_FAST**
      RTC_FAST_CLK can be sourced from XTAL_D4 or RC_FAST by configuring soc_rtc_fast_clk_src_t

   enumerator **SOC_MOD_CLK_RTC_SLOW**
      RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

   enumerator **SOC_MOD_CLK_APB**
      APB_CLK is highly dependent on the CPU_CLK source

   enumerator **SOC_MOD_CLK_PLL_D2**
      PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

   enumerator **SOC_MOD_CLK_PLL_F160M**
      PLL_F160M_CLK is derived from PLL, and has a fixed frequency of 160MHz

   enumerator **SOC_MOD_CLK_XTAL32K**
      XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

   enumerator **SOC_MOD_CLK_RC_FAST**
      RC_FAST_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

   enumerator **SOC_MOD_CLK_RC_FAST_D256**
      RC_FAST_D256_CLK comes from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

   enumerator **SOC_MOD_CLK_XTAL**
      XTAL_CLK comes from the external crystal (2~40MHz)

   enumerator **SOC_MOD_CLK_REF_TICK**
      REF_TICK is derived from APB, it has a fixed frequency of 1MHz even when APB frequency changes

   enumerator **SOC_MOD_CLK_APLL**
      APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers
enumerator SOC_MOD_CLK_INVALID
    Indication of the end of the available module clock sources

enum soc_periph_systimer_clk_src_t
    Type of SYSTIMER clock source.
    Values:

    enumerator SYSTIMER_CLK_SRC_XTAL
        SYSTIMER source clock is XTAL

    enumerator SYSTIMER_CLK_SRC_DEFAULT
        SYSTIMER source clock default choice is XTAL

enum soc_periph_gptimer_clk_src_t
    Type of GPTimer clock source.
    Values:

    enumerator GPTIMER_CLK_SRC_APB
        Select APB as the source clock

    enumerator GPTIMER_CLK_SRC_DEFAULT
        Select APB as the default choice

enum soc_periph_tg_clk_src_legacy_t
    Type of Timer Group clock source, reserved for the legacy timer group driver.
    Values:

    enumerator TIMER_SRC_CLK_APB
        Timer group source clock is APB

    enumerator TIMER_SRC_CLK_DEFAULT
        Timer group source clock default choice is APB

enum soc_periph_lcd_clk_src_t
    Type of LCD clock source.
    Values:

    enumerator LCD_CLK_SRC_PLL160M
        Select PLL_160M as the source clock

    enumerator LCD_CLK_SRC_DEFAULT
        Select PLL_160M as the default choice

enum soc_periph_rmt_clk_src_t
    Type of RMT clock source.
    Values:
enumerator **RMT_CLK_SRC_APB**
  Select APB as the source clock

enumerator **RMT_CLK_SRC_REF_TICK**
  Select REF_TICK as the source clock

enumerator **RMT_CLK_SRC_DEFAULT**
  Select APB as the default choice

enum **soc_periph_rmt_clk_src_legacy_t**
Type of RMT clock source, reserved for the legacy RMT driver.

  Values:

  - enumerator **RMT_BASECLK_APB**
    RMT source clock is APB CLK

  - enumerator **RMT_BASECLK_REF**
    RMT source clock is REF_TICK

  - enumerator **RMT_BASECLK_DEFAULT**
    RMT source clock default choice is APB

enum **soc_periph_uart_clk_src_legacy_t**
Type of UART clock source, reserved for the legacy UART driver.

  Values:

  - enumerator **UART_SCLK_APB**
    UART source clock is APB CLK

  - enumerator **UART_SCLK_REF_TICK**
    UART source clock is REF_TICK

  - enumerator **UART_SCLK_DEFAULT**
    UART source clock default choice is APB

enum **soc_periph_mcpwm_timer_clk_src_t**
Type of MCPWM timer clock source.

  Values:

  - enumerator **MCPWM_TIMER_CLK_SRC_PLL160M**
    Select PLL_F160M as the source clock

  - enumerator **MCPWM_TIMER_CLK_SRC_DEFAULT**
    Select PLL_F160M as the default clock choice

enum **soc_periph_mcpwm_capture_clk_src_t**
Type of MCPWM capture clock source.

  Values:
enumerator **MCPWM_CAPTURE_CLK_SRC_APB**
    Select APB as the source clock

enumerator **MCPWM_CAPTURE_CLK_SRC_DEFAULT**
    Select APB as the default clock choice

defined **soc_periph_mcpwm_carrier_clk_src_t**

    Type of MCPWM carrier clock source.
    \[\text{Values:}\]
    
    enumerator **MCPWM_CARRIER_CLK_SRC_PLL160M**
        Select PLL_F160M as the source clock
    
    enumerator **MCPWM_CARRIER_CLK_SRC_DEFAULT**
        Select PLL_F160M as the default clock choice

defined **soc_periph_i2s_clk_src_t**

    I2S clock source enum.
    \[\text{Values:}\]
    
    enumerator **I2S_CLK_SRC_DEFAULT**
        Select PLL_F160M as the default source clock
    
    enumerator **I2S_CLK_SRC_PLL_160M**
        Select PLL_F160M as the source clock
    
    enumerator **I2S_CLK_SRC_APLL**
        Select APLL as the source clock

defined **soc_periph_i2c_clk_src_t**

    Type of I2C clock source.
    \[\text{Values:}\]
    
    enumerator **I2C_CLK_SRC_APB**
    
    enumerator **I2C_CLK_SRC_DEFAULT**

defined **soc_periph_spi_clk_src_t**

    Type of SPI clock source.
    \[\text{Values:}\]
    
    enumerator **SPI_CLK_SRC_DEFAULT**
        Select APB as SPI source clock
    
    enumerator **SPI_CLK_SRC_APB**
        Select APB as SPI source clock
enum `soc_periph_sdm_clk_src_t`
Sigma Delta Modulator clock source.

Values:

- `SDM_CLK_SRC_APB`
  Select APB as the source clock

- `SDM_CLK_SRC_DEFAULT`
  Select APB as the default clock choice

enum `soc_periph_dac_digi_clk_src_t`
DAC digital controller clock source.

Values:

- `DAC_DIGI_CLK_SRC_PLLD2`
  Select PLL_D2 as the source clock

- `DAC_DIGI_CLK_SRC_APLL`
  Select APLL as the source clock

- `DAC_DIGI_CLK_SRC_DEFAULT`
  Select PLL_D2 as the default source clock

enum `soc_periph_dac_cosine_clk_src_t`
DAC cosine wave generator clock source.

Values:

- `DAC_COSINE_CLK_SRC_RTC_FAST`
  Select RTC FAST as the source clock

- `DAC_COSINE_CLK_SRC_DEFAULT`
  Select RTC FAST as the default source clock

enum `soc_periph_twai_clk_src_t`
TWAI clock source.

Values:

- `TWAI_CLK_SRC_APB`
  Select APB as the source clock

- `TWAI_CLK_SRC_DEFAULT`
  Select APB as the default clock choice

enum `soc_periph_adc_digi_clk_src_t`
ADC digital controller clock source.

Note: ADC DMA mode is clocked from I2S on ESP32, using `ADC_DIGI_` here for compatibility. Its clock source is same as I2S
Chapter 2. API Reference

Values:

enumerator **ADC_DIGI_CLK_SRC_PLL_F160M**
  Select F160M as the source clock

enumerator **ADC_DIGI_CLK_SRC_APLL**
  Select APLL as the source clock

enumerator **ADC_DIGI_CLK_SRC_DEFAULT**
  Select F160M as the default clock choice

enum **soc_periph_adc_rtc_clk_src_t**
ADC RTC controller clock source.

Values:

enumerator **ADC_RTC_CLK_SRC_RC_FAST**
  Select RC_FAST as the source clock

enumerator **ADC_RTC_CLK_SRC_DEFAULT**
  Select RC_FAST as the default clock choice

enum **soc_periph_mwdt_clk_src_t**
MWDT clock source.

Values:

enumerator **MWDT_CLK_SRC_APB**
  Select APB as the source clock

enumerator **MWDT_CLK_SRC_DEFAULT**
  Select APB as the default clock choice

enum **soc_periph_ledc_clk_src_legacy_t**
Type of LEDC clock source, reserved for the legacy LEDC driver.

Values:

enumerator **LEDC_AUTO_CLK**
  LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**
  Select APB as the source clock

enumerator **LEDC_USE_RC_FAST_CLK**
  Select RC_FAST as the source clock

enumerator **LEDC_USE_REF_TICK**
  Select REF_TICK as the source clock
enumerator LEDC_USE_RTC8M_CLK
    Alias of 'LEDC_USE_RC_FAST_CLK'

denum soc_periph_sdmmc_clk_src_t
    Type of SDMMC clock source.
    Values:

    enumerator SDMMC_CLK_SRC_DEFAULT
        Select PLL_160M as the default choice

    enumerator SDMMC_CLK_SRC_PLL160M
        Select PLL_160M as the source clock

denum soc_clkout_sig_id_t
    Values:

    enumerator CLKOUT_SIG_I2S0
        I2S0 clock, depends on the i2s driver configuration

    enumerator CLKOUT_SIG_PLL
        PLL_CLK is the output of crystal oscillator frequency multiplier

    enumerator CLKOUT_SIG_RC_SLOW
        RC slow clock, depends on the RTC_CLK_SRC configuration

    enumerator CLKOUT_SIG_XTAL
        Main crystal oscillator clock

    enumerator CLKOUT_SIG_APLL
        Divided by PLL, frequency is configurable

    enumerator CLKOUT_SIG_REF_TICK
        Divided by APB clock, usually be 1MHz

    enumerator CLKOUT_SIG_PLL_F80M
        From PLL, usually be 80MHz

    enumerator CLKOUT_SIG_RC_FAST
        RC fast clock, about 8MHz

    enumerator CLKOUT_SIG_I2S1
        I2S1 clock, depends on the i2s driver configuration

    enumerator CLKOUT_SIG_INVALID

Header File

- components/esp_hw_support/include/esp_clk_tree.h
- This header file can be included with:
#include "esp_clk_tree.h"

Functions

**esp_err_t esp_clk_tree_src_get_freq_hz (soc_module_clk_t clk_src, esp_clk_tree_src_freq_precision_t precision, uint32_t *freq_value)**

Get frequency of module clock source.

**Parameters**

- **clk_src -- [in]** Clock source available to modules, in soc_module_clk_t
- **precision -- [in]** Degree of precision, one of esp_clk_tree_src_freq_precision_t values This arg only applies to the clock sources that their frequencies can vary: SOC_MOD_CLK_RTC_FAST, SOC_MOD_CLK_RTC_SLOW, SOC_MOD_CLK_RC_FAST, SOC_MOD_CLK_RC_FAST_D256, SOC_MOD_CLK_XTAL32K For other clock sources, this field is ignored.
- **freq_value -- [out]** Frequency of the clock source, in Hz

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Calibration failed

Enumerations

**enum esp_clk_tree_src_freq_precision_t**

Degree of precision of frequency value to be returned by esp_clk_tree_src_get_freq_hz()

Values:

- **enumerator ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED**
- **enumerator ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX**
- **enumerator ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT**
- **enumerator ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID**

2.6.5 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels respectively connected to GPIO25 (Channel 1) and GPIO26 (Channel 2). Each DAC channel can convert the digital value 0~255 to the analog voltage 0~Vref (The reference voltage ‘Vref’ here is input from the pin VDD3P3_RTC, which ideally equals to the power supply VDD). The output voltage can be calculated as the following:

\[
\text{out\_voltage} = \text{Vref} \times \text{digi\_val} / 255
\]

The DAC peripheral supports outputting analog signal in the following ways:

1. Outputting a voltage directly. The DAC channel keeps outputting a specified voltage.
2. Outputting continuous analog signal by DMA. The DAC converts the data in a buffer at a specified frequency.
3. Outputting a cosine wave by the cosine wave generator. The DAC channel can output a cosine wave with specified frequency and amplitude.

For other analog output options, see Sigma-Delta Modulation and LED Control. Both modules produce high-frequency PWM/PDM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

### DAC File Structure

**Fig. 7: DAC File Structure**

**Public headers that need to be included in the DAC application are listed as follows:**

- **dac.h**: The top header file of the legacy DAC driver, which should be only included in the apps which use the legacy driver API.
- **dac_oneshot.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with one-shot mode.
- **dac_cosine.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with cosine mode.
- **dac_continuous.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with continuous mode.

**Note:** The legacy driver cannot coexist with the new driver. Include dac.h to use the legacy driver or dac_oneshot.h, dac_cosine.h, and dac_continuous.h to use the new driver. The legacy driver might be removed in the future.

### Functional Overview

**Resources Management** The DAC on ESP32 has two channels. The channels have separate software resources and can be managed by **dac_oneshot_handle_t**, **dac_cosine_handle_t**, or **dac_continuous_handle_t** according to the usage. Registering different modes on a same DAC channel is not allowed.

**Direct Voltage Output (One-shot/Direct Mode)** The DAC channels in the group can convert an 8-bit digital value into the analog when **dac_oneshot_output_voltage()** is called (it can be called in ISR). The analog voltage is kept on the DAC channel until the next conversion starts. To start the voltage conversion, the DAC channels need to be enabled first through registering by **dac_oneshot_new_channel()**.
Continuous Wave Output (Continuous/DMA Mode)  
DAC channels can convert digital data continuously via the DMA. There are three ways to write the DAC data:

1. Normal writing (synchronous): Data can be transmitted at one time and kept blocked until all the data has been loaded into the DMA buffer, and the voltage is kept as the last conversion value while no more data is inputted. It is usually used to transport a long signal like an audio. To convert data continuously, the continuous channel handle need to be allocated by calling `dac_continuous_new_channels()` and the DMA conversion should be enabled by calling `dac_continuous_enable()`. Then data can be written by `dac_continuous_write()` synchronously. Refer to `peripherals/dac/dac_continuous/dac_audio` for examples.

2. Cyclical writing: A piece of data can be converted cyclically without blocking, and no more operation is needed after the data are loaded into the DMA buffer. But note that the inputted buffer size is limited by the number of descriptors and the DMA buffer size. It is usually used to transport short signals that need to be repeated, e.g., a sine wave. To achieve cyclical writing, call `dac_continuous_write_cyclically()` after the DAC continuous mode is enabled. Refer to `peripherals/dac/dac_continuous/signal_generator` for examples.

3. Asynchronous writing: Data can be transmitted asynchronously based on the event callback. `dac_event_callbacks_t::on_convert_done` must be registered to use asynchronous mode. Users can get the `dac_event_data_t` in the callback which contains the DMA buffer address and length, allowing them to load the data into the buffer directly. To use the asynchronous writing, call `dac_continuous_register_event_callback()` to register the `dac_event_callbacks_t::on_convert_done` before enabling, and then `dac_continuous_start_async_writing()` to start the asynchronous writing. Note that once the asynchronous writing is started, the callback function will be triggered continuously. Call `dac_continuous_write_asynchronously()` to load the data either in a separate task or in the callback directly. Refer to `peripherals/dac/dac_continuous/dac_audio` for examples.

On ESP32, the DAC digital controller can be connected internally to the I2S0 and use its DMA for continuous conversion. Although the DAC only needs 8-bit data for conversion, it has to be the left-shifted 8 bits (i.e., the high 8 bits in a 16-bit slot) to satisfy the I2S communication format. By default, the driver helps to expand the data to 16-bit wide automatically. To expand manually, please disable `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in the menuconfig.

The clock of the DAC digital controller comes from I2S0 as well, so there are two clock sources for selection:

- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_PLL_D2` supports frequency between 19.6 KHz to several MHz. It is the default clock which can also be selected by `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_DEFAULT`.
- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APLL` supports frequency between 648 Hz to several MHz. However, it might be occupied by other peripherals, thus not providing the required frequency. In such case, this clock source is available only if APLL still can be correctly divided into the target DAC DMA frequency.

Cosine Wave Output (Cosine Mode)  
The DAC peripheral has a cosine wave generator, which can generate cosine wave on the channels. Users can specify the frequency, amplitude, and phase of the cosine wave. To output the cosine wave, please acquire the DAC to cosine mode using `dac_cosine_new_channel()`, and then start the cosine wave generator by `dac_cosine_start()`.

Currently, the clock source of the cosine wave generator only comes from `RTC_FAST` which can be selected by `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_FAST`. It is also the default clock source which is the same as `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_DEFAULT`.

Power Management  
When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the clock source of DAC before entering Light-sleep mode, thus potential influence to the DAC signals may lead to false data conversion.

When using DAC driver in continuous mode, it can prevent the system from changing or stopping the clock source in DMA or cosine mode by acquiring a power management lock. When the clock source is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`. When the clock source is APLL (only in DMA mode), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the DAC is converting (i.e., DMA or cosine wave generator is working), the driver guarantees that the power management

1168
Release master
lock is acquired after calling \texttt{dac_continuous_enable()}. Likewise, the driver will release the lock when \texttt{dac_continuous_disable()} is called.

**IRAM Safe**  By default, the DAC DMA interrupt will be deferred when the cache is disabled for reasons like writing/erasing Flash. Thus the DMA EOF interrupt will not get executed in time. To avoid such case in real-time applications, you can enable the Kconfig option \texttt{CONFIG\_DAC\_ISR\_IRAM\_SAFE} which:

1. Enables the interrupt being serviced even when cache is disabled;
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety**  All the public DAC APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the DAC driver uses mutex lock to ensure the thread safety, thus the APIs except \texttt{dac_oneshot_output_voltage()} are not allowed to be used in ISR.

**Kconfig Options**

- \texttt{CONFIG\_DAC\_ISR\_IRAM\_SAFE} controls whether the default ISR handler can work when cache is disabled. See \texttt{IRAM Safe} for more information.
- \texttt{CONFIG\_DAC\_SUPPRESS\_DEPRECATE\_WARN} controls whether to suppress the warning message compilation while using the legacy DAC driver.
- \texttt{CONFIG\_DAC\_ENABLE\_DEBUG\_LOG} is used to enable the debug log output. Enable this option increases the firmware binary size.
- \texttt{CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN} auto expands the 8-bit data to 16-bit data in the driver to satisfy the I2S DMA format.

**Application Example**

The basic examples for the One-shot Mode, Continuous Mode, and Cosine Mode can be found in:

- \texttt{peripherals/dac/dac_oneshot}
- \texttt{peripherals/dac/dac_continuous}
- \texttt{peripherals/dac/dac_cosine_wave}

**API Reference**

**Header File**

- \texttt{components/esp_driver_dac/include/driver/dac_oneshot.h}

This header file can be included with:

```c
#include "driver/dac_oneshot.h"
```

- This header file is a part of the API provided by the \texttt{esp_driver_dac} component. To declare that your component depends on \texttt{esp_driver_dac}, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_driver_dac
  or
  PRIV_REQUIRES esp_driver_dac
  ```
Chapter 2. API Reference

Functions

`esp_err_t dac_oneshot_new_channel(const dac_oneshot_config_t *oneshot_cfg, dac_oneshot_handle_t *ret_handle)`

Allocate a new DAC oneshot channel.

Note: The channel will be enabled as well when the channel allocated

Parameters
- `oneshot_cfg` -- [in] The configuration for the oneshot channel
- `ret_handle` -- [out] The returned oneshot channel handle

Returns
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NO_MEM No memory for the DAC oneshot channel resources
- ESP_OK Allocate the new DAC oneshot channel success

`esp_err_t dac_oneshot_del_channel(dac_oneshot_handle_t handle)`

Delete the DAC oneshot channel.

Note: The channel will be disabled as well when the channel deleted

Parameters
- `handle` -- [in] The DAC oneshot channel handle

Returns
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has already been de-registered
- ESP_OK Delete the oneshot channel success

`esp_err_t dac_oneshot_output_voltage(dac_oneshot_handle_t handle, uint8_t digi_value)`

Output the voltage.

Note: Generally it’ll take 7~11 us on ESP32 and 10~21 us on ESP32-S2

Parameters
- `handle` -- [in] The DAC oneshot channel handle
- `digi_value` -- [in] The digital value that need to be converted

Returns
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_OK Convert the digital value success

Structures

`struct dac_oneshot_config_t`  
DAC oneshot channel configuration.

Public Members

```
  dac_channel_t chan_id
```

DAC channel id
Chapter 2. API Reference

Type Definitions

typedef struct dac_oneshot_s *dac_oneshot_handle_t
DAC oneshot channel handle

Header File

- components/esp_driver_dac/include/driver/dac_cosine.h
- This header file can be included with:

```c
#include "driver/dac_cosine.h"
```

- This header file is a part of the API provided by the esp_driver_dac component. To declare that your component depends on esp_driver_dac, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_driver_dac
```

or

```cmake
PRIV_REQUIRES esp_driver_dac
```

Functions

- `esp_err_t dac_cosine_new_channel(const dac_cosine_config_t *cos_cfg, dac_cosine_handle_t *ret_handle)`
  Allocate a new DAC cosine wave channel.

  **Note:** Since there is only one cosine wave generator, only the first channel can set the frequency of the cosine wave. Normally, the latter one is not allowed to set a different frequency, but the it can be forced to set by setting the bit `force_set_freq` in the configuration, notice that another channel will be affected as well when the frequency is updated.

  **Parameters**
  - `cos_cfg` -- [in] The configuration of cosine wave channel
  - `ret_handle` -- [out] The returned cosine wave channel handle

  **Returns**
  - ESP_ERR_INVALID_ARG The input parameter is invalid
  - ESP_ERR_INVALID_STATE The DAC channel has been registered already
  - ESP_ERR_NO_MEM No memory for the DAC cosine wave channel resources
  - ESP_OK Allocate the new DAC cosine wave channel success

- `esp_err_t dac_cosine_del_channel(dac_cosine_handle_t handle)`
  Delete the DAC cosine wave channel.

  **Parameters**
  - `handle` -- [in] The DAC cosine wave channel handle

  **Returns**
  - ESP_ERR_INVALID_ARG The input parameter is invalid
  - ESP_ERR_INVALID_STATE The channel has already been deregistered
  - ESP_OK Delete the cosine wave channel success

- `esp_err_t dac_cosine_start(dac_cosine_handle_t handle)`
  Start outputting the cosine wave on the channel.

  **Parameters**
  - `handle` -- [in] The DAC cosine wave channel handle

  **Returns**
  - ESP_ERR_INVALID_ARG The input parameter is invalid
  - ESP_ERR_INVALID_STATE The channel has been started already
  - ESP_OK Start the cosine wave success
Stop outputting the cosine wave on the channel.

**Parameters**

handle -- [in] The DAC cosine wave channel handle

**Returns**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has been stopped already
- ESP_OK Stop the cosine wave success

**Structures**

```c
struct dac_cosine_config_t
{
    DAC cosine channel configurations.
}
```

**Public Members**

```c
dac_channel_t chan_id
{The cosine wave channel id}
```

```c
uint32_t freq_hz
{The frequency of cosine wave, unit: Hz. The cosine wave generator is driven by RTC_FAST clock which is divide from RC_FAST. With the default RTC clock, the minimum frequency of cosine wave is about 130 Hz. Although it can support up to several MHz frequency theoretically, the waveform will distort at high frequency due to the hardware limitation. Typically not suggest to set the frequency higher than 200 KHz}
```

```c
dac_cosine_clk_src_t clk_src
{The clock source of the cosine wave generator, currently only support DAC_COSINE_CLK_SRC_DEFAULT}
```

```c
dac_cosine_atten_t atten
{The attenuation of cosine wave amplitude}
```

```c
dac_cosine_phase_t phase
{The phase of cosine wave, can only support DAC_COSINE_PHASE_0 or DAC_COSINE_PHASE_180, default as 0 while setting an unsupported phase}
```

```c
int8_t offset
{The DC offset of cosine wave}
```

```c
bool force_set_freq
{Force to set the cosine wave frequency}
```

```c
struct dac_cosine_config_t::[anonymous] flags
{Flags of cosine mode}
```

**Type Definitions**

typedef struct dac_cosine_s *dac_cosine_handle_t
{DAC cosine wave channel handle}
Chapter 2. API Reference

Header File

- components/esp_driver_dac/include/driver/dac_continuous.h
- This header file can be included with:

```c
#include "driver/dac_continuous.h"
```

- This header file is a part of the API provided by the `esp_driver_dac` component. To declare that your component depends on `esp_driver_dac`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_driver_dac
```

or

```cmake
PRIV_REQUIRES esp_driver_dac
```

Functions

```c
esp_err_t dac_continuous_new_channels(const dac_continuous_config_t *cont_cfg,
                                       dac_continuous_handle_t *ret_handle)
```

Allocates new DAC channels in continuous mode.

**Note:** The DAC channels can't be registered to continuous mode separately

**Parameters**
- `cont_cfg` -- [in] Continuous mode configuration
- `ret_handle` -- [out] The returned continuous mode handle

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NOT_FOUND Not found the available dma peripheral, might be occupied
- ESP_ERR_NO_MEM No memory for the DAC continuous mode resources
- ESP_OK Allocate the new DAC continuous mode success

```c
esp_err_t dac_continuous_del_channels(dac_continuous_handle_t handle)
```

Deletes the DAC continuous handle.

**Parameters**
- `handle` -- [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have already been deregistered or not disabled
- ESP_OK Delete the continuous channels success

```c
esp_err_t dac_continuous_enable(dac_continuous_handle_t handle)
```

Enables the DAC continuous mode.

**Note:** Must enable the channels before

**Parameters**
- `handle` -- [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Enable the continuous output success
**esp_err_t dac_continuous_disable**(dac_continuous_handle_t handle)

Disable the DAC continuous mode.

**Parameters**
- **handle** -- [in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Disable the continuous output success

**esp_err_t dac_continuous_write**(dac_continuous_handle_t handle, uint8_t* buf, size_t buf_size, size_t* bytes_loaded, int timeout_ms)

Write DAC data continuously.

**Note:** The data in buffer will only be converted one time. This function will be blocked until all data loaded or timeout then the DAC output will keep outputting the voltage of the last data in the buffer

**Parameters**
- **handle** -- [in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'
- **buf** -- [in] The digital data buffer to convert
- **buf_size** -- [in] The buffer size of digital data buffer
- **bytes_loaded** -- [out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it
- **timeout_ms** -- [in] The timeout time in millisecond, set a minus value means will block forever

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
- ESP_ERR_TIMEOUT Waiting for semaphore or message queue timeout
- ESP_OK Success to output the acyclic DAC data

**esp_err_t dac_continuous_write_cyclically**(dac_continuous_handle_t handle, uint8_t* buf, size_t buf_size, size_t* bytes_loaded)

Write DAC continuous data cyclically.

**Note:** The data in buffer will be converted cyclically using DMA once this function is called, This function will return once the data loaded into DMA buffers.

**Note:** The buffer size of cyclically output is limited by the descriptor number and dma buffer size while initializing the continuous mode. Concretely, in order to load all the data into descriptors, the cyclic buffer size is not supposed to be greater than desc_num * buf_size

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available. The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing CONFIG_DAC_DMA_AUTO_16BIT_ALIGN in menuconfig.
Parameters
- **handle** -- [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’
- **buf** -- [in] The digital data buffer to convert
- **buf_size** -- [in] The buffer size of digital data buffer
- **bytes_loaded** -- [out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it

Returns
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
- ESP_OK Success to output the acyclic DAC data

```
esp_err_t dac_continuous_register_event_callback(dac_continuous_handle_t handle, const
dac_event_callbacks_t *callbacks, void
*user_data)
```

Set event callbacks for DAC continuous mode.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

**Note:** When CONFIG_DAC_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in this function, including the user_data, should be in the internal RAM as well.

Parameters
- **handle** -- [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’
- **callbacks** -- [in] Group of callback functions, input NULL to clear the former callbacks
- **user_data** -- [in] User data, which will be passed to callback functions directly

Returns
- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument

```
esp_err_t dac_continuous_start_async_writing(dac_continuous_handle_t handle)
```

Start the async writing.

**Note:** When the asynchronous writing start, the DAC will keep outputting ‘0’ until the data are loaded into the DMA buffer. To loaded the data into DMA buffer, ‘on_convert_done’ callback is required, which can be registered by ‘dac_continuous_register_event_callback’ before enabling

Parameters **handle** -- [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’

Returns
- ESP_OK Start asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE The channel is not enabled or the ‘on_convert_done’ callback is not registered

```
esp_err_t dac_continuous_stop_async_writing(dac_continuous_handle_t handle)
```

Stop the sync writing.
**Parameters**  
* `handle` -- [in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'

**Returns**
- ESP_OK Stop asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE Asynchronous writing has not started

```c
esp_err_t dac_continuous_write_asynchronously(dac_continuous_handle_t handle, uint8_t *dma_buf, size_t dma_buf_len, const uint8_t *data, size_t data_len, size_t *bytes_loaded)
```

Write DAC data asynchronously.

**Note:** This function can be called when the asynchronous writing started, and it can be called in the callback directly but recommend to writing data in a task, referring to example: peripherals/dac/dac_continuous/dac_audio

**Parameters**
- `handle` -- [in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'
- `dma_buf` -- [in] The DMA buffer address, it can be acquired from 'dac_event_data_t' in the 'on_convert_done' callback
- `dma_buf_len` -- [in] The DMA buffer length, it can be acquired from 'dac_event_data_t' in the 'on_convert_done' callback
- `data` -- [in] The data that need to be written
- `data_len` -- [in] The data length the need to be written
- `bytes_loaded` -- [out] The bytes number that has been loaded/written into the DMA buffer

**Returns**
- ESP_OK Write the data into DMA buffer successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE The channels haven’t start the asynchronous writing
- ESP_ERR_NOT_FOUND The param 'dam_buf' not match any existed DMA buffer

**Structures**

```c
struct dac_continuous_config_t

DAC continuous channels' configurations.
```

**Public Members**

```c
dac_channel_mask_t chan_mask

DAC channels' mask for selecting which channels are used
```

```c
uint32_t desc_num

The number of DMA descriptor, at least 2 descriptors are required The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than '1' in acyclic output Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer
```

```c
size_t buf_size

The DMA buffer size, should be within 32~4092 bytes. Each DMA buffer will be attached to a DMA descriptor, i.e. the number of DMA buffer will be equal to the DMA descriptor number The DMA buffer size is not allowed to be greater than 4092 bytes The total DMA buffer size equal to desc_num * buf_size Typically, suggest to set the size to the multiple of 4
```
### Chapter 2. API Reference

**uint32_t `freq_hz`**
The frequency of DAC conversion in continuous mode, unit: Hz. The supported range is related to the target and the clock source. For the clock `DAC_DIGI_CLK_SRC_DEFAULT`: the range is 19.6 KHz to several MHz on ESP32 and 77 Hz to several MHz on ESP32-S2. For the clock `DAC_DIGI_CLK_SRC_APLL`: the range is 648 Hz to several MHz on ESP32 and 6 Hz to several MHz on ESP32-S2. Typically not suggest to set the frequency higher than 2 MHz, otherwise the severe distortion will appear.

**int8_t `offset`**
The offset of the DAC digital data. Range -128~127

**`dac_continuous_digi_clk_src_t` `clk_src`**
The clock source of digital controller, which can affect the range of supported frequency. Currently `DAC_DIGI_CLK_SRC_DEFAULT` and `DAC_DIGI_CLK_SRC_APLL` are available.

**`dac_continuous_channel_mode_t` `chan_mode`**
The channel mode of continuous mode, only take effect when multiple channels enabled, depends converting the buffer alternately or simultaneously.

**struct `dac_event_data_t`**
Event structure used in DAC event queue.

#### Public Members

**void *`buf`**
The pointer of DMA buffer that just finished sending.

**size_t `buf_size`**
The writable buffer size of the DMA buffer, equal to `dac_continuous_config_t::buf_size`

**size_t `write_bytes`**
The number of bytes that be written successfully.

**struct `dac_event_callbacks_t`**
Group of DAC callbacks.

---

**Note:** The callbacks are all running under ISR environment.

**Note:** When `CONFIG_DAC_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

#### Public Members

**`dac_isr_callback_t` `on_convert_done`**
Callback of data conversion done event. An event data buffer previously loaded to the driver has been output and converted. The event data includes DMA buffer address and size that just finished converting.
**dac_isr_callback_t on_stop**

Callback of finished sending all the data. All loaded event data buffers are converted. Driver is pending for new data buffers to be loaded. The event data will be NULL in this callback.

**Type Definitions**

typedef struct dac_continuous_s *dac_continuous_handle_t
DAC continuous channel handle

typedef bool (*dac_isr_callback_t)(dac_continuous_handle_t handle, const dac_event_data_t *event, void *user_data)
DAC event callback.

**Param handle** [in] DAC channel handle, created from dac_continuous_new_channels()
**Param event** [in] DAC event data
**Param user_data** [in] User registered context, passed from dac_continuous_register_event_callback()
**Return** Whether a high priority task has been waken up by this callback function

**Enumerations**

enum dac_channel_mask_t
DAC channel mask.

**Values:**

enumerator DAC_CHANNEL_MASK_CH0
DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator DAC_CHANNEL_MASK_CH1
DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator DAC_CHANNEL_MASK_ALL
Both DAC channel 0 and channel 1

**Header File**

- components/esp_driver_dac/include/driver/dac_types.h
- This header file can be included with:

  ```c
  #include "driver/dac_types.h"
  ```

- This header file is a part of the API provided by the esp_driver_dac component. To declare that your component depends on esp_driver_dac, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES esp_driver_dac
  ```

  or

  ```cmake
  PRIV_REQUIRES esp_driver_dac
  ```

**Type Definitions**

typedef soc_periph_dac_digi_clk_src_t dac_continuous_digi_clk_src_t
DAC DMA (digital controller) clock source.
typedef soc_periph_dac_cosine_clk_src_t dac_cosine_clk_src_t
DAC cosine wave generator clock source.

Enumerations

enum dac_continuous_channel_mode_t
DAC channel work mode in dma mode.

Note: Only take effect when multiple channels enabled.

Note: Assume the data in buffer is 'A B C D E F' DAC_CHANNEL_MODE_SIMUL:
• channel 0: A B C D E F
• channel 1: A B C D E F

DAC_CHANNEL_MODE_ALTER:
• channel 0: A C E
• channel 1: B D F

Values:

enumerator DAC_CHANNEL_MODE_SIMUL
The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator DAC_CHANNEL_MODE_ALTER
The data in the DMA buffer is alternately output to the enable channel of the DAC.

Header File

• components/hal/include/hal/dac_types.h
• This header file can be included with:

```c
#include "hal/dac_types.h"
```

Enumerations

enum dac_channel_t
Values:

enumerator DAC_CHAN_0
DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator DAC_CHAN_1
DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator DAC_CHANNEL_1
Alias of 'DAC_CHAN_0', now the channel index start from '0'

enumerator DAC_CHANNEL_2
Alias of 'DAC_CHAN_1', now the channel index start from '0'
enum **dac_cosine_atten_t**

The attenuation of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

*Values:*

- **DAC_COSINE_ATTEN_DEFAULT**
  - No attenuation to the DAC cosine wave amplitude. Default.

- **DAC_COSINE_ATTEN_DB_0**
  - Original amplitude of the DAC cosine wave, equals to DAC_COSINE_ATTEN_DEFAULT

- **DAC_COSINE_ATTEN_DB_6**
  - 1/2 amplitude of the DAC cosine wave

- **DAC_COSINE_ATTEN_DB_12**
  - 1/4 amplitude of the DAC cosine wave

- **DAC_COSINE_ATTEN_DB_18**
  - 1/8 amplitude of the DAC cosine wave

enum **dac_cosine_phase_t**

Set the phase of the cosine wave generator output.

*Note:* Only 0 or 180 are supported, it will be set to 0 as default if configured to an unsupported phase.

*Values:*

- **DAC_COSINE_PHASE_0**
  - Phase shift +0°

- **DAC_COSINE_PHASE_180**
  - Phase shift +180°

### 2.6.6 GPIO & RTC GPIO

**GPIO Summary**

The ESP32 chip features 34 physical GPIO pins (GPIO0 ~ GPIO19, GPIO21 ~ GPIO23, GPIO25 ~ GPIO27, and GPIO32 ~ GPIO39). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF]*.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</table>

### Note:

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to [ESP32 datasheet](#).
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you are having trouble getting the value from an ADC2 GPIO while using Wi-Fi, you may consider using an ADC1 GPIO instead, which should solve your problem. For more details, please refer to [Hardware Limitations of ADC Continuous Mode](#) and [Hardware Limitations of ADC Oneshot Mode](#).
- Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to [ESP32 ECO and Workarounds for Bugs](#) > Section 3.11 for the detailed description of the issue.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the current configurations of IOs, such as pull-up/pull-down, input/output enable, pin mapping, etc. Below is an example of how to dump the configuration of GPIO4, GPIO18, and GPIO26:

```
```
gpio_dump_io_configuration(stdout, (1ULL << 4) | (1ULL << 18) | (1ULL << 26));

The dump will be like this:

```
IO DUMP Start

IO[4] -
Pullup: 1, Pulldown: 0, DriveCap: 2
InputEn: 1, OutputEn: 0, OpenDrain: 0
FuncSel: 1 (GPIO)
GPIO Matrix SigIn ID: (simple GPIO input)
SleepSelEn: 1

IO[18] -
Pullup: 0, Pulldown: 0, DriveCap: 2
InputEn: 0, OutputEn: 1, OpenDrain: 0
FuncSel: 1 (GPIO)
GPIO Matrix SigOut ID: 256 (simple GPIO output)
SleepSelEn: 1

IO[26] *RESERVED* -
Pullup: 1, Pulldown: 0, DriveCap: 2
InputEn: 1, OutputEn: 0, OpenDrain: 0
FuncSel: 0 (IOMUX)
SleepSelEn: 1

IO DUMP End
```

In addition, if you would like to dump the configurations of all IOs, you can use:

```
gpio_dump_all_io_configuration(stdout, SOC_GPIO_VALID_GPIO_MASK);
```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the `soc/gpio_sig_map.h` file. The word **RESERVED** indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

There is also separate "RTC GPIO" support, which functions when GPIOs are routed to the "RTC" low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The Ultra Low Power FSM co-processor is running
- Analog functions such as ADC/DAC/etc are in use

**Application Example**

- GPIO output and input interrupt example: `peripherals/gpio/generic_gpio`.

**API Reference - Normal GPIO**

**Header File**

- `components/esp_driver_gpio/include/driver/gpio.h`
- This header file can be included with:

  ```
  #include "driver/gpio.h"
  ```
- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:
Functions

**esp_err_t gpio_config (const gpio_config_t *pGPIOConfig)**

GPIO common configuration.

Parameters: pGPIOConfig -- Pointer to GPIO configure struct

Returns:
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_reset_pin (gpio_num_t gpio_num)**

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Parameters: gpio_num -- GPIO number.

Returns: Always return ESP_OK.

**esp_err_t gpio_set_intr_type (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

GPIO set interrupt trigger type.

Parameters:
- gpio_num -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- intr_type -- Interrupt type, select from gpio_int_type_t

Returns:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_intr_enable (gpio_num_t gpio_num)**

Enable GPIO module interrupt signal.

Note: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue.

Parameters: gpio_num -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

Returns:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_intr_disable (gpio_num_t gpio_num)**

Disable GPIO module interrupt signal.
**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**Parameters**
- `gpio_num` -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16 (16);

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)
```

GPIO set output level.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**Parameters**
- `gpio_num` -- GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16 (16);
- `level` -- Output level. 0: low; 1: high

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

```c
int gpio_get_level (gpio_num_t gpio_num)
```

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters**
- `gpio_num` -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16 (16);

**Returns**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

```c
esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
```

GPIO set direction.

Configure GPIO direction, such as `output_only`, `input_only`, `output_and_input`

**Parameters**
- `gpio_num` -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16 (16);
- `mode` -- GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

```c
esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
```

Configure GPIO pull-up/pull-down resistors.

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.
Parameters
- **gpio_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** -- GPIO pull up/down mode.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

```c
esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```
Enable GPIO wake-up function.

Parameters
- **gpio_num** -- GPIO number.
- **intr_type** -- GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)
```
Disable GPIO wake-up function.

Parameters **gpio_num** -- GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_isr_register (void (*fn)(void*), void* arg, intr_alloc_flags, gpio_isr_handle_t *handle)
```
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the **interrupt allocation functions**.

Parameters
- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns
- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

```c
esp_err_t gpio_pullup_en (gpio_num_t gpio_num)
```
Enable pull-up on GPIO.

Parameters **gpio_num** -- GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)
```
Disable pull-up on GPIO.

Parameters **gpio_num** -- GPIO number

Returns
- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)
```
Enable pull-down on GPIO.

Parameters
- `gpio_num` -- GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)
```
Disable pull-down on GPIO.

Parameters
- `gpio_num` -- GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_install_isr_service (int intr_alloc_flags)
```
Install the GPIO driver's ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Parameters
- `intr_alloc_flags` -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns
- ESP_OK Success
- ESP_ERR_NO_MEM Nomemory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

```c
void gpio_uninstall_isr_service (void)
```
Uninstall the driver's GPIO ISR service, freeing related resources.

```c
esp_err_t gpio_isr_handler_add (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
```
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Parameters
- `gpio_num` -- GPIO number
- `isr_handler` -- ISR handler function for the corresponding GPIO number.
- `args` -- parameter for ISR handler.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)
```
Remove ISR handler for the corresponding GPIO pin.

Parameters
- `gpio_num` -- GPIO number

Returns
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

**`esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)`**

Set GPIO pad drive capability.

**Parameters**
- `gpio_num` -- GPIO number, only support output GPIOs
- `strength` -- Drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**`esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)`**

Get GPIO pad drive capability.

**Parameters**
- `gpio_num` -- GPIO number, only support output GPIOs
- `strength` -- Pointer to accept drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**`esp_err_t gpio_hold_en (gpio_num_t gpio_num)`**

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters**
- `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**`esp_err_t gpio_hold_dis (gpio_num_t gpio_num)`**

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters**
- `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function
void **gpio_deep_sleep_hold_en** (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call **gpio_deep_sleep_hold_dis** to disable this feature.

void **gpio_deep_sleep_hold_dis** (void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio_iomux_in** (uint32_t gpio_num, uint32_t signal_idx)

SOC_GPIO_SUPPORT_HOLD_SINGLE_IO_IN_DSLP.

Set pad input to a peripheral signal through the IOMUX.

Parameters

- **gpio_num** -- GPIO number of the pad.
- **signal_idx** -- Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void **gpio_iomux_out** (uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- **gpio_num** -- gpio_num GPIO number of the pad.
- **func** -- The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- **oen_inv** -- True if the output enable needs to be inverted, otherwise False.

**esp_err_t gpio_sleep_sel_en** (gpio_num_t gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters **gpio_num** -- GPIO number of the pad.

Returns

- ESP_OK Success

**esp_err_t gpio_sleep_sel_dis** (gpio_num_t gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters **gpio_num** -- GPIO number of the pad.

Returns

- ESP_OK Success

**esp_err_t gpio_sleep_set_direction** (gpio_num_t gpio_num, gpio_mode_t mode)

GPIO set direction at sleep.

Configure GPIO direction, such as output only, input only, output and input

Parameters

- **gpio_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** -- GPIO direction

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**esp_err_t gpio_sleep_set_pull_mode** (gpio_num_t gpio_num, gpio_pull_mode_t pull)

Configure GPIO pull-up/pull-down resistors at sleep.
Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters
- **gpio_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- **pull** -- GPIO pull up/down mode.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

```c
esp_err_t gpio_dump_io_configuration(FILE *out_stream, uint64_t io_bit_mask)
```
Dump IO configuration information to console.

Parameters
- **out_stream** -- IO stream (e.g. stdout)
- **io_bit_mask** -- IO pin bit mask, each bit maps to an IO

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

```c
struct gpio_config_t
```
Configuration parameters of GPIO pad for gpio_config function.

Public Members

```c
uint64_t pin_bit_mask
```
GPIO pin: set with bit mask, each bit maps to a GPIO

```c
gpio_mode_t mode
```
GPIO mode: set input/output mode

```c
gpio_pullup_t pull_up_en
```
GPIO pull-up

```c
gpio_pulldown_t pull_down_en
```
GPIO pull-down

```c
gpio_int_type_t intr_type
```
GPIO interrupt type

Macros

#define GPIO_IS_VALID_GPIO(gpio_num)
```
Check whether it is a valid GPIO number.

```c
#define GPIO_IS_VALID_OUTPUT_GPIO(gpio_num)
```
Check whether it can be a valid GPIO number of output mode.
**GPIO_IS_VALID_DIGITAL_IO_PAD** *(gpio_num)*

Check whether it can be a valid digital I/O pad.

**Type Definitions**

```c
typedef intr_handle_t gpio_isr_handle_t
```

```c
typedef void(*gpio_isr_t)(void *arg)
```

GPIO interrupt handler.

**Param arg** User registered data

**Header File**

- `components/hal/include/hal/gpio_types.h`
- This header file can be included with:

```c
#include "hal/gpio_types.h"
```

      Pad drive capability: weak

   enumerator GPIO_DRIVE_CAP_1
      Pad drive capability: stronger

   enumerator GPIO_DRIVE_CAP_2
      Pad drive capability: medium

   enumerator GPIO_DRIVE_CAP_DEFAULT
      Pad drive capability: medium

   enumerator GPIO_DRIVE_CAP_3
      Pad drive capability: strongest

   enumerator GPIO_DRIVE_CAP_MAX
Chapter 2. API Reference

API Reference - RTC GPIO

Header File

- components/esp_driver_gpio/include/driver/rtc_io.h
- This header file can be included with:
  ```c
  #include "driver/rtc_io.h"
  ```
- This header file is a part of the API provided by the esp_driver_gpio component. To declare that your component depends on esp_driver_gpio, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRES esp_driver_gpio
  ```
  or
  ```cmake
  PRIV_REQUIRES esp_driver_gpio
  ```

Functions

bool rtc_gpio_is_valid_gpio(gpio_num_t gpio_num)
Determine if the specified GPIO is a valid RTC GPIO.

Parameters

- `gpio_num`: GPIO number

Returns

- true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get(gpio_num_t gpio_num)
Get RTC IO index number by gpio number.

Parameters

- `gpio_num`: GPIO number

Returns

- >=0: Index of rtcio. -1: The gpio is not rtcio.

esp_err_t rtc_gpio_init(gpio_num_t gpio_num)
Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_deinit(gpio_num_t gpio_num)
Init a GPIO as digital GPIO.

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

uint32_t rtc_gpio_get_level(gpio_num_t gpio_num)
Get the RTC IO input level.

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

Returns

- 1: High level
- 0: Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_set_level(gpio_num_t gpio_num, uint32_t level)
Set the RTC IO output level.

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)
- `level`: output level
Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction.
Configure RTC GPIO direction, such as output only, input only, output and input.

Parameters
- `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
- `mode` -- GPIO direction

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction_in_sleep(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT_ONLY mode. The rest targets support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Parameters
- `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
- `mode` -- GPIO direction

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)`
RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Parameters `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)`
RTC GPIO pulldown enable.
This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Parameters `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)`
RTC GPIO pullup disable.
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Parameters `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO
**esp_err_t rtc_gpio_pulldown_dis (gpio_num_t gpio_num)**

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

- **Parameters**
  - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)**

Set RTC GPIO pad drive capability.

- **Parameters**
  - `gpio_num` -- GPIO number, only support output GPIOs
  - `strength` -- Drive capability of the pad

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)**

Get RTC GPIO pad drive capability.

- **Parameters**
  - `gpio_num` -- GPIO number, only support output GPIOs
  - `strength` -- Pointer to accept drive capability of the pad

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_iomux_func_sel (gpio_num_t gpio_num, int func)**

Select a RTC IOMUX function for the RTC IO.

- **Parameters**
  - `gpio_num` -- GPIO number
  - `func` -- Function to assign to the pin

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_hold_en (gpio_num_t gpio_num)**

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

- **Parameters**
  - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_hold_dis (gpio_num_t gpio_num)**

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

- **Parameters**
  - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

- **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO
**esp_err_t rtc_gpio_force_hold_en_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all** (void)

Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable** (gpio_num_t gpio_num, gpio_int_type_t intr_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio_num** -- GPIO number
- **intr_type** -- Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**esp_err_t rtc_gpio_wakeup_disable** (gpio_num_t gpio_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio_num** -- GPIO number

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Macros**

**RTC_GPIO_IS_VALID_GPIO** (gpio_num)

**Header File**

- components/esp_driver_gpio/include/driver/lp_io.h
  - This header file can be included with:
    ```
    #include "driver/lp_io.h"
    ```
  - This header file is a part of the API provided by the esp_driver_gpio component. To declare that your component depends on esp_driver_gpio, add the following to your CMakeLists.txt:
    ```
    REQUIRES esp_driver_gpio
    ```
    or
    ```
    PRIV_REQUIRES esp_driver_gpio
    ```

**Enumerations**

```
enum rtc_gpio_mode_t
    RTCIO output/input mode type.

Values:

enumerator RTC_GPIO_MODE_INPUT_ONLY
    Pad input

enumerator RTC_GPIO_MODE_OUTPUT_ONLY
    Pad output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT
    Pad input + output

enumerator RTC_GPIO_MODE_DISABLED
    Pad (output + input) disable

enumerator RTC_GPIO_MODE_OUTPUT_OD
    Pad open-drain output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT_OD
    Pad input + open-drain output

2.6.7 General Purpose Timer (GPTimer)

Introduction

GPTimer (General Purpose Timer) is the driver of ESP32 Timer Group peripheral. The hardware timer features
high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target
value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

• Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
• Generate period alarms, trigger events periodically
• Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

• Resource Allocation - covers which parameters should be set up to get a timer handle and how to recycle the
resources when GPTimer finishes working.
• Set and Get Count Value - covers how to force the timer counting from a start point and how to get the count
value at anytime.
• Set up Alarm Action - covers the parameters that should be set up to enable the alarm event.
• Register Event Callbacks - covers how to hook user specific code to the alarm event callback function.
• Enable and Disable Timer - covers how to enable and disable the timer.
• Start and Stop Timer - shows some typical use cases that start the timer with different alarm behavior.
• Power Management - describes how different source clock selections can affect power consumption.
• IRAM Safe - describes tips on how to make the timer interrupt and IO control functions work better along with
a disabled cache.
• Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.
Chapter 2. API Reference

- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**

Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.\(^1\)

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section **Power Management**.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to \(1 / \text{resolution_hz}\) seconds.
- `gptimer_config_t::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to **Interrupt Handling**.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

**Creating a GPTimer Handle with Resolution of 1 MHz**

```c
#define GPTIMER_CLK_SRC_DEFAULT
#define GPTIMER_COUNT_UP
#define SOC_TIMER_GROUP_TOTAL_TIMERS
#define SOC_TIMER_GROUP_COUNTER_BIT_WIDTH

ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value**

When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

---

\(^1\) Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to ESP32 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]. The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `gptimer_new_timer()`).
Set up Alarm Action  
For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to `NULL`, the alarm function will be disabled.

Note: If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

Register Event Callbacks  
After the timer starts up, it can generate a specific event (e.g., the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section Enable and Disable Timer for more information.

Enable and Disable Timer  
Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function:

- Switches the timer driver state from `init` to `enable`.
- Enables the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section Power Management for more information.

Calling `gptimer_disable()` does the opposite, that is, put the timer driver back to the `init` state, disable the interrupts service and release the power management lock.

Start and Stop Timer  
The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling `gptimer_start()` transits the driver state from `enable` to `run`, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e., `gptimer_start()` is called but not finished).
Start Timer as a Wall Clock

```c
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this__callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

Trigger One-Shot Event

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
```
Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing \texttt{gptimer\_alarm\_event\_data\_t::alarm\_value}. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

```c
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```
Power Management  There are some power management strategies, which might turn off or change the frequency of GPTimer’s source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver increases the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

IRAM Safe  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Thread Safety  All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Examples

---

2 `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.
• Typical use cases of GPTimer are listed in the example peripherals/timer_group/gptimer.

API Reference

Header File
• components/esp_driver_gptimer/include/driver/gptimer.h
  This header file can be included with:
  
  ```
  #include "driver/gptimer.h"
  ```

• This header file is a part of the API provided by the esp_driver_gptimer component. To declare that your component depends on esp_driver_gptimer, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_driver_gptimer
  ```
  or
  ```
  PRIV_REQUIRES esp_driver_gptimer
  ```

Functions

```gptimer_new_timer```
(\texttt{const gptimer\_config\_t *config, gptimer\_handle\_t *ret\_timer})
Create a new General Purpose Timer, and return the handle.

\textbf{Note:} The newly created timer is put in the "init" state.

\textbf{Parameters}
- \texttt{config} -- [in] GPTimer configuration
- \texttt{ret\_timer} -- [out] Returned timer handle

\textbf{Returns}
- ESP_OK: Create GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Create GPTimer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPTimer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create GPTimer failed because of other error

```gptimer_del_timer```
(\texttt{gptimer\_handle\_t \texttt{timer}})
Delete the GPTimer handle.

\textbf{Note:} A timer must be in the "init" state before it can be deleted.

\textbf{Parameters} \texttt{timer} -- [in] Timer handle created by gptimer\_new\_timer

\textbf{Returns}
- ESP_OK: Delete GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Delete GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete GPTimer failed because the timer is not in init state
- ESP\_FAIL: Delete GPTimer failed because of other error

```gptimer_set_raw_count```
(\texttt{gptimer\_handle\_t \texttt{timer}, uint64\_t \texttt{value}})
Set GPTimer raw count value.
Note: When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Note: This function is allowed to run within ISR context

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters
- **timer** -- [in] Timer handle created by gptimer_new_timer
- **value** -- [in] Count value to be set

Returns
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_raw_count (gptimer_handle_t timer, uint64_t *value)
```
Get GPTimer raw count value.

Note: This function will trigger a software capture event and then return the captured count value.

Note: With the raw count value and the resolution returned from gptimer_get_resolution, you can convert the count value into seconds.

Note: This function is allowed to run within ISR context

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters
- **timer** -- [in] Timer handle created by gptimer_new_timer
- **value** -- [out] Returned GPTimer count value

Returns
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_resolution (gptimer_handle_t timer, uint32_t *out_resolution)
```
Return the real resolution of the timer.

Note: usually the timer resolution is same as what you configured in the gptimer_config_t::resolution_hz, but some unstable clock source (e.g. RC_FAST) will do a calibration, the real resolution can be different from the configured one.
### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out_resolution** -- [out] Returned timer resolution, in Hz

### Returns

- ESP_OK: Get GPTimer resolution successfully
- ESP_ERR_INVALID_ARG: Get GPTimer resolution failed because of invalid argument
- ESP_FAIL: Get GPTimer resolution failed because of other error

```c
esp_err_t gptimer_get_captured_count (gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer captured count value.

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned captured count value

### Returns

- ESP_OK: Get GPTimer captured count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer captured count value failed because of invalid argument
- ESP_FAIL: Get GPTimer captured count value failed because of other error

```c
esp_err_t gptimer_register_event_callbacks (gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for GPTimer.

**Note:** User registered callbacks are expected to be runnable within ISR context

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

### Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
```
**esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)**

Set alarm event actions for GPTimer.

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

**Note:** If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**

- **timer** -- [in] Timer handle created by gptimer_new_timer
- **config** -- [in] Alarm configuration, especially, set config to NULL means disabling the alarm function

**Returns**

- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**esp_err_t gptimer_enable (gptimer_handle_t timer)**

Enable GPTimer.

**Note:** This function will transit the timer state from "init" to "enable".

**Note:** This function will enable the interrupt service, if it's lazy installed in gptimer_register_event_callbacks.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the gptimer_config_t, while CONFIG_PM_ENABLE is enabled.

**Note:** Enable a timer doesn't mean to start it. See also gptimer_start for how to make the timer start counting.

**Parameters**

- **timer** -- [in] Timer handle created by gptimer_new_timer

**Returns**

- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

**esp_err_t gptimer_disable (gptimer_handle_t timer)**

Disable GPTimer.

**Note:** This function will transit the timer state from "enable" to "init".
Chapter 2. API Reference

**Note:** This function will disable the interrupt service if it's installed.

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

### Parameters

**timer** -- [in] Timer handle created by `gptimer_new_timer`

### Returns

- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

**esp_err_t gptimer_start** (`gptimer_handle_t` timer)

Start GPTimer (internal counter starts counting)

**Note:** This function will transit the timer state from "enable" to "run".

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

### Parameters

**timer** -- [in] Timer handle created by `gptimer_new_timer`

### Returns

- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled or is already in running
- ESP_FAIL: Start GPTimer failed because of other error

**esp_err_t gptimer_stop** (`gptimer_handle_t` timer)

Stop GPTimer (internal counter stops counting)

**Note:** This function will transit the timer state from "run" to "enable".

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.
Chapter 2. API Reference

Returns

• ESP_OK: Stop GPTimer successfully
• ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
• ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct gptimer_config_t
  General Purpose Timer configuration.

Public Members

gptimer_clock_source_t clk_src
  GPTimer clock source

gptimer_count_direction_t direction
  Count direction

uint32_t resolution_hz
  Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

int intr_priority
  GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t intr_shared
  Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_config_t::[anonymous] flags
  GPTimer config flags

struct gptimer_event_callbacks_t
  Group of supported GPTimer callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gptimer_alarm_cb_t on_alarm
  Timer alarm callback

struct gptimer_alarm_config_t
  General Purpose Timer alarm configuration.
Chapter 2. API Reference

Public Members

```cpp
uint64_t alarm_count
   Alarm target count value

uint64_t reload_count
   Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm
   Reload the count value by hardware, immediately at the alarm event
```

```cpp
struct gptimer_alarm_config_t::[anonymous] flags
   Alarm config flags
```

Header File

- components/esp_driver_gptimer/include/driver/gptimer_etm.h
- This header file can be included with:
  ```
  #include "driver/gptimer_etm.h"
  ```
- This header file is a part of the API provided by the esp_driver_gptimer component. To declare that your component depends on esp_driver_gptimer, add the following to your CMakeLists.txt:
  ```
  REQUIRE esp_driver_gptimer
  or
  PRIV_REQUIRE esp_driver_gptimer
  ```

Functions

```cpp
gptimer_new_etm_event (gptimer_handle_t timer, const gptimer_etm_event_config_t *config, esp_etm_event_handle_t*out_event)
```

Get the ETM event for GPTimer.

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`.

**Parameters**

- `timer` -- [in] Timer handle created by `gptimer_new_timer`
- `config` -- [in] GPTimer ETM event configuration
- `out_event` -- [out] Returned ETM event handle

**Returns**

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

```cpp
gptimer_new_etm_task (gptimer_handle_t timer, const gptimer_etm_task_config_t *config, esp_etm_task_handle_t*out_task)
```

Get the ETM task for GPTimer.

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`.

**Parameters**

---

Submit Document Feedback
• **timer** -- [in] Timer handle created by `gptimer_new_timer`
• **config** -- [in] GPTimer ETM task configuration
• **out_task** -- [out] Returned ETM task handle

**Returns**
• ESP_OK: Get ETM task successfully
• ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
• ESP_FAIL: Get ETM task failed because of other error

**Structures**

struct `gptimer_etm_event_config_t`
GPTimer ETM event configuration.

**Public Members**

`gptimer_etm_event_type_t event_type`
GPTimer ETM event type

struct `gptimer_etm_task_config_t`
GPTimer ETM task configuration.

**Public Members**

`gptimer_etm_task_type_t task_type`
GPTimer ETM task type

**Header File**

• components/esp_driver_gptimer/include/driver/gptimer_types.h
• This header file can be included with:

```
#include "driver/gptimer_types.h"
```
• This header file is a part of the API provided by the `esp_driver_gptimer` component. To declare that your component depends on `esp_driver_gptimer`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_gptimer
```

or

```
PRIV_REQUIRES esp_driver_gptimer
```

**Structures**

struct `gptimer_alarm_event_data_t`
GPTimer alarm event data.

**Public Members**

`uint64_t count_value`
Current count value
Chapter 2. API Reference

```
uint64_t alarm_value
Current alarm value
```

Type Definitions

typedef struct gptimer_t *gptimer_handle_t
Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
Timer alarm callback prototype.

- **Param timer** [in] Timer handle created by gptimer_new_timer
- **Param edata** [in] Alarm event data, fed by driver
- **Param user_ctx** [in] User data, passed from gptimer_register_event_callbacks

**Return** Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/timer_types.h
- This header file can be included with:

```c
#include "hal/timer_types.h"
```

Type Definitions

typedef soc_periph_gptimer_clk_src_t gptimer_clock_source_t
GPTimer clock source.

**Note:** User should select the clock source based on the power and resolution requirement

Enumerations

enum gptimer_count_direction_t
GPTimer count direction.

- **Values:**
  - enumerator GPTIMER_COUNT_DOWN
    Decrease count value
  - enumerator GPTIMER_COUNT_UP
    Increase count value

enum gptimer_etm_task_type_t
GPTimer specific tasks that supported by the ETM module.

- **Values:**
  - enumerator GPTIMER_ETM_TASK_START_COUNT
    Start the counter
enumerator **GPTIMER_ETM_TASK_STOP_COUNT**
Stop the counter

enumerator **GPTIMER_ETM_TASK_EN_ALARM**
Enable the alarm

enumerator **GPTIMER_ETM_TASK_RELOAD**
Reload preset value into counter

enumerator **GPTIMER_ETM_TASK_CAPTURE**
Capture current count value into specific register

enumerator **GPTIMER_ETM_TASK_MAX**
Maximum number of tasks

enum **gptimer_etm_event_type_t**
GPTimer specific events that supported by the ETM module.

**Values:**

enumerator **GPTIMER_ETM_EVENT_ALARM_MATCH**
Count value matches the alarm target value

enumerator **GPTIMER_ETM_EVENT_MAX**
Maximum number of events

### 2.6.8 Inter-Integrated Circuit (I2C)

**Introduction**

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhms to 5 KOhms, but users may also need to make some adjustments depending on their current draw requirements.
### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_APB`: APB clock as I2C clock source.

### I2C File Structure

![I2C file structure](image)

**Fig. 8: I2C file structure**

**Public headers that need to be included in the I2C application**

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
- `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

**Note:** The legacy driver can’t coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

**Public headers that have been included in the headers above**

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

### Functional Overview

The I2C driver offers following services:
- **Resource Allocation** - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **I2C Master Controller** - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- **I2C Slave Controller** - covers behavior of I2C slave controller. Involve data transmit and data receive.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation**  Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

**Install I2C master bus and device**  The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

![Fig. 9: I2C master bus-device module](image)

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to **Power Management** section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
• `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pull up buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

I2C master device requires the configuration that specified by `i2c_device_config_t`:

• `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).

• `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don’t carry a write/read bit.

• `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```c
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
  .clk_source = I2C_CLK_SRC_DEFAULT,
  .i2c_port = TEST_I2C_PORT,
  .scl_io_num = I2C_MASTER_SCL_IO,
  .sda_io_num = I2C_MASTER_SDA_IO,
  .glitch_ignore_cnt = 7,
  .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
  .dev_addr_length = I2C_ADDR_BIT_LEN_7,
  .device_address = 0x58,
  .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

Uninstall I2C master bus and device If a previously installed I2C bus or device is no longer needed, it’s recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

Install I2C slave device I2C slave requires the configuration that specified by `i2c_slave_config_t`:

• `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.

• `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).

• `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).

• `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to Power Management section.

• `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.

• `i2c_slave_config_t::slave_addr` sets the slave address

---

Espressif Systems 1217 Release master

Submit Document Feedback
Chapter 2. API Reference

- **`i2c_master_bus_config_t::intr_priority`** Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1, 2, 3), not the bitmask form ((1<<1), (1<<2), (1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.

- **`i2c_slave_config_t::addr_bit_len`** set true if you need the slave to have a 10-bit address.

Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```c
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};
```

```c
i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

**Uninstall I2C slave device**  If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

**I2C Master Controller**  After installing the i2c master driver by `i2c_new_master_bus()`, ESP32 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

![Standard I2C Transaction Timing Diagram](image)

**I2C Master Write**  After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

![Fig. 10: I2C master write to slave](image)

Simple example for writing data to slave:
```
define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};
i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));
```

**I2C Master Read**  
After installing I2C master bus successfully, you can simply call `i2c_master_receive()` to read data from the slave device. The principle of this function can be explained by following chart.

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};
i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);
```

**I2C Master Write and Read**  
Some I2C device needs write configurations before reading data from it, therefore, an interface called `i2c_master_transmit_receive()` can help. The principle of this function can be explained by following chart.
Fig. 12: I2C master write to slave and read from slave

Simple example for writing and reading from slave:

```
#include <i2c.h>

// Define device configuration structure
i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

// Allocate memory for the buffer
uint8_t* buf = malloc(20);

// Create the master device handle
i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));

// Allocate memory for the buffer
uint8_t buffer[2];

// Perform the I2C transfer
