This function can be used to unregister a handler so that it no longer gets called during dispatch. Handlers can be unregistered for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

This function ignores unregistration of handler instances that have not been previously registered.

Return

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

Parameters

- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the id of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

\[
\text{esp_err_t esp_event_handler_instance_unregister(}\text{esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance})
\]

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

Return

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

Parameters

- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the id of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

\[
\text{esp_err_t esp_event_post(}\text{esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait})
\]

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Return

- ESP_OK: Success
Chapter 2. API Reference

- **ESP_ERR_TIMEOUT**: Time to wait for event queue to unblock expired, queue full when posting from ISR
- **ESP_ERR_INVALID_ARG**: Invalid combination of event base and event id
- **Others**: Fail

**Parameters**
- `[in] event_base`: the event base that identifies the event
- `[in] event_id`: the event id that identifies the event
- `[in] event_data`: the data, specific to the event occurrence, that gets passed to the handler
- `[in] event_data_size`: the size of the event data
- `[in] ticks_to_wait`: number of ticks to block on a full event queue

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as `esp_event_post_to`, except the additional specification of the event loop to post the event to.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_TIMEOUT**: Time to wait for event queue to unblock expired, queue full when posting from ISR
- **ESP_ERR_INVALID_ARG**: Invalid combination of event base and event id
- **Others**: Fail

**Parameters**
- `[in] event_loop`: the event loop to post to
- `[in] event_base`: the event base that identifies the event
- `[in] event_id`: the event id that identifies the event
- `[in] event_data`: the data, specific to the event occurrence, that gets passed to the handler
- `[in] event_data_size`: the size of the event data
- `[in] ticks_to_wait`: number of ticks to block on a full event queue

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
<table>
<thead>
<tr>
<th>event loop</th>
<th>handler</th>
<th>handler</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>event loop</td>
<td>handler</td>
<td>handler</td>
<td>...</td>
</tr>
</tbody>
</table>
```

**where:**

- **event loop**
  - `format`: address, name rx:total_recieved dr:total_dropped
  - `where`:
    - address - memory address of the event loop
    - name - name of the event loop, 'none' if no dedicated task
    - total_recieved - number of successfully posted events
    - total_dropped - number of events unsuccessfully posted due to queue full
    - being full
  - handler
    - `format`: address ev:base, id inv:total_invoked run:total_runtime

(continues on next page)
where:

- **address**: address of the handler function
- **base**, **id**: the event specified by event base and id this handler executes
- **total_invoked**: number of times this handler has been invoked
- **total_runtime**: total amount of time used for invoking this handler

**Note**: this function is a noop when `CONFIG_ESP_EVENT_LOOP_PROFILING` is disabled

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

**Parameters**

- **[in]** **file**: the file stream to output to

**Structures**

```c
struct esp_event_loop_args_t
```

Configuration for creating event loops.

**Public Members**

```c
int32_t queue_size
```
size of the event loop queue

```c
const char *task_name
```
name of the event loop task; if NULL, a dedicated task is not created for event loop

```c
UBaseType_t task_priority
```
priority of the event loop task, ignored if task name is NULL

```c
uint32_t task_stack_size
```
stack size of the event loop task, ignored if task name is NULL

```c
BaseType_t task_core_id
```
core to which the event loop task is pinned to, ignored if task name is NULL

**Header File**

- **esp/include/esp_event_base.h**

**Macros**

```c
ESP_EVENT_DECLARE_BASE (id)
```

```c
ESP_EVENT_DEFINE_BASE (id)
```

```c
ESP_EVENT_ANY_BASE
```
register handler for any event base

```c
ESP_EVENT_ANY_ID
```
register handler for any event id

**Type Definitions**

```c
typedef const char *esp_event_base_t
```
unique pointer to a subsystem that exposes events

```c
typedef void *esp_event_loop_handle_t
```
a number that identifies an event with respect to a base
typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)

function called when an event is posted to the queue

typedef void *esp_event_handler_instance_t

context identifying an instance of a registered event handler

Legacy event loop

API Reference

Header File

- esp_event/include/esp_event_legacy.h

Functions

esp_err_t esp_event_send(system_event_t *event)

Send a event to event task.

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Return ESP_OK : succeed
Return others : fail

Parameters

- [in] event: Event to send

esp_err_t esp_event_send_internal(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Send a event to event task.

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

Note This API is used by WiFi Driver only.

Return ESP_OK : succeed
Return others : fail

Parameters

- [in] event_base: the event base that identifies the event
- [in] event_id: the event id that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event_data_size: the size of the event data
- [in] ticks_to_wait: number of ticks to block on a full event queue

esp_err_t esp_event_process_default(system_event_t *event)

Default event handler for system events.

This function performs default handling of system events. When using esp_event_loop APIs, it is called automatically before invoking the user-provided callback function.

Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Applications which implement a custom event loop must call this function as part of event processing.

Return ESP_OK if an event was handled successfully

Parameters

- [in] event: pointer to event to be handled

void esp_event_set_default_eth_handlers(void)

Install default event handlers for Ethernet interface.
Note: This API is part of the legacy event system. New code should use event library API in esp_event.h

`void esp_event_set_default_wifi_handlers (void)`

Install default event handlers for Wi-Fi interfaces (station and AP)

Note: This API is part of the legacy event system. New code should use event library API in esp_event.h

`esp_err_t esp_event_loop_init (system_event_cb_t cb, void *ctx)`

Initialize event loop.

Create the event handler and task

Note: This API is part of the legacy event system. New code should use event library API in esp_event.h

Return
- `ESP_OK`: succeed
- others: fail

Parameters
- `cb`: application specified event callback, it can be modified by call `esp_event_set_cb`
- `ctx`: reserved for user

`system_event_cb_t esp_event_loop_set_cb (system_event_cb_t cb, void *ctx)`

Set application specified event callback function.

Note: This API is part of the legacy event system. New code should use event library API in esp_event.h

Attention 1. If `cb` is `NULL`, means application don’t need to handle. If `cb` is not `NULL`, it will be call when an event is received, after the default event callback is completed

Return: old callback

Parameters
- `cb`: application callback function
- `ctx`: argument to be passed to callback

Unions

`union system_event_info_t` #include <esp_event_legacy.h>

Union of all possible `system_event` argument structures

Public Members

`system_event_sta_connected_t connected`
ESP32 station connected to AP

`system_event_sta_disconnected_t disconnected`
ESP32 station disconnected to AP

`system_event_sta_scan_done_t scan_done`
ESP32 station scan (APs) done

`system_event_sta_authmode_change_t auth_change`
the auth mode of AP ESP32 station connected to changed

`system_event_sta_got_ip / got_ip`
ESP32 station got IP, first time got IP or when IP is changed

`system_event_sta_wps_er_pin / sta_er_pin`
ESP32 station WPS enrollee mode PIN code received

`system_event_sta_wps_fail_reason_t sta_er_fail_reason`
ESP32 station WPS enrollee mode failed reason code received

`system_event_ap_staconnected_t sta_connected`
a station connected to ESP32 soft-AP

`system_event_ap_stadisconnected_t sta_disconnected`
a station disconnected to ESP32 soft-AP
Chapter 2. API Reference

system_event_ap_probe_req_rx_t  
ap_probereqrecved  
ESP32 soft-AP receive probe request packet

system_event_ap_staipassigned_t  
ap_staipassigned  
ESP32 soft-AP assign an IP to the station

system_event_got_ip6_t  
got_ip6  
ESP32 station or ap or ethernet ipv6 addr state change to preferred

Structures

struct system_event_t  
Event, as a tagged enum

SYSTEM_EVENT_STA_GOT_IP  
Argument structure of event

typedef ip_event_got_ip6_t  
SYSTEM_EVENT_STA_GOT_IP6  
Argument structure of event
typedef esp_err_t (*system_event_handler_t)(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Event handler function type

typedef esp_err_t (*system_event_cb_t)(void *ctx, system_event_t *event)

Application specified event callback function.

Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Return

• ESP_OK: succeed
• others: fail

Parameters

• ctx: reserved for user
• event: event type defined in this file

Enumerations

define system_event_id_t

System event types enumeration

Values:

SYSTEM_EVENT_WIFI_READY = 0
ESP32 WiFi ready
SYSTEM_EVENT_SCAN_DONE
ESP32 finish scanning AP
SYSTEM_EVENT_STA_START
ESP32 station start
SYSTEM_EVENT_STA_STOP
ESP32 station stop
SYSTEM_EVENT_STA_CONNECTED
ESP32 station connected to AP
SYSTEM_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP
SYSTEM_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed
SYSTEM_EVENT_STA_GOT_IP
ESP32 station got IP from connected AP
SYSTEM_EVENT_STA_LOST_IP
ESP32 station lost IP and the IP is reset to 0
SYSTEM_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode
SYSTEM_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode
SYSTEM_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode
SYSTEM_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode
SYSTEM_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode
SYSTEM_EVENT_AP_START
ESP32 soft-AP start
Chapter 2. API Reference

SYSTEM_EVENT_AP_STOP
   ESP32 soft-AP stop

SYSTEM_EVENT_AP_STACONNECTED
   a station connected to ESP32 soft-AP

SYSTEM_EVENT_AP_STADISCONNECTED
   a station disconnected from ESP32 soft-AP

SYSTEM_EVENT_AP_STAIPASSIGNED
   ESP32 soft-AP assign an IP to a connected station

SYSTEM_EVENT_AP_PROBEREQRECVED
   Receive probe request packet in soft-AP interface

SYSTEM_EVENT_GOT_IP6
   ESP32 station or ap or ethernet interface v6IP addr is preferred

SYSTEM_EVENT_ETH_START
   ESP32 ethernet start

SYSTEM_EVENT_ETH_STOP
   ESP32 ethernet stop

SYSTEM_EVENT_ETH_CONNECTED
   ESP32 ethernet phy link up

SYSTEM_EVENT_ETH_DISCONNECTED
   ESP32 ethernet phy link down

SYSTEM_EVENT_ETH_GOT_IP
   ESP32 ethernet got IP from connected AP

SYSTEM_EVENT_MAX
   Number of members in this enum

2.7.9 FreeRTOS

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

For more information about FreeRTOS features specific to ESP-IDF, see ESP-IDF FreeRTOS SMP Changes and ESP-IDF FreeRTOS Additions.

Task API

Header File

- freertos/include/freertos/task.h

Functions

BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pc-Name, const uint32_t uxStackDepth, void *const pvPa-rameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h
Parameters

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e., continuous loop).
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- `usStackDepth`: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters`: Pointer that will be used as the parameter for the task being created.
- `uxPriority`: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- `pvCreatedTask`: Used to pass back a handle by which the created task can be referenced.
- `xCoreID`: If the value is `tskNO_AFFINITY`, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than `portNUM_PROCESSORS - 1` will cause the function to fail.

```c
static BaseType_t xTaskCreate(TaskFunction_t pvTaskCode, const char* const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
  for( ;; )
  {
    // Task code goes here.
  }
}

// Function that creates a task.
void vOtherFunction( void )
{
  static uint8_t ucParameterToPass;
  TaskHandle_t xHandle = NULL;

  // Create the task, storing the handle. Note that the passed parameter...
  ucParameterToPass
  // must exist for the lifetime of the task, so in this case is declared...
  static. If it was just an
  // an automatic stack variable it might no longer exist, or at least have...
  // been corrupted, by the time
  // the new task attempts to access it.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
  // PRIORITY, &xHandle );
  configASSERT( xHandle );
```

(continues on next page)
Use the handle to delete the task.

```c
if( xHandle != NULL ) {
  vTaskDelete( xHandle );
}
```

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Note If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pvCreatedTask**: Used to pass back a handle by which the created task can be referenced.

```c
TaskHandle_t xTaskCreateStaticPinnedToCore( TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID )
```

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and a task handle will be returned by which the created task can be referenced. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

Parameters

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task will run.
- **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.
static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void *pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( 
        vTaskCode, // Function that implements the task.
        "NAME", // Text name for the task.
        STACK_SIZE, // Stack size in bytes, not words.
        ( void * ) 1, // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack, // Array to use as the task's stack.
        &xTaskBuffer ); // Variable to hold the task's data...

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}
```
Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and a task handle will be returned by which the created task can be referenced. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

Note If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskDelete (TaskHandle_t xTaskToDelete)

Remove a task from the RTOS real time kernel’s management.

The task being deleted will be removed from all ready, blocked, suspended and event lists.

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

See the demo application file death.c for sample code that utilises vTaskDelete().

Note The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

Parameters

- xTaskToDelete: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void vTaskDelay (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks.

The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after
vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See vTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;
    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

### Parameters

- **xTicksToDelay**: The amount of time, in tick periods, that the calling task should block.

**vTaskDelayUntil**

```c
void vTaskDelayUntil( TickType_t *pxPreviousWakeTime, const TickType_t xTimeIncrement )
```

Delay a task until a specified time.

INCLUDE_vTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, vTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    
    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );
        
        // Perform action here.
    }
}
```

### Parameters
• **pxPreviousWakeTime**: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within vTaskDelayUntil().
• **xTimeIncrement**: The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling vTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

**UBaseType_t uxTaskPriorityGet(TaskHandle_t xTask)**

Obtain the priority of any task.

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Return** The priority of xTask.

**Parameters**

- **xTask**: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**UBaseType_t uxTaskPriorityGetFromISR(TaskHandle_t xTask)**

A version of uxTaskPriorityGet() that can be used from an ISR.

**Return** The priority of xTask.

**Parameters**

- **xTask**: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**eTaskState eTaskGetState(TaskHandle_t xTask)**

Obtain the state of any task.

States are encoded by the eTaskState enumerated type.

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

**Return** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.
Parameters
• \texttt{xTask}: Handle of the task to be queried.

\begin{verbatim}
void \textbf{vTaskPrioritySet} ( TaskHandle_t \texttt{xTask}, UBaseType_t \texttt{uxNewPriority} )
\end{verbatim}

Set the priority of any task.

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

\begin{verbatim}
void vAFunction( void )
{
 TaskHandle_t xHandle;

 // Create a task, storing the handle.
 xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...);

 // ...

 // Use the handle to \textit{raise} the priority of the created task.
 vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

 // ...

 // Use a NULL handle to \textit{raise} our priority to the same value.
 vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
\end{verbatim}

Parameters
• \texttt{xTask}: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
• \texttt{uxNewPriority}: The priority to which the task will be set.

\begin{verbatim}
void \textbf{vTaskSuspend} ( TaskHandle_t \texttt{xTaskToSuspend} )
\end{verbatim}

Suspend a task.

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

When suspended, a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

\begin{verbatim}
void vAFunction( void )
{
 TaskHandle_t xHandle;

 // Create a task, storing the handle.
 xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...);

 // ...

 // Use the handle to suspend the created task.
 vTaskSuspend( xHandle );

 // ...
\end{verbatim}
The created task will not run during this period, unless another task calls `vTaskResume(xHandle)`.

...  

Suspend ourselves.
`vTaskSuspend(NULL);`

We cannot get here unless another task calls `vTaskResume` with our handle as the parameter.

### Parameters
- `xTaskToSuspend`: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

```c
void vTaskResume(TaskHandle_t xTaskToResume)
```

Resumes a suspended task.

IFDEF vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to `vTaskSuspend()` will be made available for running again by a single call to `vTaskResume()`.

Example usage:

```c
void vAFunction(void)
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate(vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend(xHandle);

    // ...

    // The created task will not run during this period, unless another task calls vTaskResume(xHandle).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume(xHandle);

    // The created task will once again get microcontroller processing time in accordance with its priority within the system.
}
```

### Parameters
- `xTaskToResume`: Handle to the task being readied.

```c
BaseType_t xTaskResumeFromISR(TaskHandle_t xTaskToResume)
```

An implementation of `vTaskResume()` that can be called from within an ISR.
INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Return pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

Parameters
- xTaskToResume: Handle to the task being readied.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL() / taskEXIT_CRITICAL() as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll();
    }
}
```

BaseType_t xTaskResumeAll (void)
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL (/) /taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.
        // ...

        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}

Return If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is
returned.

TickType_t xTaskGetTickCount (void)
Get tick count

Return The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)
Get tick count from ISR

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Return The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)
Get current number of tasks

Return The number of tasks that the real time kernel is currently managing. This includes all ready, blocked
and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included
in the count.

char *pcTaskGetTaskName ( TaskHandle_t xTaskToQuery )
Get task name

Return The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can
query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL. IN-Clude pcTaskGetTaskName must be set to 1 in FreeRTOSConfig.h for pcTaskGetTaskName() to be
available.
Chapter 2. API Reference

UBaseType_t uxTaskGetStackHighWaterMark(TaskHandle_t xTask)
Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

High water mark is the minimum free stack space there has been (in bytes rather than words as found in vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

Return The smallest amount of free stack space there has been (in bytes rather than words as found in vanilla FreeRTOS) since the task referenced by xTask was created.

Parameters
• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

uint8_t *pxTaskGetStackStart(TaskHandle_t xTask)
Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the highest stack memory address on architectures where the stack grows down from high memory, and the lowest memory address on architectures where the stack grows up from low memory.

Return A pointer to the start of the stack.

Parameters
• xTask: Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

void vTaskSetApplicationTaskTag(TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)
Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters
• xTask: Handle of the task to set the hook function for. Passing xTask as NULL has the effect of setting the calling tasks hook function.
• pxHookFunction: Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag(TaskHandle_t xTask)
Get the hook function assigned to given task.

Return The pxHookFunction value assigned to the task xTask.

Parameters
• xTask: Handle of the task to get the hook function for. Passing xTask as NULL has the effect of getting the calling tasks hook function.

void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters
• xTaskToSet: Task to set thread local storage pointer for
• xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue: Pointer value to set.

void *pvTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)
Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.
Return  Pointer value
Parameters  
• xTaskToQuery: Task to get thread local storage pointer for
• xIndex: The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallback-Function_t pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters  
• xTaskToSet: Task to set thread local storage pointer for
• xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue: Pointer value to set.
• pvDelCallback: Function to call to dispose of the local storage pointer when the task is deleted.

BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters  
• xTask: Handle of the task to call the hook for.
• pvParameter: Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle (void)

Get the handle of idle task for the current CPU.

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Return  The handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

TaskHandle_t xTaskGetIdleTaskHandleForCPU (UBaseType_t cpuid)

Get the handle of idle task for the given CPU.

xTaskGetIdleTaskHandleForCPU() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Return  Idle task handle of a given cpu. It is not valid to call xTaskGetIdleTaskHandleForCPU() before the scheduler has been started.

Parameters  
• cpuid: The CPU to get the handle for

UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

Get the state of tasks in the system.

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total
amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

Example usage:

```c
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        ulTotalRunTime = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter /
                ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                    ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
                }
                pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
            }
        }
    }
}
```

(continues on next page)
Note This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Return The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

Parameters
- pxTaskStatusArray: A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- uxArraySize: The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- pulTotalRunTime: If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see http://www.freertos.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

void vTaskList (char *pcWriteBuffer)
List all the current tasks.
configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

Lists all the current tasks, along with their current state and stack usage high water mark.

Note This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

Note This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

Parameters
- pcWriteBuffer: A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void vTaskGetRunTimeStats (char *pcWriteBuffer)
Get the state of running tasks as a string
configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for port-
CONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer's current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

Note This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

Note This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printft-stdarg.c (note printft-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

Parameters

- pcWriteBuffer: A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

BaseType_t **xTaskNotify** (TaskHandle_t xTaskToNotify, uint32_t ulValue, eNotifyAction eAction)

Send task notification.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value” which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
Chapter 2. API Reference

- **ulValue**: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction**: Specifies how the notification updates the task's notification value, if at all. Valid values for eAction are as follows:
  - eSetBits: The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.
  - eIncrement: The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithOverwrite: The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithoutOverwrite: If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.
  - eNoAction: The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

BaseType_t xTaskNotifyFromISR(TaskHandle_t xTaskToNotify, uint32_t ulValue, eNotifyAction eAction, BaseType_t *pxHigherPriorityTaskWoken)

Send task notification from an ISR.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value” which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotify() that can be used from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

- **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue**: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction**: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - eSetBits: The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.
  - eIncrement: The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithOverwrite: The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a
notification pending). xTaskNotify() always returns pdPASS in this case.

– eSetValueWithoutOverwrite: If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

– eNoAction: The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

• pxHigherPriorityTaskWoken: xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskNotifyWait (uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Wait for task notification

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

Return If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

Parameters

• ulBitsToClearOnEntry: Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

• ulBitsToClearOnExit: If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

• pulNotificationValue: Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.
xTicksToWait: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
void vTaskNotifyGiveFromISR(TaskHandle_t xTaskToNotify, BaseType_t *pxHigherPriorityTaskWoken)
```

Simplified macro for sending task notification from ISR.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotifyGive() that can be called from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotifyTake() API function rather than the xTaskNotifyWait() API function.

**Parameters**

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- pxHigherPriorityTaskWoken: vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskNotifyTake(BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Simplified macro for receiving task notification.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTake() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTake().
When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGive() macro, or xTaskNotify() function with the eAction parameter set to eIncrement.

ulTaskNotifyTake() can either clear the task’s notification value to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the task’s notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTake() to [optionally] block to wait for a the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWait() will return when a notification is pending, ulTaskNotifyTake() will return when the task’s notification value is not zero.

Return The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

Parameters
- xClearCountOnExit: if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- xTicksToWait: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

Structures
struct xTASK_STATUS
Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Public Members

TaskHandle_t xHandle
The handle of the task to which the rest of the information in the structure relates.

const char *pcTaskName
A pointer to the task’s name. This value will be invalid if the task was deleted since the structure was populated!

UBaseType_t xTaskNumber
A number unique to the task.

eTaskState eCurrentState
The state in which the task existed when the structure was populated.

UBaseType_t uxCurrentPriority
The priority at which the task was running (may be inherited) when the structure was populated.

UBaseType_t uxBasePriority
The priority to which the task will return if the task’s current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

uint32_t ulRunTimeCounter
The total run time allocated to the task so far, as defined by the run time stats clock. See http://www.freertos.org/rtos-run-time-stats.html. Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

StackType_t *pxStackBase
Points to the lowest address of the task’s stack area.
The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

Core this task is pinned to (0, 1, or -1 for tskNO_AFFINITY). This field is present if CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID is set.

Used with the uxTaskGetSnapshotAll() function to save memory snapshot of each task in the system. We need this struct because TCB_t is defined (hidden) in tasks.c.

Address of task control block.

Points to the location of the last item placed on the tasks stack.

Points to the end of the stack. pxTopOfStack < pxEndOfStack, stack grows hi2lo pxTopOfStack > pxEndOfStack, stack grows lo2hi

Current state of the task. Can be running or suspended

CPU where this task was running

Defines the priority used by the idle task. This must not be modified.

Macro for forcing a context switch.

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note This may alter the stack (depending on the portable implementation) so must be used with care!

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note This may alter the stack (depending on the portable implementation) so must be used with care!
**taskEXIT_CRITICAL_ISR** (mux)

Macro to disable all maskable interrupts.

**taskDISABLE_INTERRUPTS** ()

Macro to disable all maskable interrupts.

**taskENABLE_INTERRUPTS** ()

Macro to enable microcontroller interrupts.

**taskSCHEDULER_SUSPENDED**

**taskSCHEDULER_NOT_STARTED**

**taskSCHEDULER_RUNNING**

**xTaskNotifyGive** (xTaskToNotify)

Simplified macro for sending task notification.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value” , which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

**xTaskNotifyGive** is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the `xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGive()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `uTaskNotificationTake()` API function rather than the `xTaskNotifyWait()` API function.

**Return** `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so pdPASS is always returned.

**Parameters**

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.

**Type Definitions**

```c
typedef void *TaskHandle_t task. h
```

Type by which tasks are referenced. For example, a call to `xTaskCreate` returns (via a pointer parameter) an `TaskHandle_t` variable that can then be used as a parameter to `vTaskDelete` to delete the task.

```c
typedef BaseType_t (*TaskHookFunction_t) (void *)
```

Defines the prototype to which the application task hook function must conform.

```c
typedef struct xTASK_STATUS TaskStatus_t
```

Used with the `uxTaskGetSystemState()` function to return the state of each task in the system.

```c
typedef struct xTASK_SNAPSHOT TaskSnapshot_t
```

Used with the `uxTaskGetSnapshotAll()` function to save memory snapshot of each task in the system. We need this struct because TCB_t is defined (hidden) in tasks.c.
typedef void (*TlsDeleteCallbackFunction_t)(int, void *)
  Prototype of local storage pointer deletion callback.

Enumerations
enum eTaskState
  Task states returned by eTaskGetState.

  Values:
  eRunning = 0
  A task is querying the state of itself, so must be running.
  eReady
  The task being queried is in a read or pending ready list.
  eBlocked
  The task being queried is in the Blocked state.
  eSuspended
  The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.
  eDeleted
  The task being queried has been deleted, but its TCB has not yet been freed.

enum eNotifyAction
  Actions that can be performed when vTaskNotify() is called.

  Values:
  eNoAction = 0
  Notify the task without updating its notify value.
  eSetBits
  Set bits in the task’s notification value.
  eIncrement
  Increment the task’s notification value.
  eSetValueWithOverwrite
  Set the task’s notification value to a specific value even if the previous value has not yet been read by the task.
  eSetValueWithoutOverwrite
  Set the task’s notification value if the previous value has been read by the task.

enum eSleepModeStatus
  Possible return values for eTaskConfirmSleepModeStatus().

  Values:
  eAbortSleep = 0
  A task has been made ready or a context switch pended since portSUPPRESS_TICKS_AND_SLEEP() was called - abort entering a sleep mode.
  eStandardSleep
  Enter a sleep mode that will not last any longer than the expected idle time.
  eNoTasksWaitingTimeout
  No tasks are waiting for a timeout so it is safe to enter a sleep mode that can only be exited by an external interrupt.

Queue API

Header File
  • freertos/include/freertos/queue.h
**Functions**

**BaseType** \(\text{xQueueGenericSendFromISR(QueueHandle_t xQueue, const void *pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)\)**

It is preferred that the macros \(\text{xQueueSendFromISR()\), \text{xQueueSendToFrontFromISR()\) and \text{xQueueSendToBackFromISR()\) be used in place of calling this function directly. \text{xQueueGiveFromISR()\) is an equivalent for use by semaphores that don’t actually copy any data.}

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &
                       xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that...
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        taskYIELD_YIELD_FROM_ISR();
    }
}
```

**Return** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

**Parameters**

- \(xQueue\): The handle to the queue on which the item is to be posted.
- \(pvItemToQueue\): A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from \(pvItemToQueue\) into the queue storage area.
- \([\text{out}]\) \(pxHigherPriorityTaskWoken\): \(\text{xQueueGenericSendFromISR()}\) will set \(pxHigherPriorityTaskWoken\) to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If \(\text{xQueueGenericSendFromISR()}\) sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- \(xCopyPosition\): Can take the value \(\text{queueSEND_TO_BACK}\) to place the item at the back of the queue, or \(\text{queueSEND_TO_FRONT}\) to place the item at the front of the queue (for high priority messages).

**BaseType** \(\text{xQueueGiveFromISR(QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken)\)**

**BaseType** \(\text{xQueueIsQueueEmptyFromISR(const QueueHandle_t xQueue)\)**

Utilities to query queues that are safe to use from an ISR. These utilities should be used only from with an ISR, or within a critical section.
BaseType_t xQueueIsQueueFullFromISR(const QueueHandle_t xQueue)

UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)

BaseType_t xQueueGenericSend(QueueHandle_t xQueue, const void* pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    ... 

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, xqueueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, xqueueSEND_TO_BACK );
    }

    ... Rest of task code.
}
```

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from
pvItemToQueue into the queue storage area.

- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

- **xCopyPosition**: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

```c
BaseType_t xQueuePeekFromISR(QueueHandle_t xQueue, void *const pvBuffer)
```

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**

- **xQueue**: The handle to the queue from which the item is to be received.
- **pvBuffer**: Pointer to the buffer into which the received item will be copied.

```c
BaseType_t xQueueGenericReceive(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait, const BaseType_t xJustPeek)
```

It is preferred that the macro xQueueReceive() be used rather than calling this function directly.

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char uData[20];
} xMessage;
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
```

(continues on next page)
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxedMessage;

if( xQueue != 0 )
{
    // Receive a message on the created queue. Block for 10 ticks if a
    // message is not immediately available.
    if( xQueueGenericReceive( xQueue, &pxRxedMessage, ( TickType_t )10 ) )
    {
        // pcRxedMessage now points to the struct AMessage variable posted
        // by vATask.
    }
}

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
• xQueue: The handle to the queue from which the item is to be received.
• pvBuffer: Pointer to the buffer into which the received item will be copied.
• xTicksToWait: The maximum amount of time the task should block waiting for an item to
  receive should the queue be empty at the time of the call. The time is defined in tick periods so
  the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
  xQueueGenericReceive() will return immediately if the queue is empty and xTicksToWait is 0.
• xJustPeek: When set to true, the item received from the queue is not actually removed from the
  queue - meaning a subsequent call to xQueueReceive() will return the same item. When set to false,
  the item being received from the queue is also removed from the queue.

UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
Return the number of messages stored in a queue.

Return The number of messages available in the queue.
Parameters
• xQueue: A handle to the queue being queried.

UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )
Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to
the queue before the queue becomes full if no items are removed.

Return The number of spaces available in the queue.
Parameters
• xQueue: A handle to the queue being queried.

void vQueueDelete( QueueHandle_t xQueue )
Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters
• xQueue: A handle to the queue to be deleted.

BaseType_t xQueueReceiveFromISR( QueueHandle_t xQueue, void *const pvBuffer, BaseType_t
  *const pxHigherPriorityTaskWoken )
Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ... post some characters that will be used within an ISR. If the queue is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue becomes full.
    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, & cTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was posting onto the queue cTaskWokenByReceive will have been set to pdTRUE. No matter how many times this loop iterates only one task will be woken.
    }

    if( cTaskWokenByPost != ( char ) pdFALSE;
    {
        taskYIELD ();
    }
}

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
• xQueue: The handle to the queue from which the item is to be received.
• pvBuffer: Pointer to the buffer into which the received item will be copied.
• [out] pxHigherPriorityTaskWoken: A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.
### vQueueAddToRegistry

```c
void vQueueAddToRegistry(QueueHandle_t xQueue, const char *pcName)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` to add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

`configQUEUE_REGISTRY_SIZE` defines the maximum number of handles the registry can hold. `configQUEUE_REGISTRY_SIZE` must be greater than 0 within `FreeRTOSConfig.h` for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

**Parameters**
- `xQueue`: The handle of the queue being added to the registry. This is the handle returned by a call to `xQueueCreate()`. Semaphore and mutex handles can also be passed in here.
- `pcName`: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

### vQueueUnregisterQueue

```c
void vQueueUnregisterQueue(QueueHandle_t xQueue)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` to add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and `vQueueUnregisterQueue()` to remove the queue, semaphore or mutex from the registry. If you are not using a kernel aware debugger then this function can be ignored.

**Parameters**
- `xQueue`: The handle of the queue being removed from the registry.

### pcQueueGetName

```c
const char *pcQueueGetName(QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue’s handle.

**Note** This function has been backported from FreeRTOS v9.0.0

**Return** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

**Parameters**
- `xQueue`: The handle of the queue the name of which will be returned.

### xQueueGenericCreate

```c
QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

### xQueueGenericCreateStatic

```c
QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

### xQueueCreateSet

```c
QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)
```

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

**Note 1:** See the documentation on [http://www.FreeRTOS.org/RTOS-queue-sets.html](http://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.
Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

Parameters
- uxEventQueueLength: Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
  - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
  - If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 + 1), or 3.
  - If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to (5 + 3), or 8.

BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

Parameters
- xQueueOrSemaphore: The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- xQueueSet: The handle of the queue set to which the queue or semaphore is being added.

BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Return If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

Parameters
- xQueueOrSemaphore: The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- xQueueSet: The handle of the queue set in which the queue or semaphore is included.

QueueSetMemberHandle_t xQueueSelectFromSet (QueueSetHandle_t xQueueSet, const TickType_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.
See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on http://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

Parameters
• xQueueSet: The queue set on which the task will (potentially) block.
• xTicksToWait: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

QueueSetMemberHandle_t xQueueSelectFromSetFromISR (QueueSetHandle_t xQueueSet)
A version of xQueueSelectFromSet() that can be used from an ISR.

Macros

xQueueCreate (uxQueueLength, uxItemSize)
Creates a new queue instance. This allocates the storage required by the new queue and returns a handle for the queue.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}
```

Return If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

Parameters
Chapter 2. API Reference

- **uxQueueLength**: The maximum number of items that the queue can contain.
- **uxItemSize**: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[QUEUE_LENGTH * ITEM_SIZE];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can hold.
                              ITEM_SIZE,   // The size of each item in the queue
                              & ucQueueStorage[0], // The buffer that will hold the items in the queue.
                              & xQueueBuffer ); // The buffer that will hold the queue structure.

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}
```

**Return** If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

**Parameters**

- **uxQueueLength**: The maximum number of items that the queue can contain.
- **uxItemSize**: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage**: If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero
then pucQueueStorageBuffer can be NULL.

• pxQueueBuffer: Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

\textbf{xQueueSendToFront}(\textit{xQueue, pvItemToQueue, xTicksToWait})

This is a macro that calls xQueueGenericSend().

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

\begin{verbatim}
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;
    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate(10, sizeof(uint32_t));
    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));
    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t.  Wait for 10 ticks for space to become available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }
    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object.  Don’t block if the queue is already full.
        pxMessage = &xMessage;
        xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }
    // ... Rest of task code.
}
\end{verbatim}

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

• xQueue: The handle to the queue on which the item is to be posted.
• pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
Chapter 2. API Reference

- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

**xQueueSendToBack** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    /\ Create a queue capable of containing 10 uint32_t values.\n    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    /\ Create a queue capable of containing 10 pointers to AMessage structures.\n    /\ These should be passed by pointer as they contain a lot of data.\n    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    ...\n
    if( xQueue1 != 0 )
    {
        /\ Send an uint32_t. Wait for 10 ticks for space to become available if necessary.\n        if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.\n        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.\n        pxMessage = &xMessage;
        xQueueSendToBack( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
    }

    /\ ... Rest of task code.\n}
```

Return: pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters:
- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from
pvItemToQueue into the queue storage area.

- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

`xQueueSend(xQueue, pvItemToQueue, xTicksToWait)`

This is a macro that calls `xQueueGenericSend()`. It is included for backward compatibility with versions of FreeRTOS.org that did not include the `xQueueSendToFront()` and `xQueueSendToBack()` macros. It is equivalent to `xQueueSendToBack()`.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate(10, sizeof(uint32_t));

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}
```

Return  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items
the queue will hold was defined when the queue was created, so this many bytes will be copied from
pvItemToQueue into the queue storage area.

• xTicksToWait: The maximum amount of time the task should block waiting for space to become
available on the queue, should it already be full. The call will return immediately if this is set to 0
and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
should be used to convert to real time if this is required.

**xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is
queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an
alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the
    // value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
    // A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 100 )
    {
        // Error!
    }

    // ...
}
```

**Return** xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return
values as \texttt{xQueueSendToFront()}. However, \texttt{pdPASS} is the only value that can be returned because \texttt{xQueueOverwrite()} will write to the queue even when the queue is already full.

**Parameters**

- \texttt{xQueue}: The handle of the queue to which the data is being sent.
- \texttt{pvItemToQueue}: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from \texttt{pvItemToQueue} into the queue storage area.

\texttt{xQueuePeek} \texttt{(xQueue, pvBuffer, xTicksToWait)}

This is a macro that calls the \texttt{xQueueGenericReceive()} function.

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to \texttt{xQueueReceive()}.

This macro must not be used in an interrupt service routine. See \texttt{xQueuePeekFromISR()} for an alternative that can be called from an interrupt service routine.

**Example usage:**

```c
struct AMessage
{
  char ucMessageID;
  char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
  struct AMessage pxMessage;

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
  if( xQueue == 0 )
  {
    // Failed to create the queue.
  }
  ...

  // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
  pxMessage = & xMessage;
  xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

  // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
  struct AMessage pxRxedMessage;

  if( xQueue != 0 )
  {
    // Peek a message on the created queue. Block for 10 ticks if a message is not immediately available.
    // (continues on next page)
  }
}
```

(continues on next page)
if( xQueuePeek( xQueue, & pxRxedMessage ), ( TickType_t ) 10 )
{
  // pcRxedMessage now points to the struct AMessage variable posted
  // by vATask, but the item still remains on the queue.
}

// ... Rest of task code.

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters

- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

xQueueReceive (xQueue, pvBuffer, xTicksToWait)

queue. h

This is a macro that calls the xQueueGenericReceive() function.

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
  char ucMessageID;
  char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
  struct AMessage *pxMessage;

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
  if( xQueue == 0 )
  {
    // Failed to create the queue.
  }
  // ...

  // Send a pointer to a struct AMessage object. Don't block if the
  // queue is already full.
  pxMessage = & xMessage;
  xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
}'''

(continues on next page)
void vADifferentTask( void *pvParameters ){
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 ){
        // Receive a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueueReceive( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) ){
            // pcRxedMessage now points to the struct AMessage variable posted by vATask.
        }
    }

    // ... Rest of task code.
}

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueueSendToFrontFromISR( xQueue, pItemToQueue, pxHigherPriorityTaskWoken )
This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

void vBufferISR( void ){
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do{
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    }while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
}
Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters  
- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out]** pxHigherPriorityTaskWoken: xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFrontFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xQueueSendToBackFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```

Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters  
- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out]** pxHigherPriorityTaskWoken: xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR()
sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xQueueOverwriteFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)**

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

**Example usage:**

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended ‘not’ to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    xHigherPriorityTaskWoken = pdFALSE;

    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.

    // ...

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a...
        // context
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the...
        // port.
    }
}
```

**Return**  
`xQueueOverwriteFromISR()` is a macro that calls `xQueueGenericSendFromISR()`, and therefore has the same return values as `xQueueSendToFrontFromISR()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwriteFromISR()` will write to the queue even when the queue is already full.

**Parameters**

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
Chapter 2. API Reference

• [out] pxHigherPriorityTaskWoken: xQueueOverwriteFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR ();
    }
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

• xQueue: The handle to the queue on which the item is to be posted.
• pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• [out] pxHigherPriorityTaskWoken: xQueueSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueReset(xQueue)
Reset a queue back to its original empty state. pdPASS is returned if the queue is successfully reset. pdFAIL is returned if the queue could not be reset because there are tasks blocked on the queue waiting to either receive from the queue or send to the queue.

Return always returns pdPASS

Parameters

• xQueue: The queue to reset
Type Definitions

```c
typedef void *QueueHandle_t
```
Type by which queues are referenced. For example, a call to `xQueueCreate()` returns a `QueueHandle_t` variable that can then be used as a parameter to `xQueueSend()`, `xQueueReceive()`, etc.

```c
typedef void *QueueSetHandle_t
```
Type by which queue sets are referenced. For example, a call to `xQueueCreateSet()` returns a `QueueSetHandle_t` variable that can then be used as a parameter to `xQueueSelectFromSet()`, `xQueueAddToSet()`, etc.

```c
typedef void *QueueSetMemberHandle_t
```
Queue sets can contain both queues and semaphores, so the `QueueSetMemberHandle_t` is defined as a type to be used where a parameter or return value can be either a `QueueHandle_t` or a `SemaphoreHandle_t`.

Semaphore API

Header File

- `freertos/include/freertos/semphr.h`

Macros

```c
semBINARY_SEMAPHORE_QUEUE_LENGTH
semSEMAPHORE_QUEUE_ITEM_LENGTH
semGIVE_BLOCK_TIME
```

```c
xSemaphoreCreateBinary()
```
Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old `vSemaphoreCreateBinary()` macro is now deprecated in favour of this `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to `take` the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the the semaphore must first be `given` before it can be `taken`.

Function that creates a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as nothing is actually stored - all that is important is whether the queue is empty or full (the binary semaphore is available or not).

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously `give` the semaphore while another continuously `takes` the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

(continues on next page)```
if ( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}
}

Return  Handle to the created semaphore.

xSemaphoreCreateBinaryStatic ( pxStaticSemaphore )

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! http://www.freertos.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see http://www.freertos.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;
void vATask( void *pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or xSemaphoreCreateBinaryStatic().
    // The semaphore’s data structures will be placed in the xSemaphoreBuffer variable, the address of which is passed into the function. The function’s parameter is not NULL, so the function will not attempt any dynamic memory allocation, and therefore the function will not return.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );
    // Rest of task code goes here.
}

Return  If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

Parameters

• pxStaticSemaphore: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

xSemaphoreTake ( xSemaphore, xBlockTime )

Macro to obtain a semaphore. The semaphore must have previously been created with a call to vSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not...
        // available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...
            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

Return  pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

Parameters
  • xSemaphore: A handle to the semaphore being taken - obtained when the semaphore was created.
  • xBlockTime: The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

xSemaphoreTakeRecursive( xMutex, xBlockTime )
Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.
            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure. This is just for illustrative purposes.
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

Return  pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

Parameters
- xMutex: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- xBlockTime: The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlockTime.

xSemaphoreGive( xSemaphore )
**Macro** to release a semaphore. The semaphore must have previously been created with a call to vSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR() for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

**Example usage:**

```c
SemaphoreHandle_t xSemaphore = NULL;
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

**Return** `pdTRUE` if the semaphore was released. `pdFALSE` if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

**Parameters**

- `xSemaphore`: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

**xSemaphoreGiveRecursive**(`xMutex`)

**Macro** to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.
Example usage:

```
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.
            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

**Return**  pdTRUE if the semaphore was given.

**Parameters**

- **xMutex**: A handle to the mutex being released, or ‘given’. This is the handle returned by xSemaphoreCreateMutex();

**xSemaphoreGiveFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to vSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;    
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}
```

Return pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.
Parameters

- `xSemaphore`: A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- `[out] pxHigherPriorityTaskWoken`: `xSemaphoreGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xSemaphoreGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

`xSemaphoreTakeFromISR(xSemaphore, pxHigherPriorityTaskWoken)`

**Macro** to take a semaphore from an ISR. The semaphore must have previously been created with a call to `vSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Return** `pdTRUE` if the semaphore was successfully taken, otherwise `pdFALSE`

Parameters

- `xSemaphore`: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- `[out] pxHigherPriorityTaskWoken`: `xSemaphoreTakeFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xSemaphoreTakeFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

`xSemaphoreCreateMutex()`

**Macro** that implements a mutex semaphore by using the existing queue mechanism.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using `xSemaphoreCreateMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateMutex()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provided the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `vSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```
Return If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

\textbf{\texttt{xSemaphoreCreateMutexStatic}}(\texttt{pxMutexBuffer})

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using \texttt{xSemaphoreCreateMutex()} then the required memory is automatically dynamically allocated inside the \texttt{xSemaphoreCreateMutex()} function. (see \url{http://www.freertos.org/a00111.html}). If a mutex is created using \texttt{xSemaphoreCreateMutexStatic()} then the application writer must provided the memory. \texttt{xSemaphoreCreateMutexStatic()} therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the \texttt{xSemaphoreTake()} and \texttt{xSemaphoreGive()} macros. The \texttt{xSemaphoreTakeRecursive()} and \texttt{xSemaphoreGiveRecursive()} macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See \texttt{xSemaphoreCreateBinary()} for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void *pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

\textbf{Return} If the mutex was successfully created then a handle to the created mutex is returned. If \texttt{pxMutexBuffer} was NULL then NULL is returned.

\textbf{Parameters}

- \texttt{pxMutexBuffer}: Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

\textbf{\texttt{xSemaphoreCreateRecursiveMutex}}()

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using \texttt{xSemaphoreCreateRecursiveMutex()} then the required memory is automatically dynamically allocated inside the \texttt{xSemaphoreCreateRecursiveMutex()} function. (see \url{http://www.freertos.org/a00111.html}). If a recursive mutex is created using \texttt{xSemaphoreCreateRecursiveMutexStatic()} then the application writer must provide the memory that will get used by the mutex. \texttt{xSemaphoreCreateRecursiveMutexStatic()} therefore allows a recursive mutex to be created without using any dynamic memory allocation.
 Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**xSemaphoreCreateRecursiveMutexStatic** (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a recursive mutex is created using
    // xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

Return If the recursive mutex was successfully created then a handle to the created recursive mutex is returned.
If pxMutexBuffer was NULL then NULL is returned.

Parameters
• pxStaticSemaphore: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

xSemaphoreCreateCounting(uxMaxCount, uxInitialCount)
Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (incrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    (continues on next page)
Semaphore cannot be used before a call to xSemaphoreCreateCounting().

The max value to which the semaphore can count should be 10, and the
// initial value assigned to the count should be 0.
xSemaphore = xSemaphoreCreateCounting( 10, 0 );

if( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}

Return  Handle to the created semaphore. Null if the semaphore could not be created.

Parameters

- uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this
  value it can no longer be ‘given’.
- uxInitialCount: The count value assigned to the semaphore when it is created.

xSemaphoreCreateCountingStatic(uxMaxCount,uxInitialCount,pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can
be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a
counting semaphore! http://www.freertos.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which
the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreate-
Counting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreate-
Counting() function. (see http://www.freertos.org/a00111.html). If a counting semaphore is created using
xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCre-
ateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory
allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing
the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event
(decrementing the semaphore count value). The count value is therefore the difference between the number
of events that have occurred and the number that have been processed. In this case it is desirable for the initial
count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a
resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value
reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back
- incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to
the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;
    // Counting semaphore cannot be used before they have been created. Create
```
// a counting semaphore using xSemaphoreCreateCountingStatic(). The max
// value to which the semaphore can count is 10, and the initial value
// assigned to the count will be 0. The address of xSemaphoreBuffer is
// passed in and will be used to hold the semaphore structure, so no dynamic
// memory allocation will be used.
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.

Return  If the counting semaphore was successfully created then a handle to the created counting semaphore
is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

Parameters
  • uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this
    value it can no longer be ‘given’.
  • uxInitialCount: The count value assigned to the semaphore when it is created.
  • pxSemaphoreBuffer: Must point to a variable of type StaticSemaphore_t, which will then be
    used to hold the semaphore’s data structure, removing the need for the memory to be allocated
dynamically.

vSemaphoreDelete (xSemaphore)
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore
if the mutex is held by a task.

Parameters
  • xSemaphore: A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of deter-
mining the identity of the mutex holder as the holder may change between the function exiting and the returned
value being tested.

uxSemaphoreGetCount (xSemaphore)
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the
semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0
if the semaphore is not available.

Type Definitions
typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File
• freertos/include/freertos/timers.h

Functions
TimerHandle_t xTimerCreate (const char *const pcTimerName, const TickType_t xTimerPeriod
InTicks, const UBaseType_t uxAutoReload, void *const pvTimerID,
TimerCallbackFunction_t pxCallbackFunction)

Creates a new software timer instance, and returns a handle by which the created software timer can be refer-
cenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer
data structure is stored. If a software timer is created using xTimerCreate() then the required memory is
automatically dynamically allocated inside the xTimerCreate() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

**Example usage:**

```c
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[ NUM_TIMERS ];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback( TimerHandle_t pxTimer )
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT( pxTimer );

    // Which timer expired?
    lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[ lArrayIndex ] += 1;

    // If the timer has expired 10 times then stop it from running.
    if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop( pxTimer, 0 );
    }
}

void main( void )
{
    int32_t x;

    // Create then start some timers. Starting the timers before the scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,...
                                   not used by the kernel.
                                   ( 100 * x ), // The timer period in...
                                   ticks.
                                   pdTRUE, // The timers will auto-
                                   reload themselves when they expire.
                                   ( void * ) x, // Assign each timer a...
                                   unique id equal to its array index.
    }
}
```

(continues on next page)
--same callback when it expires.

};

if( xTimers[ x ] == NULL )
{
    // The timer was not created.
}
else
{
    // Start the timer. No block time is specified, and even if one was
    // it would be ignored because the scheduler has not yet been started.
    if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
    {
        // The timer could not be set into the Active state.
    }
}

// ...  
// Create tasks here.  
// ...  

// Starting the scheduler will start the timers running as they have already  
// been set into the active state.
vTaskStartScheduler();  

// Should not reach here.
for( ;; );

---

Return If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

Parameters

- `pcTimerName`: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- `xTimerPeriodInTicks`: The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to `( 500 / portTICK_PERIOD_MS )` provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `uxAutoReload`: If `uxAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `uxAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- `pvTimerID`: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- `pxCallbackFunction`: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “`void vCallbackFunction(TimerHandle_t xTimer );`”.

`TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t* pxTimerBuffer)`

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.
Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see http://www.freertos.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
// The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

// A variable that will be incremented by the software timer's callback
// function.
UBaseType_t uxVariableToIncrement = 0;

// A software timer callback function that increments a variable passed to
// it when the software timer was created. After the 5th increment the
// callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(xExpiredTimer);

    // Increment the variable to show the timer callback has executed.
    (*puxVariableToIncrement)++;

    // If this callback has executed the required number of times, stop the
    // timer.
    if( (*puxVariableToIncrement) == 5 )
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }
}

void main( void )
{
    // Create the software time. xTimerCreateStatic() has an extra parameter
    // than the normal xTimerCreate() API function. The parameter is a pointer
    // to the StaticTimer_t structure that will hold the software timer
    // structure. If the parameter is passed as NULL then the structure will
    // be allocated dynamically, just as if xTimerCreate() had been called.
    xTimer = xTimerCreateStatic( "T1", // Text name for the task.
                                xTimerPeriod, // The period of the timer
                                pdTRUE, // This is an auto-reload
                                ( void * ) &uxVariableToIncrement, // A
                                prvTimerCallback, // The function to execute
                                when the timer expires.
```

(continues on next page)
The buffer that will hold the software timer structure.

// The scheduler has not started yet so a block time is not used.
xReturned = xTimerStart( xTimer, 0 );

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timers running as they have already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );
}

Return If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

Parameters

- `pcTimerName`: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- `xTimerPeriodInTicks`: The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to `( 500 / portTICK_PERIOD_MS )` provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `uxAutoReload`: If `uxAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `uxAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- `pvTimerID`: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- `pxCallbackFunction`: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “`void vCallbackFunction( TimerHandle_t xTimer );`”.
- `pxTimerBuffer`: Must point to a variable of type `StaticTimer_t`, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

```c
void *pvTimerGetTimerID( TimerHandle_t xTimer)
Returns the ID assigned to the timer.
IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.
If the same callback function is assigned to multiple timers then the timer ID can be used within the callback function to identify which timer actually expired.

Example usage:

```Return The ID assigned to the timer being queried.

Parameters

- `xTimer`: The timer being queried.

See the xTimerCreate() API function example usage scenario.

```
ID$s are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

Parameters

• xTimer: The timer being updated.
• pvNewID: The ID to assign to the timer.

See the xTimerCreate() API function example usage scenario.

BaseType_t xTimerIsTimerActive (TimerHandle_t xTimer)

Queries a timer to see if it is active or dormant.

A timer will be dormant if:

1) It has been created but not started, or
2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
// This function assumes xTimer has already been created.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and...
        // equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is active, do something.
    }
    else
    {
        // xTimer is not active, do something else.
    }
}
```

Return pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

Parameters

• xTimer: The timer being queried.

TaskHandle_t xTimerGetTimerDaemonTaskHandle (void)

xTimerGetTimerDaemonTaskHandle() is only available if INCLUDE_xTimerGetTimerDaemonTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

TickType_t xTimerGetPeriod (TimerHandle_t xTimer)

Returns the period of a timer.

Return The period of the timer in ticks.

Parameters

• xTimer: The handle of the timer being queried.

TickType_t xTimerGetExpiryTime (TimerHandle_t xTimer)

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.
Return If the timer is running then the time in ticks at which the timer will next expire is returned. If the
timer is not running then the return value is undefined.

Parameters

- xTimer: The handle of the timer being queried.

BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task
(the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of
processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunc-
tionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the
pended callback function. This allows the callback function to execute contiguously in time with the interrupt
- just as if the callback had executed in the interrupt itself.

Example usage:

```c
void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
{
    BaseType_t xInterfaceToService;

    // The interface that requires servicing is passed in the second
    // parameter. The first parameter is not used in this case.
    xInterfaceToService = ( BaseType_t ) ulParameter2;

    // Perform the processing here...
}

An ISR that receives data packets from multiple interfaces
void vAnISR( void )
{
    BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;

    // Query the hardware to determine which interface needs processing.
    xInterfaceToService = prvCheckInterfaces();

    // The actual processing is to be deferred to a task. Request the
    // vProcessInterface() callback function is executed, passing in the
    // number of the interface that needs processing. The interface to
    // service is passed in the second parameter. The first parameter is
    // not used in this case.
    xHigherPriorityTaskWoken = pdFALSE;
    xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )-
                                  xInterfaceToService, &xHigherPriorityTaskWoken );

    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and will
    // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
    // the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Return pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise
pdFALSE is returned.

Parameters

- xFunctionToPend: The function to execute from the timer service/daemon task. The function
  must conform to the PendedFunction_t prototype.
**pvParameter1**: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.

**ulParameter2**: The value of the callback function’s second parameter.

**pxHigherPriorityTaskWoken**: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

```c
BaseType_t xTimerPendFunctionCall(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

**Parameters**

- **xFunctionToPend**: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1**: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2**: The value of the callback function’s second parameter.
- **xTicksToWait**: Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

**const char *pcTimerGetTimerName(TimerHandle_t xTimer)**

Returns the name that was assigned to a timer when the timer was created.

**Return** The name assigned to the timer specified by the xTimer parameter.

**Parameters**

- **xTimer**: The handle of the timer being queried.

**Macros**

- `<tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR`
- `<tmrCOMMAND_EXECUTE_CALLBACK`
- `<tmrCOMMAND_START_DONT_TRACE`
- `<tmrCOMMAND_START`
- `<tmrCOMMAND_RESET`
- `<tmrCOMMAND_STOP`
- `<tmrCOMMAND_CHANGE_PERIOD`
- `<tmrCOMMAND_DELETE`
- `<tmrFIRST_FROM_ISR_COMMAND`
- `<tmrCOMMAND_START_FROM_ISR`
- `<tmrCOMMAND_RESET_FROM_ISR`
- `<tmrCOMMAND_STOP_FROM_ISR`
- `<tmrCOMMAND_CHANGE_PERIOD_FROM_ISR`
xTimerStart (xTimer, xTicksToWait)
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.
xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.
Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.
It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.
The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.
Example usage:
Return pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
Parameters
• xTimer: The handle of the timer being started/restarted.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

xTimerStop (xTimer, xTicksToWait)
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.
xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.
Stopping a timer ensures the timer is not in the active state.
The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.
Example usage:
Return pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
Parameters
• xTimer: The handle of the timer being stopped.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.
See the xTimerCreate() API function example usage scenario.

**xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
// This function assumes xTimer has already been created. If the timer
// referenced by xTimer is already active when it is called, then the timer
// is deleted. If the timer referenced by xTimer is not active when it is
// called, then the period of the timer is set to 500ms and the timer is
// started.
void vAFunction( TimerHandle_t xTimer )
{
    if ( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
        // equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    }
    else
    {
        // xTimer is not active, change its period to 500ms. This will also
        // cause the timer to start. Block for a maximum of 100 ticks if the
        // change period command cannot immediately be sent to the timer
        // command queue.
        if ( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==
            pdPASS )
            // The command was successfully sent.
        }
        else
        {
            // The command could not be sent, even after waiting for 100 ticks
            // to pass. Take appropriate action here.
        }
    }
}
```

**Return**  
pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- **xTimer**: The handle of the timer that is having its period changed.
- **xNewPeriod**: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue,
should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

**xTimerDelete** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function. The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

**Return**

pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- xTimer: The handle of the timer being deleted.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

See the xTimerChangePeriod() API function example usage scenario.

**xTimerReset** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerReset() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```c
// When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer.

TimerHandle_t xBacklightTimer = NULL;

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}
```

(continues on next page)
The key press event handler.

```c
void vKeyPressEventHandler( char cKey ) {
    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. Wait 10 ticks for the command to be successfully sent
    // if it cannot be sent immediately.
    vSetBacklightState( BACKLIGHT_ON );
    if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
        // The reset command was not executed successfully. Take appropriate
        // action here.

    // Perform the rest of the key processing here.
}

void main( void ) {
    int32_t x;

    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer", 0, pdFALSE, 0, vBacklightTimerCallback );
    if( xBacklightTimer == NULL )
        // The timer was not created.
    else
        // Start the timer. No block time is specified, and even if one was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
            // The timer could not be set into the Active state.

    // Should not reach here.
}
```
Return pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- **xTimer**: The handle of the timer being reset/started/restarted.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

**xTimerStartFromISR**(xTimer, pxHigherPriorityTaskWoken)
A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```c
for (;;) {
}
```

```c
Return pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- **xTimer**: The handle of the timer being reset/started/restarted.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

**xTimerStartFromISR**(xTimer, pxHigherPriorityTaskWoken)
A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```c
// This scenario assumes xBacklightTimer has already been created. When a key is pressed, an LCD back-light is switched on. If 5 seconds pass without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer, and unlike the example given for the xTimerReset() function, the key press event handler is an interrupt service routine.

// The callback function assigned to the one-shot timer. In this case the parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer ){
  // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
  vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void ){
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;

  // Ensure the LCD back-light is on, then restart the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
  vSetBacklightState( BACKLIGHT_ON );

  // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time.
  // xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
  if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS ){
    // The start command was not executed successfully. Take appropriate action here.
  }

  // Perform the rest of the key processing here.
```
If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

```c
if ( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}
```

**Return** pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**
- xTimer: The handle of the timer being started/restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**xTimerStopFromISR** (xTimer, pxHigherPriorityTaskWoken)
A version of xTimerStop() that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xTimer has already been created and started. When an interrupt occurs, the timer should be simply stopped.

void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - simply stop the timer.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined (within this function). As this is an interrupt service routine, only FreeRTOS API functions that end in "FromISR" can be used.
    if ( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The stop command was not executed successfully. Take appropriate action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.
    if ( xHigherPriorityTaskWoken != pdFALSE )
    {
```

__(continues on next page)__
Call the interrupt safe `yield` function here (actual function depends on the FreeRTOS port being used).

**Return** pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**
- `xTimer`: The handle of the timer being stopped.
- `pxHigherPriorityTaskWoken`: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `pxHigherPriorityTaskWoken` will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

### xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)
A version of xTimerChangePeriod() that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the period of xTimer should be changed to 500ms.

void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - change the period of xTimer to 500ms.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The command to change the timers period was not executed
        // successfully. Take appropriate action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

**Return** pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task.
task relative to other tasks in the system. The timer service/daemon task priority is set by the config-
TIMER_TASK_PRIORITY configuration constant.

**Parameters**

- `xTimer`: The handle of the timer that is having its period changed.
- `xNewPeriod`: The new period for `xTimer`. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xNewPeriod` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xNewPeriod` can be set to `(500 / portTICK_PERIOD_MS)` provided configTICK_RATE_HZ is less than or equal to 1000.
- `pxHigherPriorityTaskWoken`: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerChangePeriodFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to pdTRUE internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

`xTimerResetFromISR` *(xTimer, pxHigherPriorityTaskWoken)*

A version of `xTimerReset()` that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xBacklightTimer has already been created. When a key is pressed, an LCD back-light is switched on. If 5 seconds pass without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer, and unlike the example given for the xTimerReset() function, the key press event handler is an interrupt service routine.

void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time. xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
    if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate action here.
    }
}
```

(continues on next page)
Perform the rest of the key processing here.

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer that is to be started, reset, or restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Type Definitions
typedef void *TimerHandle_t
    Type by which software timers are referenced. For example, a call to xTimerCreate() returns an TimerHandle_t variable that can then be used to reference the subject timer in calls to other software timer API functions (for example, xTimerStart(), xTimerReset(), etc.).

typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
    Defines the prototype to which timer callback functions must conform.

typedef void (*PendedFunction_t)(void *, uint32_t)
    Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

Event Group API

Header File
- freertos/include/freertos/event_groups.h

Functions
EventGroupHandle_t xEventGroupCreate(void)
    Create a new event group.

    Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see http://www.
freertos.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Return If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See http://www.freertos.org/a00111.html

**EventGroupHandle_t xEventGroupCreateStatic(StaticEventGroup_t *pxEventGroupBuffer)**

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see http://www.freertos.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```
Return If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

Parameters
- pxEventGroupBuffer: pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

EventBits_t xEventGroupWaitBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, const TickType_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup, // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait for.
        pdTRUE, // BIT_0 and BIT_4 should be cleared before returning.
        pdFALSE, // Don't wait for both bits, either bit will do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    { // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    { // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    { // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    { // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}
```

Return The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

Parameters
• **xEventGroup**: The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.

• **uxBitsToWaitFor**: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to 0x07. Etc.

• **xClearOnExit**: If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.

• **xWaitForAllBits**: If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.

• **xTicksToWait**: The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set.

### EventBits_t xEventGroupClearBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

#### Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
    else if( ( uxBits & BIT_0 ) != 0 )
        // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
    else if( ( uxBits & BIT_4 ) != 0 )
        // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.
    else
        // Neither bit 0 nor bit 4 were set in the first place.
}
```

**Return** The value of the event group before the specified bits were cleared.

**Parameters**

- **xEventGroup**: The event group in which the bits are to be cleared.
- **uxBitsToClear**: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set `uxBitsToClear` to 0x08. To clear bit 3 and bit 0 set `uxBitsToClear` to 0x09.
to 0x09.

**EventBits_t xEventGroupSetBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)**

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBitsFromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0   ( 1 << 0 )
#define BIT_4   ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set. It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}
```

**Return** The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

**Parameters**

- **xEventGroup**: The event group in which the bits are to be set.
- **uxBitsToSet**: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

**EventBits_t xEventGroupSync (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)**
Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT ( 1 << 0 )
#define TASK_1_BIT ( 1 << 1 )
#define TASK_2_BIT ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the sync point. The other two tasks will set the other two bits defined by ALL_SYNC_BITS. All three tasks have reached the synchronisation point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the synchronisation point. The other two tasks will set the other two bits defined by ALL_SYNC_BITS. All three tasks have reached the synchronisation point when all the ALL_SYNC_BITS are set. Wait indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so this task will only reach here if the synchronisation was made by all
    }
}
```
(continues on next page)

```
// three tasks, so there is no need to test the return value.
}

void vTask2( void *pvParameters )
{
    for ( ;; )
    {
        // Perform task functionality here.
        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
```

### Return

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

### Parameters

- `xEventGroup`: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- `uxBitsToSet`: The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWait parameter are set.
- `uxBitsToWaitFor`: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- `xTicksToWait`: The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by uxBitsToWaitFor to become set.

### EventBits_t xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

#### Return

The event group bits at the time xEventGroupGetBitsFromISR() was called.

#### Parameters

- `xEventGroup`: The event group being queried.

### void vEventGroupDelete (EventGroupHandle_t xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

#### Parameters

- `xEventGroup`: The event group being deleted.

### Macros

xEventGroupClearBitsFromISR (xEvetntGroup, uxBitsToClear)

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending
the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to 
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4 );  // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

Return: If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

Parameters:
- `xEventGroup`: The event group in which the bits are to be cleared.
- `uxBitsToClear`: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

`xEventGroupSetBitsFromISR(xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)`

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to 
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4  // The bits being set.
        &xHigherPriorityTaskWoken );
```

(continues on next page)
// Was the message posted successfully?
if( xResult == pdPASS )
{
    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and
    // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
    // refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

Return If the request to execute the function was posted successfully then pdPASS is returned, otherwise
pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

Parameters
• xEventGroup: The event group in which the bits are to be set.
• uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only,
  set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
• pxHigherPriorityTaskWoken: As mentioned above, calling this function will result in a
  message being sent to the timer daemon task. If the priority of the timer daemon task is higher than
  the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPrior-
  ityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context
  switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken
  must be initialised to pdFALSE. See the example code below.

xEventGroupGetBits(xEventGroup)
Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Return The event group bits at the time xEventGroupGetBits() was called.

Parameters
• xEventGroup: The event group being queried.

Type Definitions
typedef void *EventGroupHandle_t
An event group is a collection of bits to which an application can assign a meaning. For example, an application
may create an event group to convey the status of various CAN bus related events in which bit 0 might mean
“A CAN
message has been received and is ready for processing”, bit 1 might mean “The application has queued a
message that is ready for sending onto the CAN network”, and bit 2 might mean “It is time to send a SYNC
message onto the CAN network” etc. A task can then test the bit values to see which events are active, and
optionally enter the Blocked state to wait for a specified bit or a group of specified bits to be active. To continue
the CAN bus example, a CAN controlling task can enter the Blocked state (and therefore not consume any
processing time) until either bit 0, bit 1 or bit 2 are active, at which time the bit that was actually active would
inform the task which action it had to take (process a received message, send a message, or send a SYNC).

The event groups implementation contains intelligence to avoid race conditions that would otherwise occur
were an application to use a simple variable for the same purpose. This is particularly important with respect
to when a bit within an event group is to be cleared, and when bits have to be set and then tested atomically - as is
the case where event groups are used to create a synchronisation point between multiple tasks (a ‘rendezvous’
). event_groups.h

Type by which event groups are referenced. For example, a call to xEventGroupCreate() returns an Event-
GroupHandle_t variable that can then be used as a parameter to other event group functions.

typedef TickType_t EventBits_t

2.7.10 FreeRTOS Additions
Overview

ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However various features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

**Ring Buffers**: Ring buffers were added to provide a form of buffer that could accept entries of arbitrary lengths.

**Hooks**: ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric amongst both CPUs.

Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. You may apply for a piece of memory on the ring buffer to send an item, or just use the API to copy your data and send (according to the send API you call). For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items must also be returned in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

- **No-Split** buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use no-split buffers when items must occupy contiguous memory. *Only this buffer type allows you getting the data item address and writing to the item by yourself.*
- **Allow-Split** buffers will allow an item to be split when wrapping around if doing so will allow the item to be stored. Allow-split buffers are more memory efficient than no-split buffers but can return an item in two parts when retrieving.
- **Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes and be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

**Note:** No-split/allow-split buffers will always store items at 32-bit aligned addresses. Therefore when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

**Note:** Each item stored in no-split/allow-split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of no-split/allow-split buffers will also be rounded up when created.

Usage

The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
```

(continues on next page)
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to apply for the memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This way adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))
...
    dma_item_t item;
    UBaseType_t res = xRingbufferSendAcquire(buf_handle,
                                          &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
    if (res != pdTRUE) {
        printf("Failed to acquire memory for item\n");
    }
    item.dma_desc = (lldesc_t) {
        .size = buffer_size,
        .length = buffer_size,
        .eof = 0,
        .owner = i,
        .buf = &item->buf,
    };
    res = xRingbufferSendComplete(buf_handle, &item);
    if (res != pdTRUE) {
        printf("Failed to send item\n");
    }
```

The following example demonstrates retrieving and returning an item from a no-split ring buffer using `xRingbufferReceive()` and `vRingbufferReturnItem()`

```c
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));
    //Check received item
    if (item != NULL) {
        //Print item
        for (int i = 0; i < item_size; i++) {
            printf("%c", item[i]);
        }
        printf("\n");
        //Return Item
```
vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    // Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from an allow-split ring buffer using \texttt{xRingbufferReceiveSplit()} and \texttt{vRingbufferReturnItem()}

\begin{verbatim}
... // Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

    // Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    // Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    // Failed to receive item
    printf("Failed to receive item\n");
}
\end{verbatim}

The following example demonstrates retrieving and returning an item from a byte buffer using \texttt{xRingbufferReceiveUpTo()} and \texttt{vRingbufferReturnItem()}

\begin{verbatim}
... // Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

    // Check received data
if (item != NULL) {
    // Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    // Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    // Failed to receive item
    printf("Failed to receive item\n");
}
\end{verbatim}

For ISR safe versions of the functions used above, call \texttt{xRingbufferSendFromISR()}, \texttt{xRingbufferReceiveFromISR()}, \texttt{xRingbufferReceiveSplitFromISR()}, \texttt{xRingbufferReceive-}
UpToFromISR(), and vRingbufferReturnItemFromISR()

Sending to Ring Buffer  The following diagrams illustrate the differences between no-split/allow-split buffers and byte buffers with regards to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.

For no-split/allow-split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is rounded up to the nearest 32-bit aligned size in order to maintain overall 32-bit alignment. However the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

Using SendAcquire and SendComplete  Items in no-split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However the receiving of data items must occur in FIFO order, therefore not calling SendComplete the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire/SendComplete don’t happen in the same order. At the beginning, there is already an data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Due to the usage if 20 bytes item is not complete, it’s not available, nor the following data items.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-split/byte buffers do not allow using SendAcquire/SendComplete since acquired buffers are required to be complete (not wrapped).
**Wrap around** The following diagrams illustrate the differences between no-split, allow-split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.

No-split buffers will only store an item in continuous free space and will not split an item under any circumstances. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Allow-split buffers will attempt to split the item into two parts when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Note:** Allow-split buffers treats the both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread.
safemanner.

Byte buffers will store as much data as possible into the free space at the tail of buffer. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each part continuous will be treated as a separate item by the byte buffer.

Retrieving/Returning The following diagrams illustrates the differences between no-split/allow-split and byte buffers in retrieving and returning data.

Items in no-split/allow-split buffers are retrieved in strict FIFO order and must be returned for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the 16, 20, and 8 byte items are retrieved in FIFO order. However the items are not returned in they were retrieved (20, 8, 16). As such, the space is not freed until the first item (16 byte) is returned.

Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return before another retrieval is permitted). When using xRingbufferReceive() or xRingbufferReceiveFromISR(), all continuous stored data will be retrieved. xRingbufferReceiveUpTo() or xRingbufferReceiveUpToFromISR() can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to xRingbufferReceive() or xRingbufferReceiveFromISR() then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.
Ring Buffers with Queue Sets  Ring buffers can be added to FreeRTOS queue sets using \texttt{xRingbufferAddToQueueSetRead()} such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to \texttt{xQueueSelectFromSet()}. To check whether the selected queue set member is the ring buffer, call \texttt{xRingbufferCanRead()}.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item...
}
else {
    ...
}
```

Ring Buffers with Static Allocation  The \texttt{xRingbufferCreateStatic()} can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the \texttt{xRingbufferCreateStatic()} to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type \texttt{StaticRingbuffer_t}
The ring buffer’s storage area of size \(x\text{BufferSize}\). Note that \(x\text{BufferSize}\) must be 32-bit aligned for no-split/allow-split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

**Note:** The `CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION` option must be enabled in `menuconfig` for statically allocated ring buffers to be available.

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE 400 //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

**Ring Buffer API Reference**

**Note:** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore the semaphore will be given before the highest priority task can re-acquire the semaphore.
This will result in the **semaphore being acquired by the second highest priority task** waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

**Header File**

- esp_ringbuf/include/freertos/ringbuf.h

**Functions**

**RingbufHandle_t xRingbufferCreate** *(size_t xBufferSize, RingbufferType_t xBufferType)*

Create a ring buffer.

**Note** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

**Parameters**
- [in] xBufferSize: Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers
- [in] xBufferType: Type of ring buffer, see documentation.

**RingbufHandle_t xRingbufferCreateNoSplit** *(size_t xItemSize, size_t xItemNum)*

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

**Parameters**
- [in] xItemSize: Size of each item to be put into the ring buffer
- [in] xItemNum: Maximum number of items the buffer needs to hold simultaneously

**RingbufHandle_t xRingbufferCreateStatic** *(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)*

Create a ring buffer but manually provide the required memory.

**Note** The CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION option must be enabled for this to be available

**Note** xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

**Parameters**
- [in] xBufferSize: Size of the buffer in bytes.
- [in] xBufferType: Type of ring buffer, see documentation
- [in] pucRingbufferStorage: Pointer to the ring buffer’s storage area. Storage area must of the same size as specified by xBufferSize
- [in] pxStaticRingbuffer: Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**BaseType_t xRingbufferSend** *(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)*

Insert an item into the ring buffer.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Parameters**
- [in] xRingbuffer: Handle to the created ring buffer
- [in] pvItem: Pointer to the item to be inserted
- [in] xItemSize: Size of the item
- [in] xTicksToWait: Time to wait before sending the item

**Return**
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer
• [in] xRingbuffer: Ring buffer to insert the item into
• [in] pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
• [in] xItemSize: Size of data to insert.
• [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType_t xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t* pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

Note For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return
• pdTRUE if succeeded
• pdFALSE when the ring buffer does not have space.

Parameters
• [in] xRingbuffer: Ring buffer to insert the item into
• [in] pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
• [in] xItemSize: Size of data to insert.
• [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

BaseType_t xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return
• pdTRUE if succeeded
• pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

Parameters
• [in] xRingbuffer: Ring buffer to allocate the memory
• [out] ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
• [in] xItemSize: Size of item to acquire.
• [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType_t xRingbufferSendComplete(RingbufHandle_t xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

Note Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

Return
• pdTRUE if succeeded
• pdFALSE if fail for some reason.

Parameters
• [in] xRingbuffer: Ring buffer to insert the item into
• [in] pvItem: Pointer to item in allocated memory to insert.

void *xRingbufferReceive(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.
Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Return**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

**Parameters**
- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- [in] xTicksToWait: Ticks to wait for items in the ring buffer.

```c
void *xRingbufferReceiveFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize)
```

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

**Note** A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Return**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

**Parameters**
- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.

```c
BaseType_t xRingbufferReceiveSplit(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)
```

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

**Note** Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers

**Return**
- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

**Parameters**
- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
- [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
- [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
- [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)
- [in] xTicksToWait: Ticks to wait for items in the ring buffer.

```c
BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void *ppvHeadItem, void *ppvTailItem, size_t pxHeadItemSize, size_t pxTailItemSize)
```

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

**Note** Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers

**Return**
- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved
Parameters

- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
- [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
- [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
- [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)

void *xRingbufferReceiveUpTo (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note A call to vRingbufferReturnItem() is required after this to free up the data retrieved.
Note This function should only be called on byte buffers
Note Byte buffers do not allow multiple retrievals before returning an item
Return
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

Parameters

- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- [in] xTicksToWait: Ticks to wait for items in the ring buffer.
- [in] xMaxSize: Maximum number of bytes to return.

void *xRingbufferReceiveUpToFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.
Note This function should only be called on byte buffers
Note Byte buffers do not allow multiple retrievals before returning an item
Return
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

Parameters

- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- [in] xMaxSize: Maximum number of bytes to return.

void vRingbufferReturnItem (RingbufHandle_t xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- [in] xRingbuffer: Ring buffer the item was retrieved from
- [in] pvItem: Item that was received earlier

void vRingbufferReturnItemFromISR (RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- [in] xRingbuffer: Ring buffer the item was retrieved from
- [in] pvItem: Item that was received earlier
- [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.
void *vRingbufferDelete(RingbufHandle_t xRingbuffer)
Delete a ring buffer.

Note This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually by the user.

Parameters
• [in] xRingbuffer: Ring buffer to delete

size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer)
Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note The max item size for a no-split buffer is limited to ((buffer_size/2)-header_size). This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Return Maximum size, in bytes, of an item that can be placed in a ring buffer.

Parameters
• [in] xRingbuffer: Ring buffer to query

size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)
Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Warning This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

Note An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2)-header_size). See API reference for xRingbufferGetMaxItemSize().

Return Current free size, in bytes, available for an entry

Parameters
• [in] xRingbuffer: Ring buffer to query

BaseType_t xRingbufferAddToQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

Return
• pdTRUE on success, pdFALSE otherwise

Parameters
• [in] xRingbuffer: Ring buffer to add to the queue set
• [in] xQueueSet: Queue set to add the ring buffer’s read semaphore to

BaseType_t xRingbufferCanRead(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)
Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

Return
• pdTRUE when semaphore belongs to ring buffer
• pdFALSE otherwise.

Parameters
• [in] xRingbuffer: Ring buffer which should be checked
• [in] xMember: Member returned from xQueueSelectFromSet

BaseType_t xRingbufferRemoveFromQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
Remove the ring buffer’s read semaphore from a queue set.
This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer.

**Return**
- **pdTRUE** on success
- **pdFALSE** otherwise

**Parameters**
- **[in]** `xRingbuffer`: Ring buffer to remove from the queue set
- **[in]** `xQueueSet`: Queue set to remove the ring buffer’s read semaphore from

```c
void vRingbufferGetInfo (RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)
```

Get information about ring buffer status.

Get information of the a ring buffer’s current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**
- **[in]** `xRingbuffer`: Ring buffer to remove from the queue set
- **[out]** `uxFree`: Pointer use to store free pointer position
- **[out]** `uxRead`: Pointer use to store read pointer position
- **[out]** `uxWrite`: Pointer use to store write pointer position
- **[out]** `uxAcquire`: Pointer use to store acquire pointer position
- **[out]** `uxItemsWaiting`: Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```

Debugging function to print the internal pointers in the ring buffer.

**Parameters**
- **xRingbuffer**: Ring buffer to show

**Structures**

```c
struct xSTATIC_RINGBUFFER
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Note** The CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION option must be enabled for this structure to be available.

**Type Definitions**

```c
typedef void *RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Note** The CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION option must be enabled for this structure to be available.

**Enumerations**

```c
enum RingbufferType_t
```

Values:
**RINGBUF_TYPE_NOSPLIT**
= 0
No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

**RINGBUF_TYPE_ALLOWSPLIT**
Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

**RINGBUF_TYPE_BYTEBUF**
Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

**RINGBUF_TYPE_MAX**

**Hooks**
FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by Vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

**Vanilla FreeRTOS Hooks**
Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as Legacy Hooks in ESP-IDF FreeRTOS. To enable legacy hooks, `CONFIG_FREERTOS_LEGACY_HOOKS` should be enabled in the project configuration menu.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32 is dual core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

**ESP-IDF Idle and Tick Hooks**
Due to the the dual core nature of the ESP32, it may be necessary for some applications to have separate hooks for each core. Furthermore, it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time. Therefore the ESP-IDF provides it’s own hooks API in addition to the legacy hooks provided by Vanilla FreeRTOS.

The ESP-IDF tick/idle hooks are registered at run time, and each tick/idle hook must be registered to a specific CPU. When the idle task runs/tick Interrupt occurs on a particular CPU, the CPU will run each of its registered idle/tick hooks in turn.

**Hooks API Reference**

**Header File**

- esp_common/include/esp_freertos_hooks.h

**Functions**

`esp_err_t esp_register_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)`

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning**
Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Return**
• ESP_OK: Callback registered to the specified core’s idle hook
• ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
• ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters
• [in] new_idle_cb: Callback to be called
• [in] cpuid: id of the core

esp_err_t esp_register_freertos_idle_hook (esp_freertos_idle_cb_t new_idle_cb)
Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning  Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Return
• ESP_OK: Callback registered to the calling core’s idle hook
• ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

Parameters
• [in] new_idle_cb: Callback to be called

esp_err_t esp_register_freertos_tick_hook_for_cpu (esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)
Register a callback to be called from the specified core’s tick hook.

Return
• ESP_OK: Callback registered to specified core’s tick hook
• ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
• ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters
• [in] new_tick_cb: Callback to be called
• [in] cpuid: id of the core

esp_err_t esp_register_freertos_tick_hook (esp_freertos_tick_cb_t new_tick_cb)
Register a callback to be called from the calling core’s tick hook.

Parameters
• [in] new_tick_cb: Callback to be called

void esp_deregister_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)
Unregister an idle callback from the idle hook of the specified core.

Parameters
• [in] old_idle_cb: Callback to be unregistered
• [in] cpuid: id of the core

void esp_deregister_freertos_idle_hook (esp_freertos_idle_cb_t old_idle_cb)
Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

Parameters
• [in] old_idle_cb: Callback to be unregistered

void esp_deregister_freertos_tick_hook_for_cpu (esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)
Unregister a tick callback from the tick hook of the specified core.

Parameters
• [in] old_tick_cb: Callback to be unregistered
• [in] cpuid: id of the core

void esp_deregister_freertos_tick_hook (esp_freertos_tick_cb_t old_tick_cb)
Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will
be unregistered from both cores.

**Parameters**
- `[in] old_tick_cb`: Callback to be unregistered

**Type Definitions**
- `typedef bool (*esp_freertos_idle_cb_t)(void)`
- `typedef void (*esp_freertos_tick_cb_t)(void)`

## 2.7.11 Heap Memory Allocation

### Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, **DMA-Capable Memory** or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

### Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM** (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM** (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be **32-bit aligned**.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see Application memory layout.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

### Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.
To find the amount of statically allocated memory, use the `idf.py size` command.

**Note:** Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

**Heap Sizes** At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>Heap Address</th>
<th>Size</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>3FFAE6E0</td>
<td>6 KiB</td>
<td>DRAM</td>
</tr>
<tr>
<td>3FBB2EC8</td>
<td>180 KiB</td>
<td>DRAM</td>
</tr>
<tr>
<td>3FFE0440</td>
<td>14 KiB</td>
<td>D/IRAM</td>
</tr>
<tr>
<td>3FFE4350</td>
<td>111 KiB</td>
<td>D/IRAM</td>
</tr>
<tr>
<td>4008944C</td>
<td>90 KiB</td>
<td>IRAM</td>
</tr>
</tbody>
</table>

Finding available heap  
See *Heap Information*.

**Special Capabilities**

**DMA-Capable Memory** Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

**32-Bit Accessible Memory** If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with `MALLOC_CAP_32BIT` can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

**External SPI Memory** When *external RAM* is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on configuration. See *Configuring External RAM* for more details.

**API Reference - Heap Allocation**

**Header File**

- `heap/include/esp_heap_caps.h`
**Functions**

*esp_err_t heap_caps_register_failed_alloc_callback*(esp_alloc_failed_hook_t callback)
registers a callback function to be invoked if a memory allocation operation fails

**Return** ESP_OK if callback was registered.

**Parameters**
- callback: caller defined callback to be invoked

void *heap_caps_malloc*(size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, malloc(p) is equivalent to heap_caps_malloc(p, MALLOC_CAP_8BIT).

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**
- size: Size, in bytes, of the amount of memory to allocate
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void heap_caps_free*(void *ptr)
Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

**Parameters**
- ptr: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void *heap_caps_realloc*(void *ptr, size_t size, int caps)
Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).

‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

**Return** Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

**Parameters**
- ptr: Pointer to previously allocated memory, or NULL for a new allocation.
- size: Size of the new buffer requested, or 0 to free the buffer.
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

void *heap_caps_aligned_alloc*(size_t alignment, size_t size, int caps)
Allocate a aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

**Return** A pointer to the memory allocated on success, NULL on failure

**Note** Any memory allocated with heap_caps_aligned_alloc() MUST be freed with heap_caps_aligned_free() and CANNOT be passed to free()

**Parameters**
- alignment: How the pointer received needs to be aligned must be a power of two
- size: Size, in bytes, of the amount of memory to allocate
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void *heap_caps_aligned_calloc*(size_t alignment, size_t n, size_t size, uint32_t caps)
Allocate a aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**Return** A pointer to the memory allocated on success, NULL on failure

**Note** Any memory allocated with heap_caps_aligned_calloc() MUST be freed with heap_caps_aligned_free() and CANNOT be passed to free()
Parameters
- alignment: How the pointer received needs to be aligned must be a power of two
- n: Number of continuing chunks of memory to allocate
- size: Size, in bytes, of a chunk of memory to allocate
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void heap_caps_aligned_free (void *ptr)
Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

Note This function is aimed to deallocate only memory allocated with heap_caps_aligned_alloc, memory allocated with heap_caps_malloc MUST not be passed to this function

Parameters
- ptr: Pointer to the memory allocated

void *heap_caps_calloc (size_t n, size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- n: Number of continuing chunks of memory to allocate
- size: Size, in bytes, of a chunk of memory to allocate
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

size_t heap_caps_get_total_size (uint32_t caps)
Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

Return total size in bytes

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_free_size (uint32_t caps)
Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

Return Amount of free bytes in the regions

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_minimum_free_size (uint32_t caps)
Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities. Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

Return Amount of free bytes in the regions

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_largest_free_block (uint32_t caps)
Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of s for which heap_caps_malloc(s, caps) will succeed.
Return  Size of largest free block in bytes.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_get_info (multi_heap_info_t *info, uint32_t caps)
Get heap info for all regions with the given capabilities.
Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for multi_heap_info_t, except that minimum_free_bytes has the same caveats described in heap_caps_get_minimum_free_size().

Parameters
- info: Pointer to a structure which will be filled with relevant heap metadata.
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_print_heap_info (uint32_t caps)
Print a summary of all memory with the given capabilities.
Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool heap_caps_check_integrity_all (bool print_errors)
Check integrity of all heap memory in the system.
Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.
Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

Return  True if all heaps are valid, False if at least one heap is corrupt.

Parameters
- print_errors: Print specific errors if heap corruption is found.

bool heap_caps_check_integrity (uint32_t caps, bool print_errors)
Check integrity of all heaps with the given capabilities.
Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.
See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

Return  True if all heaps are valid, False if at least one heap is corrupt.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- print_errors: Print specific errors if heap corruption is found.

bool heap_caps_check_integrity_addr (intptr_t addr, bool print_errors)
Check integrity of heap memory around a given address.
This function can be used to check the integrity of a single region of heap memory, which contains the given address.
This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

Note  The entire heap region around the address is checked, not only the adjacent heap blocks.

Return  True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

Parameters
- addr: Address in memory. Check for corruption in region containing this address.
- print_errors: Print specific errors if heap corruption is found.
Chapter 2. API Reference

void heap_caps_malloc_extmem_enable(size_t limit)
Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

Parameters
- limit: Limit, in bytes.

void *heap_caps_malloc_prefer(size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- size: Size, in bytes, of the amount of memory to allocate
- num: Number of variable parameters

void *heap_caps_realloc_prefer(void *ptr, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

Parameters
- ptr: Pointer to previously allocated memory, or NULL for a new allocation.
- size: Size of the new buffer requested, or 0 to free the buffer.
- num: Number of variable parameters

void *heap_caps calloc_prefer(size_t n, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- n: Number of continuing chunks of memory to allocate
- size: Size, in bytes, of a chunk of memory to allocate
- num: Number of variable parameters

void heap_caps_dump(uint32_t caps)
Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr).
For each (variable sized) block in each matching heap, the following output is printed on a single line:
- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_dump_all(void)
Dump the full structure of all heaps.
Covers all registered heaps. Prints a large amount of output to serial.
Output is the same as for heap_caps_dump.

size_t heap_caps_get_allocated_size(void *ptr)
Return the size that a particular pointer was allocated with.

Note The app will crash with an assertion failure if the pointer is not valid.
Return  Size of the memory allocated at this block.

Parameters

- `ptr`: Pointer to currently allocated heap memory. Must be a pointer value previously returned by `heap_caps_malloc`, `malloc`, `calloc`, etc. and not yet freed.

Macros

`MALLOC_CAP_EXEC`
- Flags to indicate the capabilities of the various memory systems.
- Memory must be able to run executable code

`MALLOC_CAP_32BIT`
- Memory must allow for aligned 32-bit data accesses.

`MALLOC_CAP_8BIT`
- Memory must allow for 8/16/⋯-bit data accesses.

`MALLOC_CAP_DMA`
- Memory must be able to be accessed by DMA.

`MALLOC_CAP_PID2`
- Memory must be mapped to PID2 memory space (PIDs are not currently used)

`MALLOC_CAP_PID3`
- Memory must be mapped to PID3 memory space (PIDs are not currently used)

`MALLOC_CAP_PID4`
- Memory must be mapped to PID4 memory space (PIDs are not currently used)

`MALLOC_CAP_PID5`
- Memory must be mapped to PID5 memory space (PIDs are not currently used)

`MALLOC_CAP_PID6`
- Memory must be mapped to PID6 memory space (PIDs are not currently used)

`MALLOC_CAP_PID7`
- Memory must be mapped to PID7 memory space (PIDs are not currently used)

`MALLOC_CAP_SPIRAM`
- Memory must be in SPI RAM.

`MALLOC_CAP_INTERNAL`
- Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

`MALLOC_CAP_DEFAULT`
- Memory can be returned in a non-capability-specific memory allocation (e.g. `malloc()`, `calloc()`) call.

`MALLOC_CAP_IRAM_8BIT`
- Memory must be in IRAM and allow unaligned access.

`MALLOC_CAP_INVALID`
- Memory can’t be used / list end marker.

Type Definitions

`typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)`
- Callback called when a allocation operation fails, if registered

Parameters

- `size`: in bytes of failed allocation
- `caps`: capabilities requested of failed allocation
- `function_name`: function which generated the failure
Thread Safety Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- Heap Information (free space, etc.)
- Heap Corruption Detection
- Heap Tracing (memory leak detection, monitoring, etc.)

API Reference - Initialisation

Header File

- heap/include/esp_heap_caps_init.h

Functions

void heap_caps_init (void)
Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void heap_caps_enable_nonos_stack_heaps (void)
Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can’t be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

Return ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

Parameters

- start: Start address of new region.
- end: End address of new region.

esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.
Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

Parameters

- caps: Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- start: Start address of new region.
- end: End address of new region.

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() or multi_heap_calloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling multi_heap_free() on that particular multi_heap instance.

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- heap/include/multi_heap.h

Functions

void *multi_heap_aligned_alloc(multi_heap_handle_t heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

Return pointer to the memory allocated, NULL on failure

Parameters

- heap: Handle to a registered heap.
- size: size in bytes of memory chunk
- alignment: how the memory must be aligned

void *multi_heap_malloc(multi_heap_handle_t heap, size_t size)
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

Return Pointer to new memory, or NULL if allocation fails.

Parameters

- heap: Handle to a registered heap.
- size: Size of desired buffer.
void multi_heap_aligned_free(multi_heap_handle_t heap, void *p)
free() a buffer aligned in a given heap.

Parameters
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void multi_heap_free(multi_heap_handle_t heap, void *p)
free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

Parameters
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void *multi_heap_realloc(multi_heap_handle_t heap, void *p, size_t size)
realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

Return New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

Parameters
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
• size: Desired new size for buffer.

size_t multi_heap_get_allocated_size(multi_heap_handle_t heap, void *p)
Return the size that a particular pointer was allocated with.

Return Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

Parameters
• heap: Handle to a registered heap.
• p: Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

multi_heap_handle_t multi_heap_register(void *start, size_t size)
Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

Return Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

Parameters
• start: Start address of the memory to use for a new heap.
• size: Size (in bytes) of the new heap.

void multi_heap_set_lock(multi_heap_handle_t heap, void *lock)
Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters
• heap: Handle to a registered heap.
• lock: Optional pointer to a locking structure to associate with this heap.
void **multi_heap_dump (multi_heap_handle_t heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters**

- heap: Handle to a registered heap.

bool **multi_heap_check (multi_heap_handle_t heap, bool print_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

**Return** true if heap is valid, false otherwise.

**Parameters**

- heap: Handle to a registered heap.
- print_errors: If true, errors will be printed to stderr.

size_t **multi_heap_free_size (multi_heap_handle_t heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

**Return** Number of free bytes.

**Parameters**

- heap: Handle to a registered heap.

size_t **multi_heap_minimum_free_size (multi_heap_handle_t heap)

Return the lifetime minimum free heap size.

Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returns the lifetime “low water mark” of possible values returned from multi_free_heap_size(), for the specified heap.

**Return** Number of free bytes.

**Parameters**

- heap: Handle to a registered heap.

void **multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)

Return metadata about a given heap.

Fills a multi_heap_info_t structure with information about the specified heap.

**Parameters**

- heap: Handle to a registered heap.
- info: Pointer to a structure to fill with heap metadata.

**Structures**

**struct multi_heap_info_t**

Structure to access heap metadata via multi_heap_get_info.

**Public Members**

- size_t total_free_bytes
  Total free bytes in the heap. Equivalent to multi_free_heap_size().

- size_t total_allocated_bytes
  Total bytes allocated to data in the heap.
size_t largest_free_block
Size of largest free block in the heap. This is the largest malloc-able size.

size_t minimum_free_bytes
Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

size_t allocated_blocks
Number of (variable size) blocks allocated in the heap.

size_t free_blocks
Number of (variable size) free blocks in the heap.

size_t total_blocks
Total number of (variable size) blocks in the heap.

Type Definitions
typedef struct multi_heap_info *multi_heap_handle_t
Opaque handle to a registered heap.

2.7.12 Heap Memory Debugging

Overview
ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the Heap Memory Allocation page.

Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,
**Assertions**  The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

**Memory Allocation Failed Hook**  Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time a allocation operation fails.

Additionally user can enable a generation of a system abort if allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below show how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n",
           function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
                                    failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

**Finding Heap Corruption**  Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. For example `esp_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE). Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
• For buffer overflows, heap tracing in \texttt{HEAP\_TRACE\_ALL} mode lets you see which callers are allocating which addresses from the heap. See \textit{Heap Tracing To Find Heap Corruption} for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.

• Calling \texttt{heap\_caps\_dump()} or \texttt{heap\_caps\_dump\_all()} can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

\textbf{Configuration}  
Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting \texttt{CONFIG\_HEAP\_CORRUPTION\_DETECTION} can be set to one of three levels:

\textbf{Basic (no poisoning)}  
This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling \texttt{heap\_caps\_check\_integrity()} in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

\textbf{Light Impact}  
At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time \texttt{free()} is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When \texttt{heap\_caps\_check\_integrity()} is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

\textbf{Comprehensive}  
This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.
Crashes in Comprehensive Mode

If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a "use after free bug"). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode

Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks

If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the xPortGetFreeHeapSize(), heap_caps_get_free_size(), or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode

Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see CONFIG_HEAP_TRACING_DEST).
- Call the function heap_trace_init_standalone() early in the program, to register a buffer which can be used to record the memory trace.
Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.

Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in external RAM
...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes @ 0x3ffaf214 allocated CPU 0 ccount 0x2e9b7384 caller...
    0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes @ 0x3ffaf804 allocated CPU 0 ccount 0x2e9b79c0 caller...
    0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

- **XX bytes** is number of bytes allocated
- **@ 0x...** is the heap address returned from malloc/calloc.
- **CPU x** is the CPU (0 or 1) running when the allocation was made.
• `ccount 0x...` is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
• `caller 0x...` gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging -> Enable heap tracing -> Heap tracing stack depth. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each `heap_trace_record_t` record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

**Host-Based Mode** Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> `CONFIG_HEAP_TRACING_DEST` and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> `CONFIG_APPTRACE_DESTINATION` and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable `CONFIG_SYSVIEW_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACELeaks) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).
3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```plaintext
target remote :3333
mon reset halt
flushregs

heap_trace_start
commands
mon esp32 sysview start file:///tmp/heap_trace
end

heap_trace_stop
commands
mon esp32 sysview stop
end
```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Tracedata will be saved to `/tmp/heap_trace`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:

```plaintext
xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>
```

5. Quit GDB when program stops at `heap_trace_stop()`. Tracedata are saved in `/tmp/heap_trace`

6. Run processing script:

```plaintext
$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b
</path/to/program/elf> /tmp/heap_trace
```

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap_trace'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '/tmp/heap_trace'...

(continues on next page)
Heap Tracing To Find Heap Corruption

Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact

Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks

Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- `heap/include/esp_heap_trace.h`

Functions
**esp_err_t heap_trace_init_standalone** (heap_trace_record_t *record_buffer, size_t num_records)

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**Parameters**

- record_buffer: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- num_records: Size of the heap trace buffer, as number of record structures.

**esp_err_t heap_trace_init_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Return**

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**esp_err_t heap_trace_start** (heap_trace_mode_t mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

**Note** heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

**Note** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- ESP_OK Tracing is started.

**Parameters**

- mode: Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

**esp_err_t heap_trace_stop** (void)

Stop heap tracing.

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped.

**esp_err_t heap_trace_resume** (void)

Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

**Return**

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

**size_t heap_trace_get_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.
esp_err_t heap_trace_get(size_t index, heap_trace_record_t *record)

Return a raw record from the heap trace buffer.

Note It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

Return
  • ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
  • ESP_ERR_INVALID_STATE Heap tracing was not initialised.
  • ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
  • ESP_OK Record returned successfully.

Parameters
  • index: Index (zero-based) of the record to return.
  • [out] record: Record where the heap trace record will be copied.

void heap_trace_dump (void)

Dump heap trace record data to stdout.

Note It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

Structures
struct heap_trace_record_t

Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t ccound
  CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void *address
  Address which was allocated.

size_t size
  Size of the allocation.

void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
  Call stack of the caller which allocated the memory.

void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
  Call stack of the caller which freed the memory (all zero if not freed.)

Macros
CONFIG_HEAP_TRACING_STACK_DEPTH

Enumerations
enum heap_trace_mode_t

Values:

  HEAP_TRACE_ALL

  HEAP_TRACE_LEAKS

2.7.13 High Resolution Timer

Overview

Although FreeRTOS provides software timers, these timers have a few limitations:
  • Maximum resolution is equal to RTOS tick period
• Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

esp_timer set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, esp_timer uses a 64-bit hardware timer CONFIG_ESP_TIMER_IMPL:
• LAC timer (ESP32)
• (legacy) FRC2 timer (ESP32)
• SYSTIMER for (ESP32-S2)

Timer callbacks are dispatched from a high-priority esp_timer task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than esp_timer are running, callback dispatching will be delayed until esp_timer task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot esp_timer. If esp_timer_start_once() is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic esp_timer also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

Using esp_timer APIs

Single timer is represented by esp_timer_handle_t type. Timer has a callback function associated with it. This callback function is called from the esp_timer task each time the timer elapses.

• To create a timer, call esp_timer_create().
• To delete the timer when it is no longer needed, call esp_timer_delete().

The timer can be started in one-shot mode or in periodic mode.

• To start the timer in one-shot mode, call esp_timer_start_once(), passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
• To start the timer in periodic mode, call esp_timer_start_periodic(), passing the period with which the callback should be called. The timer keeps running until esp_timer_stop() is called.

Note that the timer must not be running when esp_timer_start_once() or esp_timer_start_periodic() is called. To restart a running timer, call esp_timer_stop() first, then call one of the start functions.

Obtaining Current Time

esp_timer also provides a convenience function to obtain the time passed since start-up, with microsecond precision: esp_timer_get_time(). This function returns the number of microseconds since esp_timer was initialized, which usually happens shortly before app_main function is called.

Unlike gettimeofday function, values returned by esp_timer_get_time():
• Start from zero after the chip wakes up from deep sleep
• Do not have timezone or DST adjustments applied
Application Example

The following example illustrates usage of esp_timer APIs: system/esp_timer.

API Reference

Header File

- esp_timer/include/esp_timer.h

Functions

`esp_err_t esp_timer_init (void)`

Initialize esp_timer library.

**Note** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

`esp_err_t esp_timer_deinit (void)`

De-initialize esp_timer library.

**Note** Normally this function should not be called from applications

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

`esp_err_t esp_timer_create (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)`

Create an esp_timer instance.

**Note** When done using the timer, delete it with esp_timer_delete function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

**Parameters**

- create_args: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- [out] out_handle: Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

`esp_err_t esp_timer_start_once (esp_timer_handle_t timer, uint64_t timeout_us)`

Start one-shot timer.

Timer should not be running when this function is called.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**Parameters**

- timer: timer handle created using esp_timer_create
- timeout_us: timer timeout, in microseconds relative to the current moment

`esp_err_t esp_timer_start_periodic (esp_timer_handle_t timer, uint64_t period)`

Start a periodic timer.
Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**Parameters**
- `timer`: timer handle created using esp_timer_create
- `period`: timer period, in microseconds

```c
esp_err_t esp_timer_stop(esp_timer_handle_t timer)
```
Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

**Parameters**
- `timer`: timer handle created using esp_timer_create

```c
esp_err_t esp_timer_delete(esp_timer_handle_t timer)
```
Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

**Parameters**
- `timer`: timer handle allocated using esp_timer_create

```c
int64_t esp_timer_get_time(void)
```
Get time in microseconds since boot.

**Return** number of microseconds since esp_timer_init was called (this normally happens early during application startup).

```c
int64_t esp_timer_get_next_alarm(void)
```
Get the timestamp when the next timeout is expected to occur.

**Return** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

```c
esp_err_t esp_timer_dump(FILE *stream)
```
Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

<table>
<thead>
<tr>
<th>name</th>
<th>period</th>
<th>alarm</th>
<th>times_armed</th>
<th>times_triggered</th>
<th>total_callback_run_time</th>
</tr>
</thead>
</table>

where:

- `name` — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer
- `period` — period of timer, in microseconds, or 0 for one-shot timer
- `alarm` — time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

- `times_armed` — number of times the timer was armed via esp_timer_start_X
- `times_triggered` — number of times the callback was called
- `total_callback_run_time` — total time taken by callback to execute, across all calls

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

**Parameters**
- stream: stream (such as stdout) to dump the information to

**Structures**

```c
struct esp_timer_create_args_t
    Timer configuration passed to esp_timer_create.
```

**Public Members**

```c
callback
timer::callback
    Function to call when timer expires.

dispatch_method
dispatch_method
    Call the callback from task or from ISR.

name
    Timer name, used in esp_timer_dump function.
```

**Type Definitions**

```c
typedef struct esp_timer *esp_timer_handle_t
    Opaque type representing a single esp_timer.

typedef void (*esp_timer_cb_t)(void *arg)
    Timer callback function type.
```

**Enumerations**

```c
typedef enum esp_timer_dispatch_t
    Method for dispatching timer callback.
```

**Values:**

- **ESP_TIMER_TASK**
  - Callback is called from timer task.

### 2.7.14 The himem allocation API

**Overview**

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.

In order to use the himem API, you have to enable it in the menuconfig using `CONFIG_SPIRAM_BANKSWITCH_ENABLE`, as well as set the amount of banks reserved for this in `CONFIG_SPIRAM_BANKSWITCH_reserve`. This decreases the amount of external memory allocated by functions.
like `malloc()`, but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.

**Example**

An example doing a simple memory test of the high memory range is available in esp-idf: `system/himem`

**API Reference**

**Header File**

- `esp32/include/esp32/himem.h`

**Functions**

`esp_err_t esp_himem_alloc(size_t size, esp_himem_handle_t *handle_out)`

Allocate a block in high memory.

**Return**
- ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

**Parameters**

- `size`: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- `*handle_out`: Handle to be returned

`esp_err_t esp_himem_alloc_map_range(size_t size, esp_himem_rangehandle_t *handle_out)`

Allocate a memory region to map blocks into.

This allocates a contiguous CPU memory region that can be used to map blocks of physical memory into.

**Return**
- ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory or address space
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

**Parameters**

- `size`: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- `*handle_out`: Handle to be returned

`esp_err_t esp_himem_map(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)`

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

**Note** The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

**Return**
- ESP_OK if the memory could be mapped
  - ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
  - ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
  - ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

**Parameters**

- `handle`: Handle to the block of memory, as given by `esp_himem_alloc`
- `range`: Range handle to map the memory in
- `ram_offset`: Offset into the block of physical memory of the block to map
- `range_offset`: Offset into the address range where the block will be mapped
- `len`: Length of region to map
- `flags`: One of ESP_HIMEM_MAPFLAG_*
Chapter 2. API Reference

- [out] out_ptr: Pointer to variable to store resulting memory pointer in

```
esp_err_t esp_himem_free (esp_himem_handle_t handle)
```

Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.

**Return** - ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

**Parameters**
- handle: Handle to the block of memory, as given by esp_himem_alloc

```
esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)
```

Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

**Return** - ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

**Parameters**
- handle: Handle to the range block, as given by esp_himem_alloc_map_range

```
esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)
```

Unmap a region.

**Return** - ESP_OK if the memory is successfully unmapped,
- ESP_ERR_INVALID_ARG if ptr or len are invalid.

**Parameters**
- range: Range handle
- ptr: Pointer returned by esp_himem_map
- len: Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

```
size_t esp_himem_get_phys_size (void)
```

Get total amount of memory under control of himem API.

**Return** Amount of memory, in bytes

```
size_t esp_himem_get_free_size (void)
```

Get free amount of memory under control of himem API.

**Return** Amount of free memory, in bytes

```
size_t esp_himemReserved_area_size (void)
```

Get amount of SPI memory address space needed for bankswitching.

**Note** This is also weakly defined in esp32/siram.c and returns 0 there, so if no other function in this file is used, no memory is reserved.

**Return** Amount of reserved area, in bytes

**Macros**

```
ESP_HIMEM_BLKSIZE
ESP_HIMEM_MAPFLAG_RO
```

Indicates that a mapping will only be read from. Note that this is unused for now.

**Type Definitions**

```
typedef struct esp_himem_ramdata_t *esp_himem_handle_t
typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t
```
**2.7.15 Inter-Processor Call**

**Overview**

Due to the dual core nature of the ESP32, there are instances where a certain function must be run in the context of a particular core (e.g. allocating ISR to an interrupt source of a particular core). The IPC (Inter-Processor Call) feature allows for the execution of functions on a particular CPU.

A given function can be executed on a particular core by calling `esp_ipc_call()` or `esp_ipc_call_blocking()`. IPC is implemented via two high priority FreeRTOS tasks pinned to each CPU known as the IPC Tasks. The two IPC Tasks remain inactive (blocked) until `esp_ipc_call()` or `esp_ipc_call_blocking()` is called. When an IPC Task of a particular core is unblocked, it will preempt the current running task on that core and execute a given function.

**Usage**

`esp_ipc_call()` unblocks the IPC task on a particular core to execute a given function. The task that calls `esp_ipc_call()` will be blocked until the IPC Task begins execution of the given function. `esp_ipc_call_blocking()` is similar but will block the calling task until the IPC Task has completed execution of the given function.

Functions executed by IPCs must be functions of type `void func(void *arg)`. To run more complex functions which require a larger stack, the IPC tasks stack size can be configured by modifying `CONFIG_ESP_IPC_TASK_STACK_SIZE` in `menuconfig`. The IPC API is protected by a mutex hence simultaneous IPC calls are not possible.

Care should taken to avoid deadlock when writing functions to be executed by IPC, especially when attempting to take a mutex within the function.

**API Reference**

**Header File**

- esp_common/include/esp_ipc.h

**Functions**

`esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the cpu_id parameter. The calling task will be blocked until the IPC task begins executing the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the “Inter-Processor Call (IPC) task stack size” setting in menuconfig. Increase this setting if the given function requires more stack than default.

**Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

**Return**

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

**Parameters**

- [in] cpu_id: CPU where the given function should be executed (0 or 1)
- [in] func: Pointer to a function of type void func(void* arg) to be executed
- [in] arg: Arbitrary argument of type void* to be passed into the function

`esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU and blocks until it completes.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the cpu_id parameter. The
calling task will be blocked until the IPC task completes execution of the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the "Inter-Processor Call (IPC) task stack size" setting in menuconfig. Increase this setting if the given function requires more stack than default.

Note In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

Return
- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

Parameters
- [in] cpu_id: CPU where the given function should be executed (0 or 1)
- [in] func: Pointer to a function of type void func(void* arg) to be executed
- [in] arg: Arbitrary argument of type void* to be passed into the function

2.7.16 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as \texttt{printf}. The given function can be called inside the macro \texttt{ESP_EXECUTE_EXPRESSION_WITH_STACK()} it will redirect the target function to be executed using the space allocated by the user.

Usage

\texttt{ESP_EXECUTE_EXPRESSION_WITH_STACK()} takes three arguments, a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack, a pointer to the top of stack used to that function, and the function itself, note the function is passed exactly in the same way as do when you call it on a regular way.

The usage may looks like the code below:

```c
//Let's suppose we wanting to call printf using a separated stack space
//allowing app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    ESP_EXECUTE_EXPRESSION_WITH_STACK(printf_lock,
                                         shared_stack,
                                         printf("Executing this from external stack! \n")));
    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File
• esp_common/include/esp_expression_with_stack.h

**Functions**

StackType_t *\texttt{esp_switch_stack_setup}(StackType_t *stack, size_t stack_size)

Fill stack frame with CPU-specifics value before use.

- **Return** New pointer to the top of stack
- **Note** Application must not call this function directly

**Parameters**
- stack: Caller allocated stack pointer
- stack_size: Size of stack in bytes

void \texttt{esp_switch_stack_enter}(StackType_t *stack, uint32_t *backup_stack)

Changes CPU sp-register to use another stack space and save the previous one.

- **Note** Application must not call this function directly

**Parameters**
- stack: Caller allocated stack pointer
- backup_stack: Pointer to a place to save the current stack

void \texttt{esp_switch_stack_exit}(uint32_t *backup_stack)

Restores the previous CPU sp-register.

- **Note** Application must not call this function directly

**Parameters**
- backup_stack: Pointer to the place where stack was saved

**Macros**

\texttt{ESP_EXECUTE_EXPRESSION_WITH_STACK}(lock, stack, stack_size, expression)

Executes a 1-line expression with a application allocated stack.

- **Note** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

**Parameters**
- lock: Mutex object to protect in case of shared stack
- stack: Pointer to user allocated stack
- stack_size: Size of current stack in bytes
- expression: Expression or function to be executed using the stack

### 2.7.17 Interrupt allocation

**Overview**

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc (or esp_intr_alloc_sintrstatus). It can use the flags passed to this function to set the type of interrupt allocated, specifying a specific level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code has two different types of interrupts it handles differently: Shared interrupts and non-shared interrupts. The simplest of the two are non-shared interrupts: a separate interrupt is allocated per esp_intr_alloc call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering it, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to see if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts (because of the chance of missed interrupts when edge interrupts are used.) (The logic behind this: DevA and DevB share an int. DevB signals an int. Int line goes high. ISR handler calls code for DevA -> does nothing. ISR handler calls code for DevB, but while doing that, DevA signals an int. ISR DevB is done, clears int for DevB, exits interrupt code. Now an interrupt for DevA is still pending, but because the int line never went low (DevA kept it high even when the int for DevB was cleared) the interrupt is never serviced.)
Multicore issues

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

Internal peripheral interrupts Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in esp_intr_alloc.h as ETS_INTERNAL_*_INTR_SOURCE.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have e.g. an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using esp_intr_alloc as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

External Peripheral Interrupts The remaining interrupt sources are from external peripherals. These are defined in soc/soc.h as ETS_*_INTR_SOURCE.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing ESP_INTR_FLAG_SHARED as a flag to esp_intr_alloc().

Care should be taken when calling esp_intr_alloc() from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use xTaskCreatePinnedToCore() with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

IRAM-Safe Interrupt Handlers

The ESP_INTR_FLAG_IRAM flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the SPI flash API documentation for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to the same source, given that all handlers are allocated using the ESP_INTR_FLAG_SHARED flag. They’ll be all allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is
attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist 2 ways to stop a interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles the enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits should always be masked before the handler responsible for it is disabled, or the status should be handled in other enabled interrupt properly. You may leave some status bits unhandled if you just disable one of all the handlers without masking the status bits, which causes the interrupt to trigger infinitely resulting in a system crash.

API Reference

Header File

- esp32/include/esp_intr_alloc.h

Functions

`esp_err_t esp_intr_mark_shared(int intno, int cpu, bool is_in_iram)`

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- intno: The number of the interrupt (0-31)
- cpu: CPU on which the interrupt should be marked as shared (0 or 1)
- is_in_iram: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

`esp_err_t esp_intr_reserve(int intno, int cpu)`

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- intno: The number of the interrupt (0-31)
- cpu: CPU on which the interrupt should be marked as shared (0 or 1)

`esp_err_t esp_intr_alloc(int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)`

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**Parameters**

- source: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- flags: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared...
interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.

- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_alloc_intrstatus (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)
```

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**Parameters**
- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg**: The address of an interrupt status register
- **intrstatusmask**: A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_free (intr_handle_t handle)
```

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. see esp_intr_disable for more details. Please do not call this function in esp_ipc_call_blocking.

**Return** ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_cpu (intr_handle_t handle)
```

Get CPU number an interrupt is tied to.

**Return** The core number where the interrupt is allocated

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
int esp_intr_get_intno(intr_handle_t handle)
Get the allocated interrupt for a certain handle.

Return  The interrupt number
Parameters
  • handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_disable(intr_handle_t handle)
Disable the interrupt associated with the handle.

Note
1. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

Return  ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise
Parameters
  • handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_enable(intr_handle_t handle)
Enable the interrupt associated with the handle.

Note For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

Return  ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise
Parameters
  • handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_set_in_iram(intr_handle_t handle, bool is_in_iram)
Set the “in IRAM” status of the handler.

Note Does not work on shared interrupts.

Return  ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise
Parameters
  • handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
  • is_in_iram: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

void esp_intr_noniram_disable(void)
Disable interrupts that aren’t specifically marked as running from IRAM.

void esp_intr_noniram_enable(void)
Re-enable interrupts disabled by esp_intr_noniram_disable.

Macros
ESP_INTR_FLAG_LEVEL1
Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4
Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5
Accept a Level 5 interrupt vector.
Chapter 2. API Reference

ESP_INTR_FLAG_LEVEL6
Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI
Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
Low and medium pri interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
Xtensa timer 0 interrupt source.

ETS_INTERNAL_TIMER1_INTR_SOURCE
Xtensa timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE
Xtensa timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)
Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)
Disable interrupt by interrupt number

Type Definitions
typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function

typedef struct intr_handle_data_t intr_handle_data_t
Interrupt handler associated data structure

typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler
2.7.18 Logging library

Overview

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. All logging statements for verbosity levels higher than `CONFIG_LOG_DEFAULT_LEVEL` will be removed by the preprocessor.
- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_DEFAULT_LEVEL`. To increase log level for a specific file at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error...100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g., `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```c
CFLAGS += -D LOG_LOCAL_LEVEL=ESP_LOG_DEBUG
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:
Logging to Host via JTAG  
By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

API Reference

Header File

- log/include/esp_log.h

Functions

void esp_log_level_set(const char* tag, esp_log_level_t level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function can not raise log level above the level set using CONFIG_LOG_DEFAULT_LEVEL setting in menuconfig.

To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

Parameters

- tag: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- level: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

vprintf_like_t esp_log_set_vprintf(vprintf_like_t func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

Return  func old Function used for output.

Parameters

- func: new Function used for output. Must have same signature as vprintf.

uint32_t esp_log_timestamp(void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

Return  timestamp, in milliseconds
char *esp_log_system_timestamp (void)
Function which returns system timestamp to be used in log output.
This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.
Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will still print the RTOS tick time.
Return timestamp, in “HH:MM:SS.sss”

uint32_t esp_log_early_timestamp (void)
Function which returns timestamp to be used in log output.
This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.
Return timestamp, in milliseconds

void esp_log_write (esp_log_level_t level, const char *tag, const char *format, ...)
Write message into the log.
This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.
This function or these macros should not be used from an interrupt.

void esp_log_writev (esp_log_level_t level, const char *tag, const char *format, va_list args)
Write message into the log, va_list variant.
This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.
See esp_log_write()

Macros
ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)
Log a buffer of hex bytes at specified level, separated into 16 bytes each line.
Parameters
• tag: description tag
• buffer: Pointer to the buffer array
• buff_len: length of buffer in bytes
• level: level of the log
ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)
Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.
Parameters
• tag: description tag
• buffer: Pointer to the buffer array
• buff_len: length of buffer in bytes
• level: level of the log
ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)
Dump a buffer to the log at specified level.
The dump log shows just like the one below:

W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb4290 77 6f 72 6b 69 6e 67 20 61 6c 66 6f 6e 20 74 68 65 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (205) log_example: 0x3ffb42a0 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb42b0 67 76 74 68 73 69 74 69 61 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb42c0 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb42d0 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb42e0 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00
W (195) log_example: 0x3ffb42f0 74 68 20 74 68 65 20 49 44 46 2e 00 44 46 2e 00

Chapter 2. API Reference

It is highly recommend to use terminals with over 102 text width.

Parameters
- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes
- `level`: level of the log

**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)
Log a buffer of hex bytes at Info level.

See esp_log_buffer_hex_level

Parameters
- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes

**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)
Log a buffer of characters at Info level. Buffer should contain only printable characters.

See esp_log_buffer_char_level

Parameters
- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes

**ESP_EARLY_LOGE** (tag, format, ...)
macro to output logs in startup code, before heap allocator and syscalls have been initialized. log at ESP_LOG_ERROR level.

See printf, ESP_LOGE

**ESP_EARLY_LOGW** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_WARN level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGI** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_INFO level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGD** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_DEBUG level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGV** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_VERBOSE level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_LOG_EARLY_IMPL** (tag, format, log_level, log_tag_letter, ...)
runtime macro to output logs at a specified level.

See printf runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.

See printf, ESP_LOG_LEVEL
Parameters

- tag: tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- level: level of the output log.
- format: format of the output log. see `printf`
- ...: variables to be replaced into the log. see `printf`

ESP_DRAM_LOGE (tag, format, ...)
Macro to output logs when the cache is disabled. log at ESP_LOG_ERROR level.

Similar to ESP_EARLY_LOGE, the log level cannot be changed by `esp_log_level_set`.

Usage: ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", "..."), where TAG is a char* that points to a str in the DRAM.

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.
See ets_printf, ESP_LOGE

ESP_DRAM_LOGW (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_WARN level.
See ESP_DRAM_LOGW, ESP_LOGW, ets_printf

ESP_DRAM_LOGI (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_INFO level.
See ESP_DRAM_LOGI, ESP_LOGI, ets_printf

ESP_DRAM_LOGD (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.
See ESP_DRAM_LOGD, ESP_LOGD, ets_printf

ESP_DRAM_LOGV (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.
See ESP_DRAM_LOGV, ESP_LOGV, ets_printf

Type Definitions

typedef int (*vprintf_like_t)(const char *, va_list)

Enumerations

enum esp_log_level_t
Log level.

Values:

ESP_LOG_NONE
No log output

ESP_LOG_ERROR
Critical errors, software module can not recover on its own

ESP_LOG_WARN
Error conditions from which recovery measures have been taken

ESP_LOG_INFO
Information messages which describe normal flow of events

ESP_LOG_DEBUG
Extra information which is not necessary for normal use (values, pointers, sizes, etc).

ESP_LOG_VERBOSE
Bigger chunks of debugging information, or frequent messages which can potentially flood the output.
2.7.19 Miscellaneous System APIs

Software reset

To perform software reset of the chip, \texttt{esp_restart()} function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, \texttt{esp_register_shutdown_handler()} function is provided to register a routine which needs to be called prior to restart (when done by \texttt{esp_restart()}). This is similar to the functionality of \texttt{atexit} POSIX function.

Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call \texttt{esp_reset_reason()} function. See description of \texttt{esp_reset_reason_t} for the list of possible reset reasons.

Heap memory

Two heap memory related functions are provided:

- \texttt{esp_get_free_heap_size()} returns the current size of free heap memory
- \texttt{esp_get_minimum_free_heap_size()} returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using \texttt{malloc} family of functions. For further information about heap memory see \textit{Heap Memory Allocation}.

Random number generation

ESP32 contains a hardware random number generator, values from it can be obtained using \texttt{esp_random()}.

When Wi-Fi or Bluetooth are enabled, numbers returned by hardware random number generator (RNG) can be considered true random numbers. Without Wi-Fi or Bluetooth enabled, hardware RNG is a pseudo-random number generator. At startup, ESP-IDF bootloader seeds the hardware RNG with entropy, but care must be taken when reading random values between the start of \texttt{app_main} and initialization of Wi-Fi or Bluetooth drivers.

MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

In ESP-IDF these addresses are calculated from \textit{Base MAC address}. Base MAC address can be initialized with factory-programmed value from internal eFuse, or with a user-defined value. In addition to setting the base MAC address, applications can specify the way in which MAC addresses are allocated to devices. See \textit{Number of universally administered MAC address} section for more details.

\textbf{Base MAC address} To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), you can simply use \texttt{esp_read_mac()} function.

By default, this function takes the eFuse value burned at a pre-defined block (e.g. BLK0 for ESP32, BLK1 for ESP32-S2) as the base MAC address. Per-interface MAC addresses will be calculated according to the table above.

Applications who want to customize base MAC address (not the one provided by Espressif) should call \texttt{esp_base_mac_addr_set()} before \texttt{esp_read_mac()}. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).
Note that, calls to `esp_base_mac_addr_set()` should take place before the initialization of network stack, for example, early in `app_main`.

**Custom MAC address in eFuse** To facilitate the usage of custom MAC addresses, ESP-IDF provides `esp_efuse_mac_get_custom()` function, which loads MAC address from internal pre-defined eFuse block (e.g. BLK3 for ESP32). This function assumes that custom MAC address is stored in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others — valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Number of universally administered MAC address** Several MAC addresses (universally administered by IEEE) are uniquely assigned to the networking interfaces (Wi-Fi/BT/Ethernet). The final octet of each universally administered MAC address increases by one. Only the first one of them (which is called base MAC address) is stored in eFuse or external storage, the others are generated from it. Here, ‘generate’ means adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the universally administered MAC addresses are not enough for all of the networking interfaces, locally administered MAC addresses which are derived from universally administered MAC addresses are assigned to the rest of networking interfaces.

See this article for the definition of local and universally administered MAC addresses.

**Chip version**

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

**SDK version**

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.

  - `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

    ```c
    #include "esp_idf_version.h"
    
    #if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
    #endif
    ```
App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set `PROJECT_VER` variable in your project CMake-Lists.txt/Makefile:

- In application CMakeLists.txt put `set(PROJECT_VER "0.1.0.1")` before including `project.cmake`.

(For legacy GNU Make build system: in application Makefile put `PROJECT_VER = "0.1.0.1"` before including `project.mk`.)

If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise if `PROJECT_VER` variable is not set in the project then it will be retrieved from either `$(PROJECT_PATH)/version.txt` file (if present) else using git command `git describe`. If neither is available then `PROJECT_VER` will be set to “1”. Application can make use of this by calling `esp_ota_get_app_description()` or `esp_ota_get_partition_description()` functions.

API Reference

Header File

- `esp_system/include/esp_system.h`

Functions

`esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

**Parameters**

- `handle`: function to execute on restart

`esp_err_t esp_unregister_shutdown_handler(shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

`void esp_restart(void)`

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason(void)`

Get reason of last reset.

**Return** See description of `esp_reset_reason_t` for explanation of each value.

`uint32_t esp_get_free_heap_size(void)`

Get the size of available heap.
Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available heap size, in bytes.

```c
uint32_t esp_get_minimum_free_heap_size(void)
```

Get the minimum heap that has ever been available.

**Return** Minimum free heap ever available

```c
uint32_t esp_random(void)
```

Get one random 32-bit word from hardware RNG.

The hardware RNG is fully functional whenever an RF subsystem is running (i.e., Bluetooth or WiFi is enabled). For random values, call this function after WiFi or Bluetooth are started.

If the RF subsystem is not used by the program, the function `bootloader_random_enable()` can be called to enable an entropy source. `bootloader_random_disable()` must be called before RF subsystem or I2S peripheral are used. See these functions’ documentation for more details.

Any time the app is running without an RF subsystem (or `bootloader_random`) enabled, RNG hardware should be considered a PRNG. A very small amount of entropy is available due to pre-seeding while the IDF bootloader is running, but this should not be relied upon for any use.

**Return** Random value between 0 and UINT32_MAX

```c
void esp_fill_random(void* buf, size_t len)
```

Fill a buffer with random bytes from hardware RNG.

**Note** This function has the same restrictions regarding available entropy as `esp_random()`

**Parameters**
- `buf`: Pointer to buffer to fill with random numbers.
- `len`: Length of buffer in bytes

```c
esp_err_t esp_base_mac_addr_set(const uint8_t* mac)
```

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. If using base MAC address stored in BLK3 of EFUSE or external storage, call this API to set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage before initializing WiFi/BT/Ethernet.

**Note** Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

**Note** If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

**Parameters**
- `mac`: base MAC address, length: 6 bytes.

```c
esp_err_t esp_base_mac_addr_get(uint8_t* mac)
```

Return base MAC address which is set using `esp_base_mac_addr_set`.

**Return** ESP_OK on success ESP_ERR_INVALID_MAC base MAC address has not been set

**Parameters**
- `mac`: base MAC address, length: 6 bytes.

```c
esp_err_t esp_efuse_mac_get_custom(uint8_t* mac)
```

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to BLK3 of EFUSE. Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see `esp_base_mac_addr_set()` for details.

**Return** ESP_OK on success ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE

**Parameters**
- `mac`: base MAC address, length: 6 bytes.

```c
esp_err_t esp_efuse_mac_get_default(uint8_t* mac)
Return base MAC address which is factory-programmed by Espressif in BLK0 of EFUSE.
```

**Parameters**

- *mac*: base MAC address, length: 6 bytes.

```c
esp_err_t esp_read_mac(uint8_t* mac, esp_mac_type_t type)
Read base MAC address and set MAC address of the interface.
This function first get base MAC address using esp_base_mac_addr_get or reads base MAC address from
BLK0 of EFUSE. Then set the MAC address of the interface including wifi station, wifi softap, bluetooth and
ethernet.
```

**Return** ESP_OK on success

**Parameters**

- *mac*: MAC address of the interface, length: 6 bytes.
- *type*: type of MAC address, 0: wifi station, 1: wifi softap, 2: bluetooth, 3: ethernet.

```c
esp_err_t esp_derive_local_mac(uint8_t* local_mac, const uint8_t* universal_mac)
Derive local MAC address from universal MAC address.
This function derives a local MAC address from an universal MAC address. A definition of local
vs universal MAC address can be found on Wikipedia <>. In ESP32, universal MAC
address is generated from base MAC address in EFUSE or other external storage. Local MAC address is
derived from the universal MAC address.
```

**Return** ESP_OK on success

**Parameters**

- *local_mac*: Derived local MAC address, length: 6 bytes.
- *universal_mac*: Source universal MAC address, length: 6 bytes.

```c
void esp_system_abort(const char* details)
Trigger a software abort.
```

**Parameters**

- *details*: Details that will be displayed during panic handling.

```c
void esp_chip_info(esp_chip_info_t* out_info)
Fill an esp_chip_info_t structure with information about the chip.
```

**Parameters**

- [out] *out_info*: structure to be filled

**Structures**

```c
struct esp_chip_info_t
The structure represents information about the chip.
```

**Public Members**

```c
esp_chip_model_t model
chip model, one of esp_chip_model_t
```

```c
uint32_t features
bit mask of CHIP_FEATURE_x feature flags
```

```c
uint8_t cores
number of CPU cores
```

```c
uint8_t revision
chip revision number
```
Macros

CHIP_FEATURE_EMB_FLASH
    Chip has embedded flash memory.

CHIP_FEATURE_WIFI_BGN
    Chip has 2.4GHz WiFi.

CHIP_FEATURE_BLE
    Chip has Bluetooth LE.

CHIP_FEATURE_BT
    Chip has Bluetooth Classic.

Type Definitions

typedef void (*shutdown_handler_t) (void)
    Shutdown handler type

Enumerations

enum esp_mac_type_t
    Values:
    
    ESP_MAC_WIFI_STA
    ESP_MAC_WIFI_SOFTAP
    ESP_MAC_BT
    ESP_MAC_ETH

enum esp_reset_reason_t
    Reset reasons.
    Values:
    
    ESP_RST_UNKNOWN
        Reset reason can not be determined.
    ESP_RST_POWERON
        Reset due to power-on event.
    ESP_RST_EXT
        Reset by external pin (not applicable for ESP32)
    ESP_RST_SW
        Software reset via esp_restart.
    ESP_RST_PANIC
        Software reset due to exception/panic.
    ESP_RST_INT_WDT
        Reset (software or hardware) due to interrupt watchdog.
    ESP_RST_TASK_WDT
        Reset due to task watchdog.
    ESP_RST_WDT
        Reset due to other watchdogs.
    ESP_RST_DEEPSLEEP
        Reset after exiting deep sleep mode.
    ESP_RST_BROWNOUT
        Brownout reset (software or hardware)
    ESP_RST_SDIO
        Reset over SDIO.
enum esp_chip_model_t
    Chip models.
    Values:
    CHIP_ESP32 = 1
        ESP32.
    CHIP_ESP32S2 = 2
        ESP32-S2.

Header File
- esp_common/include/esp_idf_version.h

Functions
const char *esp_get_idf_version (void)
    Return full IDF version string, same as ‘git describe’ output.
    Note If you are printing the ESP-IDF version in a log file or other information, this function provides more
    information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.
    Return constant string from IDF_VER

Macros
ESP_IDF_VERSION_MAJOR
    Major version number (X.x.x)
ESP_IDF_VERSION_MINOR
    Minor version number (x.X.x)
ESP_IDF_VERSION_PATCH
    Patch version number (x.x.X)
ESP_IDF_VERSION_VAL (major, minor, patch)
    Macro to convert IDF version number into an integer
    To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
ESP_IDF_VERSION
    Current IDF version, as an integer
    To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

2.7.20 Over The Air Updates (OTA)

OTA Process Overview
The OTA update mechanism allows a device to update itself based on data received while the normal firmware is
running (for example, over WiFi or Bluetooth.)
OTA requires configuring the Partition Table of the device with at least two “OTA app slot” partitions (ie ota_0 and
ota_1) and an “OTA Data Partition”. The OTA operation functions write a new app firmware image to whichever OTA app slot is not currently being used for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.
OTA Data Partition

An OTA data partition (type data, subtype ota) must be included in the *Partition Table* of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually ota_0) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, *esp_ota_mark_app_valid_cancel_rollback()* marks the running application with the state ESP_OTA_IMG_VALID. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, *esp_ota_mark_app_invalid_rollback_and_reboot()* marks the running application with the state ESP_OTA_IMG_INVALID and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application it is written to the *otadata* partition. The partition contains a ota_seq counter which is a pointer to the slot (ota_0, ota_1, …) from which the application will be selected for boot.

App OTA State  States control the process of selecting a boot app:

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>Non restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>Non restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_NEW</td>
<td><em>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</em> option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING_VERIFY</td>
<td><em>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</em> option is set it will not be selected and the state will change to ESP_OTA_IMG_ABORTED.</td>
</tr>
</tbody>
</table>

If *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* option is not enabled (by default), then the use of the following functions *esp_ota_mark_app_valid_cancel_rollback()* and *esp_ota_mark_app_invalid_rollback_and_reboot()* are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING_VERIFY states are not used.

An option in Kconfig *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling *esp_ota_mark_app_valid_cancel_rollback()* function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.
Rollback Process

The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state `ESP_OTA_IMG_NEW`. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the `ESP_OTA_IMG_PENDING_VERIFY` state if it is set, then it will be written to `ESP_OTA_IMG_ABORTED`.
- The bootloader selects a new application to boot so that the state is not set as `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED`.
- The bootloader checks the selected application for `ESP_OTA_IMG_NEW` state if it is set, then it will be written to `ESP_OTA_IMG_PENDING_VERIFY`. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to `ESP_OTA_IMG_ABORTED` (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (`ESP_OTA_IMG_PENDING_VERIFY` state).
- If the self-test fails then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to rollback to the previous working application, while the invalid application is set `ESP_OTA_IMG_INVALID` state.
- If the application has not been confirmed, the state remains `ESP_OTA_IMG_PENDING_VERIFY`, and the next boot it will be changed to `ESP_OTA_IMG_ABORTED`. That will prevent re-boot of this application. There will be a rollback to the previous working application.

Unexpected Reset

If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

Booting invalid/aborted apps

Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the otadata.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

Where the states are set

A brief description of where the states are set:

- `ESP_OTA_IMG_VALID` state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- `ESP_OTA_IMG_UNDEFINED` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- `ESP_OTA_IMG_NEW` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- `ESP_OTA_IMG_INVALID` state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- `ESP_OTA_IMG_ABORTED` state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
ESP OTA Img Pending Verify state is set in a bootloader if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is enabled and selected app has ESP OTA IMG NEW state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip. This function works if set CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip. CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK and CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function esp_ota_set_boot_partition(). If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If odata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call esp_ota_mark_app_valid_cancel_rollback() function to mark the running application with the ESP OTA IMG VALID state and update the secure version on chip. Note that if was called esp_ota_mark_app_invalid_rollback_and_reboot() function a rollback may not happen due to the device may not have any bootable apps then it will return ESP_ERR_OTA_ROLLBACK_FAILED error and stay in the ESP OTA IMG_PENDING_VERIFY state.
- The next update of app is possible if a running app is in the ESP OTA IMG_Valid state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower then running app you have to get new_app_info.secure_version from the first package of an image and compare it with the secure version of efuse. Use esp_efuse_check_secure_version(new_app_info.secure_version) function if it is true then continue downloading otherwise abort.

```c
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if ((esp_efuse_check_secure_version(new_app_info.secure_version) == false)) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                }
            }
        }
    }
}
```

(continues on next page)
Restrictions:

- The number of bits in the `secure_version` field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option.
- Anti-rollback only works if the encoding scheme for efuse is set to `NONE`.
- The partition table should not have a factory partition, only two of the app.

`security_version`:

- In application image it is stored in `esp_app_desc` structure. The number is set `CONFIG_BOOTLOADER_APP_SECURE_VERSION`.

Secure OTA Updates Without Secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. For doing so, refer Signed App Verification Without Hardware Secure Boot

OTA Tool (otatool.py)

The component `app_update` provides a tool `otatool.py` for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (read_otadata)
- erase otadata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

Python API

Before anything else, make sure that the `otatool` module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py lives in $IDF_PATH/components/app_update
sys.path.append(otatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```
Chapter 2. API Reference

The starting point for using the tool’s Python API to do is create a `OtatoolTarget` object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

**Command-line Interface**  The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]
```

- **command-args** - these are arguments that are needed for executing the main command (parttool.py), mostly pertaining to the target device
- **subcommand** - this is the operation to be performed
- **subcommand-args** - these are arguments that are specific to the chosen operation

```
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3
```

More information can be obtained by specifying `-help` as argument:

```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

Chapter 2. API Reference

Application Example

End-to-end example of OTA firmware update workflow: system/ota.

API Reference

Header File

- app_update/include/esp_ota_ops.h

Functions

`const esp_app_desc_t *esp_ota_get_app_description(void)`

Return esp_app_desc structure. This structure includes app version.

Return description for running app.

`int esp_ota_get_app_elf_sha256(char *dst, size_t size)`

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Return Number of bytes written to dst (including null terminator)

Parameters

- `dst`: Destination buffer
- `size`: Size of the buffer

`esp_err_t esp_ota_begin(const esp_partition_t *partition, size_t image_size, esp_ota_handle_t *out_handle)`

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

Return

- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_IMAGE_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state.

Before performing an update, the application must be valid.

Parameters

- `partition`: Pointer to info for partition which will receive the OTA update. Required.
- `image_size`: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
• out_handle: On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

```c
esp_err_t esp_ota_write(esp_ota_handle_t handle, const void *data, size_t size)
```

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

**Return**

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**

- handle: Handle obtained from esp_ota_begin
- data: Data buffer to write
- size: Size of data buffer in bytes.

```c
esp_err_t esp_ota_end(esp_ota_handle_t handle)
```

Finish OTA update and validate newly written app image.

**Note** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**

- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**

- handle: Handle obtained from esp_ota_begin().

```c
esp_err_t esp_ota_set_boot_partition(const esp_partition_t *partition)
```

Configure OTA data for a new boot partition.

**Note** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

**Parameters**

- partition: Pointer to info for partition containing app image to boot.

```c
const esp_partition_t *esp_ota_get_boot_partition(void)
```

Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.
Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

**Return** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_ota_get_running_partition(void)
```

Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Return** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Returned pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_ota_get_next_update_partition(const esp_partition_t *start_from)
```

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

**Return** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

**Parameters**
* start_from: If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

```c
esp_err_t esp_ota_get_partition_description(const esp_partition_t *partition, esp_app_desc_t *app_desc)
```

Returns esp_app_desc structure for app partition. This structure includes app version.

**Return**
* ESP_OK: Successful.
* ESP_ERR_NOT_FOUND: app_desc structure is not found. Magic word is incorrect.
* ESP_ERR_NOT_SUPPORTED: Partition is not application.
* ESP_ERR_INVALID_ARG: Arguments are NULL or partition’s offset exceeds partition size.
* ESP_ERR_INVALID_SIZE: Read would go out of bounds of the partition.
* or one of error codes from lower-level flash driver.

**Parameters**
* [in] partition: Pointer to app partition. (only app partition)
* [out] app_desc: Structure of info about app.

```c
esp_err_t esp_ota_mark_app_valid_cancel_rollback(void)
```

This function is called to indicate that the running app is working well.

**Return**
* ESP_OK: if successful.

```c
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot(void)
```

This function is called to rollback to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

**Return**
* ESP_FAIL: if not successful.
• ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

```c
const esp_partition_t *esp_ota_get_last_invalid_partition (void)
```

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Return partition.

```c
esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t *ota_state)
```

Returns state for given partition.

Return

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otdata or state was not found for given partition.

Parameters

- [in] partition: Pointer to partition.
- [out] ota_state: state of partition (if this partition has a record in otdata).

```c
esp_err_t esp_ota_erase_last_boot_app_partition (void)
```

Erase previous boot app partition and corresponding otdata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Return

- ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible (void)
```

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otdata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Return

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

Macros

- OTA_SIZE_UNKNOWN
  Used for esp_ota_begin() if new image size is unknown

- ESP_ERR_OTA_BASE
  Base error code for ota_ops api

- ESP_ERR_OTA_PARTITION_CONFLICT
  Error if request was to write or erase the current running partition

- ESP_ERR_OTA_SELECT_INFO_INVALID
  Error if OTA data partition contains invalid content

- ESP_ERR_OTA_VALIDATE_FAILED
  Error if OTA app image is invalid

- ESP_ERR_OTA_SMALL_SEC_VER
  Error if the firmware has a secure version less than the running firmware.

- ESP_ERR_OTA_ROLLBACK_FAILED
  Error if flash does not have valid firmware in passive partition and hence rollback is not possible

- ESP_ERR_OTA_ROLLBACK_INVALID_STATE
  Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
### Type Definitions

```c
typedef uint32_t esp_ota_handle_t
```

Opaque handle for an application OTA update.

`esp_ota_begin()` returns a handle which is then used for subsequent calls to `esp_ota_write()` and `esp_ota_end()`.

### 2.7.21 Performance Monitor

The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

#### Application Example

An example which combines performance monitor is provided in `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.

#### High level API Reference

**Header Files**

**API Reference**

**Header File**

- `perfmon/include/xtensa_perfmon_access.h`

**Functions**

- `esp_err_t xtensa_perfmon_init(int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)`

  Init Performance Monitor.

  Initialize performance monitor register with define values

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if one of the arguments is not correct

  **Parameters**

  - `[in] id`: performance counter number
  - `[in] select`: select value from PMCTRLx register
  - `[in] mask`: mask value from PMCTRLx register
  - `[in] kernelcnt`: kernelcnt value from PMCTRLx register
  - `[in] tracelevel`: tracelevel value from PMCTRLx register

- `esp_err_t xtensa_perfmon_reset(int id)`

  Reset PM counter.

  Reset PM counter. Writes 0 to the PMx register.

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if id out of range

  **Parameters**

  - `[in] id`: performance counter number

- `void xtensa_perfmon_start(void)`

  Start PM counters.

  Start all PM counters synchronously. Write 1 to the PGM register.
void xtensa_perfmon_stop(void)
    Stop PM counters.
    Stop all PM counters synchronously. Write 0 to the PGM register

uint32_t xtensa_perfmon_value(int id)
    Read PM counter.
    Read value of defined PM counter.

return
    • Performance counter value

Parameters
    • [in] id: performance counter number

esp_err_t xtensa_perfmon_overflow(int id)
    Read PM overflow state.
    Read overflow value of defined PM counter.

return
    • ESP_OK if there is no overflow (overflow = 0)
    • ESP_FAIL if overflow occurred (overflow = 1)

Parameters
    • [in] id: performance counter number

void xtensa_perfmon_dump(void)
    Dump PM values.
    Dump all PM registers to the console.

Header File
    • perfmon/include/xtensa_perfmon_apis.h

Functions

esp_err_t xtensa_perfmon_exec(const xtensa_perfmon_config_t *config)
    Execute PM.
    Execute performance counter for dedicated function with defined parameters

return
    • ESP_OK if no errors
    • ESP_ERR_INVALID_ARG if one of the required parameters not defined
    • ESP_FAIL - counter overflow

Parameters
    • [in] config: pointer to the configuration structure

void xtensa_perfmon_view_cb(void *params, uint32_t select, uint32_t mask, uint32_t value)
    Dump PM results.
    Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

Parameters
    • [in] params: used parameters passed from configuration (callback_params). This parameter expected as FILE* hanlde, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
    • [in] select: select value for current counter
    • [in] mask: mask value for current counter
    • [in] value: counter value for current counter
Structures

```
struct xtensa_perfmon_config
  Performance monitor configuration structure.
  Structure to configure performance counter to measure dedicated function
```

Public Members

- `int repeat_count`
  - How many times function will be called before the callback will be repeated
- `float max_deviation`
  - Difference between min and max counter number: 0..1, 0 - no difference, 1 - not used
- `void *call_params`
  - This pointer will be passed to the call function as a parameter
- `void (*call_function)(void *params)`
  - Pointer to the function that have to be called
- `void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)`
  - Pointer to the function that will be called with result parameters
- `void *callback_params`
  - Parameter that will be passed to the callback
- `int tracelevel`
  - Trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.
- `uint32_t counters_size`
  - Amount of counter in the list
- `const uint32_t *select_mask`
  - List of the select/mask parameters

Type Definitions

```
typedef struct xtensa_perfmon_config xtensa_perfmon_config_t
  Performance monitor configuration structure.
  Structure to configure performance counter to measure dedicated function
```

2.7.22 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.
Chapter 2. API Reference

Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (true/false).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the `Sleep Modes` documentation can be used to trigger wakeup from the light sleep state. For example, the EXT0 and EXT1 wakeups can be used to wake up the chip via a GPIO.

Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_PM_CPU_FREQ_MAX</td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code>. For ESP32, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td>ESP_PM_APB_FREQ_MAX</td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32, this is 80 MHz.</td>
</tr>
<tr>
<td>ESP_PM_NO_LIGHT_SLEEP</td>
<td>Disables automatic switching to light sleep.</td>
</tr>
</tbody>
</table>
ESP32 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ`.

<table>
<thead>
<tr>
<th>Max CPU Frequency Set</th>
<th>Lock Acquisition</th>
<th>CPU and APB Frequencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>240</td>
<td>Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired</td>
<td>CPU: 240 MHz</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>160</td>
<td>ESP_PM_CPU_FREQ_MAX acquired</td>
<td>CPU: 160 MHz</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>80</td>
<td>Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired</td>
<td>CPU: 80 MHz</td>
</tr>
</tbody>
</table>

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with High resolution timer APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the work of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK is used as a clock source. See `use_ref_tick` member of `uart_config_t`.
- **LED**: if REF_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT**: if REF_TICK is used as a clock source. See `flags` member of `rmt_config_t` and macro `RMT_CHANNEL_FLAGS_ALWAYS_ON`.

Submit Document Feedback
Release v4.2-dev-1660-g7d75213
Currently, the following peripheral drivers are aware of DFS and will use the \texttt{ESP\_PM\_APB\_FREQ\_MAX} lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APPLL clock is used, then it will use the \texttt{ESP\_PM\_NO\_LIGHT\_SLEEP} lock)
- SDMMC

The following drivers will hold the \texttt{ESP\_PM\_APB\_FREQ\_MAX} lock while the driver is enabled:

- SPI slave: between calls to \texttt{spi\_slave\_initialize()} and \texttt{spi\_slave\_free()}.
- Ethernet: between calls to \texttt{esp\_eth\_driver\_install()} and \texttt{esp\_eth\_driver\_uninstall()}.
- WiFi: between calls to \texttt{esp\_wifi\_start()} and \texttt{esp\_wifi\_stop()}. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- CAN: between calls to \texttt{can\_driver\_install()} and \texttt{can\_driver\_uninstall()}.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

**API Reference**

**Header File**

- \texttt{esp\_common\_include/esp\_pm.h}

**Functions**

\texttt{esp\_err\_t esp\_pm\_configure(const void *config)}

Set implementation-specific power management configuration.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the configuration values are not correct
- ESP\_ERR\_NOT\_SUPPORTED if certain combination of values is not supported, or if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- \texttt{config}: pointer to implementation-specific configuration structure (e.g. esp\_pm\_config\_esp32)

\texttt{esp\_err\_t esp\_pm\_lock\_create(esp\_pm\_lock\_type\_t lock\_type, int arg, const char *name, esp\_pm\_lock\_handle\_t *out\_handle)}

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call \texttt{esp\_pm\_lock\_acquire} to take the lock.

This function must not be called from an ISR.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if the lock structure can not be allocated
- ESP\_ERR\_INVALID\_ARG if out\_handle is NULL or type argument is not valid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- \texttt{lock\_type}: Power management constraint which the lock should control
- \texttt{arg}: argument, value depends on lock\_type, see esp\_pm\_lock\_type\_t
- \texttt{name}: arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the esp\_pm\_dump\_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- \texttt{[out] out\_handle}: handle returned from this function. Use this handle when calling esp\_pm\_lock\_delete, esp\_pm\_lock\_acquire, esp\_pm\_lock\_release. Must not be NULL.

\texttt{esp\_err\_t esp\_pm\_lock\_acquire(esp\_pm\_lock\_handle\_t handle)}

Take a power management lock.
Once the lock is taken, power management algorithm will not switch to the mode specified in a call to `esp_pm_lock_create`, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**
- handle: handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_lock_release(esp_pm_lock_handle_t handle)
```

Release the lock taken using `esp_pm_lock_acquire`.

Call to this function removes power management restrictions placed when taking the lock.

Locks are recursive, so if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**
- handle: handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_lock_delete(esp_pm_lock_handle_t handle)
```

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**
- handle: handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_dump_locks(FILE *stream)
```

Dump the list of all locks to stderr.

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**
- stream: stream to print information to; use stdout or stderr to print to the console; use fmopen/open_memstream to print to a string buffer.
Type Definitions

typedef struct esp_pm_lock *esp_pm_lock_handle_t
Opaque handle to the power management lock.

Enumerations

typedef enum esp_pm_lock_type_t
Power management constraints.

Values:

ESP_PM_CPU_FREQ_MAX
Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and
should be set to 0.

ESP_PM_APB_FREQ_MAX
Require APB frequency to be at the maximum value supported by the chip. Argument is unused and
should be set to 0.

ESP_PM_NO_LIGHT_SLEEP
Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- esp32/include.esp32/pm.h

Structures

struct esp_pm_config_esp32_t
Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.

Public Members

int max_freq_mhz
Maximum CPU frequency, in MHz

int min_freq_mhz
Minimum CPU frequency to use when no locks are taken, in MHz

bool light_sleep_enable
Enter light sleep when no locks are taken

2.7.23 Sleep Modes

Overview

ESP32 is capable of light sleep and deep sleep power saving modes.
In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced.
Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.
In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from APB_CLK
are powered off. The only parts of the chip which can still be powered on are: RTC controller, RTC peripherals
(including ULP coprocessor), and RTC memories (slow and fast).
Wakeup from deep and light sleep modes can be done using several sources. These sources can be
combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup
sources can be enabled using esp_sleep_enable_X_wakeup APIs and can be disabled using
esp_sleep_disable_wakeup_source() API. Next section describes these APIs in detail. Wakeup
sources can be configured at any moment before entering light or deep sleep mode.
Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using \texttt{esp_sleep_pd_config()} API.

Once wakeup sources are configured, application can enter sleep mode using \texttt{esp_light_sleep_start()} or \texttt{esp_deep_sleep_start()} APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (\texttt{esp_bluedroid_disable()}, \texttt{esp_bt_controller_disable()}, \texttt{esp_wifi_stop()}). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see \textit{Power Management APIs}). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

Wakeup sources

Timer \hspace{0.5em} RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW CLK. See chapter “Reset and Clock” of the ESP32 Technical Reference Manual for details about RTC clock options.

This wakeup mode doesn’t require RTC peripherals or RTC memories to be powered on during sleep. \texttt{esp_sleep_enable_timer_wakeup()} function can be used to enable deep sleep wakeup using a timer.

Touch pad \hspace{0.5em} RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

\texttt{esp_sleep_enable_touchpad_wakeup()} function can be used to enable this wakeup source.

External wakeup (ext0) \hspace{0.5em} RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.

Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using \texttt{rtc_gpio_pullup_en()} and \texttt{rtc_gpio_pulldown_en()} functions, before calling \texttt{esp_sleep_start()}. \texttt{esp_sleep_enable_ext0_wakeup()} function can be used to enable this wakeup source.

\begin{footnotesize}
\begin{warning}
After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using \texttt{rtc_gpio_deinit(gpio_num)} function.
\end{warning}
\end{footnotesize}

External wakeup (ext1) \hspace{0.5em} RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (\texttt{ESP_EXT1_WAKEUP_ANY_HIGH})
- wake up if all the selected pins are low (\texttt{ESP_EXT1_WAKEUP_ALL_LOW})

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using \texttt{rtc_gpio_} functions, before entering sleep.
Warning: After wake up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using `rtc_gpio_deinit(gpio_num)` function.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

**ULP coprocessor wakeup**  ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

**GPIO wakeup (light sleep only)**  In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

**UART wakeup (light sleep only)**  When ESP32 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup, before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

**Power-down of RTC peripherals and memories**

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

If some variables in the program are placed into RTC slow memory (for example, using `RTC_DATA_ATTR` attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

**Entering light sleep**

`esp_light_sleep_start()` function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.
Chapter 2. API Reference

**Entering deep sleep**

`esp_deep_sleep_start()` function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

**Configuring IOs**

Some ESP32 IOs have internal pull-ups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pull-ups and pulldowns.

To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

**UART output handling**

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs. When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

**Checking sleep wakeup cause**

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad and ext1 wakeup sources, it is possible to identify pin or touch pad which has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` and `esp_sleep_get_ext1_wakeup_status()` functions.

**Disable sleep wakeup source**

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

**Application Example**

Implementation of basic functionality of deep sleep is shown in `protocols/sntp` example, where ESP module is periodically waken up to retrieve time from NTP server.

More extensive example in `system/deep_sleep` illustrates usage of various deep sleep wakeup triggers and ULP co-processor programming.

**API Reference**

**Header File**

- `esp32/include/esp_sleep.h`
**Functions**

**esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)**

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in esp_sleep_start function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**Parameters**

- source: - number of source to disable of type esp_sleep_source_t

**esp_err_t esp_sleep_enable_ulp_wakeup(void)**

Enable wakeup by ULP coprocessor.

**Note** ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

**esp_err_t esp_sleep_enable_timer_wakeup(uint64_t time_in_us)**

Enable wakeup by timer.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

**Parameters**

- time_in_us: time before wakeup, in microseconds

**esp_err_t esp_sleep_enable_touchpad_wakeup(void)**

Enable wakeup by touch sensor.

**Note** Touch wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note** The FSM mode of the touch button should be configured as the timer trigger mode.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

**esp_err_t esp_sleep_get_touchpad_wakeup_status(void)**

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

**Return**

touch_pad which caused wakeup

**esp_err_t esp_sleep_enable_ext0_wakeup(gpio_num_t gpio_num, int level)**

Enable wakeup using a pin.

This function uses external wakeup feature of RTC_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pin is configured in esp_sleep_start, immediately before entering sleep mode.
Note  ext0 wakeup source cannot be used together with touch or ULP wakeup sources.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

Parameters

- gpio_num: GPIO number used as wakeup source. Only GPIOs which are have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- level: input level which will trigger wakeup (0=low, 1=high)

```c
esp_err_t esp_sleep_enable_ext1_wakeup (uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)
```

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

Note This function does not modify pin configuration. The pins are configured in esp_sleep_start, immediately before entering sleep mode.

Note internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

Parameters

- mask: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit mask: 0,2,4,12-15,25-27,32-39.
- mode: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wakeup when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

```c
esp_err_t esp_sleep_enable_gpio_wakeup (void)
```

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

Note  GPIO wakeup source cannot be used together with touch or ULP wakeup sources.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)
```

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

Note  ESP32 does not support wakeup from UART2.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

Parameters

- uart_num: UART port to wake up from
Chapter 2. API Reference

```c
uint64_t esp_sleep_get_ext1_wakeup_status (void)
    Get the bit mask of GPIOs which caused wakeup (ext1)
    If wakeup was caused by another source, this function will return 0.
    Return bit mask, if GPIO caused wakeup, BIT(n) will be set
```

```c
esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)
    Set power down mode for an RTC power domain in sleep mode.
    If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.
    Return
        • ESP_OK on success
        • ESP_ERR_INVALID_ARG if either of the arguments is out of range
 Parameters
        • domain: power domain to configure
        • option: power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)
```

```c
void esp_deep_sleep_start (void)
    Enter deep sleep with the configured wakeup options.
    This function does not return.
```

```c
esp_err_t esp_light_sleep_start (void)
    Enter light sleep with the configured wakeup options.
    Return
        • ESP_OK on success (returned after wakeup)
        • ESP_ERR_INVALID_STATE if WiFi or BT is not stopped
```

```c
void esp_deep_sleep (uint64_t time_in_us)
    Enter deep-sleep mode.
    The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep
    wake stub, and then proceeds to load application.
    Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to
    esp_deep_sleep_start.
    esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure
    relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These
    include:
        • esp_bluedroid_disable
        • esp_bt_controller_disable
        • esp_wifi_stop
    This function does not return.
 Parameters
        • time_in_us: deep-sleep time, unit: microsecond
```

```c
esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause (void)
    Get the wakeup source which caused wakeup from sleep.
    Return cause of wake up from last sleep (deep sleep or light sleep)
```

```c
void esp_wake_deep_sleep (void)
    Default stub to run on wake from deep sleep.
    Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app
    has started up.
    This function is weak-linked, so you can implement your own version to run code immediately when the chip
    wakes from sleep.
    See docs/deep-sleep-stub.rst for details.
```
void esp_set_deep_sleep_wake_stub(esp_deep_sleep_wake_stub_fn_t new_stub)
   Install a new stub at runtime to run on wake from deep sleep.

   If implementing esp_wake_deep_sleep() then it is not necessary to call this function.

   However, it is possible to call this function to substitute a different deep sleep stub. Any function
   used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for
   esp_wake_deep_sleep().

esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub(void)
   Get current wake from deep sleep stub.

   Return Return current wake from deep sleep stub, or NULL if no stub is installed.

void esp_default_wake_deep_sleep(void)
   The default esp-idf-provided esp_wake_deep_sleep() stub.

   See docs/deep-sleep-stub.rst for details.

void esp_deep_sleep_disable_rom_logging(void)
   Disable logging from the ROM code after deep sleep.

   Using LSB of RTC_STORE4.

Type Definitions

typedef esp_sleep_source_t esp_sleep_wakeup_cause_t
typedef void(*esp_deep_sleep_wake_stub_fn_t)(void)
   Function type for stub to run on wake from sleep.

Enumerations

enum esp_sleep_ext1_wakeup_mode_t
   Logic function used for EXT1 wakeup mode.

   Values:

   ESP_EXT1_WAKEUP_ALL_LOW = 0
      Wake the chip when all selected GPIOs go low.

   ESP_EXT1_WAKEUP_ANY_HIGH = 1
      Wake the chip when any of the selected GPIOs go high.

enum esp_sleep_pd_domain_t
   Power domains which can be powered down in sleep mode.

   Values:

   ESP_PD_DOMAIN_RTC_PERIPH
      RTC IO, sensors and ULP co-processor.

   ESP_PD_DOMAIN_RTC_SLOW_MEM
      RTC slow memory.

   ESP_PD_DOMAIN_RTC_FAST_MEM
      RTC fast memory.

   ESP_PD_DOMAIN_XTAL
      XTAL oscillator.

   ESP_PD_DOMAIN_MAX
      Number of domains.

enum esp_sleep_pd_option_t
   Power down options.

   Values:

   ESP_PD_OPTION_OFF
      Power down the power domain in sleep mode.
Chapter 2. API Reference

ESP_PD_OPTION_ON
Keep power domain enabled during sleep mode.

ESP_PD_OPTION_AUTO
Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum esp_sleep_source_t
Sleep wakeup cause.

Values:
ESP_SLEEP_WAKEUP_UNDEFINED
In case of deep sleep, reset was not caused by exit from deep sleep.

ESP_SLEEP_WAKEUP_ALL
Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

ESP_SLEEP_WAKEUP_EXT0
Wakeup caused by external signal using RTC_IO.

ESP_SLEEP_WAKEUP_EXT1
Wakeup caused by external signal using RTC_CNTL.

ESP_SLEEP_WAKEUP_TIMER
Wakeup caused by timer.

ESP_SLEEP_WAKEUP_TOUCHPAD
Wakeup caused by touchpad.

ESP_SLEEP_WAKEUP_ULP
Wakeup caused by ULP program.

ESP_SLEEP_WAKEUP_GPIO
Wakeup caused by GPIO (light sleep only)

ESP_SLEEP_WAKEUP_UART
Wakeup caused by UART (light sleep only)

2.7.24 Watchdogs

Overview

The ESP-IDF has support for two types of watchdogs: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using Project Configuration Menu, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

Interrupt watchdog
The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn’t blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can’t get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as “Interrupt wdt timeout on CPU0” or “Interrupt wdt timeout on CPU1” (as applicable).
Configuration  The interrupt watchdog is enabled by default via the CONFIG_ESP_INT_WDT configuration flag. The timeout is configured by setting CONFIG_ESP_INT_WDT_TIMEOUT_MS. The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see CONFIG_FREERTOS_HZ).

Tuning  If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the CONFIG_ESP_INT_WDT_TIMEOUT_MS setting instead.

Task Watchdog Timer  The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. Each watched task must ‘reset’ the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function esp_task_wdt_isr_user_handler in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling esp_task_wdt_init() which will configure the hardware timer. A task can then subscribe to the TWDT using esp_task_wdt_add() in order to be watched. Each subscribed task must periodically call esp_task_wdt_reset() to reset the TWDT. Failure by any subscribed tasks to periodically call esp_task_wdt_reset() indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using esp_task_wdt_delete(). A task that has been unsubscribed should no longer call esp_task_wdt_reset(). Once all tasks have unsubscribed form the TWDT, the TWDT can be deinitialized by calling esp_task_wdt_deinit().

The default timeout period for the TWDT is set using config item CONFIG_ESP_TASK_WDT_TIMEOUT_S. This should be set to at least as long as you expect any single task will need to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling esp_task_wdt_init().

The following config options control TWDT configuration at startup. They are all enabled by default:

- CONFIG_ESP_TASK_WDT - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling esp_task_wdt_init().
- CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0 - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling esp_task_wdt_add() at any time.
- CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1 - CPU1 Idle task is subscribed to the TWDT during startup.

JTAG and watchdogs  While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving
the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

**Interrupt Watchdog API Reference**

**Header File**

- `esp_common/include/esp_int_wdt.h`

**Functions**

```c
void esp_int_wdt_init (void)
```

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

**Task Watchdog API Reference**

A full example using the Task Watchdog is available in esp-idf: `system/task_watchdog`

**Header File**

- `esp_common/include/esp_task_wdt.h`

**Functions**

```c
esp_err_t esp_task_wdt_init (uint32_t timeout, bool panic)
```

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add()`.

**Return**

- ESP_OK: Initialization was successful
- ESP_ERR_NO_MEM: Initialization failed due to lack of memory

**Note**

`esp_task_wdt_init()` must only be called after the scheduler started

**Parameters**

- `[in]` timeout: Timeout period of TWDT in seconds
- `[in]` panic: Flag that controls whether the panic handler will be executed when the TWDT times out

```c
esp_err_t esp_task_wdt_deinit (void)
```

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Return**

- ESP_OK: TWDT successfully deinitialized
- ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
- ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

```c
esp_err_t esp_task_wdt_add (TaskHandle_t handle)
```

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.
Chapter 2. API Reference

Return
• ESP_OK: Successfully subscribed the task to the TWDT
• ESP_ERR_INVALID_ARG: Error, the task is already subscribed
• ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters
• [in] handle: Handle of the task. Input NULL to subscribe the current running task to the TWDT

esp_err_t esp_task_wdt_reset (void)
Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

Return
• ESP_OK: Successfully reset the TWDT on behalf of the currently running task
• ESP_ERR_NOT_FOUND: Error, the current running task has not subscribed to the TWDT
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

esp_err_t esp_task_wdt_delete (TaskHandle_t handle)
Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset(). If the task is an IDLE task, this function will automatically disable the calling of esp_task_wdt_reset() from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

Return
• ESP_OK: Successfully unsubscribed the task from the TWDT
• ESP_ERR_INVALID_ARG: Error, the task is already unsubscribed
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters
• [in] handle: Handle of the task. Input NULL to unsubscribe the current running task.

esp_err_t esp_task_wdt_status (TaskHandle_t handle)
Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

Return
• ESP_OK: The task is currently subscribed to the TWDT
• ESP_ERR_NOT_FOUND: The task is currently not subscribed to the TWDT
• ESP_ERR_INVALID_STATE: The TWDT is not initialized, therefore no tasks can be subscribed

Parameters
• [in] handle: Handle of the task. Input NULL to query the current running task.

2.7.25 System Time

Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:
• **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an *RTC Clock Source* and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.

• **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32_TIME_SYSCALL` in project configuration.

**RTC Clock Source**

The RTC timer has the following clock sources:

- **Internal 150kHz RC oscillator** (default): Features lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- **External 32kHz crystal**: Requires a 32kHz crystal to be connected to the 32K_XP and 32K_NP pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
- **External 32kHz oscillator at 32K_XP pin**: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XP pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of $0.1 < V_{cm} < 0.5 \times V_{amp}$, where $V_{amp}$ is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K_XN pin and ground. In this case, the 32K_XN pin cannot be used as a GPIO pin.
- **Internal 8.5MHz oscillator, divided by 256 (~33kHz)**. Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K_XP pin sources can be found in Section 2.1.4 *Crystal Oscillator* of *Hardware Design Guidelines*.

**Get Current Time**

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
gettimeofday
time
asctime
clock
cftime
difftime
gmtime
localtime
mktime
strftime
adjtime`
```

* –To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.
If you need to obtain time with one second resolution, use the following method:

```c
#include <time.h>

#include <esp_log.h>

#define TAG  "SNTP"

#define ESP_LOGI(TAG, format, args)  esp_log_esp32_info(TAG, format, args)

void ntp_sync_mode = SNTP_SYNC_MODE_IMMED;

const char* ntp_server = "pool.ntp.org";

// SNTP lib initialization
SNTP* snntp = sntp_init();

sntp_setserver(&snntp, ntp_server);

sntp_settime(&snntp, 0, NULL, 0);

sntp_syncmark(&snntp);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```c
#include <sys/time.h>
#include <time.h>
#include <string.h>

void ntp_send_data(char* data)
{
    // send data to NTP server
}

void ntp_receive_data(char* data)
{
    // receive data from NTP server
}
```

### SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_time_sync_notification_cb()` to set one of the following sync modes:

- **SNTP_SYNC_MODE_IMMED** (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- **SNTP_SYNC_MODE_SMOOTH** updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_Sntp_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_Sntp_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in `protocols/sntp` directory.

### Timezones

To set local timezone, use the following POSIX functions:

```c
import java.util.Date;
import java.text.SimpleDateFormat;
import java.text.ParseException;
import java.time.ZoneId;
import java.time.ZonedDateTime;
import java.time.format.DateTimeFormatter;
import java.time.format.DateTimeParseException;
import java.time.temporal.ChronoField;
import java.time.ZoneOffset;
import java.time.ZonedDateTime;
import java.time.format.DateTimeFormatterBuilder;
import java.time.format.TextStyle;
import java.time.getMonthValue;
import java.time.getDayValue;
import java.time.DayOfWeek;
import java.time.getYearValue;
import java.time.format.DateTimeFieldType;
import java.time.format.DateTimeParseException;
import java.time.format.DateTimeFormatter;
import java.time.format.DateTimeFormatterBuilder;
import java.time.format.DateTimeFormatterFactory;
import java.time.format.DateTimeFormatterParser;
import java.time.format.DateTimeFormatterQuery;
import java.time.format.DateTimeFormatterWithStyle;
import java.time.format.DateTimeParseException;
import java.time.format.DateTimeFormatter;
import java.time.format.DateTimeFormatter;  
```
Chapter 2. API Reference

1. Call `setenv()` to set the `TZ` environment variable to the correct value depending on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).

2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

API Reference

Header File

- `lwip/include/apps/sntp/sntp.h`

Functions

void `sntp_sync_time` (struct timeval *tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

Parameters
- `tv`: Time received from SNTP server.

void `sntp_set_sync_mode` (sntp_sync_mode_t sync_mode)

Set the sync mode.

Allowable two mode: SNTP_SYNC_MODE_IMMED and SNTP_SYNC_MODE_SMOOTH.

Parameters
- `sync_mode`: Sync mode.

`sntp_sync_mode_t` `sntp_get_sync_mode` (void)

Get set sync mode.

Return SNTP_SYNC_MODE_IMMED: Update time immediately. SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

`sntp_sync_status_t` `sntp_get_sync_status` (void)

Get status of time sync.

After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

Return SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

void `sntp_set_sync_status` (sntp_sync_status_t sync_status)

Set status of time sync.

Parameters
- `sync_status`: status of time sync (see sntp_sync_status_t)

void `sntp_set_time_sync_notification_cb` (sntp_time_sync_t cb)

Set a callback function for time synchronization notification.

Parameters
- `cb`: a callback function
void `sntp_set_sync_interval` (uint32_t `interval_ms`)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in
the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function,
otherwise, it will be applied after the last interval expired.

**Parameters**

- **interval_ms**: The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds
  will be set.

`uint32_t sntp_get_sync_interval` (void)

Get the sync interval of SNTP operation.

**Return** the sync interval

`bool sntp_restart` (void)

Restart SNTP.

**Return** True - Restart False - SNTP was not initialized yet

**Type Definitions**

```python
typedef void (*sntp_sync_time_cb_t) (struct timeval *tv)
```

SNTP callback function for notifying about time sync event.

**Parameters**

- **tv**: Time received from SNTP server.

**Enumerations**

```python
enum sntp_sync_mode_t
```

SNTP time update mode.

**Values:**

- **SNTP_SYNC_MODE_IMMED**: Update system time immediately when receiving a response from the SNTP server.
- **SNTP_SYNC_MODE_SMOOTH**: Smooth time updating. Time error is gradually reduced using `adjtime` function. If the difference between
  SNTP response time and system time is large (more than 35 minutes) then update immediately.

```python
enum sntp_sync_status_t
```

SNTP sync status.

**Values:**

- **SNTP_SYNC_STATUS_RESET**
- **SNTP_SYNC_STATUS_COMPLETED**
- **SNTP_SYNC_STATUS_IN_PROGRESS**

Code examples for this API section are provided in the `system` directory of ESP-IDF examples.

## 2.8 Project Configuration

### 2.8.1 Introduction

ESP-IDF uses `kconfiglib` which is a Python-based extension to the `Kconfig` system which provides a compile-time
project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig
files specify dependencies between options, default values of the options, the way the options are grouped together,
etc.

For the complete list of available features please see `Kconfig` and `kconfiglib` extensons.
2.8.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sdkconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with `make menuconfig`.)

2.8.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the `sdkconfig` file. Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see Custom `sdkconfig defaults`.

2.8.4 Kconfig Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of `conf-idf` which causes that Windows line endings are not recognized after a backslash).

Format checker

tools/check_kconfigs.py is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.8.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file.

3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.

4. Deprecated options and their replacements are automatically generated by `confgen.py`.

### 2.8.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in menuconfig, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

#### SDK tool configuration

Contains:

- `CONFIG_SDK_TOOLPREFIX`
- `CONFIG_SDK_PYTHON`
- `CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`
- `CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`

**CONFIG_SDK_TOOLPREFIX**

Compiler toolchain path/prefix

*Found in: SDK tool configuration*

The prefix/path that is used to call the toolchain. The default setting assumes a crosstool-ng gcc setup that is in your PATH.

**CONFIG_SDK_PYTHON**

Python interpreter

*Found in: SDK tool configuration*

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)

**CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES**

`make` warns on undefined variables

*Found in: SDK tool configuration*

Adds `-warn-undefined-variables` to `MAKEFLAGS`. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.

(Note: this option is used with the legacy GNU Make build system only.)
### CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS

Toolchain supports time_t wide 64-bits

**Found in:** SDK tool configuration

Enable this option in case you have a custom toolchain which supports time_t wide 64-bits. This option checks time_t is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits time_t.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide time_t. This will change in a future major release, but currently 64-bit time_t requires a custom built toolchain.

### Build type

Contains:

- **CONFIG_APP_BUILD_TYPE**

### CONFIG_APP_BUILD_TYPE

Application build type

**Found in:** Build type

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP32 bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows:

```bash
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt
# Run to a specific point in ROM code, # where most of initialization is complete.
thb *0x40007901 c
# Load the application into RAM load
# Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

`xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit`

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=y
CONFIG_ESP_ERR_TO_NAME_LOOKUP=y
```

**Available options:**

- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL) (CONFIG_APP_BUILD_TYPE_ELF_RAM)
Partition Table

Contains:

- `CONFIG_PARTITION_TABLE_TYPE`
- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_MD5`

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. Otherwise it’s possible to create a new custom partition CSV for your application.

*Available options:*

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.
Serial flasher config

Contains:

- `CONFIG_ESPTOOLPY_PORT`
- `CONFIG_ESPTOOLPY_BAUD`
- `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_COMPRESSED`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`

**CONFIG_ESPTOOLPY_PORT**

Default serial port

*Found in: Serial flasher config*

The serial port that’s connected to the ESP chip. This can be overridden by setting the `ESP_PORT` environment variable.

This value is ignored when using the CMake-based build system or idf.py.

**CONFIG_ESPTOOLPY_BAUD**

Default baud rate

*Found in: Serial flasher config*

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the `ESP_BAUD` variable.

This value is ignored when using the CMake-based build system or idf.py.

**Available options:**

- 115200 baud (ESPTOOLPY_BAUD_115200B)
- 230400 baud (ESPTOOLPY_BAUD_230400B)
- 921600 baud (ESPTOOLPY_BAUD_921600B)
- 2Mb (ESPTOOLPY_BAUD_2MB)
- Other baud rate (ESPTOOLPY_BAUD_OTHER)

**CONFIG_ESPTOOLPY_BAUD_OTHER_VAL**

Other baud rate value

*Found in: Serial flasher config*

**CONFIG_ESPTOOLPY_COMPRESSED**

Use compressed upload

*Found in: Serial flasher config*

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.
CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

**Available options:**

- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

**Available options:**

- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)

CONFIG_ESPTOOLPY_FLASHSIZE_DETECT

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
• No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

**CONFIG_ESPTOOLPY_MONITOR_BAUD**

`idf.py` monitor baud rate

*Found in: Serial flasher config*

Baud rate to use when running `idf.py` monitor or `make` monitor to view serial output from a running chip.

Can override by setting the `MONITORBAUD` environment variable.

**Available options:**

- 9600 bps (ESPTOOLPY_MONITOR_BAUD_9600B)
- 57600 bps (ESPTOOLPY_MONITOR_BAUD_57600B)
- 115200 bps (ESPTOOLPY_MONITOR_BAUD_115200B)
- 230400 bps (ESPTOOLPY_MONITOR_BAUD_230400B)
- 921600 bps (ESPTOOLPY_MONITOR_BAUD_921600B)
- 2 Mbps (ESPTOOLPY_MONITOR_BAUD_2MB)
- Custom baud rate (ESPTOOLPY_MONITOR_BAUD_OTHER)

**CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL**

Custom baud rate value

*Found in: Serial flasher config*

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**
- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

**Available options:**
- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_SPI_WP_PIN

SPI Flash WP Pin when customising pins via eFuse (read help)

*Found in: Bootloader config*

This value is ignored unless flash mode is set to QIO or QOUT *and* the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. That pin number is compiled into the bootloader instead.

The default value (GPIO 7) is correct for WP pin on ESP32-D2WD integrated flash.

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**
Chapter 2. API Reference

- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input pulled low while device starts up. See settings below.

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a factory reset, this GPIO must be pulled low on reset. Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**CONFIG_BOOTLOADER_OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, ..” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**CONFIG_BOOTLOADER_APP_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.
**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If it is set, the client must itself reset or disable rtc_wdt in their code (app_main()). Otherwise rtc_wdt will be disabled before calling app_main function. Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.
**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

*eFuse secure version of app*

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

*Size of the eFuse secure version field*

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the eFuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

*Emulate operations with eFuse secure version (only test)*

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allow emulate read/write operations with eFuse secure version. It allow to test anti-rollback implementation without permanent write eFuse bits. In partition table should be exist this partition emul_efuse, data, 5, 0x2000.

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

*Skip image validation when exiting deep sleep*

*Found in: Bootloader config*

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

*Reserve RTC FAST memory for custom purposes*

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.
CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE

Size in bytes for custom purposes

*Found in:* Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

Security features

Contains:

- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_MODE
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- Potentially insecure options

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

*Found in:* Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

*Found in:* Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two options: 1. ECDSA based secure boot scheme. (Only choice for Secure Boot V1) Supported in ESP32 and ESP32-ECO3. 2. The RSA based secure boot scheme. (Only choice for Secure Boot V2) Supported in ESP32-ECO3. (ESP32 Chip Revision 3 onwards)

*Available options:*

- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
  Refer to the documentation before enabling.
- RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

**Available options:**

- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.
CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

*Found in:* Security features

**Available options:**

- **One-time flash** (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- **Reflashable** (SECURE_BOOTLOADER_REFLASHABLE)
  
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows re-flashing of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

*Found in:* Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

*Found in:* Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

*Found in:* Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.
Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espefuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

*Available options:*
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows UART bootloader to perform flash encryption operations.

Select Release mode only for production or manufacturing. Once enabled you can not reflash using UART bootloader.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version and *Flash Encryption* for details.

*Available options:*
- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)
Potentially insecure options

Contains:

- `CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`

**CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC**

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

**CONFIG_SECURE_BOOT_ALLOW_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

**CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS eFuse when Secure Boot is enabled. This prevents any more efuses from being read protected.
If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER.Allow_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espefuse.py.

**Application manager**

Contains:

- **CONFIG_APP_COMPILE_TIME_DATE**
- **CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**
- **CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**
- **CONFIG_APP_PROJECT_VER_FROM_CONFIG**
- **CONFIG_APP_RETRIEVE_LEN_ELF_SHA**
**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
• 

- CONFIG_COMPILER_CXX_RTTI
- CONFIG_COMPILER_STACK_CHECK_MODE
- CONFIG_COMPILER_WARN_WRITE_STRINGS
- CONFIG_COMPILER_DISABLE_GCC8_WARNINGS

## CONFIG_COMPILER_OPTIMIZATION

### Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting causes the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER_COMPILER_OPTIMIZATION setting.

### Available options:

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

## CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

### Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

### Available options:

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

## CONFIG_COMPILER_CXX_EXCEPTIONS
Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Contains:

- *CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE*

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**CONFIG_COMPILER_CXX_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, the program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected — those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

Available options:

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)
**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**CONFIG_COMPILER_DISABLE_GCC8_WARNINGS**

Disable new warnings introduced in GCC 6-8

*Found in: Compiler options*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.

**Component config**

Contains:

- Wi-Fi Provisioning Manager
- Unity unit testing library
- TinyUSB
- ESP-MQTT Configurations
- Modbus configuration
- Wi-Fi
- PHY
- High resolution timer (esp_timer)
- ESP System Settings
- ESP NETIF Adapter
- ESP HTTPS server
- HTTP Server
- GDB Stub
- Event Loop Library
- Ethernet
- Common ESP-related
- eFuse Bit Manager
- Supplicant
- Wear Levelling
- Virtual file system
- SPIFFS Configuration
- SPI Flash driver
- PThreads
- OpenSSL
- NVS
- Newlib
- mDNS
- mbedtlsTLS
- LWIP
- Log output
- libsodium
- jsmn
- Heap memory debugging
- FreeRTOS
Chapter 2. API Reference

- FAT Filesystem support
- Core dump
- ESP HTTPS OTA
- ESP HTTP client
- ADC-Calibration
- ESP32-specific
- Power Management
- ESP-TLS
- Driver configurations
- CoAP Configuration
- Bluetooth
- CONFIG_BLE_MESH
- Application Level Tracing

Wi-Fi Provisioning Manager  Contains:

- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Unity unit testing library  Contains:

- `CONFIG_UNITY_ENABLE_FLOAT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`

**CONFIG_UNITY_ENABLE_FLOAT**

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**CONFIG_UNITY_ENABLE_DOUBLE**

Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.
Chapter 2. API Reference

**CONFIG_UNITY_ENABLE_COLOR**
Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER**
Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**CONFIG_UNITY_ENABLE_FIXTURE**
Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL**
Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**TinyUSB** Contains:

- *Descriptor configuration*

**Descriptor configuration** Contains:

- **CONFIG_USB_DESC_CUSTOM_VID**
- **CONFIG_USB_DESC_CUSTOM_PID**

**CONFIG_USB_DESC_CUSTOM_VID**
Custom VID value

*Found in: Component config > TinyUSB > Descriptor configuration*

Custom Vendor ID
CONFIG_USB_DESC_CUSTOM_PID

Custom PID value

*Found in: Component config > TinyUSB > Descriptor configuration*

Custom Product ID

ESP-MQTT Configurations  Contains:

- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_CUSTOM_OUTBOX`

**CONFIG_MQTT_PROTOCOL_311**

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**CONFIG_MQTT_TRANSPORT_SSL**

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedTLS

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**

Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE**

Enable MQTT over Websocket Secure

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*

Enable MQTT transport over Websocket Secure.

**CONFIG_MQTT_USE_CUSTOM_CONFIG**

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.
Chapter 2. API Reference

`CONFIG_MQTT_TCP_DEFAULT_PORT`
Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default MQTT over TCP port

`CONFIG_MQTT_SSL_DEFAULT_PORT`
Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default MQTT over SSL port

`CONFIG_MQTT_WS_DEFAULT_PORT`
Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default MQTT over Websocket port

`CONFIG_MQTT_WSS_DEFAULT_PORT`
Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default MQTT over Websocket Secure port

`CONFIG_MQTT_BUFFER_SIZE`
Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
This buffer size using for both transmit and receive

`CONFIG_MQTT_TASK_STACK_SIZE`
MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
MQTT task stack size

`CONFIG_MQTT_DISABLE_API_LOCKS`
Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

`CONFIG_MQTT_TASK_PRIORITY`
MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
MQTT task priority. Higher number denotes higher priority.
CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistant outbox in NVM or similar).

Modbus configuration  Contains:

- CONFIG_FMB_COMM_MODE_RTU_EN
- CONFIG_FMB_COMM_MODE_ASCII_EN
- CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND
- CONFIG_FMB_MASTER_DELAY_MS_CONVERT
- CONFIG_FMB_QUEUE_LENGTH
- CONFIG_FMB_SERIAL_TASK_STACK_SIZE
- CONFIG_FMB_SERIAL_BUF_SIZE
- CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB
- CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS
- CONFIG_FMB_SERIAL_TASK_PRIO
- CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT
- CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT
- CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE
- CONFIG_FMB_CONTROLLER_STACK_SIZE
- CONFIG_FMB_EVENT_QUEUE_TIMEOUT
- CONFIG_FMB_TIMER_PORT_ENABLED
- CONFIG_FMB_TIMER_GROUP
- CONFIG_FMB_TIMER_INDEX
- CONFIG_FMB_TIMER_ISR_IN_IRAM

CONFIG_FMB_COMM_MODE_RTU_EN

Enable Modbus stack support for RTU mode

*Found in: Component config > Modbus configuration*

Enable RTU Modbus communication mode option for Modbus serial stack.
Chapter 2. API Reference

**CONFIG_FMB_COMM_MODE_ASCII_EN**
Enable Modbus stack support for ASCII mode
*Found in: Component config > Modbus configuration*
Enable ASCII Modbus communication mode option for Modbus serial stack.

**CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND**
Slave respond timeout (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a frame which is not broadcast, it has to wait sometime for slave response. If slave is not respond in this time, the master will process timeout error.

**CONFIG_FMB_MASTER_DELAY_MS_CONVERT**
Slave conversion delay (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**CONFIG_FMB_QUEUE_LENGTH**
Modbus serial task queue length
*Found in: Component config > Modbus configuration*
Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**CONFIG_FMB_SERIAL_TASK_STACK_SIZE**
Modbus serial task stack size
*Found in: Component config > Modbus configuration*
Modbus serial task stack size for event queue task. It may be adjusted when debugging is enabled (for example).

**CONFIG_FMB_SERIAL_BUF_SIZE**
Modbus serial task RX/TX buffer size
*Found in: Component config > Modbus configuration*
Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB**
Number of data bits per ASCII character
*Found in: Component config > Modbus configuration*
This option defines the number of data bits per ASCII character.
Chapter 2. API Reference

**CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS**

Response timeout for ASCII communication mode (ms)

*Found in: Component config > Modbus configuration*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master’s program to handle the error.

**CONFIG_FMB_SERIAL_TASK_PRIO**

Modbus serial task priority

*Found in: Component config > Modbus configuration*

Modbus UART driver event task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_SERIAL_TASK_PRIO - 1).

**CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT**

Modbus controller slave ID support

*Found in: Component config > Modbus configuration*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

**CONFIG_FMB_CONTROLLER_SLAVE_ID**

Modbus controller slave ID

*Found in: Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

**CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT**

Modbus controller notification timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE**

Modbus controller notification queue size

*Found in: Component config > Modbus configuration*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**CONFIG_FMB_CONTROLLER_STACK_SIZE**

Modbus controller stack size

*Found in: Component config > Modbus configuration*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).
CONFIG_FMB_EVENT_QUEUE_TIMEOUT

Modbus stack event queue timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

CONFIG_FMB_TIMER_PORT_ENABLED

Modbus slave stack use timer for 3.5T symbol time measurement

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

CONFIG_FMB_TIMER_GROUP

Modbus Timer group number

*Found in: Component config > Modbus configuration*

Modbus Timer group number that is used for timeout measurement.

CONFIG_FMB_TIMER_INDEX

Modbus Timer index in the group

*Found in: Component config > Modbus configuration*

Modbus Timer Index in the group that is used for timeout measurement.

CONFIG_FMB_TIMER_ISR_IN_IRAM

Place timer interrupt handler into IRAM

*Found in: Component config > Modbus configuration*

This option places Modbus timer IRQ handler into IRAM. This allows to avoid delays related to processing of non-IRAM-safe interrupts during a flash write operation (NVS updating a value, or some other flash API which has to perform an read/write operation and disable CPU cache). This option has dependency with the UART_ISR_IN_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

Wi-Fi Contains:

- CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE
- CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_TX_BUFFER
- CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_CS1_ENABLED
- CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED
- CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED
- CONFIG_ESP32_WIFI_NVOS_ENABLED
- CONFIG_ESP32_WIFI_TASK_CORE_ID
- CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN
- CONFIG_ESP32_WIFI_MGMT_SBUF_NUM
- CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE
- CONFIG_ESP32_WIFI_IRAM_OPT
Chapter 2. API Reference

- CONFIG_ESP32_WIFI_RX_IRAM_OPT
- CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP32_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP32_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

- If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

- If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

- If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.
Available options:

- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

 CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM

Max number of WiFi static TX buffers

*Found in:* Component config > Wi-Fi

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

 CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM

Max number of WiFi dynamic TX buffers

*Found in:* Component config > Wi-Fi

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

 CONFIG_ESP32_WIFI_CSI_ENABLED

WiFi CSI (Channel State Information)

*Found in:* Component config > Wi-Fi

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

 CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED

WiFi AMPDU TX

*Found in:* Component config > Wi-Fi

Select this option to enable AMPDU TX feature.

 CONFIG_ESP32_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.
**CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**CONFIG_ESP32_WIFI_RX_BA_WIN**

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**CONFIG_ESP32_WIFI_NVS_ENABLED**

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**CONFIG_ESP32_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**

- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added ontop of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.
**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

**CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE**

Enable WiFi debug log

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi debug log.

**CONFIG_ESP32_WIFI_DEBUG_LOG_LEVEL**

WiFi debug log level

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE*

The WiFi log is divided into the following levels: ERROR, WARNING, INFO, DEBUG, VERBOSE. The ERROR, WARNING, INFO levels are enabled by default, and the DEBUG, VERBOSE levels can be enabled here.

**Available options:**

- WiFi Debug Log Debug (ESP32_WIFI_DEBUG_LOG_DEBUG)
- WiFi Debug Log Verbose (ESP32_WIFI_DEBUG_LOG_VERBOSE)

**CONFIG_ESP32_WIFI_DEBUG_LOG_MODULE**

WiFi debug log module

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE*

The WiFi log module contains three parts: WIFI, COEX, MESH. The WIFI module indicates the logs related to WiFi, the COEX module indicates the logs related to WiFi and BT (or BLE) coexist, the MESH module indicates the logs related to Mesh. When ESP32_WIFI_LOG_MODULE_ALL is enabled, all modules are selected.

**Available options:**

- WiFi Debug Log Module All (ESP32_WIFI_DEBUG_LOG_MODULE_ALL)
- WiFi Debug Log Module WiFi (ESP32_WIFI_DEBUG_LOG_MODULE_WIFI)
- WiFi Debug Log Module Coex (ESP32_WIFI_DEBUG_LOG_MODULE_COEX)
- WiFi Debug Log Module Mesh (ESP32_WIFI_DEBUG_LOG_MODULE_MESH)

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE**

WiFi debug log submodule

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE*

Enable this option to set the WiFi debug log submodule. Currently the log submodule contains the following parts: INIT, IOCTL, CONN, SCAN. The INIT submodule indicates the initialization process. The IOCTL submodule indicates the API calling process. The CONN submodule indicates the connecting process. The SCAN submodule indicates the scanning process.
Chapter 2.  API Reference

CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_ALL

WiFi Debug Log Submodule All

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_ALL

When this option is enabled, all debug submodules are selected.

CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_INIT

WiFi Debug Log Submodule Init

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_INIT

CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_IOCTL

WiFi Debug Log Submodule Iocctl

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_IOCTL

CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_CONN

WiFi Debug Log Submodule Conn

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_CONN

CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_SCAN

WiFi Debug Log Submodule Scan

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_SCAN

CONFIG_ESP32_WIFI_IRAM_OPT

WiFi IRAM speed optimization

*Found in:* Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

CONFIG_ESP32_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

*Found in:* Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.
CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

Found in: Component config > Wi-Fi

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

PHY Contains:

- CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE
- CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION
- CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER

CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

Found in: Component config > PHY

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

Found in: Component config > PHY

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

Contains:

- CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN

CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN

Support multiple PHY init data bin

Found in: Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.
**CONFIG_ESP32_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**High resolution timer (esp_timer)**

Contains:

- `CONFIG_ESP_TIMER_PROFILING`
- `CONFIG_ESP_TIMER_TASK_STACK_SIZE`
- `CONFIG_ESP_TIMER_IMPL`

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**CONFIG_ESP_TIMER_IMPL**

Hardware timer to use for esp_timer

*Found in: Component config > High resolution timer (esp_timer)*

esp_timer APIs can be implemented using different hardware timers.

- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for ESP32-S2 chip.

**Available options:**
• FRC2 (legacy) timer (ESP_TIMER_IMPL_FRC2)
• LAC timer of Timer Group 0 (ESP_TIMER_IMPL_TG0_LAC)
• SYSTIMER (ESP_TIMER_IMPL_SYSTIMER)

ESP System Settings  Contains:

• CONFIG_ESP_SYSTEM_PANIC

CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

*Available options:*

• Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.

• Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.

• Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything

• Invoke GDBStub (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

ESP NETIF Adapter  Contains:

• CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL
• CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB
• CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER

CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

*Available options:*

• LwIP (ESP_NETIF_TCPIP_LWIP)
  LwIP is a small independent implementation of the TCP/IP protocol suite.

• Loopback (ESP_NETIF_LOOPBACK)
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only
**CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER**

Enable backward compatible tcpip_adapter interface

*Found in: Component config > ESP NETIF Adapter*

Backward compatible interface to tcpip_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

**ESP HTTPS server**  Contains:

- **CONFIG_ESP_HTTPS_SERVER_ENABLE**

**CONFIG_ESP_HTTPS_SERVER_ENABLE**

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

**HTTP Server**  Contains:

- **CONFIG_HTTPD_MAX_REQ_HDR_LEN**
- **CONFIG_HTTPD_MAX_URI_LEN**
- **CONFIG_HTTPD_ERR_RESP_NO_DELAY**
- **CONFIG_HTTPD_PURGE_BUF_LEN**
- **CONFIG_HTTPD_LOG_PURGE_DATA**
- **CONFIG_HTTPD_WS_SUPPORT**

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures
Chapter 2. API Reference

CONFIG_HTTPD_PURGE_BUF_LEN
Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler. If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

CONFIG_HTTPD_WS_SUPPORT
WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

GDB Stub Contains:

- **CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS
Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

Event Loop Library Contains:

- **CONFIG_ESP_EVENT_LOOP_PROFILING**
- **CONFIG_ESP_EVENT_POST_FROM_ISR**
CONFIG_ESP_EVENT_LOOP_PROFILING

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

CONFIG_ESP_EVENT_POST_FROM_ISR

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

CONFIG_ESP_EVENT_POST_FROM IRAM_ISR

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

Ethernet Contains:

- CONFIG_ETH_USE_ESP32_EMAC
- CONFIG_ETH_USE_SPI_ETHERNET
- CONFIG_ETH_USE_OPENETH

CONFIG_ETH_USE_ESP32_EMAC

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

Contains:

- CONFIG_ETH_PHY_INTERFACE
- CONFIG_ETH_RMII_CLK_MODE
- CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0
- CONFIG_ETH_RMII_CLK_OUT_GPIO
- CONFIG_ETH_DMA_BUFFER_SIZE
- CONFIG_ETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_DMA_TX_BUFFER_NUM

CONFIG_ETH_PHY_INTERFACE

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

Available options:

- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)
- Media Independent Interface (MII) (ETH_PHY_INTERFACE_MII)
Chapter 2. API Reference

**CONFIG_ETH_RMII_CLK_MODE**

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**

- Input RMII clock from external (ETH_RMII_CLK_INPUT)
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

**CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

**CONFIG_ETH_RMII_CLK_OUT_GPIO**

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

**CONFIG_ETH_DMA_BUFFER_SIZE**

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

**CONFIG_ETH_DMA_RX_BUFFER_NUM**

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.
**CONFIG_ETH_USE_SPI_ETHERNET**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

Contains:

- `CONFIG_ETH_SPI_ETHERNET_DM9051`

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select to enable DM9051 driver.

**CONFIG_ETH_USE_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

Contains:

- `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Common ESP-related**

Contains:

- `CONFIG_ESP_ERR_TO_NAME_LOOKUP`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_IPC_TASK_STACK_SIZE`
- `CONFIG_ESP_IPC_USES_CALLERS_PRIORITY`
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
• CONFIG_ESP_INT_WDT
• CONFIG_ESP_TASK_WDT
• CONFIG_ESP_PANIC_HANDLER_IRAM

CONFIG_ESP_ERR_TO_NAME LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE

System event queue size

*Found in: Component config > Common ESP-related*

Config system event queue size in different application.

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE

Event loop task stack size

*Found in: Component config > Common ESP-related*

Config system event task stack size in different application.

CONFIG_ESP_MAIN_TASK_STACK_SIZE

Main task stack size

*Found in: Component config > Common ESP-related*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > Common ESP-related*

Configure the IPC tasks stack size. One IPC task runs on each core (in dual core mode), and allows for cross-core function calls.

See IPC documentation for more details.

The default stack size should be enough for most common use cases. It can be shrunk if you are sure that you do not use any custom IPC functionality.

CONFIG_ESP_IPCUSES_CALLERS_PRIORITY

IPC runs at caller’s priority

*Found in: Component config > Common ESP-related*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, and hence IPC task will run at (configMAX_PRIORITIES - 1) priority.
**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**

Minimal allowed size for shared stack

*Found in: Component config > Common ESP-related*

Minimal value of size, in bytes, accepted to execute an expression with shared stack.

**CONFIG_ESP_CONSOLE_UART**

UART for console output

*Found in: Component config > Common ESP-related*

Select whether to use UART for console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This output can be further suppressed by bootstrapping GPIO13 pin to low logic level.

*Available options:*

- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- Custom: UART0 (ESP_CONSOLE_UART_CUSTOM)
- None: UART0 (ESP_CONSOLE_UART_NONE)

**CONFIG_ESP_CONSOLE_UART_NUM**

UART peripheral to use for console output (0-1)

*Found in: Component config > Common ESP-related*

Due to a ROM bug, UART2 is not supported for console output via ets_printf.

*Available options:*

- UART0: UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1: UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSOLE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Common ESP-related*

**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Common ESP-related*

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > Common ESP-related*
CONFIG_ESP_INT_WDT
Interrupt watchdog

*Found in: Component config > Common ESP-related*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

CONFIG_ESP_INT_WDT_TIMEOUT_MS
Interrupt watchdog timeout (ms)

*Found in: Component config > Common ESP-related > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

CONFIG_ESP_INT_WDT_CHECK_CPU1
Also watch CPU1 tick interrupt

*Found in: Component config > Common ESP-related > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

CONFIG_ESP_TASK_WDT
Initialize Task Watchdog Timer on startup

*Found in: Component config > Common ESP-related*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference).

CONFIG_ESP_TASK_WDT_PANIC
Invoke panic handler on Task Watchdog timeout

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference).

CONFIG_ESP_TASK_WDT_TIMEOUT_S
Task Watchdog timeout period (seconds)

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference).

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0
Watch CPU0 Idle Task

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.
**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > Common ESP-related*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code is placed in IRAM. This allows the panic handler to run without needing to re-enable cache first. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash.)

eFuse Bit Manager  Contains:

- `CONFIG_EFUSE_CUSTOM_TABLE`
- `CONFIG_EFUSE_VIRTUAL`
- `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`

**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

All read and writes operations are redirected to RAM instead of eFuse registers. If this option is set, all permanent changes (via eFuse) are disabled. Log output will state changes which would be applied, but they will not be.

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

*Available options:*
None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

Supplicant Contains:
• CONFIG_WPA_MBEDTLS_CRYPTO
• CONFIG_WPA_DEBUG_PRINT
• CONFIG_WPA_TESTING_OPTIONS
• CONFIG_WPA_TLS_V12
• CONFIG_WPA_WPS_WARS

CONFIG_WPA_MBEDTLS_CRYPTO
Use MbedTLS crypto API’s
Found in: Component config > Supplicant
Select this option to use MbedTLS crypto API’s which utilize hardware acceleration.

CONFIG_WPA_DEBUG_PRINT
Print debug messages from WPA Supplicant
Found in: Component config > Supplicant
Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.
Enabling this could increase the build size ~60kb depending on the project logging level.

CONFIG_WPA_TESTING_OPTIONS
Add DPP testing code
Found in: Component config > Supplicant
Select this to enable unity test for DPP.

CONFIG_WPA_TLS_V12
Enable TLS v1.2
Found in: Component config > Supplicant
Select this to enable TLS v1.2 for WPA2-Enterprise Authentication.

CONFIG_WPA_WPS_WARS
Add WPS Interoperability Fixes
Found in: Component config > Supplicant
Select this option to enable WPS related IOT fixes with different APs. This option fixes IOT related issues with APs which do not follow some of the standards of WPS-2.0 specification. These do not include any of the security related bypassing, just simple configuration corrections.
Current fixes under this flag. 1. Allow NULL-padded WPS attributes: Some APs keep NULL-padding at the end of some variable length WPS Attributes. This is not as par the WPS2.0 specs, but to avoid interop issues, ignore the padding by reducing the attribute length by 1. 2. Bypass WPS-Config method validation: Some APs set display/pbc button bit without setting virtual/physical display/button bit which will cause M2 validation fail, bypassing WPS-Config method validation.
Wear Levelling  Contains:
  • CONFIG_WL_SECTOR_SIZE
  • CONFIG_WL_SECTOR_MODE

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

*Available options:*
  • 512 (WL_SECTOR_SIZE_512)
  • 4096 (WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

* • In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.  
  • In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.*

*Available options:*
  • Performance (WL_SECTOR_MODE_PERF)
  • Safety (WL_SECTOR_MODE_SAFE)

Virtual file system  Contains:
  • CONFIG_VFS_SUPPORT_IO

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.
CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

CONFIG_VFS_SUPPORT_SELECT

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

- If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.
- If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

Host File System I/O (Semihosting) Contains:

- `CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS`
- `CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN`

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.
**CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN**

Host FS: Maximum path length for the host base directory

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum path length for the host base directory which is to be mounted. If host path passed to esp_vfs_semihost_register() is longer than this value it will be truncated.

**SPIFFS Configuration**

Contains:

- `CONFIG_SPIFFS_MAX_PARTITIONS`
- SPIFFS Cache Configuration
- `CONFIG_SPIFFS_PAGE_CHECK`
- `CONFIG_SPIFFS_GC_MAX_RUNS`
- `CONFIG_SPIFFS_GC_STATS`
- `CONFIG_SPIFFS_PAGE_SIZE`
- `CONFIG_SPIFFS_OBJ_NAME_LEN`
- `CONFIG_SPIFFS_FOLLOW_SYMLINKS`
- `CONFIG_SPIFFS_USE_MAGIC`
- `CONFIG_SPIFFS_META_LENGTH`
- `CONFIG_SPIFFS_USE_MTIME`
- `CONFIG_SPIFFS_MTIME_WIDE_64_BITS`
- Debug Configuration

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**SPIFFS Cache Configuration**

Contains:

- `CONFIG_SPIFFS_CACHE`

**CONFIG_SPIFFS_CACHE**

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disables memory read caching of nucleus file system operations.

**CONFIG_SPIFFS_CACHE_WRT**

Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**CONFIG_SPIFFS_CACHE_STATS**

Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disable statistics on caching. Debug/test purpose only.
**CONFIG_SPIFFS_PAGE_CHECK**

Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**CONFIG_SPIFFS_GC_MAX_RUNS**

Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.
**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support time_t 64 bits (see SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS).

**Debug Configuration**

Contains:

- **CONFIG_SPIFFS_DBG**
- **CONFIG_SPIFFS_API_DBG**
- **CONFIG_SPIFFS_GC_DBG**
- **CONFIG_SPIFFS_CACHE_DBG**
- **CONFIG_SPIFFS_CHECK_DBG**
- **CONFIG_SPIFFS_TEST_VISUALISATION**

**CONFIG_SPIFFS_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.
**CONFIG_SPIFFS_API_DBG**

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**CONFIG_SPIFFS_GC_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**CONFIG_SPIFFS_CACHE_DBG**

Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**CONFIG_SPIFFS_CHECK_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**CONFIG_SPIFFS_TEST_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

**SPI Flash driver**

Contains:

- `CONFIG_SPI_FLASH_VERIFY_WRITE`
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH`
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`
- `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`
- `CONFIG_SPI_FLASH_SHARE_SPI1_BUS`
- `CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE`
- `CONFIG_SPI_FLASH_YIELD_DURING_ERASE`
- Auto-detect flash chips

**CONFIG_SPI_FLASH_VERIFY_WRITE**

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.
CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option is needed to write to flash on ESP32-D2WD, and any configuration where external SPI flash is connected to non-default pins.

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the `esp_rom_xxx` SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:
• Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
• Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
• Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

**CONFIG_SPI_FLASH_USE_LEGACY_IMPL**

Use the legacy implementation before IDF v4.0

*Found in: Component config > SPI Flash driver*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

**CONFIG_SPI_FLASH_SHARE_SPI1_BUS**

Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp.flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**CONFIG_SPI_FLASH_YIELD_DURING_ERASE**

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

**CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS**

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**CONFIG_SPI_FLASH_ERASE_YIELD_TICKS**

CPU release time (tick)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.
Auto-detect flash chips

Contains:
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`

**CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**PThreads**

Contains:
- `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
- `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`
- `CONFIG_PTHREAD_STACK_MIN`
- `CONFIG_PTHREAD_TASK_CORE_DEFAULT`
- `CONFIG_PTHREAD_TASK_NAME_DEFAULT`

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.
Chapter 2. API Reference

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**

- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**OpenSSL**

Contains:

- *CONFIG_OPENSSL_DEBUG*
- *CONFIG_OPENSSL_ASSERT*

**CONFIG_OPENSSL_DEBUG**

Enable OpenSSL debugging

*Found in: Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL_DEBUG” works.

**CONFIG_OPENSSL_DEBUG_LEVEL**

OpenSSL debugging level

*Found in: Component config > OpenSSL > CONFIG_OPENSSL_DEBUG*

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL_DEBUG_LEVEL” works.

For example: If OPENSSL_DEBUG_LEVEL = 2, you use function “SSL_DEBUG(1, “malloc failed”)”. Because 1 < 2, it will not print.

**CONFIG_OPENSSL_LOWLEVEL_DEBUG**

Enable OpenSSL low-level module debugging

*Found in: Component config > OpenSSL > CONFIG_OPENSSL_DEBUG*

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.
CONFIG_OPENSSL_ASSERT

Select OpenSSL assert function

Found in: Component config > OpenSSL

OpenSSL function needs "assert" function to check if input parameters are valid.
If you want to use assert debugging function, "OPENSSL_DEBUG" should be enabled.

Available options:
- Do nothing (OPENSSL_ASSERT_DO NOTHING)
- Check and exit (OPENSSL_ASSERT_EXIT)
- Show debugging message (OPENSSL_ASSERT_DEBUG)
- Show debugging message and exit (OPENSSL_ASSERT_DEBUG_EXIT)
- Show debugging message and block (OPENSSL_ASSERT_DEBUG_BLOCK)

NVS Contains:
- CONFIG_NVS_ENCRYPTION

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

Found in: Component config > NVS

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

Newlib Contains:
- CONFIG_NEWLIB_STDOUT_LINE_ENDING
- CONFIG_NEWLIB_STDIN_LINE_ENDING
- CONFIG_NEWLIB_NANO_FORMAT

CONFIG_NEWLIB_STDOUT_LINE_ENDING

Line ending for UART output

Found in: Component config > Newlib

This option allows configuring the desired line endings sent to UART when a newline (‘n’, LF) appears on stdout. Three options are possible:
CRLF: whenever LF is encountered, prepend it with CR
LF: no modification is applied, stdout is sent as is
CR: each occurrence of LF is replaced with CR
This option doesn’t affect behavior of the UART driver (drivers/uart.h).

Available options:
- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
• CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘n’, LF) on stdin.

Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’ : https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**mDNS** Contains:

- **CONFIG_MDNS_MAX_SERVICES**
- **CONFIG_MDNS_TASK_PRIORITY**
- **CONFIG_MDNS_TASK_STACK_SIZE**
- **CONFIG_MDNS_TASK_AFFINITY**
- **CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS**
- **CONFIG_MDNS_TIMER_PERIOD_MS**

**CONFIG_MDNS_MAX_SERVICES**

Max number of services

*Found in: Component config > mDNS*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.
Chapter 2. API Reference

CONFIG_MDNS_TASK_PRIORITY
mDNS task priority

*Found in: Component config > mDNS*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

CONFIG_MDNS_TASK_STACK_SIZE
mDNS task stack size

*Found in: Component config > mDNS*

Allows setting mDNS task stacksize.

CONFIG_MDNS_TASK_AFFINITY
mDNS task affinity

*Found in: Component config > mDNS*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

**Available options:**
- No affinity (MDNS_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (MDNS_TASK_AFFINITY_CPU0)
- CPU1 (MDNS_TASK_AFFINITY_CPU1)

CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS
mDNS adding service timeout (ms)

*Found in: Component config > mDNS*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

CONFIG_MDNS_TIMER_PERIOD_MS
mDNS timer period (ms)

*Found in: Component config > mDNS*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**mbedTLS** Contains:
- `CONFIG_MBEDTLS_MEM_ALLOC_MODE`
- `CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN`
- `CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`
- `CONFIG_MBEDTLS_DEBUG`
- Certificate Bundle
- `CONFIG_MBEDTLS_ECP_RESTARTABLE`
- `CONFIG_MBEDTLS CMAC_C`
- `CONFIG_MBEDTLS_HARDWARE_AES`
- `CONFIG_MBEDTLS_HARDWARE_MPI`
- `CONFIG_MBEDTLS_HARDWARE_SHA`
- `CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN`
- `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`
CONFIG_MBEDTLS_HAVE_TIME
CONFIG_MBEDTLS_ECDSA_DETERMINISTIC
CONFIG_MBEDTLS_SHA512_C
CONFIG_MBEDTLS_TLS_MODE
TLS Key Exchange Methods
CONFIG_MBEDTLS_SSL_RENEGOTIATION
CONFIG_MBEDTLS_SSL_PROTO_SSL3
CONFIG_MBEDTLS_SSL_PROTO_TLS1
CONFIG_MBEDTLS_SSL_PROTO_TLS1_1
CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
CONFIG_MBEDTLS_SSL_PROTO_DTLS
CONFIG_MBEDTLS_SSL_ALPN
CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
Symmetric Ciphers
CONFIG_MBEDTLS_RIPEMD160_C
Certificates
CONFIG_MBEDTLS_ECP_C
CONFIG_MBEDTLS_POLY1305_C
CONFIG_MBEDTLS_CHACHA20_C
CONFIG_MBEDTLS_HKDF_C
CONFIG_MBEDTLS_THREADING_C
CONFIG_MBEDTLS_SECURITY_RISKS

CONFIG_MBEDTLS_MEM_ALLOC_MODE
Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal, since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

**Available options:**

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN
TLS maximum message content length

*Found in: Component config > mbedTLS*
Maximum TLS message length (in bytes) supported by mbedTLS.
16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

**CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN**

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN**

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

**CONFIG_MBEDTLS_DYNAMIC_FREE_PEER_CERT**

Free SSL peer certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free peer certificate after its usage in handshake process.
CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free certificate, key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free certificate, private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

**Available options:**

- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

Certificate Bundle  Contains:

- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE*

**Available options:**

- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
• Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
• Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE
Add custom certificates to the default bundle

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH
Custom certificate bundle path

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE
Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_ECP_RESTARTABLE
Enable mbedTLS ecp restartable

Found in: Component config > mbedTLS
Enable “non-blocking” ECC operations that can return early and be resumed.

CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

Found in: Component config > mbedTLS
Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

Found in: Component config > mbedTLS
Enable hardware accelerated AES encryption & decryption.
Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

CONFIG_MBEDTLS_HARDWARE_MPI
Enable hardware MPI (bignum) acceleration

Found in: Component config > mbedTLS
Enable hardware accelerated multiple precision integer operations.
Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to 4096 bit results.
These operations are used by RSA.
Chapter 2. API Reference

**CONFIG_MBEDTLS_HARDWARE_SHA**
Enable hardware SHA acceleration

*Found in: Component config > mbedtls*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.
Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.
SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**
Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedtls*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY**
Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedtls*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**CONFIG_MBEDTLS_HAVE_TIME**
Enable mbedtls time

*Found in: Component config > mbedtls*

System has time.h and time(). The time does not need to be correct, only time differences are used.

**CONFIG_MBEDTLS_HAVE_TIME_DATE**
Enable mbedtls certificate expiry check

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

System has time.h and time(), gmtime() and the clock is correct. The time needs to be correct (not necessarily very accurate, but at least the date should be correct). This is used to verify the validity period of X.509 certificates.
It is suggested that you should get the real time by “SNTP”.

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**
Enable deterministic ECDSA

*Found in: Component config > mbedtls*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.
CONFIG_MBEDTLS_SHA512_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**
- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

TLS Key Exchange Methods

Contains:

- **CONFIG_MBEDTLS_PSK_MODES**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**

CONFIG_MBEDTLS_PSK_MODES

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.
Chapter 2. API Reference

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK**
Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK**
Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**
Enable RSA-only based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to support ciphersuites with prefix TLS-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**
Enable DHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**
Support Elliptic Curve based ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**
Enable ECDHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*
Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**
Enable ECDHE-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*
Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-
CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA

Enable ECDH-RSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable ECJPAKE based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

Found in: Component config > mbedTLS

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

CONFIG_MBEDTLS_SSL_PROTO_SSL3

Legacy SSL 3.0 support

Found in: Component config > mbedTLS

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

CONFIG_MBEDTLS_SSL_PROTO_TLS1

Support TLS 1.0 protocol

Found in: Component config > mbedTLS

CONFIG_MBEDTLS_SSL_PROTO_TLS1_1

Support TLS 1.1 protocol

Found in: Component config > mbedTLS

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

Found in: Component config > mbedTLS
CONF'MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)
*Found in: Component config > mbedTLS*
Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

CONF'MMBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)
*Found in: Component config > mbedTLS*
Disabling this option will save some code size if it is not needed.

CONF'MMBEDTLS_CLIENT_SSL_SESSION_TICKETS
TLS: Client Support for RFC 5077 SSL session tickets
*Found in: Component config > mbedTLS*
Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

CONF'MMBEDTLS_SERVER_SSL_SESSION_TICKETS
TLS: Server Support for RFC 5077 SSL session tickets
*Found in: Component config > mbedTLS*
Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

Symmetric Ciphers Contains:
- CONF'MMBEDTLS_AES_C
- CONF'MMBEDTLS_CAMELLIA_C
- CONF'MMBEDTLS_DES_C
- CONF'MMBEDTLS_RC4_MODE
- CONF'MMBEDTLS_BLOWFISH_C
- CONF'MMBEDTLS_XTEA_C
- CONF'MMBEDTLS_CCM_C
- CONF'MMBEDTLS_GCM_C

CONF'MMBEDTLS_AES_C
AES block cipher
*Found in: Component config > mbedTLS > Symmetric Ciphers*

CONF'MMBEDTLS_CAMELLIA_C
Camellia block cipher
*Found in: Component config > mbedTLS > Symmetric Ciphers*
Chapter 2. API Reference

**CONFIG_MBEDTLS_DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**CONFIG_MBEDTLS_RC4_MODE**

RC4 Stream Cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

**Available options:**

- Disabled (MBEDTLS_RC4_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS_RC4_ENABLED_NO_DEFAULT)
- Enabled (MBEDTLS_RC4_ENABLED)

**CONFIG_MBEDTLS_BLOWFISH_C**

Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**CONFIG_MBEDTLS_XTEA_C**

XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**CONFIG_MBEDTLS_CCM_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**CONFIG_MBEDTLS_GCM_C**

GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.
CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm

Enable the RIPEMD-160 hash algorithm.

Certificates Contains:
- CONFIG_MBEDTLS_PEM_PARSE_C
- CONFIG_MBEDTLS_PEM_WRITE_C
- CONFIG_MBEDTLS_X509_CRL_PARSE_C
- CONFIG_MBEDTLS_X509_CSR.Parse_C

CONFIG_MBEDTLS.PEM.PARSE.C
Read & Parse PEM formatted certificates

Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

CONFIG_MBEDTLS.PEM.WRITE.C
Write PEM formatted certificates

Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

CONFIG_MBEDTLS_X509.CRL.Parse.C
X.509 CRL parsing

CONFIG_MBEDTLS_X509.CSR.Parse.C
X.509 CSR parsing

Support for parsing X.509 Certificate Signing Requests

CONFIG_MBEDTLS.ECP.C
Elliptic Curve Ciphers

Contains:
- CONFIG_MBEDTLS.ECDH.C
- CONFIG_MBEDTLS.ECPAKE.C
- CONFIG_MBEDTLS.ECP.DP_SEC192R1_ENABLED

**CONFIG_MBEDTLS_ECDH_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**CONFIG_MBEDTLS_ECDSA_C**

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**CONFIG_MBEDTLS_ECJPAKE_C**

Elliptic curve J-PAKE

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED**

Enable SECP192R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP192R1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED**

Enable SECP224R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP224R1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED**

Enable SECP256R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP256R1 Elliptic Curve.
**CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED**

Enable SECP384R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP384R1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED**

Enable SECP521R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP521R1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED**

Enable SECP192K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP192K1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED**

Enable SECP224K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP224K1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP256K1 Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Support for DP Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Support for DP Elliptic Curve.

**CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Support for DP Elliptic Curve.
CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
Enable CURVE25519 curve
Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C
Enable support for CURVE25519 Elliptic Curve.

CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations
Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.
# end of Elliptic Curve options

CONFIG_MBEDTLS_POLY1305_C
Poly1305 MAC algorithm
Found in: Component config > mbedTLS
Enable support for Poly1305 MAC algorithm.

CONFIG_MBEDTLS_CHACHA20_C
Chacha20 stream cipher
Found in: Component config > mbedTLS
Enable support for Chacha20 stream cipher.

CONFIG_MBEDTLS_CHACHA20POLY_C
ChaCha20-Poly1305 AEAD algorithm
Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C
Enable support for ChaCha20-Poly1305 AEAD algorithm.

CONFIG_MBEDTLS_HKDF_C
HKDF algorithm (RFC 5869)
Found in: Component config > mbedTLS
Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

CONFIG_MBEDTLS_THREADING_C
Enable the threading abstraction layer
Found in: Component config > mbedTLS
If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.
CONFIG_MBEDTLS_THREADING_ALT
Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

CONFIG_MBEDTLS_THREADING_PTHREAD
Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

CONFIG_MBEDTLS_SECURITY_RISKS
Show configurations with potential security risks

*Found in: Component config > mbedTLS*

Contains:

- `CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT`

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT
X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

LWIP
Contains:

- `CONFIG_LWIP_LOCAL_HOSTNAME`
- `CONFIG_LWIP_DNS_SUPPORT_MDNS QUERIES`
- `CONFIG_LWIP_L2_TO_L3_COPY`

- `TCP`
- `UDP`
- `CONFIG_LWIP_TCP/IP_TASK_STACK_SIZE`
CONFIG_LWIP_LOCAL_HOSTNAME

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

CONFIG_LWIP_DNS_SUPPORT_MDNS QUERIES

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations. If this feature is disabled, all lwip functions will be put into FLASH.

CONFIG_LWIP_TIMERS_ONDEMAND

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets. This feature will reduce the power consumption for applications which do not use IGMP and MLD6.
**CONFIG_LWIP_MAX_SOCKETS**

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Use VFS_SUPPORT_SELECT instead, which is the inverse of this option.

The virtual filesystem layer of select() redirects sockets to lwip_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip_select(), therefore, select can be used for sockets only.

**CONFIG_LWIP_SO_REUSE**

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**CONFIG_LWIP_SO_REUSE_RXTOALL**

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**CONFIG_LWIP_SO_RCVBUF**

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**CONFIG_LWIP_NETBUF_RECVINFO**

Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**CONFIG_LWIP_IP_FRAG**

Enable fragment outgoing IP packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP packets if their size exceeds MTU.
CONFIG_LWIP_IP_REASSEMBLY
Enable reassembly incoming fragmented IP packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP packets.

CONFIG_LWIP_IP_FORWARD
Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

CONFIG_LWIP_IPV4_NAPT
Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

CONFIG_LWIP_STATS
Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics.

CONFIG_LWIP_ETHARP_TRUST_IP_MAC
Enable LWIP ARP trust

*Found in: Component config > LWIP*

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little latency. The peer *is* in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled:
- The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer.
- The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

CONFIG_LWIP_ESP_GRATUITOUS_ARP
Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.
This option solves the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update its ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update its ARP table.

**CONFIG_LWIP_GARP_TMR_INTERVAL**

GARP timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP GRATUITOUS ARP*

Set the timer interval for gratuitous ARP. The default value is 60s.

**CONFIG_LWIP_TCP_IP_RECV_MBOX_SIZE**

TCP/IP task receive mailbox size

*Found in: Component config > LWIP*

Set TCP/IP task receive mailbox size. Generally a bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mailbox size.

**CONFIG_LWIP_DHCP DOES ARP CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**CONFIG_LWIP_DHCP_RESTORE_LAST_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**DHCP server**

Contains:

- **CONFIG_LWIP_DHCP_MIN LEASE UNIT**
- **CONFIG_LWIP_DHCP_MAX STATION NUM**

**CONFIG_LWIP_DHCP_MIN LEASE UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**CONFIG_LWIP_DHCP_MAX STATION NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from its address pool, without notification.
**CONFIG_LWIP_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

Contains:

- `CONFIG_LWIP_AUTOIP_TRIES`
- `CONFIG_LWIP_AUTOIP_MAX_CONFLICTS`
- `CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL`

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**CONFIG_LWIP_IPV6_AUTOCONFIG**

Enable IPV6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration.

See RFC 4862.

**CONFIG_LWIP_NETIF_LOOPBACK**

Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will "loop back" and be received by this interface.

Contains:
• **CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

**CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**TCP** Contains:

• **CONFIG_LWIP_MAX_ACTIVE_TCP**
• **CONFIG_LWIP_MAX_LISTENING_TCP**
• **CONFIG_LWIP_TCP_MAXRTX**
• **CONFIG_LWIP_TCP_SYNMAXRTX**
• **CONFIG_LWIP_TCP_MSS**
• **CONFIG_LWIP_TCP_TMR_INTERVAL**
• **CONFIG_LWIP_TCP_MSL**
• **CONFIG_LWIP_TCP_SND_BUF_DEFAULT**
• **CONFIG_LWIP_TCPWND_DEFAULT**
• **CONFIG_LWIP_TCP_RECVMBOX_SIZE**
• **CONFIG_LWIP_TCP_QUEUE_OOSEQ**
• **CONFIG_LWIP_TCP_SACK_OUT**
• **CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES**
• **CONFIG_LWIP_TCP_OVERSIZE**
• **CONFIG_LWIP_WND_SCALE**

**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.
CONFIG_LWIP_TCP_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

---

CONFIG_LWIP_TCP_MSS

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

---

CONFIG_LWIP_TCP_TMR_INTERVAL

TCP timer interval (ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

---

CONFIG_LWIP_TCP_MSL

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

---

CONFIG_LWIP_TCP_SND_BUF_DEFAULT

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...). This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

---

CONFIG_LWIP_TCP_WND_DEFAULT

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will decrease performance.
**CONFIG_LWIP_TCP_RECVMBOX_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: \( \frac{\text{LWIP_TCP_WND_DEFAULT}}{\text{TCP_MSS}} + 2 \). e.g. if \( \text{LWIP_TCP_WND_DEFAULT}=14360 \), \( \text{TCP_MSS}=1436 \), then the recommended receive mail box size is \( \frac{14360}{1436} + 2 = 12 \).

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum \( \text{LWIP_TCP_RECCVMBOX_SIZE} \) packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is \( \text{LWIP_TCP_RECCVMBOX_SIZE} \times \text{maximum TCP socket number} \). In other words, the bigger \( \text{LWIP_TCP_RECCVMBOX_SIZE} \) means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**CONFIG_LWIP_TCP_SACK_OUT**

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP*

TCP will support sending selective acknowledgements (SACKs).

**CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES**

Keep TCP connections when IP changed

*Found in: Component config > LWIP > TCP*

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2

Disable this option to keep consistent with the original LWIP code behavior.

**CONFIG_LWIP_TCP_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.
Available options:
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**
Support TCP window scale

*Found in: Component config > LWIP > TCP*
Enable this feature to support TCP window scaling.

**CONFIG_LWIP_TCP_RCV_SCALE**
Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*
Enable this feature to support TCP window scaling.

**UDP**
Contains:
- **CONFIG_LWIP_MAX_UDP_PCBS**
- **CONFIG_LWIP_UDP_RECVMBOX_SIZE**

**CONFIG_LWIP_MAX_UDP_PCBS**
Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*
The maximum number of active UDP connections (i.e., UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**CONFIG_LWIP_UDP_RECVMBOX_SIZE**
Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*
Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECCVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECCVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
TCP/IP Task Stack Size

*Found in: Component config > LWIP*
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.
**CONFIG_LWIP_TCPIP_TASK_AFFINITY**

TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**

- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)

**CONFIG_LWIP_PPP_SUPPORT**

Enable PPP support (new/experimental)

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible.

PPP over serial support is experimental and unsupported.

Contains:

- CONFIG_LWIP_PPP_ENABLE_IPV6
- CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
- CONFIG_LWIP_PPP_PAP_SUPPORT
- CONFIG_LWIP_PPP_CHAP_SUPPORT
- CONFIG_LWIP_PPP_MSCHAP_SUPPORT
- CONFIG_LWIP_PPP_MPPE_SUPPORT
- CONFIG_LWIP_PPP_DEBUG_ON

**CONFIG_LWIP_PPP_ENABLE_IPV6**

Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

Enable Notify Phase Callback

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable to set a callback which is called on change of the internal PPP state machine.

**CONFIG_LWIP_PPP_PAP_SUPPORT**

Enable PAP support

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable Password Authentication Protocol (PAP) support
CONFIG_LWIP_PPP_CHAP_SUPPORT

Enable CHAP support

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable Challenge Handshake Authentication Protocol (CHAP) support

CONFIG_LWIP_PPP_MSCHAP_SUPPORT

Enable MSCHAP support

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

CONFIG_LWIP_PPP_MPPE_SUPPORT

Enable MPPE support

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable Microsoft Point-to-Point Encryption (MPPE) support

CONFIG_LWIP_PPP_DEBUG_ON

Enable PPP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable PPP debug log output

ICMP

Contains:

- CONFIG_LWIP_MULTICAST_PING
- CONFIG_LWIP_BROADCAST_PING

CONFIG_LWIP_MULTICAST_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

CONFIG_LWIP_BROADCAST_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

LWIP RAW API

Contains:

- CONFIG_LWIP_MAX_RAW_PCBS

CONFIG_LWIP_MAX_RAW_PCBS

Maximum LWIP RAW PCBS

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.
SNTP Contains:

- `CONFIG_LWIP_DHCP_MAX_NTP_SERVERS`
- `CONFIG_LWIP_SNTP_UPDATE_DELAY`

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` function is limited to this value.

**CONFIG_LWIP_SNTP_UPDATE_DELAY**

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**CONFIG_LWIP_ESP_LWIP_ASSERT**

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option allows lwip to check assert. It is recommended to keep it open, do not close it.

**Log output** Contains:

- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_COLORS`
- `CONFIG_LOG_TIMESTAMP_SOURCE`

**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

Note that this setting limits which log statements are compiled into the program. So setting this to, say, “Warning” would mean that changing log level to “Debug” at runtime will not be possible.

**Available options:**

- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)
CONFIG_LOG_COLORS
Use ANSI terminal colors in log output

*Found in: Configuration > Log output*
Enable ANSI terminal color codes in bootloader output.
In order to view these, your terminal program must support ANSI color codes.

CONFIG_LOG_TIMESTAMP_SOURCE
Log Timestamps

*Found in: Configuration > Log output*
Choose what sort of timestamp is displayed in the log output:

- **Milliseconds since boot** is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- **System time** is taken from POSIX time functions which use the ESP32’s RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- **NOTE:** Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**libsodium** Contains:
- *CONFIG_LIBSODIUM_USE_MBEDTLS_SHA*

CONFIG_LIBSODIUM_USE_MBEDTLS_SHA
Use mbedTLS SHA256 & SHA512 implementations

*Found in: Configuration > libsodium*
If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.
This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium’s API manages SHA state).

**jsmn** Contains:
- *CONFIG_JSMN_PARENT_LINKS*
- *CONFIG_JSMN_STRICT*

CONFIG_JSMN_PARENT_LINKS
Enable parent links

*Found in: Configuration > jsmn*
You can access to parent node of parsed json
CONFIG_JSMN STRICT

Enable strict mode

Found in: Component config > jsmn

In strict mode primitives are: numbers and booleans

Heap memory debugging  Contains:

- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH
- CONFIG_HEAP_TASK_TRACKING
- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS

CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

Found in: Component config > Heap memory debugging

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

CONFIG_HEAP_TRACING_DEST

Heap tracing

Found in: Component config > Heap memory debugging

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

Available options:

- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

Found in: Component config > Heap memory debugging

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.
Chapter 2. API Reference

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**FreeRTOS** Contains:

- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION`
- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_ASSERT`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_LEGACY_HOOKS`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_FPU_IN_ISR`

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.
CONFIG_FREERTOS_CORETIMER

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1

CONFIG_FREERTOS_OPTIMIZED_SCHEDULER

Enable FreeRTOS platform optimized scheduler

*Found in: Component config > FreeRTOS*

On most platforms there are instructions that can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

CONFIG_FREERTOS_HZ

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

CONFIG_FREERTOS_CHECK_STACKOVERFLOW

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplicationStackOverflowHook when this happens.

**Available options:**

- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW=0)
- Check by stack pointer value (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW=1)
- Check using canary bytes (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW=2)
**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Set a debug watchpoint as a stack overflow check

*Found in: Component config > FreeRTOS*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the debug memory watchpoint 1 (the second one) to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively only have one watchpoint; the 2nd one is overwritten as soon as a task switch happens.

This check only triggers if the stack overflow writes within 4 bytes of the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higer level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

Number of thread local storage pointers

*Found in: Component config > FreeRTOS*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**CONFIG_FREERTOS_ASSERT**

FreeRTOS assertions

*Found in: Component config > FreeRTOS*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

**Available options:**

- abort() on failed assertions (FREERTOS_ASSERT_FAIL_ABORT)
  If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic handler can be configured to handle the outcome of an abort() in different ways.
- Print and continue failed assertions (FREERTOS_ASSERT_FAIL_PRINT_CONTINUE)
  If a FreeRTOS assertion fails, print it out and continue.
- Disable FreeRTOS assertions (FREERTOS_ASSERT_DISABLE)
  FreeRTOS configASSERT() will not be compiled into the binary.
**CONFIG_FREERTOS_IDLE_TASK_STACKSIZE**

Idle Task stack size

*Found in: Component config > FreeRTOS*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**CONFIG_FREERTOS_LEGACY_HOOKS**

Use FreeRTOS legacy hooks

*Found in: Component config > FreeRTOS*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp_register_freertos_xxx_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can’t be migrated to the esp_register_freertos_xxx_hook system.

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

Maximum task name length

*Found in: Component config > FreeRTOS*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION**

Enable FreeRTOS static allocation API

*Found in: Component config > FreeRTOS*

FreeRTOS gives the application writer the ability to instead provide the memory themselves, allowing the following objects to optionally be created without any memory being allocated dynamically:

- Tasks
- Software Timers (Daemon task is still dynamic. See documentation)
- Queues
- Event Groups
- Binary Semaphores
- Counting Semaphores
- Recursive Semaphores
- Mutexes
Whether it is preferable to use static or dynamic memory allocation is dependent on the application, and the preference of the application writer. Both methods have pros and cons, and both methods can be used within the same RTOS application.

Creating RTOS objects using statically allocated RAM has the benefit of providing the application writer with more control: RTOS objects can be placed at specific memory locations. The maximum RAM footprint can be determined at link time, rather than run time. The application writer does not need to concern themselves with graceful handling of memory allocation failures. It allows the RTOS to be used in applications that simply don’t allow any dynamic memory allocation (although FreeRTOS includes allocation schemes that can overcome most objections).

**CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP**

Enable static task clean up hook

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```c
void vPortCleanUpTCB ( void *pxTCB ) {
    // place clean up code here
}
```

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

FreeRTOS timer task priority

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the priority that the timer task will run at.

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

FreeRTOS timer task stack size

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

FreeRTOS timer queue length

*Found in: Component config > FreeRTOS*

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the ‘timer command queue’. The ‘timer command queue’ is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.
**CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE**

FreeRTOS queue registry size

*Found in: Component config > FreeRTOS*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

---

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

Enable FreeRTOS trace facility

*Found in: Component config > FreeRTOS*

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

---

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

Enable FreeRTOS stats formatting functions

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY*

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

---

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

---

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

Enable FreeRTOS to collect run time stats

*Found in: Component config > FreeRTOS*

If enabled, configGENERATE_RUN_TIME_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS_USE_STATS_FORMATTING_FUNCTIONS and FREERTOS_USE_TRACE_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

---

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.
Available options:

- **Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)**
  
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.

- **Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)**

  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

Tickless idle support

*Found in: Component config > FreeRTOS*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run.

If disabled, automatic light sleep support will be disabled.

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: Component config > FreeRTOS*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.
CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

*Found in: Component config > FreeRTOS*

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure.

CONFIG_FREERTOS_FPU_IN_ISR

Allow use of float inside Level 1 ISR (EXPERIMENTAL)

*Found in: Component config > FreeRTOS*

When enabled, the usage of float type is allowed inside Level 1 ISRs.

FAT Filesystem support

Contains:

- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_TIMEOUT_MS
- CONFIG_FATFS_PER_FILE_CACHE
- CONFIG_FATFS_ALLOC_PREFER_EXTRAM

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)
CONFIG_FATFS_LONG_FILENAMES

Long filename support

Found in: Component config > FAT Filesystem support

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:
- No long filenames (FATFS_LFNNONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

CONFIG_FATFS_MAX_LFN

Max long filename length

Found in: Component config > FAT Filesystem support

Maximum long filename length. Can be reduced to save RAM.

CONFIG_FATFS_API_ENCODING

API character encoding

Found in: Component config > FAT Filesystem support

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

Found in: Component config > FAT Filesystem support

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

CONFIG_FATFS_TIMEOUT_MS

Timeout for acquiring a file lock, ms

Found in: Component config > FAT Filesystem support

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.
**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY_.

If this option is set, _FS_TINY_ is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS_ variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY_ is 1, and single cache is used for all open files, size is also equal to _MAX_SS_ variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Core dump** Contains:

- `CONFIG_ESP32_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP32_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP32_COREDUMP_CHECKSUM`
- `CONFIG_ESP32_CORE_DUMP_MAX_TASKS_NUM`
- `CONFIG_ESP32_CORE_DUMP_UART_DELAY`
- `CONFIG_ESP32_CORE_DUMP_STACK_SIZE`
- `CONFIG_ESP32_CORE_DUMP_DECODE`

**CONFIG_ESP32_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (ESP32_ENABLE_COREDUMP_TO_FLASH)
- UART (ESP32_ENABLE_COREDUMP_TO_UART)
- None (ESP32_ENABLE_COREDUMP_TO_NONE)

**CONFIG_ESP32_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

**Available options:**

- Binary format (ESP32_COREDUMP_DATA_FORMAT_BIN)
• ELF format (ESP32_COREDUMP_DATA_FORMAT_ELF)

CONFIG_ESP32_COREDUMP_CHECKSUM

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

*Available options:*
  - Use CRC32 for integrity verification (ESP32_COREDUMP_CHECKSUM_CRC32)
  - Use SHA256 for integrity verification (ESP32_COREDUMP_CHECKSUM_SHA256)

CONFIG_ESP32_CORE_DUMP_MAX_TASKS_NUM

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

CONFIG_ESP32_CORE_DUMP_UART_DELAY

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

CONFIG_ESP32_CORE_DUMP_STACK_SIZE

Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

CONFIG_ESP32_CORE_DUMP_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

*Available options:*
  - Decode and show summary (info_corefile) (ESP32_COREDUMP_DECODE_INFO)
  - Don’t decode (ESP32_COREDUMP_DECODE_DISABLE)

ESP HTTPS OTA

Contains:

*CONFIG_OTA_ALLOW_HTTP*
Chapter 2. API Reference

**CONFIG_OTA_ALLOW_HTTP**
Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of:
- Non-encrypted communication channel with server
- Accepting firmware upgrade image from server with fake identity

**ESP HTTP client** Contains:

- **CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**
- **CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**
Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking mbedtls library and initializing SSL transport

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**
Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**ADC-Calibration** Contains:

- **CONFIG_ADC_CAL_EFUSE_TP_ENABLE**
- **CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**
- **CONFIG_ADC_CAL_LUT_ENABLE**

**CONFIG_ADC_CAL_EFUSE_TP_ENABLE**
Use Two Point Values

*Found in: Component config > ADC-Calibration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**
Use eFuse Vref

*Found in: Component config > ADC-Calibration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.
CONFIG_ADC_CAL_LUT_ENABLE

Use Lookup Tables

*Found in:* Component config > ADC-Calibration

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**ESP32-specific** Contains:
- CONFIG_ESP32_REV_MIN
- CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ
- CONFIG_ESP32_SPIRAM_SUPPORT
- CONFIG_ESP32_TRAX
- CONFIG_ESP32_UNIFORM_MAC_ADDRESSES
- CONFIG_ESP32_ULP_CORPROC_ENABLED
- CONFIG_ESP32_DEBUG_OCDWARE
- CONFIG_ESP32_BROWNOUT_DET
- CONFIG_ESP32_REDUCE_PHY_TX_POWER
- CONFIG_ESP32_TIME_SYSCALL
- CONFIG_ESP32_RTC_CLK_SRC
- CONFIG_ESP32_RTC_EXTCRYST_ADDIT_CURRENT
- CONFIG_ESP32_RTC_CLK_CAL_CYCLES
- CONFIG_ESP32_RTC_CAL_RETRY
- CONFIG_ESP32_RTC_XTAL_BOOTSTRAP_CYCLES
- CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP32_XTAL_FREQ_SEL
- CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE
- CONFIG_ESP32_NO_BLOBS
- CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS
- CONFIG_ESP32_RTCDATA_IN_FAST_MEM
- CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE
- CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL
- CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

*Found in:* Component config > ESP32-specific

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

**Available options:**
- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)

**CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in:* Component config > ESP32-specific

CPU frequency to be set on application startup.

**Available options:**
- 80 MHz (ESP32_DEFAULT_CPU_FREQ_80)
• 160 MHz (ESP32_DEFAULT_CPU_FREQ_160)
• 240 MHz (ESP32_DEFAULT_CPU_FREQ_240)

CONFIG_ESP32_SPIRAM_SUPPORT

Support for external, SPI-connected RAM

Found in: Component config > ESP32-specific

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

SPI RAM config Contains:

- CONFIG_SPIRAM_TYPE
- CONFIG_SPIRAM_SPEED
- CONFIG_SPIRAM BOOT_INIT
- CONFIG_SPIRAM_USE
- CONFIG_SPIRAM_MEMTEST
- CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL
- CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
- CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
- CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
- CONFIG_SPIRAM_CACHE_WORKAROUND
- SPIRAM cache workaround debugging
- CONFIG_SPIRAM_BANKSWITCH_ENABLE
- CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY
- CONFIG_SPIRAM_OCCUPY_SPI_HOST
- PSRAM clock and cs IO for ESP32-DOWD
- PSRAM clock and cs IO for ESP32-D2WD
- PSRAM clock and cs IO for ESP32-PICO
- CONFIG_SPIRAM_SPIWP_SD3_PIN
- CONFIG_SPIRAM_2T_MODE

CONFIG_SPIRAM_TYPE

Type of SPI RAM chip in use

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Available options:
- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

CONFIG_SPIRAM_SPEED

Set RAM clock speed

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode(80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSI/VSI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSI/VSI hardware in this
Chapter 2. API Reference

case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY_FLASHFREQ_80M is true)

**Available options:**
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

**Available options:**
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(,…, MALLOC_CAP_SPIRAM) (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.
**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If enabled the option, and add EXT_RAM_ATTR defined your variable, then your variable will be placed in PSRAM instead of internal memory, and placed most of variables of lwip, net802.11, pp, bluedroid library to external memory defaultly.

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**SPIRAM cache workaround debugging** Contains:

- **CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**
**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

Workaround strategy

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

**Available options:**

- Insert memw after vulnerable instructions (default) (SPI- RAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPI- RAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPI- RAM_CACHE_WORKAROUND_STRATEGY_NOPS)

**CONFIG_SPIRAM_BANKSWITCH_ENABLE**

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_spiram_writeback_cache needs some kind of mapping of some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psrcram will be changed as 32Mbit, so himem will be unusable.

**CONFIG_SPIRAM_BANKSWITCH_RESERVE**

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate and friends always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack
and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try to disable this and use xTaskCreateStatic to create the tasks stack in external memory.

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**
- HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
- VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
- Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-D0WD**

Contains:
- `CONFIG_D0WD_PSRAM_CLK_IO`
- `CONFIG_D0WD_PSRAM_CS_IO`

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D0WD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**CONFIG_D0WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D0WD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**PSRAM clock and cs IO for ESP32-D2WD**

Contains:
- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`

**CONFIG_D2WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.
**CONFIG_D2WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**PSRAM clock and cs IO for ESP32-PICO**

Contains:

- **CONFIG_PICO_PSRAM_CS_IO**

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

SPI PSRAM WP(SD3) Pin when customising pins via eFuse (read help)

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

This value is ignored unless flash mode is set to DIO or DOUT and the SPI flash pins have been overriden by setting the eFuses SPI_PAD_CONFIG_xxx.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. And the psram only has QPI mode, the WP pin is necessary, so we need to configure this value here.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set as the value configured in bootloader.

For ESP32-PICO chip, the default value of this config should be 7.

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.
CONFIG_ESP32_TRAX

Use TRAX tracing feature

*Found in: Component config > ESP32-specific*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

CONFIG_ESP32_TRAX_TWOBANKS

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP32-specific > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > ESP32-specific*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**
- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

CONFIG_ESP32_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Coprocessor

*Found in: Component config > ESP32-specific*

Set to ‘y’ if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

CONFIG_ESP32_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

*Found in: Component config > ESP32-specific > CONFIG_ESP32_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP coprocessor firmware & data.

Data is reserved at the beginning of RTC slow memory.
CONFIG_ESP32_DEBUG_OCD_AWARE

Make exception and panic handlers JTAG/OCD aware

*Found in:* Component config > ESP32-specific

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

CONFIG_ESP32_BROWNOUT_DET

Hardware brownout detect & reset

*Found in:* Component config > ESP32-specific

The ESP32 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

CONFIG_ESP32_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_BROWNOUT_DET

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP32 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages of the brownout threshold levels.

**Available options:**

- 2.43V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_7)

CONFIG_ESP32_REDUCE_PHY_TX_POWER

Reduce PHY TX power when brownout reset

*Found in:* Component config > ESP32-specific

When brownout reset occurs, reduce PHY TX power to keep the code running

# Note about the use of “FRC1” name: currently FRC1 timer is not used for high resolution timekeeping anymore. Instead the esp_timer API is used. # FRC1 name in the option name is kept for compatibility.

CONFIG_ESP32_TIME_SYSCALL

Timers used for gettimeofday function

*Found in:* Component config > ESP32-specific

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
• If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.
• If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
• When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (ESP32_TIME_SYSCALL_USE_RTC_FRC1)
- RTC (ESP32_TIME_SYSCALL_USE_RTC)
- High-resolution timer (ESP32_TIME_SYSCALL_USE_FRC1)
- None (ESP32_TIME_SYSCALL_USE_NONE)

**CONFIG_ESP32_RTC_CLK_SRC**

RTC clock source

*Found in: Component config > ESP32-specific*

Choose which clock is used as RTC clock source.

- “Internal 150kHz oscillator” option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- “External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
- “External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XP pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XN pin and ground. 32K_XN pin can not be used as a GPIO in this case.
- “Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

**Available options:**

- Internal 150kHz RC oscillator (ESP32_RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (ESP32_RTC_CLK_SRC_EXT_CRYS)
- External 32kHz oscillator at 32K_XP pin (ESP32_RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (ESP32_RTC_CLK_SRC_INT_8MD256)

**CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT**

Additional current for external 32kHz crystal

*Found in: Component config > ESP32-specific*

Choose which additional current is used for rtc external crystal.

- With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating during deep sleep. If this option is enabled, additional current from touchpad 9 is provided internally to drive the 32kHz crystal. If this option is enabled, deep sleep current is slightly higher (4-5uA) and the touchpad and ULP wakeup sources are not available.

**CONFIG_ESP32_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > ESP32-specific*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of
RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**CONFIG_ESP32_RTC_XTAL_CAL_RETRY**

Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > ESP32-specific*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

**CONFIG_ESP32_RTC_XTAL_BOOTSTRAP_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP32-specific*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY**

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > ESP32-specific*

When ESP32 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**CONFIG_ESP32_XTAL_FREQ_SEL**

Main XTAL frequency

*Found in: Component config > ESP32-specific*

ESP32 currently supports the following XTAL frequencies:

- 26 MHz
- 40 MHz
Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.

Available options:
- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
- Autodetect (ESP32_XTAL_FREQ_AUTO)

**CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE**

Permanently disable BASIC ROM Console

*Found in: Component config > ESP32-specific*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**CONFIG_ESP32_NO_BLOBS**

No Binary Blobs

*Found in: Component config > ESP32-specific*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before IDF v2.1

*Found in: Component config > ESP32-specific*

Bootloaders before IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s 1RAM usage.

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP32-specific*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

**CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP32-specific*
If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in: Component config > ESP32-specific > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE*

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BT_reserveDRAM if Bluetooth controller is enabled.

**CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL**

Disable the interrupt level for the DPORT workarounds

*Found in: Component config > ESP32-specific*

To prevent interrupting DPORT workarounds, need to disable interrupt with a maximum used level in the system.

**CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY**

Enable IRAM as 8 bit accessible memory

*Found in: Component config > ESP32-specific*

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9). Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

**Power Management**

Contains:

- **CONFIG_PM_ENABLE**

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.
CONFIG_PM_USE_RTC_TIMER_REF

Use RTC timer to prevent time drift (EXPERIMENTAL)

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

When APB clock frequency changes, high-resolution timer (esp_timer) scale and base value need to be adjusted. Each adjustment may cause small error, and over time such small errors may cause time drift. If this option is enabled, RTC timer will be used as a reference to compensate for the drift. It is recommended that this option is only used if 32k XTAL is selected as RTC clock source.

CONFIG_PM_PROFILING

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

ESP-TLS Contains:

- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_DEBUG_WOLFSSL

CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_SECURE_ELEMENT
Use Secure Element (ATECC608A) with ESP-TLS

*Found in:* Component config > ESP-TLS

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

**CONFIG_ESP_TLS_SERVER**

Enable ESP-TLS Server

*Found in:* Component config > ESP-TLS

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in:* Component config > ESP-TLS

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**

Enable SMALL_CERT_VERIFY

*Found in:* Component config > ESP-TLS

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**CONFIG_ESP_DEBUG_WOLFSSL**

Enable debug logs for wolfSSL

*Found in:* Component config > ESP-TLS

Enable detailed debug prints for wolfSSL SSL library.

**Driver configurations**

Contains:

- ADC configuration
- SPI configuration
- UART configuration
- RTCIO configuration

**ADC configuration**

Contains:

- `CONFIG_ADC_FORCE_XPD_FSM`
- `CONFIG_ADC_DISABLE_DAC`

**CONFIG_ADC_FORCE_XPD_FSM**

Use the FSM to control ADC power

*Found in:* Component config > Driver configurations > ADC configuration

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.
**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**SPI configuration**  Contains:

- `CONFIG_SPI_MASTER_IN_IRAM`
- `CONFIG_SPI_MASTER_ISR_IN_IRAM`
- `CONFIG_SPI_SLAVE_IN_IRAM`
- `CONFIG_SPI_SLAVE_ISR_IN_IRAM`

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.
UART configuration  Contains:
  •  `CONFIG_UART_ISR_IN_IRAM`

`CONFIG_UART_ISR_IN_IRAM`
Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

RTCIO configuration  Contains:
  •  `CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC`

`CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC`
Support array `rtc_gpio_desc` for ESP32

*Found in: Component config > Driver configurations > RTCIO configuration*

The the array `rtc_gpio_desc` will don’t compile by default. If this option is selected, the array `rtc_gpio_desc` can be compile. If user use this array, please enable this configuration.

CoAP Configuration  Contains:
  •  `CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE`
  •  `CONFIG_COAP_MBEDTLS_DEBUG`

`CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE`
CoAP Encryption method

*Found in: Component config > CoAP Configuration*

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)
  •  Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
  •  Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

Available options:
  •  Pre-Shared Keys (COAP_MBEDTLS_PSK)
  •  PKI Certificates (COAP_MBEDTLS_PKI)

`CONFIG_COAP_MBEDTLS_DEBUG`
Enable CoAP debugging

*Found in: Component config > CoAP Configuration*

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call `coap_set_log_level()` at runtime in order to enable CoAP debug output via the ESP log mechanism.
CONFIG_COAP_MBEDTLS_DEBUG_LEVEL

Set CoAP debugging level

Found in: Component config > CoAP Configuration > CONFIG_COAP_MBEDTLS_DEBUG

Set CoAP debugging level

Available options:

- Emergency (COAP_LOG_EMERG)
- Alert (COAP_LOG_ALERT)
- Critical (COAP_LOG_CRIT)
- Error (COAP_LOG_ERROR)
- Warning (COAP_LOG_WARNING)
- Notice (COAP_LOG_NOTICE)
- Info (COAP_LOG_INFO)
- Debug (COAP_LOG_DEBUG)

Bluetooth

Contains:

- CONFIG_BT_ENABLED
- Bluetooth controller
- CONFIG_BT_HOST
- Bluedroid Options
- NimBLE Options

CONFIG_BT_ENABLED

Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

Bluetooth controller

Contains:

- CONFIG_BTDM_CTRL_MODE
- CONFIG_BTDM_CTRL_BLE_MAX_CONN
- CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
- CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN
- CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH
- CONFIG_BTDM_CTRL_AUTO_LATENCY
- CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE
- CONFIG_BTDM_CTRL_HCI_MODE_CHOICE
- HCI UART(H4) Options
- MODEM SLEEP Options
- CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
- CONFIG_BTDM_BLE_SCAN_DUPL
- CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
- CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BTDM_COEX_BT_OPTIONS

CONFIG_BTDM_CTRL_MODE

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

Found in: Component config > Bluetooth > Bluetooth controller

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

Available options:

- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

**CONFIG_BTDM_CTRL_BLE_MAX_CONN**

BLE Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN**

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN**

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH**

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Bluetooth controller*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

*Available options:*

- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

**CONFIG_BTDM_CTRL_AUTO_LATENCY**

Auto latency

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Bluetooth controller*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

*Available options:*

- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)
Chapter 2. API Reference

CONFIG_BTDM_CTRL_HCI_MODE_CHOICE

HCI mode

Found in: Component config > Bluetooth > Bluetooth controller

Specify HCI mode as VHCI or UART(H4)

Available options:

• VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
• UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

HCI UART(H4) Options  Contains:

• CONFIG_BT_HCI_UART_NO
• CONFIG_BT_HCI_UART_BAUDRATE

CONFIG_BT_HCI_UART_NO

UART Number for HCI

Found in: Component config > Bluetooth > Bluetooth controller > HCI UART(H4) Options

Uart number for HCI. The available uart is UART1 and UART2.

CONFIG_BT_HCI_UART_BAUDRATE

UART Baudrate for HCI

Found in: Component config > Bluetooth > Bluetooth controller > HCI UART(H4) Options

UART Baudrate for HCI. Please use standard baudrate.

MODEM SLEEP Options  Contains:

• CONFIG_BTDM_MODEM_SLEEP
• CONFIG_BTDM_LOW_POWER_CLOCK

CONFIG_BTDM_MODEM_SLEEP

Bluetooth modem sleep

Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options

Enable/disable bluetooth controller low power mode.

CONFIG_BTDM_MODEM_SLEEP_MODE

Bluetooth Modem sleep mode

Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options > CONFIG_BTDM_MODEM_SLEEP

To select which strategy to use for modem sleep

Available options:

• ORIG Mode(sleep with low power clock) (BTDM_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
• EVED Mode (For internal test only) (BTDM_MODEM_SLEEP_MODE_EVED)

EVED mode is for BLE only and is only for internal test. Do not use it for production. This mode is not compatible with DFS nor light sleep.

**CONFIG_BTDM_LOW_POWER_CLOCK**

Bluetooth low power clock

*Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options*

Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**

- **Main crystal** (BTDM_LPCLK_SEL_MAIN_XTAL)
  
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.

- **External 32kHz crystal** (BTDM_LPCLK_SEL_EXT_32K_XTAL)
  
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

**CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g., 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

**Available options:**

- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

**CONFIG_BTDM_BLE_SCAN_DUPL**

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Bluetooth controller*

This select enables parameters setting of BLE scan duplicate.
CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*  

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
  
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
  
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Special duplicate BLE Mesh scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*  

This enables the BLE scan duplicate for special BLE Mesh scan.

CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED

BLE full scan feature supported

*Found in: Component config > Bluetooth > Bluetooth controller*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.
Chapter 2. API Reference

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**
BLE adv report flow control supported

*Found in: Component config > Bluetooth > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM**
BLE adv report flow control number

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set **BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM** to a small value, this may cause adv packets lost. If you set **BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM** to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set **BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM** according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD**
BLE adv lost event threshold value

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set **BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD** to a small value or printf every adv lost event, it may cause adv packets lost more.

**CONFIG_BTDM_COEX_BT_OPTIONS**
Coexistence Bluetooth Side Options

*Found in: Component config > Bluetooth > Bluetooth controller*

Options of Bluetooth Side of WiFi and bluetooth coexistence.

Contains:

- **CONFIG_BTDM_COEX_BLE_ADV_HIGH_PRIORITY**

**CONFIG_BTDM_COEX_BLE_ADV_HIGH_PRIORITY**
Improve BLE ADV priority for WiFi & BLE coexistence

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_COEX_BT_OPTIONS*

Improve BLE ADV coexistence priority to make it better performance. For example, BLE mesh need to enable this option to improve BLE adv performance.

**CONFIG_BT_HOST**
Bluetooth Host

*Found in: Component config > Bluetooth*

This helps to choose Bluetooth host stack
Available options:

- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode use cases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only use cases to save on memory
- Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**Bluedroid Options**

Contains:

- CONFIG_BT_BTC_TASK_STACK_SIZE
- CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE
- CONFIG_BT_BTU_TASK_STACK_SIZE
- CONFIG_BT_BLUEDROID_MEM_DEBUG
- CONFIG_BT_CLASSIC_ENABLED
- CONFIG_BT_HFP_WBS_ENABLE
- CONFIG_BT_HID_HOST_ENABLED
- CONFIG_BT_SSP_ENABLED
- CONFIG_BT_BLE_ENABLED
- CONFIG_BT_STACK_NO_LOG
- BT DEBUG LOG LEVEL
- CONFIG_BT_ACL_CONNECTIONS
- CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
- CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
- CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
- CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN
- CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

**CONFIG_BT_BTC_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size
**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distributation Profile

**CONFIG_BT_SPP_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

**CONFIG_BT_HFP_ROLE**

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

*Available options:*  
- Hands Free Unit (BT_HFP_CLIENT_ENABLE)  
- Audio Gateway (BT_HFP_AG_ENABLE)

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

*Available options:*  
- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)  
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)
CONFIG_BT_HFP_WBS_ENABLE
Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

CONFIG_BT_HID_HOST_ENABLED
Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

CONFIG_BT_SSP_ENABLED
Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

CONFIG_BT_BLE_ENABLED
Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

CONFIG_BT_GATTS_ENABLE
Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

CONFIG_BT_GATTS_PPCP_CHAR_GAP
Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE
GATT Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

**Available options:**
- GATTs manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  - Manually send service change indication through API
    esp_ble_gatts_send_service_change_indication()
• GATTS automatically send service change indication
  (BT_GATTS_SEND_SERVICECHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTC_ENABLE**

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**CONFIG_BT_GATTC_CACHE_NVS_FLASH**

Save gatt cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**BT DEBUG LOG LEVEL** Contains:

- CONFIG_BT_LOG_HCI_TRACE_LEVEL
- CONFIG_BT_LOG_BTM_TRACE_LEVEL
- CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
- CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
- CONFIG_BT_LOG_SDP_TRACE_LEVEL
- CONFIG_BT_LOG_GAP_TRACE_LEVEL
- CONFIG_BT_LOG_BNEP_TRACE_LEVEL
- CONFIG_BT_LOG_PAN_TRACE_LEVEL
- CONFIG_BT_LOG_A2DP_TRACE_LEVEL
- CONFIG_BT_LOG_AVDT_TRACE_LEVEL
- CONFIG_BT_LOG_AVCT_TRACE_LEVEL
- CONFIG_BT_LOG_AVRC_TRACE_LEVEL
- CONFIG_BT_LOG_MCA_TRACE_LEVEL
- CONFIG_BT_LOG_HID_TRACE_LEVEL
**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_L2CAP_TRACE_LEVEL**

L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

**Available options:**

- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL
SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL
GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL
BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

**Available options:**
- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:
• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:
• NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVDT_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer
Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRClayer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRClayer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_LOG_APPL_TRACE_LEVEL**

APL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GATT_TRACE_LEVEL**

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SMP_TRACE_LEVEL**

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTIF_TRACE_LEVEL**

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTC layer

Available options:
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer

Available options:
• NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
• API (BT_LOG_OSI_TRACE_LEVEL_API)
• EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BLUFI layer

Available options:
• NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
• API (BT_LOG_BLUFI_TRACE_LEVEL_API)
• EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~7)

Found in: Component config > Bluetooth > Bluedroid Options

Maximum BT/BLE connection count
CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the internal RAM if there have the PSRAM

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: Component config > Bluetooth > Bluedroid Options

This select can make the allocation of memory will become more flexible

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > Bluedroid Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: Component config > Bluetooth > Bluedroid Options

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: Component config > Bluetooth > Bluedroid Options

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATT_S_OPEN_EVT is triggered.

NimBLE Options

Contains:
- CONFIG_BT_NIMBLE_MEM_ALLOC_MODE
- CONFIG_BT_NIMBLE_MAX_CONNECTIONS
- CONFIG_BT_NIMBLE_MAX_BONDS
- CONFIG_BT_NIMBLE_MAX_CCCDS
- CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
- CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
- CONFIG_BT_NIMBLE_TASK_STACK_SIZE
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_ROLEPeripheral
- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_OBSERVER
- CONFIG_BT_NIMBLE_NV_S_PERSIST
- CONFIG_BT_NIMBLE_SM_LEGACY
- CONFIG_BT_NIMBLE_SM_SC
Chapter 2. API Reference

- CONFIG_BT_NIMBLE_DEBUG
- CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS
- CONFIG_BT_NIMBLE_svc_gap_device_name
- CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
- CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
- CONFIG_BT_NIMBLE_svc_gap_appearance
- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
- CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
- CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_HS_FLOW_CTRL
- CONFIG_BT_NIMBLE_RPA_TIMEOUT
- CONFIG_BT_NIMBLE_MESH
- CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal, since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

*Available options:*

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

 Defines maximum number of concurrent BLE connections

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

 Defines maximum number of bonds to save for peer security and our security
CONFIG_BT_NIMBLE_MAX_CCCDS
Maximum number of CCC descriptors to save across reboots

*Found in:* Component config > Bluetooth > NimBLE Options

Defines maximum number of CCC descriptors to save

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
Maximum number of connection oriented channels

*Found in:* Component config > Bluetooth > NimBLE Options

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
The CPU core on which NimBLE host will run

*Found in:* Component config > Bluetooth > NimBLE Options

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

*Available options:*
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_TASK_STACK_SIZE
NimBLE Host task stack size

*Found in:* Component config > Bluetooth > NimBLE Options

This configures stack size of NimBLE host task

CONFIG_BT_NIMBLE_ROLE_CENTRAL
Enable BLE Central role

*Found in:* Component config > Bluetooth > NimBLE Options

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Enable BLE Peripheral role

*Found in:* Component config > Bluetooth > NimBLE Options

CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

*Found in:* Component config > Bluetooth > NimBLE Options

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

*Found in:* Component config > Bluetooth > NimBLE Options
CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS
*Found in:* Component config > Bluetooth > NimBLE Options
Enable this flag to make bonding persistent across device reboots

CONFIG_BT_NIMBLE_SM_LEGACY
Security manager legacy pairing
*Found in:* Component config > Bluetooth > NimBLE Options
Enable security manager legacy pairing

CONFIG_BT_NIMBLE_SM_SC
Security manager secure connections (4.2)
*Found in:* Component config > Bluetooth > NimBLE Options
Enable security manager secure connections

CONFIG_BT_NIMBLE_DEBUG
Enable extra runtime asserts and host debugging
*Found in:* Component config > Bluetooth > NimBLE Options
This enables extra runtime asserts and host debugging

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS
Use predefined public-private key pair
*Found in:* Component config > Bluetooth > NimBLE Options
If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
BLE GAP default device name
*Found in:* Component config > Bluetooth > NimBLE Options
The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

CONFIG_BT_NIMBLE_GAPDEVICE_NAME_MAX_LEN
Maximum length of BLE device name in octets
*Found in:* Component config > Bluetooth > NimBLE Options
Device Name characteristic value shall be 0 to 248 octets in length
**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**CONFIG_BT_NIMBLE_ACL_BUF_COUNT**

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**CONFIG_BT_NIMBLE_ACL_BUF_SIZE**

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE**

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes

**CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT**

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped
CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

Contains:

- CONFIG_BT_NIMBLE_MESH_PROXY
- CONFIG_BT_NIMBLE_MESH_PROV
- CONFIG_BT_NIMBLE_MESH_GATT_PROXY
- CONFIG_BT_NIMBLE_MESH_RELAY
Chapter 2. API Reference

- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**CONFIG_BT_NIMBLE_MESH_PROV**

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**CONFIG_BT_NIMBLE_MESH_PB_ADV**

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**CONFIG_BT_NIMBLE_MESH_PB_GATT**

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**CONFIG_BT_NIMBLE_MESH_GATT_PROXY**

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**CONFIG_BT_NIMBLE_MESH_RELAY**

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**CONFIG_BT_NIMBLE_MESH_LOW_POWER**

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node
**CONFIG_BT_NIMBLE_MESH_FRIEND**

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- `CONFIG_BLE_MESH_ALLOC_FROM_PSRAM_FIRST`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PROXY`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_NET_BUF_POOL_USAGE`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
Chapter 2. API Reference

- **CONFIG_BLE_MESH_TX_SEG_MAX**
- **CONFIG_BLE_MESH_RELAY**
- **CONFIG_BLE_MESH_LOW_POWER**
- **CONFIG_BLE_MESH_FRIEND**
- **CONFIG_BLE_MESH_NO_LOG**
- **BLE Mesh STACK DEBUG LOG LEVEL**
- **BLE Mesh NET BUF DEBUG LOG LEVEL**
- **CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**
- **Support for BLE Mesh Client Models**
- **CONFIG_BLE_MESH_IV_UPDATE_TEST**
- **BLE Mesh specific test option**

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**CONFIG_BLE_MESH_ALLOC_FROM_PSRAM_FIRST**

BLE Mesh will first allocate memory from PSRAM

*Found in: Component config > CONFIG_BLE_MESH*

When this option is enabled, BLE Mesh stack will try to allocate memory from PSRAM firstly. This will save the internal RAM if PSRAM exists.

**CONFIG_BLE_MESH_FAST_PROV**

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**CONFIG_BLE_MESH_NODE**

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.
CONFIG_BLE_MESH_PROVISIONER
Support for BLE Mesh Provisioner

**Found in:** Component config > CONFIG_BLE_MESH

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM
Maximum number of unprovisioned devices that can be added to device queue

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

CONFIG_BLE_MESH_MAX_PROV_NODES
Maximum number of devices that can be provisioned by Provisioner

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

CONFIG_BLE_MESH_PBA_SAME_TIME
Maximum number of PB-ADV running at the same time by Provisioner

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

CONFIG_BLE_MESH_PBG_SAME_TIME
Maximum number of PB-GATT running at the same time by Provisioner

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT
Maximum number of mesh subnets that can be created by Provisioner

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.
**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**CONFIG_BLE_MESH_PB_GATT**

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

**CONFIG_BLE_MESH_PROXY**

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.
Chapter 2. API Reference

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**CONFIG_BLE_MESH_NET_BUF_POOL_USAGE**

BLE Mesh net buffer pool usage tracking

*Found in: Component config > CONFIG_BLE_MESH*

Enable BLE Mesh net buffer pool tracking. This option is used to introduce another variable in the bottom layer to record the usage of advertising buffers of BLE Mesh devices. Recommend to enable this option as default.

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.
CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.
If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies the maximum number of application keys to which each model can be bound.

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies the maximum number of addresses to which each model can be subscribed.

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.
CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH*

When selected, users can send normal BLE advertising packets with specific API.

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).
CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

CONFIG_BLE_MESH_RELAY

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.
**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling bt_mesh_lpn_set(true). When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.
CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT
Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

CONFIG_BLE_MESH_LPN_RSSI_FACTOR
RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR
ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE
Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as \( \log_2(N) \), where \( N \) is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives \( N = 2 \), and value 7 gives \( N = 128 \).

CONFIG_BLE_MESH_LPN_RECV_DELAY
Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT
The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received from the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.
CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

CONFIG_BLE_MESH_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

CONFIG_BLE_MESH_FRIEND_RECV_WIN

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.
CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in:* Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

BLE Mesh STACK DEBUG LOG LEVEL

Contains:

- CONFIG_BLE_MESH_STACK_TRACE_LEVEL

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

Contains:

- CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
• WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
• INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
• DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
• VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout (ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Support for BLE Mesh Client Models**

Contains:

- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_TIME_CLI`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client Model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models*

Enable support for Configuration client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client Model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models*

Enable support for Health client model.

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client Model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models*

Enable support for Generic OnOff client model.
CONFIG_BLE_MESH GENERIC LEVEL_CLI
Generic Level Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Level client model.

CONFIG_BLE_MESH GENERIC DEF TRANS TIME_CLI
Generic Default Transition Time Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Default Transition Time client model.

CONFIG_BLE_MESH GENERIC POWER ON/OFF_CLI
Generic Power OnOff Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Power OnOff client model.

CONFIG_BLE_MESH GENERIC POWER LEVEL_CLI
Generic Power Level Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Power Level client model.

CONFIG_BLE_MESH GENERIC BATTERY_CLI
Generic Battery Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Battery client model.

CONFIG_BLE_MESH GENERIC LOCATION_CLI
Generic Location Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Location client model.

CONFIG_BLE_MESH GENERIC PROPERTY_CLI
Generic Property Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Generic Property client model.

CONFIG_BLE_MESH SENSOR_CLI
Sensor Client Model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Sensor client model.
CONFIG_BLE_MESH_TIME_CLI

Time Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Time client model.

CONFIG_BLE_MESH_SCENE_CLI

Scene Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Scene client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Scheduler client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI

Light Lightness Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Light Lightness client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Light CTL client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Light HSL client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Light XYL client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client Model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client Models
Enable support for Light LC client model.
**CONFIG_BLE_MESH_IV_UPDATE_TEST**
Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**BLE Mesh specific test option**  Contains:
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_DEBUG`

**CONFIG_BLE_MESH_SELF_TEST**
Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**
Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**CONFIG_BLE_MESH_TEST_USE_WHITE_LIST**
Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**CONFIG_BLE_MESH_SHELL**
Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**CONFIG_BLE_MESH_DEBUG**
Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.
Chapter 2. API Reference

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG`

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG`

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG`

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG`

Enable Proxy protocol debug logs for the BLE Mesh functionality.

**Application Level Tracing** Contains:

- `CONFIG_APPTRACE_DESTINATION`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `FreeRTOS SystemView Tracing`
- `CONFIG_APPTRACE_GCOV_ENABLE`

**CONFIG_APPTRACE_DESTINATION**

Data Destination

*Found in:* `Component config > Application Level Tracing`

Select destination for application trace: trace memory or none (to disable).

**Available options:**

- Trace memory (`APPTTRACE_DEST_TRAX`)
- None (`APPTTRACE_DEST_NONE`)
Chapter 2. API Reference

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing**

Contains:

- **CONFIG_SYSVIEW_ENABLE**

**CONFIG_SYSVIEW_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_SYSVIEW_TS_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**

- CPU cycle counter (CCOUNT) (SYSVIEW_TS_SOURCE_CCOUNT)
- Timer 0, Group 0 (SYSVIEW_TS_SOURCE_TIMER_00)
- Timer 1, Group 0 (SYSVIEW_TS_SOURCE_TIMER_01)
- Timer 0, Group 1 (SYSVIEW_TS_SOURCE_TIMER_10)
- Timer 1, Group 1 (SYSVIEW_TS_SOURCE_TIMER_11)
- esp_timer high resolution timer (SYSVIEW_TS_SOURCE_ESP_TIMER)
CONFIG_SYSVIEW_MAX_TASKS

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Configures maximum supported tasks in sysview debug.

CONFIG_SYSVIEW_BUF_WAIT_TMO

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_SYSVIEW_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “Trace Buffer Overflow” event.

CONFIG_SYSVIEW_EVT_ISR_ENTER_ENABLE

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “ISR Enter” event.

CONFIG_SYSVIEW_EVT_ISR_EXIT_ENABLE

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “ISR Exit” event.

CONFIG_SYSVIEW_EVT_ISR_TO_SCHEDULER_ENABLE

ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “ISR to Scheduler” event.

CONFIG_SYSVIEW_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “Task Start Execution” event.
CONFIG_SYSVIEW_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Stop Execution” event.

CONFIG_SYSVIEW_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Start Ready State” event.

CONFIG_SYSVIEW_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Stop Ready State” event.

CONFIG_SYSVIEW_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Create” event.

CONFIG_SYSVIEW_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Terminate” event.

CONFIG_SYSVIEW_EVT_IDLE_ENABLE

System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “System Idle” event.

CONFIG_SYSVIEW_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Timer Enter” event.
**CONFIG_SYSVIEW_EVT_TIMER_EXIT_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “Timer Exit” event.

**CONFIG_APPTRACE_GCOV_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**Compatibility options**

Contains:

- `CONFIG_LEGACY_INCLUDE_COMMON_HEADERS`

**CONFIG_LEGACY_INCLUDE_COMMON_HEADERS**

Include headers across components as before IDF v4.0

*Found in: Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It’s not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it’s changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

**Deprecated options and their replacements**

2.8.7 Customisations

Because IDF builds by default with Warning On Undefined Variables, when the Kconfig tool generates Makefiles (the auto.conf file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that ifdef and ifndef can still be used in Makefiles, because they test if a variable is defined and has a non-empty value.)

When generating header files for C & C++, the behaviour is not customised - so #ifdef can be used to test if a boolean config item is set or not.

2.9 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.
For general information about error codes in ESP-IDF, see Error Handling.

**ESP_FAIL** (-1): Generic esp_err_t code indicating failure

**ESP_OK** (0): esp_err_t value indicating success (no error)

**ESP_ERR_NO_MEM** (0x101): Out of memory

**ESP_ERR_INVALID_ARG** (0x102): Invalid argument

**ESP_ERR_INVALID_STATE** (0x103): Invalid state

**ESP_ERR_INVALID_SIZE** (0x104): Invalid size

**ESP_ERR_NOT_FOUND** (0x105): Requested resource not found

**ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported

**ESP_ERR_TIMEOUT** (0x107): Operation timed out

**ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid

**ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid

**ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (0x201)

**ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_FULL** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry
**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed
**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found
**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version
**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** (0x1116): NVS key partition is uninitialized
**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt
**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes
**ESP_ERR_ULP_SIZE_TOO_BIG** (0x1201): Program doesn’t fit into RTC memory reserved for the ULP
**ESP_ERR_ULP_INVALID_LOAD_ADDR** (0x1202): Load address is outside of RTC memory reserved for the ULP
**ESP_ERR_ULP_DUPLICATE_LABEL** (0x1203): More than one label with the same number was defined
**ESP_ERR_ULP_UNDEFINED_LABEL** (0x1204): Branch instructions references an undefined label
**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE** (0x1205): Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE** (0x1500): Base error code for ota_ops api
**ESP_ERR_OTA_PARTITION_CONFLICT** (0x1501): Error if request was to write or erase the current running partition
**ESP_ERR_OTA_SELECT_INFO_INVALID** (0x1502): Error if OTA data partition contains invalid content
**ESP_ERR_OTA_VALIDATE_FAILED** (0x1503): Error if OTA app image is invalid
**ESP_ERR_OTA_SMALL_SEC_VER** (0x1504): Error if the firmware has a secure version less than the running firmware.
**ESP_ERR_OTA_ROLLBACK_FAILED** (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
**ESP_ERR_OTA_ROLLBACK_INVALID_STATE** (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**ESP_ERR_EFUSE** (0x1600): Base error code for efuse api.
**ESP_OK_EFUSE_CNT** (0x1601): OK the required number of bits is set.
**ESP_ERR_EFUSE_CNT_IS_FULL** (0x1602): Error field is full.
**ESP_ERR_EFUSE_REPEATED_PROG** (0x1603): Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING** (0x1604): Error while a encoding operation.

**ESP_ERR_IMAGE_BASE** (0x2000)
**ESP_ERR_IMAGE_FLASH_FAIL** (0x2001)
**ESP_ERR_IMAGE_INVALID** (0x2002)

**ESP_ERR_WIFI_BASE** (0x3000): Starting number of WiFi error codes
**ESP_ERR_WIFI_NOT_INIT** (0x3001): WiFi driver was not installed by esp_wifi_init
**ESP_ERR_WIFI_NOT_STARTED** (0x3002): WiFi driver was not started by esp_wifi_start

API Guides

4.1 Application Level Tracing library

4.1.1 Overview

IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behavior analysis, see System Behavior Analysis with SEGGER SystemView
4. Source code coverage, see Gcov (Source Code Coverage)

Tracing components when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

Post-mortem mode. This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from HW UP BUFFER buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program’s behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

Streaming mode. Tracing module enters this mode when host connects to ESP32. In this mode before writing new data to HW UP BUFFER tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISRs, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX. This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.
4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see JTAG Debugging for details.

2. **Target side:** Application tracing functionality can be enabled in menuconfig. Component config > Application Level Tracing menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables `CONFIG_APPTRACE_ENABLE` option.

**Note:** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see Optimize JTAG speed.

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic** (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less than 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic they will not be flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic** (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.
4.1.4 How to use this library

This library provides API for transferring arbitrary data between host and ESP32. When enabled in menuconfig, the target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

Application Specific Tracing

In general, the user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. On target side, the user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
    ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

The `esp_apptrace_write()` function uses `memcpy` to copy user data to the internal buffer. In some cases, it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
    "tmo in us");
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
    "tmo in us");
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report--
        incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

Also according to his needs, user may want to receive data from the host. Piece of code below shows an example how to do this.

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
sizet sz = sizeof(buf);
/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not--
    wait*/);
```

(continues on next page)
 Chapter 4. API Guides

(continued from previous page)

```c
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

`esp_apprace_read()` function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use `esp_apprace_down_buffer_get()` and `esp_apprace_down_buffer_put()` functions. They allow developers to occupy chunk of read buffer and process it-in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apprace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz,
    100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 0) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apprace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
    /*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report...*/
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the Getting Started Guide.
3. Run OpenOCD (see JTAG Debugging).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal `telnet <oocd_host> 4444`. If telnet session is opened on the same machine which runs OpenOCD you can use `localhost` as `<oocd_host>` in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see OpenOCD Application Level Tracing Commands.
6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in `$IDF_PATH/tools/esp_app_trace`: `apptrace_proc.py` (used for feature tests) and `logtrace_proc.py` (see more details in section Logging to Host).

OpenOCD Application Level Tracing Commands  

`HW UP BUFFER` is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multitreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So
it is possible situation that user data preparation process is not completed at the moment when that chunk is read
by the host. To handle such conditions tracing module prepends all user data chunks with header which contains
allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4
bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in
any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

**Note:** Currently OpenOCD does not provide commands to send arbitrary user data to the target.

Command usage:

```
esp32 apptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size] [stop_tmo [wait4halt [skip_size]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: file://
  path/to/file.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-
  blocking mode. By default 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is
  received. By default -1 (tracesizetoptriggerisdisabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1
  (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from
  target.
- **wait4halt** If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by
  breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.
- **skip_size** Number of bytes to skip at the start. By default 0.

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You
must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session).
Another option is to set **trace_size** and wait until this size of data is collected. At this point tracing stops
automatically.

Command usage examples:

1. Collect 2048 bytes of tracing data to a file “trace.log”. The file will be saved in “openocd-esp32” directory.
   ```
   esp32 apptrace start file:///trace.log 1 2048 5 0 0
   ```
   The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after
   2048 bytes are collected, or if no data are available for more than 5 seconds.

   **Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message,
   then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of time-
   out. Either increase the timeout or use a function `esp_apptrace_flush()` to flush the data on specific
   intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.
Chapter 4. API Guides

There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp32 aptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp32 aptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp32 aptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset use the `openocd reset halt` command.

Logging to Host

IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host.

By default IDF’s logging library uses `vprintf`-like function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of `vprintf`-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_apptrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

Limitations Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for printf arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from .rodata section are supported as format strings and arguments.
4. Maximum number of printf arguments is 256.

How To Use It In order to use logging via trace module user needs to perform the following steps:

1. On target side special vprintf-like function needs to be installed. As it was mentioned earlier this function is `esp_apptrace_vprintf`. It sends log data to the host. Example code is provided in `system/app_trace_to_host`.
2. Follow instructions in items 2-5 in Application Specific Tracing.
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`. 

Submit Document Feedback 1320 Release v4.2-dev-1660-g7d75213
Log Trace Processor Command Options  

Command usage:

```bash
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

- `<trace_file>` Path to log trace file
- `<elf_file>` Path to program ELF file

Optional arguments:

- `-h, --help` show this help message and exit
- `--no-errors, -n` Do not print errors

System Behavior Analysis with SEGGER SystemView

Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

**Note:** Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

How To Use It  

Support for this feature is enabled by `Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG_SYSVIEW_ENABLE)` menuconfig option. There are several other options enabled under the same menu:

1. ESP32 timer to use as SystemView timestamp source: `CONFIG_SYSVIEW_TS_SOURCE` selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32 internal cycle counter running at maximum 240 MHz (~4 ns granularity). In dual-core mode external timer working at 40 MHz is used, so timestamp granularity is 25 ns.

2. Individually enabled or disabled collection of SystemView events (CONFIG_SYSVIEW_EVT_XXX):
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Start Ready State Event
   - Task Stop Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

OpenOCD SystemView Tracing Command Options  

Command usage:

```bash
esp32 sysview [start <options>] | [stop] | [status]
```

Sub-commands:

- `start` Start tracing (continuous streaming).
- `stop` Stop tracing.
- `status` Get tracing status.
Chapter 4. API Guides

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

**outfile1** Path to file to save data from PRO CPU. This argument should have the following format: file://path/to/file.

**outfile2** Path to file to save data from APP CPU. This argument should have the following format: file://path/to/file.

**poll_period** Data polling period (in ms) for available trace data. If greater then 0 then command runs in non-blocking mode. By default 1 ms.

**trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).

**stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

**Note:** If **poll_period** is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVDat” and “app-cpu.SVDat”. The files will be saved in “opencocd-esp32” directory.

```
$ esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
```

   The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter esp32 apptrace stop command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

```
$ esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
```

   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.

**Data Visualization** After trace data are collected user can use special tool to visualize the results and inspect behavior of the program. Unfortunately SystemView does not support tracing from multiple cores. So when tracing from ESP32 working in dual-core mode two files are generated: one for PRO CPU and another one for APP CPU. User can load every file into separate instance of the tool.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called **Impulse** which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.

Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

**Note:** IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping $SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt with $IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

**Configure Impulse for Dual Core Traces** After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs user can add special Multi Adapter port and load both files into one view. To do this user needs to do the following in Eclipse:

2. In ‘Signal Ports’ view right-click on ‘Ports’ and select ‘Add …’ ->New Multi Adapter Port
4. In open dialog select ‘SystemView Serializer’ as Serializer and set path to PRO CPU trace file. Press OK.
5. Repeat steps 3-4 for APP CPU trace file.
6. Double-click on created port. View for this port should open.
7. Click Start/Stop Streaming button. Data should be loaded.
8. Use ‘Zoom Out’, ‘Zoom In’ and ‘Zoom Fit’ button to inspect data.
9. For settings measurement cursors and other features please see Impulse documentation).

**Note:** If you have problems with visualization (no data are shown or strange behavior of zoom action is observed) you can try to delete current signal hierarchy and double click on the necessary file or port. Eclipse will ask you to create new signal hierarchy.

---

**Gcov (Source Code Coverage)**

**Basics of Gcov and Gcovr** Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’s runtime. Gcov is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The Gcovr tool is utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the Host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a .gcno notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have their own .gcno file of the same name (e.g., a main.c will generate a main.gcno when compiled).
2. Execute the program. During execution, the program should generate .gcda data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a .gcda file for each source file compiled with the `--coverage` option (e.g., main.c will generate a main.gcda).
3. Gcov or Gcovr can be used generate a code coverage based on the .gcno, .gcda, and source files. Gcov will generate a text based coverage report for each source file in the form of a .gcov file, whilst Gcovr will generate a coverage report in HTML format.

**Gcov and Gcovr in ESP-IDF** Using Gcov in ESP-IDF is complicated by the fact that the program is running remotely from the Host (i.e., on the target). The code coverage data (i.e., the .gcda files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. **Setting Up a Project for Gcov**
2. **Dumping Code Coverage Data**
3. **Generating Coverage Report**

**Setting Up a Project for Gcov**

**Compiler Option** In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

To cause all source files in a component to be compiled with the `--coverage` option.

- Add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the CMakeLists.txt file of the component if using CMake.
- Add `CFLAGS += --coverage` to the component.mk file of the component if using Make.

To cause a select number of source files (e.g. source1.c and source2.c) in the same component to be compiled with the `--coverage` option.

- Add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the CMakeLists.txt file of the component if using CMake.
• Add source1.o: `CFLAGS += --coverage` and source2.o: `CFLAGS += --coverage` to the component.mk file of the component if using Make.

When a source file is compiled with the `--coverage` option (e.g. `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project’s build directory.

**Project Configuration** Before building a project with source code coverage, ensure that the following project configuration options are enabled by running `idf.py menuconfig` (or `make menuconfig` if using the legacy Make build system).

- Enable the application tracing module by choosing Trace Memory for the `CONFIG_APPTRACE_DESTINATION` option.
- Enable Gcov to host via the `CONFIG_APPTRACE_GCOV_ENABLE` option.

**Dumping Code Coverage Data** Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the Host is known as dumping.

The dumping of coverage data is done via OpenOCD (see **JTAG Debugging** on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <oocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project’s build directory. For example, if `gcov_example_main.c` of the main component was compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda (or `build/main/gcov_example_main.gcda` if using the legacy Make build system). Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application’s life time. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application’s entire lifetime.

ESP-IDF supports two methods of dumping code coverage data form the target to the host:

- Instant Run-Time Dump
- Hard-coded Dump

**Instant Run-Time Dump** An Instant Run-Time Dump is triggered by calling the `esp32 gcov` OpenOCD command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32’s current state and execute a built-in IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the Host. Upon completion, the ESP32 will resume it’s current state.

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the Host must execute the `esp32 gcov dump` OpenOCD command (via a telnet session). The `esp32 gcov dump` command will cause OpenOCD to connect to the ESP32, retrieve the code coverage data, then disconnect from the ESP32 thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application’s lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application’s lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application’s main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp32 gcov dump` automatically via the use a `gdbinit` script (see Using GDB from **Command Line**).

The following GDB script is will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp32 gcov dump` OpenOCD command.
Chapter 4. API Guides

Note: Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.

Generating Coverage Report  Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to Gcov documentation and Gcovr documentation.

Adding Gcovr Build Target to Project  To make report generation more convenient, users can define additional build targets in their projects such report generation can be done with a single build command.

CMake Build System  For the CMake build systems, add the following lines to the `CMakeLists.txt` file of your project.

```cmake
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in
  `$\{BUILD_DIR_BASE\}/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

Make Build System  For the Make build systems, add the following lines to the `Makefile` of your project.

```make
GCOV := $(call dequote,$(CONFIG_SDK_TOOLPREFIX))gcov
REPORT_DIR := $(BUILD_DIR_BASE)/coverage_report

gcovr-report:
  echo "Generating coverage report in: $(REPORT_DIR)"
  echo "Using gcov: $(GCOV)"
  mkdir -p $(REPORT_DIR)/html
  cd $(BUILD_DIR_BASE)
  gcovr -r $(PROJECT_PATH) --gcov-executable $(GCOV) -s --html-details $(REPORT_DIR)/html/index.html

cov-data-clean:
  echo "Remove coverage data files..."
  find $(BUILD_DIR_BASE) -name "*.gcda" -exec rm {} +
  rm -rf $(REPORT_DIR)

.PHONY: gcovr-report cov-data-clean
```

The following commands can now be used:

- `make gcovr-report` will generate an HTML coverage report in
  `$\{BUILD_DIR_BASE\}/coverage_report/html` directory.
- `make cov-data-clean` will remove all coverage data files.
4.2 BluFi

4.2.1 Overview

The BluFi for ESP32 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32. Using this information ESP32 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

4.2.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32 into GATT Server mode and then it will send broadcasts with specific advertising data. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32 (see the section The Frame Formats Defined in BluFi for details).
4. After ESP32 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32.
7. When receiving this control frame, ESP32 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of The Frame Formats Defined in BluFi, with the Wi-Fi configuration information to ESP32, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32. When receiving this control frame, ESP32 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

Note:

1. After ESP32 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

4.2.3 The flow chart of BluFi

4.2.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32 are defined as follows:
Fig. 2: BluFi Flow Chart

- Advertising
  - Create GATT connection
    - Negotiate key procedure
      - Negotiate key procedure
        - CTRL: Set ESP32 to Phone Security mode
          - DATA: SSID
          - DATA: Password
          - DATA: Other information, such as CA certification
            - CTRL: Connect to AP
              - DATA: Connection State Report
Chapter 4. API Guides

The frame format with no fragment (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>${\text{Data Length}}$</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

If the Frame Ctrl bit is enabled, the Total length bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control (Frag)</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>${\text{Total Content Length}}$</td>
</tr>
<tr>
<td></td>
<td>${\text{Content}}$</td>
</tr>
<tr>
<td></td>
<td>${\text{Data Length} - 2}$</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

Normally, the control frame does not contain data bits, except for Ack Frame.

The format of Ack Frame (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type (Ack)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>Acked Sequence Number</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

1. Type

The Type field, taking 1 byte, is divided into Type and Subtype, that Type uses the lower 2 bits and Subtype uses the upper 6 bits.

- The control frame is not encrypted for the time being and supports to be verified;
- The data frame supports to be encrypted and verified.

1.1 Control Frame (0x0 b' 00)
<table>
<thead>
<tr>
<th>Control Frame (Binary)</th>
<th>Explanation</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0 (b' 0000) 000000</td>
<td>Ack</td>
<td>The data field of the Ack frame uses the same sequence value of the frame to reply to.</td>
</tr>
<tr>
<td>0x1 (b' 0000) 000001</td>
<td>Set ESP32 to the security mode.</td>
<td>The data field consumes a byte. The higher 4 bits are for the security mode setting of the control frame, and the lower 4 bits are for the security mode setting of the data frame.</td>
</tr>
<tr>
<td>0x2 (b' 0000) 000001</td>
<td>Set the opmode of Wi-Fi.</td>
<td>The frame contains opmode settings, including: 0x00: NULL; 0x01: STA; 0x02: SoftAP; 0x03: SoftAP&amp;STA. Please set the SSID/Password/Max Connection Number of the AP mode in the first place if an AP gets involved.</td>
</tr>
<tr>
<td>0x3 (b' 0000) 000001</td>
<td>Connect ESP32 to the AP.</td>
<td>To notify ESP32 that the essential information has been sent and it is allowed to connect to the AP. No data field is contained.</td>
</tr>
<tr>
<td>0x4 (b' 0000) 000100</td>
<td>Disconnect ESP32 from the AP.</td>
<td>No data field is contained.</td>
</tr>
<tr>
<td>0x5 (b' 0000) 000100</td>
<td>To get the information of ESP32's Wi-Fi mode and its status.</td>
<td>No data field is contained. When receiving this control frame, ESP32 will send back a follow-up frame of Wi-Fi connection state report to the mobile phone with the information of the current opmode, connection status, SSID and so on. The types of information sent to the mobile phone is defined by the application installed on the phone.</td>
</tr>
<tr>
<td>0x6 (b' 0000) 000100</td>
<td>Disconnect the STA device from the SoftAP (in SoftAP mode).</td>
<td>Date[0-5] is taken as the MAC address for the STA device. If there is a second STA device, then it uses data[6-11] and the rest can be done in the same manner.</td>
</tr>
<tr>
<td>0x7 (b' 0000) 000100</td>
<td>Get the version information.</td>
<td></td>
</tr>
<tr>
<td>0x8 (b' 0000) 001000</td>
<td>Disconnect the BLE GATT link.</td>
<td>ESP32 will disconnect the BLE GATT link after receives this command.</td>
</tr>
<tr>
<td>0x9 (b' 0000) 001001</td>
<td>Get the Wi-Fi list.</td>
<td>To get ESP32 to scan the Wi-Fi access points around. No data field is contained. When receiving this control frame, ESP32 will send back a follow-up frame of Wi-Fi list report to the mobile phone.</td>
</tr>
</tbody>
</table>
### 1.2 Data Frame (0x1 b’ 01)

<table>
<thead>

</tbody>
</table>

2. Frame Control
   - Control field, takes 1 byte and each bit has a different meaning.
### Chapter 4. API Guides

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>Indicates whether the frame is encrypted.</td>
</tr>
<tr>
<td></td>
<td>1 means encryption, and 0 means unencrypted.</td>
</tr>
<tr>
<td></td>
<td>The encrypted part of the frame includes the full clear data before the DATA field is encrypted</td>
</tr>
<tr>
<td></td>
<td>(no checksum).</td>
</tr>
<tr>
<td></td>
<td>Control frame is not encrypted, so this bit is 0.</td>
</tr>
<tr>
<td>0x02</td>
<td>The data field that indicates whether a frame contains a checksum (such as SHA1, MD5, CRC, etc.)</td>
</tr>
<tr>
<td></td>
<td>for the end of the frame data field includes SEQUEN + data length + clear text. Both the control</td>
</tr>
<tr>
<td></td>
<td>frame and the data frame can contain a check bit or not.</td>
</tr>
<tr>
<td>0x04</td>
<td>Represents the data direction.</td>
</tr>
<tr>
<td></td>
<td>0 means the mobile phone to ESP32;</td>
</tr>
<tr>
<td></td>
<td>1 means ESP32 to the mobile phone.</td>
</tr>
<tr>
<td>0x08</td>
<td>Indicates whether the other person is required to reply to an ACK.</td>
</tr>
<tr>
<td></td>
<td>0 indicates no requirement;</td>
</tr>
<tr>
<td></td>
<td>1 indicates to reply Ack.</td>
</tr>
<tr>
<td>0x10</td>
<td>Indicates whether there are subsequent data fragments.</td>
</tr>
<tr>
<td></td>
<td>0 indicates that there are no subsequent data fragments for this frame;</td>
</tr>
<tr>
<td></td>
<td>1 indicates that there are subsequent data fragments and used to transmit longer data.</td>
</tr>
<tr>
<td></td>
<td>In the case of a frag frame, the total length of the current content section + subsequent content</td>
</tr>
<tr>
<td></td>
<td>section is given, in the first 2 bytes of the data field (that is, the content data of the maximum</td>
</tr>
<tr>
<td></td>
<td>support 64K).</td>
</tr>
<tr>
<td>0x10–0x80</td>
<td>reserved</td>
</tr>
</tbody>
</table>

3. Sequence Control
   Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

4. Length
   The length of the data field that does not include CheckSum.

5. Data
   The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

6. CheckSum
   This field takes 2 bytes that is used to check “sequence + data length + clear text data”.

#### 4.2.5 The Security Implementation of ESP32

1. Securing data
   To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

2. Ensuring data integrity
   To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

3. Securing identity (signature)
   Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as an companion for signature.

4. Replay attack prevention
   It is added to the Sequence field and used during the checksum verification. For the coding of ESP32, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.
   The application layer needs to register several security-related functions to BluFi:
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)

This function is for ESP32 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output_data and Output_len.

BluFi will send output_data from Negotiate_data_handler after Negotiate_data_handler is called.

Here are two "*", because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED_FREE.

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int _crypt_len)

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int _crypt_len)

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

4.2.6 GATT Related Instructions

UUID

BluFi Service UUID: 0xFFFF, 16 bit
BluFi (the mobile -> ESP32): 0xFF01, writable
BluFi (ESP32 -> the mobile phone): 0xFF02, readable and callable

4.3 Bootloader

Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Select the application partition to boot, based on the partition table and ota_data (if any);
3. Load this image to RAM (IRAM & DRAM) and transfer management to it.

Bootloader is located at the address 0x1000 in the flash.

4.3.1 FACTORY reset

The user can write a basic working firmware and load it into the factory partition. Next, update the firmware via OTA (over the air). The updated firmware will be loaded into an OTA app partition slot and the OTA data partition is updated to boot from this partition. If you want to be able to roll back to the factory firmware and clear the settings, then you need to set CONFIG_BOOTLOADER_FACTORY_RESET. The factory reset mechanism allows to reset the device to factory settings:

- Clear one or more data partitions.
- Boot from “factory” partition.
CONFIG_BOOTLOADER_DATA_FACTORY_RESET allows customers to select which data partitions will be erased when the factory reset is executed. Can specify the names of partitions through comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, nvs_custom, …”). Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

CONFIG_BOOTLOADER_OTA_DATA_ERASE - the device will boot from “factory” partition after a factory reset. The OTA data partition will be cleared.

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET - number of the GPIO input for factory reset uses to trigger a factory reset, this GPIO must be pulled low on reset to trigger this.

CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Partition table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>

</tr>
</tbody>
</table>

4.3.2 Boot from TEST firmware

The user can write a special firmware for testing in production, and run it as needed. The partition table also needs a dedicated partition for this testing firmware (See partition table). To trigger a test app you need to set CONFIG_BOOTLOADER_APP_TEST.

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the normally configured application will boot (factory or any OTA slot).

CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

4.3.3 Fast boot from Deep Sleep

The bootloader has the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP option which allows to reduce the wake-up time (useful to reduce consumption). This option is available when the CONFIG_SECURE_BOOT option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

4.3.4 Customer bootloader

The current bootloader implementation allows the customer to override it. To do this, you must copy the folder /espidf/components/bootloader and then edit /your_project/components/bootloader/subproject/main/bootloader_main.c. In the bootloader space, you can not use the drivers and functions from other components. If necessary, then the required functionality should be placed in the folder bootloader (note that this will increase its size). It is necessary to monitor its size because there can be overlays in memory with a partition table leading to damage. At the moment the bootloader is limited to the partition table from the address 0x8000.
4.4 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organise and build a new ESP-IDF project or component.

4.4.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The WiFi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. At the moment, ESP-IDF supports esp32 and esp32s2 targets.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH.

4.4.2 Using the Build System

`idf.py`

The `idf.py` command line tool provides a front-end for easily managing your project builds. It manages the following tools:

- **CMake**, which configures the project to be built
- A command line build tool (either **Ninja** build or **GNU Make**)
- **esptool.py** for flashing the target.
Chapter 4. API Guides

The getting started guide contains a brief introduction to how to set up idf.py to configure, build, and flash projects.

idf.py should be run in an ESP-IDF “project” directory, ie one containing a CMakeLists.txt file. Older style projects with a Makefile will not work with idf.py.

Type idf.py --help for a list of commands. Here are a summary of the most useful ones:

- `idf.py set-target <target>` sets the target (chip) for which the project is built. See Selecting the Target.
- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory build is used to hold build output, although this can be changed with the -B option.
  - Run CMake as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool (Ninja or GNU Make). By default, the build tool is automatically detected but it can be explicitly set by passing the -G option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will clean the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete CMake configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes all files in the build directory, so use with care. Project configuration is not deleted.
- `idf.py flash` will automatically build the project if necessary, and then flash it to the target. The -p and -b options can be used to set serial port name and flasher baud rate, respectively.
- `idf.py monitor` will display serial output from the target. The -p option can be used to set the serial port name. Type Ctrl-[ ] to exit the monitor. See IDF Monitor for more details about using the monitor.

Multiple idf.py commands can be combined into one. For example, idf.py -p COM4 clean flash monitor will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to idf.py an attempt to execute them as a build system target will be made.

Note: The environment variables ESPPORT and ESPBAUD can be used to set default values for the -p and -b options, respectively. Providing these options on the command line overrides the default.

Advanced Commands

- `idf.py app, idf.py bootloader, idf.py partition_table` can be used to build only the app, bootloader, or partition table from the project as applicable.
- There are matching commands idf.py app-flash, etc. to flash only that single part of the project to the target.
- `idf.py -p PORT erase_flash` will use esptool.py to erase the target’s entire flash chip.
- `idf.py size` prints some size information about the app. size-components and size-files are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable -DOUTPUT_JSON=1 when running CMake (or idf.py), the output will be formatted as JSON not as human readable text.
- `idf.py reconfigure` re-runs CMake even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, idf.py -DNAME='VALUE' reconfigure can be used to set variable NAME in CMake cache to value VALUE.

The order of multiple idf.py commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).
Chapter 4. API Guides

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default build subdirectory of the project directory.
- `--ccache` flag can be used to enable CCache when compiling source files, if the CCache tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling ccache and build again. CCache can be enabled by default by setting the `IDF_ENABLE_CCACHE` environment variable to a non-zero value. `--v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.

### Using CMake Directly

`idf.py` is a wrapper around CMake for convenience. However, you can also invoke CMake directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):

```bash
mkdir -p build
cd build
cmake .. -G Ninja  # or 'Unix Makefiles'
ninja
```

In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is `Ninja`: running `ninja` actually builds the project.

It’s not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

**Note:** If you’re already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake’s functionality to reduce boilerplate. See [writing pure CMake components](https://docs.espressif.com/projects/esp-idf/en/latest/zh/zh/esp-idf-cmake.html) for some information about writing more “CMake style” components.

### Flashing with ninja or make

It’s possible to build and flash directly from `ninja` or `make` by running a target like:

```bash
ninja flash
```

Or:

```bash
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```bash
ESPPORT=/dev/ttyUSB0 ninja flash
```

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.
Chapter 4. API Guides

```bash
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

**Note:** Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute `idf.py` for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see **Build System Metadata**.

### Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default `python` interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

`idf.py` and other Python scripts will run with the default Python interpreter, i.e. `python`. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py ...`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 ...` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the `PYTHON` value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools `pyenv` or `virtualenv`. These let you change the default python version.

### 4.4.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project `CMakeLists.txt` file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file `/tools/cmake/project.cmake` which implements the rest of the build system. Finally, it sets the project name and defines the project.
• “sdkconfig” project configuration file. This file is created/updated when `idf.py menuconfig` runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “sdkconfig” file may or may not be added to the source control system of the project.

• Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, `EXTRA_COMPONENT_DIRS` can be set in the top-level CMakeLists.txt to look for components in other places. See the `renaming main` section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “main”.

• “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable `COMPONENT_DIRS` includes this component but you can modify this variable.

• “build” directory is where build output is created. This directory is created by `idf.py` if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component `CMakeLists.txt` file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See `Component CMakeLists Files` for more details.

Each component may also include a `Kconfig` file defining the `component configuration` options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for overriding parts of the project.

### 4.4.4 Project CMakeLists File

Each project has a single top-level `CMakeLists.txt` file that contains build settings for the entire project. By default, the project CMakeLists can be quite minimal.

#### Minimal Example CMakeLists

Minimal project:

```cmake
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

**Mandatory Parts**

The inclusion of these three lines, in the order shown above, is necessary for every project:

• `cmake_minimum_required(VERSION 3.5)` tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the CMakeLists.txt file.

• `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.

• `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie `myProject.elf`, `myProject.bin`. Only one project can be defined per CMakeLists file.

#### Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in `/tools/cmake/project.cmake` for all of the implementation details.
• **COMPONENT_DIRS, COMPONENTS_DIRS**: Directories to search for components. Defaults to IDF_PATH/components, PROJECT_DIR/components, and EXTRA_COMPONENT_DIRS. Override this variable if you don’t want to search for components in these places.

• **EXTRA_COMPONENT_DIRS, EXTRA_COMPONENTS_DIRS**: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.

• **COMPONENTS**: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the REQUIRES or PRIV_REQUIRES arguments on component registration will automatically have it added to this list, so the COMPONENTS list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` like `set(VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...)` line but before the `include(...)` line.

### Renaming main component

The build system provides special treatment to the main component. It is a component that gets automatically added to the build provided that it is in the expected location, PROJECT_DIR/main. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the main component causes the loss of these behind-the-scences heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming main are as follows:

1. Rename main directory.
2. Set EXTRA_COMPONENT_DIRS in the project CMakeLists.txt to include the renamed main directory.
3. Specify the dependencies in the renamed component’s CMakeLists.txt file via REQUIRES or PRIV_REQUIRES arguments on component registration.

#### 4.4.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project’s own components directory, or added from custom component directories (see above).

A component is any directory in the COMPONENT_DIRS list which contains a CMakeLists.txt file.

### Searching for Components

The list of directories in COMPONENT_DIRS is searched for the project’s components. Directories in this list can either be components themselves (ie they contain a CMakeLists.txt file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

### Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by COMPONENT_DIRS; by default, this means ESP-IDF’s internal components first, then the project’s components, and finally any components set in EXTRA_COMPONENT_DIRS. If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.
Minimal Component CMakeLists

The minimal component CMakeLists.txt file simply registers the component to the build system using `idf_component_register`:

```
idf_component_register(SRCS "foo.c" "bar.c"
  INCLUDE_DIRS "include"
  REQUIRES mbedtls)
```

- **SRCS** is a list of source files (*.c, *.cpp, *.cc, *.S). These source files will be compiled into the component library.
- **INCLUDE_DIRS** is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- **REQUIRES** is not actually required, but it is very often required to declare what other components this component will use. See Component Requirements.

A library with the name of the component will be built and linked into the final app. Directories are usually specified relative to the CMakeLists.txt file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed here.

See example component requirements and example component CMakeLists for more complete component CMakeLists.txt examples.

Preset Component Variables

The following component-specific variables are available for use inside component CMakeLists, but should not be modified:

- **COMPONENT_DIR**: The component directory. Evaluates to the absolute path of the directory containing CMakeLists.txt. The component path cannot contain spaces. This is the same as the `CMAKE_CURRENT_SOURCE_DIR` variable.
- **COMPONENT_NAME**: Name of the component. Same as the name of the component directory.
- **COMPONENT_ALIAS**: Alias of the library created internally by the build system for the component.
- **COMPONENT_LIB**: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- **CONFIG_***: Each value in the project configuration has a corresponding variable available in cmake. All names begin with CONFIG_. More information here.
- **ESP_PLATFORM**: Set to 1 when the CMakel file is processed within ESP-IDF build system.

Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using `idf_build_get_property` from the component CMakeLists.txt:

- **PROJECT_NAME**: Name of the project, as set in project CMakeLists.txt file.
- **PROJECT_DIR**: Absolute path of the project directory containing the project CMakeLists. Same as the `CMAKE_SOURCE_DIR` variable.
- **COMPONENTS**: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- **IDF_VER**: Git version of ESP-IDF (produced by `git describe`)
- **IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH**: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. v4.0-dev-* and v4.0-beta1 all have the same values of `IDF_VERSION_*` variables, but different `IDF_VER` values.
- **IDF_TARGET**: Name of the target for which the project is being built.
- **PROJECT_VER**: Project version.
– If CONFIG_APP_PROJECT_VER_FROM_CONFIG option is set, the value of CONFIG_APP_PROJECT_VER will be used.
– Else, if PROJECT_VER variable is set in project CMakeLists.txt file, its value will be used.
– Else, if the PROJECT_DIR/version.txt exists, its contents will be used as PROJECT_VER.
– Else, if the project is located inside a Git repository, the output of git describe will be used.
– Otherwise, PROJECT_VER will be “1”.

Other build properties are listed here.

Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the target_compile_options function:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake set_source_files_properties command:

```cmake
set_source_files_properties(mysrc.c
  PROPERTIES COMPILER_FLAGS
  -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to idf_component_register in the component CMakeLists file.

4.4.6 Component Configuration

Each component can also have a Kconfig file, alongside CMakeLists.txt. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see Adding conditional configuration.

4.4.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- ESP_PLATFORM: Can be used to detect that build happens within ESP-IDF.
- IDF_VER: Defined to a git version string. E.g. v2.0 for a tagged release or v1.0-275-g0efaa4f for an arbitrary commit.

4.4.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on (‘requires’).

When writing a component

```cmake
idf_component_register(...
  REQUIRES mbedtls
  PRIV_REQUIRES console spiffs)
```
• \textbf{REQUIRES} should be set to all components whose header files are \#included from the \textit{public} header files of this component.
• \textbf{PRIV\_REQUIRES} should be set to all components whose header files are \#included from \textit{any source files} in this component, unless already listed in \textbf{REQUIRES}. Also any component which is required to be linked in order for this component to function correctly.
• The values of \textbf{REQUIRES} and \textbf{PRIV\_REQUIRES} should not depend on any configuration choices (\texttt{CONFIG\_xxx} macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
• Not setting either or both \textbf{REQUIRES} variables is fine. If the component has no requirements except for the \textit{Common component requirements} needed for RTOS, libc, etc.

If a component only supports some target chips (values of \texttt{IDF\_TARGET}) then it can specify \texttt{REQUIRES\_IDF\_TARGETS} in the \texttt{idf\_component\_register} call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

\textbf{Note:} In CMake terms, \textbf{REQUIRES} \& \textbf{PRIV\_REQUIRES} are approximate wrappers around the CMake functions \texttt{target\_link\_libraries(\ldots PUBLIC \ldots)} and \texttt{target\_link\_libraries(\ldots PRIVATE \ldots)}.

\textbf{Example of component requirements}

Imagine there is a \texttt{car} component, which uses the \texttt{engine} component, which uses the \texttt{spark\_plug} component:

\begin{verbatim}
- autoProject/
  - CMakeLists.txt
  - components/ - car/   - CMakeLists.txt
                                             - car.c
                                             - car.h
  - engine/   - CMakeLists.txt
               - engine.c
               - include/ - engine.h
  - spark\_plug/ - CMakeLists.txt
                     - plug.c
                     - plug.h
\end{verbatim}

\textbf{Car component} The \texttt{car.h} header file is the public interface for the \texttt{car} component. This header includes \texttt{engine.h} directly because it uses some declarations from this header:

\begin{verbatim}
/* car.h */
#include "engine.h"

#ifndef ENGINE\_IS\_HYBRID
#define CAR\_MODEL "Hybrid"
#endif
\end{verbatim}

And \texttt{car.c} includes \texttt{car.h} as well:

\begin{verbatim}
/* car.c */
#include "car.h"
\end{verbatim}

This means the \texttt{car/CMakeLists.txt} file needs to declare that \texttt{car} requires \texttt{engine}:

\begin{verbatim}
idf\_component\_register(SRCS "car.c"
                        INCLUDE\_DIRS "."
                        REQUIRES engine)
\end{verbatim}

• \texttt{SRCS} gives the list of source files in the \texttt{car} component.
• INCLUDE_DIRS gives the list of public include directories for this component. Because the public interface is car.h, the directory containing car.h is listed here.
• REQUIRES gives the list of components required by the public interface of this component. Because car.h is a public header and includes a header from engine, we include engine here. This makes sure that any other component which includes car.h will be able to recursively include the required engine.h also.

### Engine component

The engine component also has a public header file include/engine.h, but this header is simpler:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

The implementation is in engine.c:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

In this component, engine depends on spark_plug but this is a private dependency. spark_plug.h is needed to compile engine.c, but not needed to include engine.h.

This means that the engine/CMakeLists.txt file can use PRIV_REQUIRES:

```c
idf_component_register(SRCS "engine.c"
    INCLUDE_DIRS "include"
    PRIV_REQUIRES spark_plug)
```

As a result, source files in the car component don’t need the spark_plug include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

### Spark Plug Component

The spark_plug component doesn’t depend on anything else. It has a public header file spark_plug.h, but this doesn’t include headers from any other components.

This means that the spark_plug/CMakeLists.txt file doesn’t need any REQUIRES or PRIV_REQUIRES clauses:

```c
idf_component_register(SRCS "spark_plug.c"
    INCLUDE_DIRS ".")
```

### Source File Include Directories

Each component’s source file is compiled with these include path directories, as specified in the passed arguments to idf_component_register:

```c
idf_component_register("
    INCLUDE_DIRS "include"
    PRIV_INCLUDE_DIRS "other")
```

• The current component’s INCLUDE_DIRS and PRIV_INCLUDE_DIRS.
• The INCLUDE_DIRS belonging to all other components listed in the REQUIRES and PRIV_REQUIRES parameters (ie all the current component’s public and private dependencies).
• Recursively, all of the INCLUDE_DIRS of those components REQUIRES lists (ie all public dependencies of this component’s dependencies, recursively expanded).
Main component requirements

The component named main is special because it automatically requires all other components in the build. So it’s not necessary to pass REQUIRES or PRIV_REQUIRES to this component. See renaming main for a description of what needs to be changed if no longer using the main component.

Common component requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: freertos, newlib, heap, log, soc, esp_rom, esp_common, xtensa, cxx.

Including components in the build

- By default, every component is included in the build.
- If you set the COMPONENTS variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  - Components mentioned explicitly in COMPONENTS.
  - Those components’ requirements (evaluated recursively).
  - The “common” components that every component depends on.
- Setting COMPONENTS to the minimal list of required components can significantly reduce compile times.

Requirements in the build system implementation

- Very early in the CMake configuration process, the script expand_requirements.cmake is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this graph may have cycles). The graph is used to generate a file component_depends.cmake in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal BUILD_COMPONENTS variable). The BUILD_COMPONENTS variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed for all components. The order should be deterministic given the same set of components and component dependencies.
- The value of BUILD_COMPONENTS is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the CMakeLists.txt file is evaluated again to add the component libraries to the build.

Component Dependency Order

The order of components in the BUILD_COMPONENTS variable determines other orderings during the build:

- Order that project_include.cmake files are included into the project.
- Order that the list of header paths is generated for compilation (via -I argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

4.4.9 Overriding Parts of the Project

project_include.cmake

For components that have build requirements which must be evaluated before any component CMakeLists files are evaluated, you can create a file called project_include.cmake in the component directory. This CMake file is included when project.cmake is evaluating the entire project.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.
Unlike component `CMakeLists.txt` files, when including a `project_include.cmake` file the current source directory (`CMAKE_CURRENT_SOURCE_DIR` and working directory) is the project directory. Use the variable `COMPONENT_DIR` for the absolute directory of the component.

Note that `project_include.cmake` isn’t necessary for the most common component uses - such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customised via the `CMakeLists.txt` file itself. See `Optional Project Variables` for details.

`project_include.cmake` files are included in the order given in `BUILD_COMPONENTS` variable (as logged by CMake). This means that a component’s `project_include.cmake` file will be included after it’s all dependencies’ `project_include.cmake` files, unless both components are part of a dependency cycle. This is important if a `project_include.cmake` file relies on variables set by another component. See also above.

Take great care when setting variables or targets in a `project_include.cmake` file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

**KConfig.projbuild**

This is an equivalent to `project_include.cmake` for `Component Configuration` KConfig files. If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the `KConfig.projbuild` file alongside the `CMakeLists.txt` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a `KConfig` file for `Component Configuration`.

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app”.

### 4.4.10 Configuration-Only Components

Special components which contain no source files, only `KConfig.projbuild` and `KConfig`, can have a one-line `CMakeLists.txt` file which calls the function `idf_component_register()` with no arguments specified. This function will include the component in the project build, but no library will be built and no header files will be added to any include paths.

### 4.4.11 Debugging CMake

For full details about `CMake` and `CMake` commands, see the `CMake v3.5 documentation`.

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the `cmake command line documentation`.

When included from a project `CMakeLists` file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in `CMake` project function. This function is overridden to add all of the ESP-IDF specific project functionality.

**Warning On Undefined Variables**

By default, `idf.py` passes the `--warn-uninitialized` flag to `CMake` so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don’t want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`. 

Browse the /tools/cmake/project.cmake file and supporting functions in /tools/cmake/ for more details.

### 4.4.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component CMakeLists.txt can be very small or even empty (see Minimal Component CMakeLists). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

**Adding conditional configuration**

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```kconfig
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
  This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```cmake
set(srcs "foo.c" "more_foo.c")
if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c")
endif()
idf_component_register(SRCS "${srcs}"
...)
```

This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```kconfig
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
  Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
  Select this to output debugging output to the lcd
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
  Select this to output temperature plots
```

CMakeLists.txt:

```cmake
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
```

(continues on next page)
Conditions which depend on the target

The current target is available to CMake files via IDF_TARGET variable.

In addition to that, if target xyz is used (IDF_TARGET=xyz), then Kconfig variable CONFIG_IDF_TARGET_XYZ will be set.

Note that component dependencies may depend on IDF_TARGET variable, but not on Kconfig variables. Also one cannot use Kconfig variables in include statements in CMake files, but IDF_TARGET can be used in such context.

Source Code Generation

Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say your component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```
add_custom_command(
  OUTPUT logo.h
  COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o logo.h
  DEPENDS ${COMPONENT_DIR}/logo.bmp
  VERBATIM)

add_custom_target (logo DEPENDS logo.h)
add_dependencies (${COMPONENT_LIB} logo)
set_property (DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

This answer is adapted from the CMake FAQ entry, which contains some other examples that will also work with ESP-IDF builds.

In this example, logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the ADDITIONAL_MAKE_CLEAN_FILES property.

**Note:** If generating files as part of the project CMakeLists.txt file, not a component CMakeLists.txt, then use build property PROJECT_DIR instead of ${COMPONENT_DIR} and ${PROJECT_NAME}.elf instead of ${COMPONENT_LIB}.)

If a source file from another component included logo.h, then add_dependencies would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.
Embedding Binary Data

Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```c
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```c
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```c
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
    pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_
    pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters /, ., etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```c
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project CMakeLists.txt file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see `protocols/https_request` - the certificate file contents are loaded from the text .pem file at compile time.

Code and Data Placements

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See Linker Script Generation for a quick start guide as well as a detailed discussion of the mechanism.

Fully Overriding The Component Build Process

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the ESP-IDF build system entirely by using a CMake feature called ExternalProject. Example component CMakeLists:

```cmake
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
    PREFIX ${{COMPONENT_DIR}}
    SOURCE_DIR ${{COMPONENT_DIR}}/quirc)
```

(continues on next page)
CONFIGURE_COMMAND ""
BUILD_IN_SOURCE 1
BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
INSTALL_COMMAND ""

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)
set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
  ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
  ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
"${COMPONENT_DIR}/quirc/libquirc.a")

(The above CMakeLists.txt can be used to create a component named quirc that builds the quirc project using its own Makefile.)

• externalproject_add defines an external build system.
  – SOURCE_DIR, CONFIGURE_COMMAND, BUILD_COMMAND and INSTALL_COMMAND should always be set. CONFIGURE_COMMAND can be set to an empty string if the build system has no “configure” step. INSTALL_COMMAND will generally be empty for ESP-IDF builds.
  – Setting BUILD_IN_SOURCE means the build directory is the same as the source directory. Otherwise you can set BUILD_DIR.
  – Consult the ExternalProject documentation for more details about externalproject_add().

• The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.

• Finally, the generated library is added to ADDITIONAL_MAKE_CLEAN_FILES. This means make clean will delete this library. (Note that the other object files from the build won’t be deleted.)

ExternalProject dependencies, clean builds CMake has some unusual behaviour around external project builds:

• ADDITIONAL_MAKE_CLEAN_FILES only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won’t delete these files when cleaning.

• However, the ExternalProject configure & build commands will always be re-run after a clean is run.

• Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external BUILD_COMMAND run a full clean compile of all sources. The build command will be run if any of the dependencies passed to externalproject_add with DEPENDS have changed, or if this is a clean build (i.e. any of idf.py clean, ninja clean, or make clean was run.)
  2. Have the external BUILD_COMMAND be an incremental build command. Pass the parameter BUILD_ALWAYS 1 to externalproject_add. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn’t take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

4.4.13 Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file sdkconfig.defaults in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn’t yet been set in the sdkconfig file.
To override the name of this file or to specify multiple files, set the `SDKCONFIG_DEFAULTS` environment variable or set `SDKCONFIG_DEFAULTS` in top-level CMakeLists.txt. If specifying multiple files, use semicolon as the list separator. File names not specified as full paths are resolved relative to current project.

**Target-dependent sdkconfig defaults**

In addition to `sdkconfig.defaults` file, build system will also load defaults from `sdkconfig.defaults.TARGET_NAME` file, where `TARGET_NAME` is the value of `IDF_TARGET`. For example, for `esp32` target, default settings will be taken from `sdkconfig.defaults.first`, and then from `sdkconfig.defaults.esp32`. If `SDKCONFIG_DEFAULTS` is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from `SDKCONFIG_DEFAULTS` value/values using the rule above.

### 4.4.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, `esptool.py` and `esptool write_flash` arguments. It’s simple to write a script to save binaries and `esptool.py`. After running a project build, the build directory contains binary output files (.bin files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.4.15 Building the Bootloader

The bootloader is built by default as part of `idf.py` build, or can be built standalone via `idf.py bootloader`. The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMakeLists.txt file and builds separate .ELF and .BIN files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.4.16 Selecting the Target

ESP-IDF supports multiple targets (chips). The identifiers used for each chip are as follows:

- `esp32` — for ESP32-D0WD, ESP32-D2WD, ESP32-S0WD (ESP-SOLO), ESP32-U4WDH, ESP32-PICO-D4
- `esp32s2` — for ESP32-S2
To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

**Important:** `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

**Note:** The behavior of `idf.py set-target` command is equivalent to:

1. Clearing the build directory (`idf.py fullclean`)
2. Removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
3. Configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the default value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

### 4.4.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components,” and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```cmake
add_library(json STATIC
  cJSON/cJSON.c
  cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF json component `/components/json/CMakeLists.txt`
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.)
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.4.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects — code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library `foo` to be used in the `main` component:
Chapter 4. API Guides

# Register the component
idf_component_register(...)

# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)

For an actual example, take a look at build_system/cmake/import_lib. Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the mbedtls component is a wrapper for Espressif’s fork of mbedtls. See its component CMakeLists.txt.

The CMake variable ESP_PLATFORM is set to 1 whenever the ESP-IDF build system is being used. Tests such as if (ESP_PLATFORM) can be used in generic CMake code if special IDF-specific logic is required.

Using ESP-IDF components from external libraries

The above example assumes that the external library `foo` (or `tinyxml` in the case of the import_lib example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as libc, libstdc++, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target idf::<componentname>.

For example, in the foo/CMakeLists.txt file:

```cmake
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
    # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
    target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.4.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (.a file), built by some other build process.

The ESP-IDF build system provides a utility function add_prebuilt_library for users to be able to easily import and use prebuilt libraries:

```cmake
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES...
    -req1 req2 ...])
```

where:

- `target_name` - name that can be used to reference the imported library, such as when linking to other targets
- `lib_path` - path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments REQUIRES and PRIV_REQUIRES specify dependency on other components. These have the same meaning as the arguments for idf_component_register.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at build_system/cmake/import_prebuilt.
4.4.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user’s targets (libraries/executables).

It is possible to do so by using the build system APIs provided by tools/cmake/idf.cmake. For example:

```cmake
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets, dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in `build_system/cmake/idf_as_lib` demonstrates the creation of an application equivalent to `hello world` application using a custom CMake project.

4.4.21 ESP-IDF CMake Build System API

**idf-build-commands**

*idf_build_get_property(var property [GENERATOR_EXPRESSION]*)

Retrieve a build property `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

*idf_build_set_property(property val [APPEND]*)

Set a build property `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

*idf_build_component(component_dir)*

Present a directory `component_dir` that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before `idf_build_process`.

This command does not guarantee that the component will be processed during build (see the `COMPONENTS` argument description for `idf_build_process`)

*idf_build_process(target
[PROJECT_DIR project_dir]
[PROJECT_VER project_ver]
[PROJECT_NAME project_name]
[SDKCONFIG sdkconfig]*)

(continues on next page)
Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user’s perspective is the libraries creation by calling each component’s `idf_component_register`.

This command creates the libraries for each component, which are accessible using aliases in the form `idf::component_name`. These aliases can be used to link the components to the user’s own targets, either libraries or executables.

The call requires the target chip to be specified with `target` argument. Optional arguments for the call include:

- `PROJECT_DIR` - directory of the project; defaults to `CMAKE_SOURCE_DIR`
- `PROJECT_NAME` - name of the project; defaults to `CMAKE_PROJECT_NAME`
- `PROJECT_VER` - version/revision of the project; defaults to “1”
- `SDKCONFIG` - output path of generated sdkconfig file; defaults to `PROJECT_DIR/sdkconfig` or `CMAKE_SOURCE_DIR/sdkconfig` depending if `PROJECT_DIR` is set
- `SDKCONFIG_DEFAULTS` - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value `filename` in the list, the config from file `filename.target`, if it exists, is also loaded.
- `BUILD_DIR` - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to `CMAKE_BINARY_DIR`
- `COMPONENTS` - select components to process among the components known by the build system (added via `idf_build_component`). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

**idf_build_executable(executable)**

Specify the executable `executable` for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after `idf_build_process`.

**idf_build_get_config(var config [GENERATOR_EXPRESSION])**

Get the value of the specified config. Much like build properties, specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to `idf_build_process`, however.

**idf-build-properties**

These are properties that describe the build. Values of build properties can be retrieved by using the build command `idf_build_get_property`. For example, to get the Python interpreter used for the build:

**idf-component-commands**

**idf_component_get_property(var component property [GENERATOR_EXPRESSION])**

Retrieve a specified component’s `component property`, `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

**idf_component_set_property(component property val [APPEND])**

Set a specified component’s `component property`, `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.
Register a component to the build system. Much like the `project()` CMake command, this should be called from the component’s `CMakeLists.txt` directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can not be called before `idf_component_register`:

- commands that are not valid in CMake script mode
- custom commands defined in `project_include.cmake`
- build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`. The arguments for `idf_component_register` include:

- `SRCS` - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- `SRC_DIRS`, `EXCLUDE_SRCS` - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via `SRCS`. Note that this is subject to the [limitations of globbing in CMake](https://cmake.org/cmake/help/latest/manual/cmakefunc.glob.7.html).
- `INCLUDE_DIRS` - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component.
- `PRIV_INCLUDE_DIRS` - directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only.
- `REQUIRES` - public component requirements for the component
- `PRIV_REQUIRES` - private component requirements for the component; ignored on config-only components
- `LDFRAGMENTS` - component linker fragment files
- `REQUIRED_IDF_TARGETS` - specify the only target the component supports

The following are used for embedding data into the component, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- `EMBED_FILES` - binary files to be embedded in the component
- `EMBED_TXTFILES` - text files to be embedded in the component

### idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the freertos component:

- `COMPONENT_ALIAS` - alias for `COMPONENT_LIB` used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- `COMPONENT_DIR` - component directory; set by `idf_build_component`
- `COMPONENT_LIB` - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- `COMPONENT_NAME` - name of the component; set by `idf_build_component` based on the component directory name
- `COMPONENT_TYPE` - type of the component, whether LIBRARY or CONFIG_ONLY. A component is of type LIBRARY if it specifies source files or embeds a file
Chapter 4. API Guides

- **MBED_FILES** - list of files to embed in component; set from `idf_component_register` `MBED_FILES` argument
- **MBED_TXTFILES** - list of text files to embed in component; set from `idf_component_register` `MBED_TXTFILES` argument
- **INCLUDE_DIRS** - list of component include directories; set from `idf_component_register` `INCLUDE_DIRS` argument
- **KCONFIG** - component Kconfig file; set by `idf_build_component`
- **KCONFIG_PROJBUILD** - component Kconfig.projbuild; set by `idf_build_component`
- **LDFFRAGMENTS** - list of component linker fragment files; set from `idf_component_register` `LDFFRAGMENTS` argument
- **PRIV_INCLUDE_DIRS** - list of component private include directories; set from `idf_component_register` `PRIV_INCLUDE_DIRS` on components of type `LIBRARY`
- **PRIV_REQUIRES** - list of private component dependences; set from `idf_component_register` `PRIV_REQUIRES` argument
- **REQUIRED_IDF_TARGETS** - list of targets the component supports; set from `idf_component_register` `REQUIRES` argument
- **REQUIRES** - list of public component dependencies; set from `idf_component_register` `REQUIRES` argument
- **SRCS** - list of component source files; set from `SRCS` or `SRC_DIRS/EXCLUDE_SRCS` argument of `idf_component_register`

### 4.4.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via `SRCS` argument to `idf_component_register`:

```cpp
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...)
```

This preference reflects the CMake best practice of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using `SRC_DIRS`:

```cpp
idf_component_register(SRC_DIRS library platform ...)
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won’t know to automatically re-run and this file won’t be added to the build.

The trade-off is acceptable when you’re adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git.

For components which are part of ESP-IDF, we use a third party Git CMake integration module (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use `SRCS` argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.
4.4.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the build/ directory. To regenerate these files, run cmake or idf.py reconfigure (or any other idf.py build command).

- compile_commands.json is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- project_description.json contains some general information about the ESP-IDF project, configured paths, etc.
- flasher_args.json contains esptool.py arguments to flash the project’s binary files. There are also flash_*_args files which can be used directly with esptool.py. See Flash arguments.
- CMakeCache.txt is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- config/sdkconfig.json is a JSON-formatted version of the project configuration values.
- config/kconfig_menus.json is a JSON-formatted version of the menus shown in menuconfig, for use in external IDE UIs.

JSON Configuration Server

A tool called confserver.py is provided to allow IDEs to easily integrate with the configuration system logic. confserver.py is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run confserver.py from a project via idf.py confserver or ninja confserver, or a similar target triggered from a different build generator.

For more information about confserver.py, see tools/kconfig_new/README.md.

4.4.24 Build System Internals

Build Scripts

The list files for the ESP-IDF build system reside in /tools/cmake. The modules which implement core build system functionality are as follows:

- build.cmake - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- component.cmake - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- kconfig.cmake - Generation of configuration files (sdkconfig, sdkconfig.h, sdkconfig.cmake, etc.) from Kconfig files.
- ldgen.cmake - Generation of final linker script from linker fragment files.
- target.cmake - Setting build target and toolchain file.
- utilities.cmake - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in /tools/cmake:

- idf.cmake - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- project.cmake - Includes idf.cmake and provides a custom project() command that takes care of all the heavy lifting of building an executable. Included in the top-level CMakeLists.txt of standard ESP-IDF projects.

The rest of the files in /tools/cmake are support or third-party scripts used in the build process.
Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

Fig. 3: ESP-IDF Build System Process

Initialization

This phase sets up necessary parameters for the build.

- **Upon inclusion of** `idf.cmake` **in** `project.cmake`, the following steps are performed:
  - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level `CMakeLists.txt`.
  - Add `/tools/cmake` to `CMAKE_MODULE_PATH` and include core modules plus the various helper/third-party scripts.
  - Set build tools/executables such as default Python interpreter.
  - Get ESP-IDF git revision and store as `IDF_VER`.
  - Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
  - Add components in `components` to the build.

- **The initial part of the custom** `project()` **command performs the following steps:**
  - Set `IDF_TARGET` from environment variable or CMake cache and the corresponding `CMAKE_TOOLCHAIN_FILE` to be used.
  - Add components in `EXTRA_COMPONENTS_DIRS` to the build.
  - Prepare arguments for calling command `idf_build_process()` from variables such as `COMPONENTS/EXCLUDE_COMPONENTS`, `SDKCONFIG`, `SDKCONFIG_DEFAULTS`.

The call to `idf_build_process()` command marks the end of this phase.

Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of `idf_build_process()`.

- Retrieve each component’s public and private requirements. A child process is created which executes each component’s `CMakeLists.txt` in script mode. The values of `idf_component_register REQUIRES` and `PRIV_REQUIRES` argument is returned to the parent build process. This is called early expansion. The variable `CMAKE_BUILD_EARLY_EXPANSION` is defined during this step.
- Recursively include components based on public and private requirements.

Processing

This phase processes the components in the build, and is the second half of `idf_build_process()`.

- Load project configuration from `sdkconfig` file and generate an `sdkconfig.cmake` and `sdkconfig.h` header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
- Include each component’s `project_include.cmake`. 
• Add each component as a subdirectory, processing its CMakeLists.txt. The component CMakeLists.txt calls the registration command, \texttt{idf\_component\_register} which adds source files, include directories, creates component library, links dependencies, etc.

\textbf{Finalization}

This phase is everything after \texttt{idf\_build\_process()}.  

• Create executable and link the component libraries to it.  
• Generate project metadata files such as \texttt{project\_description.json} and display relevant information about the project built.

Browse \texttt{/tools/cmake/project.cmake} for more details.

\section*{4.4.25 Migrating from ESP-IDF GNU Make System}

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, \texttt{idf\_component\_register}.

\textbf{Automatic Conversion Tool}

An automatic project conversion tool is available in \texttt{/tools/cmake/convert\_to\_cmake.py}. Run this command line tool with the path to a project like this:

\begin{verbatim}
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
\end{verbatim}

The project directory must contain a Makefile, and GNU Make (\texttt{make}) must be installed and available on the PATH. The tool will convert the project Makefile and any component \texttt{component.mk} files to their equivalent CMakeLists.txt files. It does so by running \texttt{make} to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent CMakeLists files to set the same variables.

\textbf{Important:} When the conversion tool converts a \texttt{component.mk} file, it doesn’t determine what other components that component depends on. This information needs to be added manually by editing the new component CMakeLists.txt file and adding \texttt{REQUIRES} and/or \texttt{PRIV\_REQUIRES} clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See \textit{Component Requirements}.

The conversion tool is not capable of dealing with complex Makefile logic or unusual targets. These will need to be converted by hand.

\textbf{No Longer Available in CMake}

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

• \texttt{COMPONENT\_BUILD\_DIR}: Use \texttt{CMAKE\_CURRENT\_BINARY\_DIR} instead.
• \texttt{COMPONENT\_LIBRARY}: Defaulted to \texttt{\$(COMPONENT\_NAME)\_a}, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
• \texttt{CC, LD, AR, OBJCOPY}: Full paths to each tool from the gcc xtensa cross-toolchain. Use \texttt{CMAKE\_C\_COMPILE, CMAKE\_C\_LINK\_EXECUTABLE}, \texttt{CMAKE\_OBJCOPY}, etc instead. \textbf{Full list here.}
• \texttt{HOSTCC, HOSTLD, HOSTAR}: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
• \texttt{COMPONENT\_ADD\_LDFLAGS}: Used to override linker flags. Use the CMake \texttt{target\_link\_libraries} command instead.
Chapter 4. API Guides

- **COMPONENT_ADD_LINKER_DEPS**: List of files that linking should depend on. `target_link_libraries` will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- **COMPONENT_SUBMODULES**: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- **COMPONENT_EXTRA_INCLUDES**: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- **COMPONENT_OBJS**: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCS` argument to `idf_component_register`.
- **COMPONENT_OBJS_EXCLUDE**: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- **COMPONENT_EXTRA_CLEAN**: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note CMake has some restrictions around this functionality.
- **COMPONENT_OWNBUILD_TARGET & COMPONENT_OWNCLEAN_TARGET**: Use CMake `ExternalProject` instead. See [Fully Overriding The Component Build Process](#) for full details.
- **COMPONENT_CONFIG_ONLY**: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](#).
- **CFLAGS, CPPFLAGS, CXXFLAGS**: Use equivalent CMake commands instead. See [Controlling Component Compilation](#).

### No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)
- Include directories (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)

### No Longer Necessary

- In the legacy Make-based build system, it is required to also set `COMPONENT_SRCDIRS` if `COMPONENT_SRCS` is set. In CMake, the equivalent is not necessary i.e. specifying `SRC_DIRS` to `idf_component_register` if `SRCS` is also specified (in fact, `SRCS` is ignored if `SRC_DIRS` is specified).

### Flashing from make

`make flash` and similar targets still work to build and flash. However, project `sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See [Flashing with ninja or make](#) for more details.

### 4.5 Build System (Legacy GNU Make)

**Note**: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document explains the legacy GNU Make Espressif IoT Development Framework build system and the concept of “components”

Read this document if you want to know how to organise an ESP-IDF project using GNU Make build system.
We recommend using the esp-idf-template project as a starting point for your project.

### 4.5.1 Using the Build System

The esp-idf README file contains a description of how to use the build system to build your project.

### 4.5.2 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP32 base libraries (libc, rom bindings etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build environment will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build process will compile the project.

### Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting output such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called sdkconfig in the root directory of the project. This configuration file is modified via make menuconfig to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by esp-idf. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “Components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by esp-idf itself, others may be sourced from other places.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the IDF_PATH environment variable which holds the path of the esp-idf directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH, or the path to the toolchain can be set as part of the compiler prefix in the project configuration.

### Example Project

An example project directory tree might look like this:

```
- myProject/
  - Makefile
  - sdkconfig
  - components/ - component1/ - component.mk
  - Kconfig
  - src1.c
```

(continues on next page)
This example “myProject” contains the following elements:

- A top-level project Makefile. This Makefile sets the PROJECT_NAME variable and (optionally) defines other project-wide make variables. It includes the core $(IDF_PATH)/make/project.mk makefile which implements the rest of the ESP-IDF build system.

- “sdkconfig” project configuration file. This file is created/updated when “make menuconfig” runs, and holds configuration for all of the components in the project (including esp-idf itself). The “sdkconfig” file may or may not be added to the source control system of the project.

- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF.

- “main” directory is a special “pseudo-component” that contains source code for the project itself. “main” is a default name, the Makefile variable COMPONENT_DIRS includes this component but you can modify this variable (or set EXTRA_COMPONENT_DIRS) to look for components in other places.

- “build” directory is where build output is created. After the make process is run, this directory will contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories contain a component makefile - component.mk. This may contain variable definitions to control the build process of the component, and its integration into the overall project. See Component Makefiles for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via the project configuration. Some components may also include Kconfig.projbuild and Makefile.projbuild files, which are special files for overriding parts of the project.

Project Makefiles

Each project has a single Makefile that contains build settings for the entire project. By default, the project Makefile can be quite minimal.

Minimal Example Makefile

```
PROJECT_NAME := myProject
include $(IDF_PATH)/make/project.mk
```

Mandatory Project Variables

- PROJECT_NAME: Name of the project. Binary output files will use this name - ie myProject.bin, myProject.elf.

Optional Project Variables These variables all have default values that can be overridden for custom behaviour. Look in make/project.mk for all of the implementation details.

- PROJECT_PATH: Top-level project directory. Defaults to the directory containing the Makefile. Many other project variables are based on this variable. The project path cannot contain spaces.
Chapter 4. API Guides

- **BUILD_DIRS_BASE**: The build directory for all objects/libraries/binaries. Defaults to 
  $(PROJECT_PATH)/build.
- **COMPONENT_DIRS**: Directories to search for components. Defaults to 
  $(IDF_PATH)/components, 
  $(PROJECT_PATH)/components, $(PROJECT_PATH)/main and EXTRA_COMPONENT_DIRS. Override 
  this variable if you don’t want to search for components in these places.
- **EXTRA_COMPONENT_DIRS**: Optional list of additional directories to search for components.
- **COMPONENTS**: A list of component names to build into the project. Defaults to all components found in the
  COMPONENT_DIRS directories.
- **EXCLUDE_COMPONENTS**: Optional list of component names to exclude during the build process. Note that 
  this decreases build time, but not binary size.
- **TEST_EXCLUDE_COMPONENTS**: Optional list of component names to exclude during the build process of
  unit tests.

Any paths in these Makefile variables should be absolute paths. You can convert relative paths using
$(PROJECT_PATH)/xxx, $(IDF_PATH)/xxx, or use the Make function $(abspath xxx).

These variables should all be set before the line include $(IDF_PATH)/make/project.mk in the Makefile.

Component Makefiles

Each project contains one or more components, which can either be part of esp-idf or added from other component
directories.

A component is any directory that contains a component.mk file.

Searching for Components

The list of directories in COMPONENT_DIRS is searched for the project’s components. Directories in this list can
either be components themselves (ie they contain a component.mk file), or they can be top-level directories whose
subdirectories are components.

Running the make list-components target dumps many of these variables and can help debug the discovery
of component directories.

Multiple components with the same name  When esp-idf is collecting all the components to compile, it will
do this in the order specified by COMPONENT_DIRS; by default, this means the idf components first, the project
components second and optionally the components in EXTRA_COMPONENT_DIRS last. If two or more of these
directories contain component subdirectories with the same name, the component in the last place searched is used.
This allows, for example, overriding esp-idf components with a modified version by simply copying the component
from the esp-idf component directory to the project component tree and then modifying it there. If used in this way,
the esp-idf directory itself can remain untouched.

Minimal Component Makefile  The minimal component.mk file is an empty file(!). If the file is empty, the
default component behaviour is set:

- All source files in the same directory as the makefile (*.c, *.cpp, *.cc, *.S) will be compiled into the
  component library
- A sub-directory “include” will be added to the global include search path for all other components.
- The component library will be linked into the project app.

See example component makefiles for more complete component makefile examples.

Note that there is a difference between an empty component.mk file (which invokes default component build
behaviour) and no component.mk file (which means no default component build behaviour will occur.) It is
possible for a component to have no component.mk file, if it only contains other files which influence the project
configuration or build process.
Preset Component Variables  The following component-specific variables are available for use inside `component.mk`, but should not be modified:

- **COMPONENT_PATH**: The component directory. Evaluates to the absolute path of the directory containing `component.mk`. The component path cannot contain spaces.
- **COMPONENT_NAME**: Name of the component. Defaults to the name of the component directory.
- **COMPONENT_BUILD_DIR**: The component build directory. Evaluates to the absolute path of a directory inside `$<BUILD_DIR_BASE>` where this component’s source files are to be built. This is also the Current Working Directory any time the component is being built, so relative paths in make targets, etc. will be relative to this directory.
- **COMPONENT_LIBRARY**: Name of the static library file (relative to the component build directory) that will be built for this component. Defaults to `$<COMPONENT_NAME>.a`.

The following variables are set at the project level, but exported for use in the component build:

- **PROJECT_NAME**: Name of the project, as set in project Makefile
- **PROJECT_PATH**: Absolute path of the project directory containing the project Makefile.
- **COMPONENTS**: Name of all components that are included in this build.
- **CONFIG_***: Each value in the project configuration has a corresponding variable available in make. All names begin with `CONFIG_`.
- **CC, LD, AR, OBJCOPY**: Full paths to each tool from the gcc xtensa cross-toolchain.
- **HOSTCC, HOSTLD, HOSTAR**: Full names of each tool from the host native toolchain.
- **IDF_VER**: ESP-IDF version, retrieved from either `$<IDF_PATH>/version.txt` file (if present) else using `git describe` command. Recommended format here is single line that specifies major IDF release version, e.g. v2.0 for a tagged release or v2.0-275-g0eaa4f for an arbitrary commit. Application can make use of this by calling `esp_get_idf_version()`.
- **IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH**: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. v4.0-dev-*, v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of ESP_IDF_VERSION_* variables, but different IDF_VER values.
- **PROJECT_VER**: Project version.
  - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
  - Else, if `PROJECT_VER` variable is set in project Makefile file, its value will be used.
  - Else, if the `$<PROJECT_PATH>/version.txt` exists, its contents will be used as `PROJECT_VER`.
  - Otherwise, `PROJECT_VER` will be “1”.

If you modify any of these variables inside `component.mk` then this will not prevent other components from building but it may make your component hard to build and/or debug.

Optional Project-Wide Component Variables  The following variables can be set inside `component.mk` to control build settings across the entire project:

- **COMPONENT_ADD_INCLUDEDIRS**: Paths, relative to the component directory, which will be added to the include search path for all components in the project. Defaults to `include` if not overridden. If an include directory is only needed to compile this specific component, add it to `COMPONENT_PRIV_INCLUDEDIRS` instead.
- **COMPONENT_ADD_LDFLAGS**: Add linker arguments to the LDFLAGS for the app executable. Defaults to `-l<COMPONENT_NAME>`. If adding pre-compiled libraries to this directory, add them as absolute paths - i.e `$<COMPONENT_PATH>/libwhatever.a`.
- **COMPONENT_DEPENDS**: Optional list of component names that should be compiled before this component. This is not necessary for link-time dependencies, because all component include directories are available at all times. It is necessary if one component generates an include file which you then want to include in another component. Most components do not need to set this variable.
- **COMPONENT_ADD_LINKER_DEPS**: Optional list of component-relative paths to files which should trigger a re-link of the ELF file if they change. Typically used for linker script files and binary libraries. Most components do not need to set this variable.

The following variable only works for components that are part of esp-idf itself:
**COMPONENT_SUBMODULES**: Optional list of git submodule paths (relative to COMPONENT_PATH) used by the component. These will be checked (and initialised if necessary) by the build process. This variable is ignored if the component is outside the IDF_PATH directory.

**Optional Component-Specific Variables**

The following variables can be set inside component.mk to control the build of that component:

- **COMPONENT_PRIV_INCLUDEDIRS**: Directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only.
- **COMPONENT_EXTRA_INCLUDES**: Any extra include paths used when compiling the component’s source files. These will be prefixed with ‘-I’ and passed as-is to the compiler. Similar to the COMPONENT_PRIV_INCLUDEDIRS variable, except these paths are not expanded relative to the component directory.
- **COMPONENT_SRCDIRS**: Directory paths, must be relative to the component directory, which will be searched for source files (*.cpp, *.c, *.S). Defaults to ‘.’, i.e. the component directory itself. Override this to specify a different list of directories which contain source files.
- **COMPONENT_OBJS**: Object files to compile. Default value is a .o file for each source file that is found in COMPONENT_SRCDIRS. Overriding this list allows you to exclude source files in COMPONENT_SRCDIRS that would otherwise be compiled. See **Specifying source files**.
- **COMPONENT_EXTRA_CLEAN**: Paths, relative to the component build directory, of any files that are generated using custom make rules in the component.mk file and which need to be removed as part of make clean. See **Source Code Generation** for an example.
- **COMPONENT_OWNBUILDTARGET & COMPONENT_OWNCLEANTARGET**: These targets allow you to fully override the default build behaviour for the component. See **Fully Overriding The Component Makefile** for more details.
- **COMPONENT_CONFIG_ONLY**: If set, this flag indicates that the component produces no built output at all (i.e. COMPONENT_LIBRARY is not built), and most other component variables are ignored. This flag is used for IDF internal components which contain only KConfig.projbuild and/or Makefile.projbuild files to configure the project, but no source files.
- **CFLAGS**: Flags passed to the C compiler. A default set of CFLAGS is defined based on project settings. Component-specific additions can be made via CFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.
- **CPPFLAGS**: Flags passed to the C preprocessor (used for .c, .cpp and .S files). A default set of CPPFLAGS is defined based on project settings. Component-specific additions can be made via CPPFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.
- **CXXFLAGS**: Flags passed to the C++ compiler. A default set of CXXFLAGS is defined based on project settings. Component-specific additions can be made via CXXFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.
- **COMPONENT_ADD_LDFRAGMENTS**: Paths to linker fragment files for the linker script generation functionality. See **Linker Script Generation**.

To apply compilation flags to a single source file, you can add a variable override as a target, ie:

```make
apps/dhcpserver.o: CFLAGS += -Wno-unused-variable
```

This can be useful if there is upstream code that emits warnings.

**Component Configuration**

Each component can also have a Kconfig file, alongside component.mk. This contains contains configuration settings to add to the “make menuconfig” for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component KConfig file, it is easiest to start with one of the KConfig files distributed with esp-idf.

For an example, see **Adding conditional configuration**.
Preprocessor Definitions

ESP-IDF build systems adds the following C preprocessor definitions on the command line:

- **ESP_PLATFORM** — Can be used to detect that build happens within ESP-IDF.
- **IDF_VER** — ESP-IDF version, see *Preset Component Variables* for more details.

Build Process Internals

Top Level: Project Makefile

- “make” is always run from the project directory and the project makefile, typically named Makefile.
- The project makefile sets **PROJECT_NAME** and optionally customises other *optional project variables*
- The project makefile includes `$(IDF_PATH)/make/project.mk` which contains the project-level Make logic.
- `project.mk` fills in default project-level make variables and includes make variables from the project configuration. If the generated makefile containing project configuration is out of date, then it is regenerated (via targets in `project_config.mk`) and then the make process restarts from the top.
- `project.mk` builds a list of components to build, based on the default component directories or a custom list of components set in *optional project variables*.
- Each component can set some *optional project-wide component variables*. These are included via generated makefiles named `component_project_vars.mk` - there is one per component. These generated makefiles are included into `project.mk`. If any are missing or out of date, they are regenerated (via a recursive make call to the component makefile) and then the make process restarts from the top.
- `Makefile.projbuild` files from components are included into the make process, to add extra targets or configuration.
- By default, the project makefile also generates top-level build & clean targets for each component and sets up `app` and `clean` targets to invoke all of these sub-targets.
- In order to compile each component, a recursive make is performed for the component makefile.

To better understand the project make process, have a read through the `project.mk` file itself.

Second Level: Component Makefiles

- Each call to a component makefile goes via the `$(IDF_PATH)/make/component_wrapper.mk` wrapper makefile.
- This component wrapper includes all component `Makefile.componentbuild` files, making any recipes, variables etc in these files available to every component.
- The `component_wrapper.mk` is called with the current directory set to the component build directory, and the `COMPONENT_MAKEFILE` variable is set to the absolute path to `component.mk`.
- `component_wrapper.mk` sets default values for all *component variables*, then includes the `component.mk` file which can override or modify these.
- If `COMPONENT_OWNBUILDTARGET` and `COMPONENT_OWNCLEANTARGET` are not defined, default build and clean targets are created for the component’s source files and the prerequisite `COMPONENT_LIBRARY` static library file.
- The `component_project_vars.mk` file has its own target in `component_wrapper.mk`, which is evaluated from `project.mk` if this file needs to be rebuilt due to changes in the component makefile or the project configuration.

To better understand the component make process, have a read through the `component_wrapper.mk` file and some of the `component.mk` files included with esp-idf.

Running Make Non-Interactively

When running `make` in a situation where you don’t want interactive prompts (for example: inside an IDE or an automated build system) append `BATCH_BUILD=1` to the make arguments (or set it as an environment variable).

Setting `BATCH_BUILD` implies the following:
Chapter 4. API Guides

- Verbose output (same as V=1, see below). If you don’t want verbose output, also set V=0.
- If the project configuration is missing new configuration items (from new components or esp-idf updates) then the project use the default values, instead of prompting the user for each item.
- If the build system needs to invoke menuconfig, an error is printed and the build fails.

Advanced Make Targets

- `make app`, `make bootloader`, `make partition table` can be used to build only the app, bootloader, or partition table from the project as applicable.
- `make erase_flash` and `make erase_otadata` will use esptool.py to erase the entire flash chip and the OTA selection setting from the flash chip, respectively.
- `make size` prints some size information about the app. `make size-components` and `make size-files` are similar targets which print more detailed per-component or per-source-file information, respectively.

Debugging The Make Process

Some tips for debugging the esp-idf build system:

- Appending `V=1` to the make arguments (or setting it as an environment variable) will cause make to echo all commands executed, and also each directory as it is entered for a sub-make.
- Running `make -w` will cause make to echo each directory as it is entered for a sub-make - same as V=1 but without also echoing all commands.
- Running `make --trace` (possibly in addition to one of the above arguments) will print out every target as it is built, and the dependency which caused it to be built.
- Running `make -p` prints a (very verbose) summary of every generated target in each makefile.

For more debugging tips and general make information, see the GNU Make Manual.

Warning On Undefined Variables   By default, the build process will print a warning if an undefined variable is referenced (like `$DOES_NOT_EXIST`). This can be useful to find errors in variable names.

If you don’t want this behaviour, it can be disabled in menuconfig’s top level menu under SDK tool configuration.

Note that this option doesn’t trigger a warning if `ifdef` or `ifndef` are used in Makefiles.

Overriding Parts of the Project

`Makefile.projbuild` For components that have build requirements that must be evaluated in the top-level project make pass, you can create a file called `Makefile.projbuild` in the component directory. This makefile is included when `project.mk` is evaluated.

For example, if your component needs to add to CFLAGS for the entire project (not just for its own source files) then you can set `CFLAGS +=` in Makefile.projbuild.

`Makefile.projbuild` files are used heavily inside esp-idf, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

Note that `Makefile.projbuild` isn’t necessary for the most common component uses - such as adding include directories to the project, or LDFLAGS to the final linking step. These values can be customised via the `component.mk` file itself. See Optional Project-Wide Component Variables for details.

Take care when setting variables or targets in this file. As the values are included into the top-level project makefile pass, they can influence or break functionality across all components!
KConfig.projbuild This is an equivalent to Makefile.projbuild for component configuration KConfig files. If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the KConfig.projbuild file alongside the component.mk file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a KConfig file for component configuration.

Makefile.componentbuild For components that e.g. include tools to generate source files from other files, it is necessary to be able to add recipes, macros or variable definitions into the component build process of every components. This is done by having a Makefile.componentbuild in a component directory. This file gets included in component_wrapper.mk, before the component.mk of the component is included. As with the Makefile.projbuild, take care with these files: as they’re included in each component build, a Makefile. componentbuild error may only show up when compiling an entirely different component.

Configuration-Only Components Some special components which contain no source files, only Kconfig. projbuild and Makefile.projbuild, may set the flag COMPONENT_CONFIG_ONLY in the component.mk file. If this flag is set, most other component variables are ignored and no build step is run for the component.

Example Component Makefiles

Because the build environment tries to set reasonable defaults that will work most of the time, component.mk can be very small or even empty (see Minimal Component Makefile). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component.mk makefiles:

Adding source directories By default, sub-directories are ignored. If your project has sources in sub-directories instead of in the root of the component then you can tell that to the build system by setting COMPONENT_SRCDIRS:

```
COMPONENT_SRCDIRS := src1 src2
```

This will compile all source files in the src1/ and src2/ sub-directories instead.

Specifying source files The standard component.mk logic adds all .S and .c files in the source directories as sources to be compiled unconditionally. It is possible to circumvent that logic and hard-code the objects to be compiled by manually setting the COMPONENT_OBJS variable to the name of the objects that need to be generated:

```
COMPONENT_OBJS := file1.o file2.o thing/filea.o thing/fileb.o anotherthing/main.o
COMPONENT_SRCDIRS := . thing anotherthing
```

Note that COMPONENT_SRCDIRS must be set as well.

Adding conditional configuration The configuration system can be used to conditionally compile some files depending on the options selected in make menuconfig. For this, ESP-IDF has the compile_only_if and compile_only_if_not macros:

```
Kconfig:

config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
      This enables the BAR feature of the FOO component.
```

component.mk:
$(call compile_only_if,$(CONFIG_FOO_ENABLE_BAR),bar.o)

As can be seen in the example, the `compile_only_if` macro takes a condition and a list of object files as parameters. If the condition is true (in this case: if the BAR feature is enabled in menuconfig) the object files (in this case: `bar.o`) will always be compiled. The opposite goes as well: if the condition is not true, `bar.o` will never be compiled.

`compile_only_if_not` does the opposite: compile if the condition is false, not compile if the condition is true.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```c
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.
endconfig

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd
endconfig

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
endconfig
```

Component.mk:

```make
# If LCD is enabled, compile interface to it, otherwise compile dummy interface
$(call compile_only_if,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-real.o lcd-spi.o)
$(call compile_only_if_not,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-dummy.o)

# We need font if either console or plot is enabled
$(call compile_only_if,$(or $(CONFIG_ENABLE_LCD_CONSOLE),$(CONFIG_ENABLE_LCD_PLOT)), font.o)
```

Note the use of the Make `or` function to include the font file. Other substitution functions, like `and` and `if` will also work here. Variables that do not come from menuconfig can also be used: ESP-IDF uses the default Make policy of judging a variable which is empty or contains only whitespace to be false while a variable with any non-whitespace in it is true.

(Note: Older versions of this document advised conditionally adding object file names to COMPONENT_OBJS. While this still is possible, this will only work when all object files for a component are named explicitly, and will not clean up deselected object files in a `make clean` pass.)

Source Code Generation Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called `graphics_lib.c`:

```make
COMPONENT_EXTRA_CLEAN := logo.h

graphics_lib.o: logo.h

logo.h: $(COMPONENT_PATH)/logo.bmp
    bmp2h -i ^ ~o $@
```

In this example, `graphics_lib.o` and `logo.h` will be generated in the current directory (the build directory) while `logo.bmp` comes with the component and resides under the component path. Because `logo.h` is a generated file,
it needs to be cleaned when make clean is called which why it is added to the COMPONENT_EXTRA_CLEAN variable.

**Cosmetic Improvements** Because logo.h is a generated file, it needs to be cleaned when make clean is called which why it is added to the COMPONENT_EXTRA_CLEAN variable.

Adding logo.h to the graphics_lib.o dependencies causes it to be generated before graphics_lib.c is compiled.

If a a source file in another component included logo.h, then this component’s name would have to be added to the other component’s COMPONENT_DEPENDS list to ensure that the components were build in-order.

**Embedding Binary Data** Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can set a variable COMPONENT_EMBED_FILES in component.mk, giving the names of the files to embed in this way:

```makefile
COMPONENT_EMBED_FILES := server_root_cert.der
```

Or if the file is a string, you can use the variable COMPONENT_EMBED_TXTFILES. This will embed the contents of the text file as a null-terminated string:

```makefile
COMPONENT_EMBED_TXTFILES := server_root_cert.pem
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```c
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_\n-pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_\n-pem_end");
```

The names are generated from the full name of the file, as given in COMPONENT_EMBED_FILES. Characters /, ., etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

For an example of using this technique, see `protocols/https_request` - the certificate file contents are loaded from the text .pem file at compile time.

**Code and Data Placements**

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See `Linker Script Generation` for a quick start guide as well as a detailed discussion of the mechanism.

**Fully Overriding The Component Makefile**

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the esp-idf build system entirely by setting COMPO- NENT_OWNBUILDTARGET and possibly COMPONENT_OWNCLEANTARGET and defining your own targets named build and clean in component.mk target. The build target can do anything as long as it creates $(COMPONENT_LIBRARY) for the project make process to link into the app binary.

(Actually, even this is not strictly necessary - if the COMPONENT_ADD_LDFLAGS variable is overridden then the component can instruct the linker to link to other binaries instead.)
Note: When using an external build process with PSRAM, remember to add `-mfix-esp32-psram-cache-issue` to the C compiler arguments. See CONFIG_SPIRAM_CACHE_WORKAROUND for details of this flag.

Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the esp-idf defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when running `make defconfig`, or creating a new config from scratch.

To override the name of this file, set the `SDKCONFIG_DEFAULTS` environment variable.

Save flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py. We can use command `make print_flash_cmd`, it will print the flash arguments:

```
--flash_mode dio --flash_freq 40m --flash_size detect 0x1000 bootloader/bootloader.
--bin 0x10000 example_app.bin 0x8000 partition_table_unit_test_app.bin
```

Then use flash arguments as the arguments for esptool write_flash arguments:

```
python esptool.py --chip esp32 --port /dev/ttyUSB0 --baud 921600 --before default_
--reset --after hard_reset write_flash --z --flash_mode dio --flash_freq 40m --
--flash_size detect 0x1000 bootloader/bootloader.bin 0x10000 example_app.bin_
--0x8000 partition_table_unit_test_app.bin
```

4.5.3 Building the Bootloader

The bootloader is built by default as part of “make all”, or can be built standalone via “make bootloader-clean”. There is also “make bootloader-list-components” to see the components included in the bootloader build.

The component in IDF components/bootloader is special, as the second stage bootloader is a separate .ELF and .BIN file to the main project. However it shares its configuration and build directory with the main project.

This is accomplished by adding a subproject under components/bootloader/subproject. This subproject has its own Makefile, but it expects to be called from the project’s own Makefile via some glue in the components/bootloader/Makefile.projectbuild file. See these files for more details.

4.6 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

4.6.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
• The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
• The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
• RTC memory must include any read-only data (.rodata) used by the stub.
• Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
• Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.6.2 Implementing A Stub

The wake stub in esp-idf is called esp_wake_deep_sleep(). This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named esp_wake_deep_sleep() then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call esp_default_wake_deep_sleep(). It is not necessary to implement esp_wake_deep_sleep() in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the esp_set_deep_sleep_wake_stub() function. This is not necessary if you only use the default esp_wake_deep_sleep() function.

All of these functions are declared in the esp_sleep.h header under components/esp32.

4.6.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the RTC_IRAM_ATTR attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with rtc_wake_stub. Files names rtc_wake_stub* have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

4.6.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory. The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the RTC_DATA_ATTR and RTC_RODATA_ATTR to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
```

(continues on next page)
ets_printf(fmt_str, wake_count++);
}

The attributes RTC_FAST_ATTR and RTC_SLOW_ATTR can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with RTC_FAST_ATTR is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with RTC_RODATA_ATTR, as shown in the example above.

The second way is to place the data into any source file whose name starts with rtc_wake_stub.

For example, the equivalent example in rtc_wake_stub_counter.c:

```c
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    ets_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP Kconfig option, see more information in Fast boot from Deep Sleep.

## 4.7 Error Handling

### 4.7.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using throw keyword
- Unrecoverable (fatal) errors:
  - Failed assertions (using assert macro and equivalent methods) and abort() calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see Fatal Errors.

### 4.7.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with ESP_OK code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with ESP_ERR_ prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see Error Code Reference.
4.7.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing 0x101 to `esp_err_to_name()` will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a standard POSIX error code, if no matching `ESP_ERR_` value is found. This is done using `strerror_r` function. POSIX error codes (such as `ENOENT`, `ENOMEM`) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See `CONFIG_ESP_ERR_TO_NAME_LOOKUP`. When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return `UNKNOWN ERROR`, and `esp_err_to_name_r()` will return `Unknown error 0xXXXX(YYYYY)`, where 0xXXXX and YYYYY are the hexadecimal and decimal representations of the error code, respectively.

4.7.4 ESP_ERROR_CHECK macro

ESP_ERROR_CHECK() macro serves similar purpose as `assert`, except that it checks `esp_err_t` value rather than a bool condition. If the argument of ESP_ERROR_CHECK() is not equal `ESP_OK`, then an error message is printed on the console, and `abort()` is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107  (ESP_ERR_TIMEOUT) at 0x400d1fdf
file:  "~/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)
Backtrace:
  0x40086e7c: 0x3ffb4ff0
  0x40087328: 0x3ffb5010
  0x400d1fdf: 0x3ffb5030
```

**Note:** If `IDF monitor` is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on `CONFIG_ESP_ERR_TO_NAME_LOOKUP` option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where ESP_ERROR_CHECK() macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See `Fatal Errors` for more information about the backtrace.

4.7.5 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g. reset an external peripheral which is not responding).

Example:

```c
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
}(continues on next page)`
while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}

2. Propagate the error to the caller. In some middleware components this means that a function must exit with
the same error code, making sure any resource allocations are rolled back.
Example:

```c
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
```

```c
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g. to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}
```

3. Convert into unrecoverable error, for example using ESP_ERROR_CHECK. See ESP_ERROR_CHECK macro
section for details.
Terminating the application in case of an error is usually undesirable behaviour for middleware components,
but is sometimes acceptable at application level.
Many ESP-IDF examples use ESP_ERROR_CHECK to handle errors from various APIs. This is not the best
practice for applications, and is done to make example code more concise.
Example:

```c
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.7.6 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using CONFIG_COMPILER_CXX.Exceptions option.
Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary
to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not
possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using
CONFIG_COMPILER_CXX.Exceptions_EMG_POOL_SIZE variable.
If an exception is thrown, but there is no catch block, the program will be terminated by abort function, and
backtrace will be printed. See Fatal Errors for more information about backtraces.
See cxx/exceptions for an example of C++ exception handling.

### 4.8 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating
large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks
can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation,
sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely
communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is de-
pendent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.
Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the [ESP-BLE-MESH Architecture](#) for information about the implementation of ESP-BLE-MESH architecture and [ESP-BLE-MESH API Reference](#) for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer here for the certification details of ESP-BLE-MESH.

**Note:** If you are looking for Wi-Fi based implementation of mesh for ESP32, please check another product by Espressif called ESP-MESH. For more information and documentation see [ESP-MESH](#).

### 4.8.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF *Get Started* documentation.

**What You Need**

**Hardware:**
- Three ESP32 boards, see options.
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

**Software:**
- Example application `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` code to load to the ESP32 boards.
- Mobile App: nRF Mesh for Android or iOS. Optionally you can use some other Apps:
  - EspBleMesh Android App
  - Silicon Labs Android or iOS App

**Installation Step by Step**

This is a detailed roadmap to walk you through the installation process.

**Step 1. Check Hardware** Both ESP32-DevKitC and ESP-WROVER-KIT development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: `idf.py menuconfig > Example Configuration > Board selection for ESP-BLE-MESH`

**Note:** If you plan to use ESP32-DevKitC, connect a RGB LED to GPIO pins 25, 26 and 27.

**Step 2. Configure Software** Enter the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example directory, run `idf.py menuconfig` to select your board and then run `idf.py build` to compile the example.
Step 3. Upload Application to Nodes  After the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example is compiled successfully, users can run idf.py flash to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn GREEN.

Fig. 4: ESP-BLE-MESH Devices Power On

Step 4. Provision Nodes  In this section, we will use the nRF Mesh Android App to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

4.1 Scanner  The Scanner is App’s functionality to search for unprovisioned devices in range. Open the App, press Scanner at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

4.2 Identify  Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the IDENTIFY interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

Note:  The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the IDENTIFY interface button, no signs can be seen from the device except from the log on the serial monitor.

After the IDENTIFY interface button is pressed, users can see the PROVISION interface button.

4.3 Provision  Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:
Chapter 4. API Guides

Fig. 5: nRF Mesh - Scanner

Fig. 6: nRF Mesh - IDENTIFY - PROVISION
Chapter 4. API Guides

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing **OK**, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

![Fig. 7: nRF Mesh - Configuration Complete](image)

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing **OK**, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press **CONNECT** on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing **CONNECT**, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

### 4.4 Configuration

When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.
Chapter 4. API Guides

Fig. 8: nRF Mesh - Initial Configuration Failed

Fig. 9: nRF Mesh - Reconnect - Initial Configuration
Fig. 10: nRF Mesh - Reconnect - Three Nodes

Fig. 11: nRF Mesh - Model Bind AppKey
Note: No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

Step 5. Operate Network  After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example, the first Generic OnOff Server Model is used to control the RED color, the second one is used to control the GREEN color and the third one is used to control the BLUE color.

![nRFMesh-GenericOnOffControl](image)

Fig. 12: nRF Mesh - Generic OnOff Control

The following screenshot shows different board with different color on.

Note: For nRF Mesh iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

4.8.2 ESP-BLE-MESH Examples

- **ESP-BLE-MESH Node OnOff Server** - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see example code.

- **ESP-BLE-MESH Node OnOff Client** - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see example code.

- **ESP-BLE-MESH Provisioner** - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see example code.
Fig. 13: Three ESP-BLE-MESH Nodes On

- ESP-BLE-MESH Fast Provisioning - Client and Server - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see example client code and example server code.
- ESP-BLE-MESH and Wi-Fi Coexistence - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32. Simply put, users can use the Wi-Fi while operating Bluetooth, see example code.
- ESP-BLE-MESH Node Console - an example that implements BLE Mesh node basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see example node code and example Provisioner code.

### ESP-BLE-MESH Feature List

#### Supported Features

**Mesh Core**

- **Provisioning: Node Role**
  - PB-ADV and PB-GATT
  - OOB Authentication

- **Provisioning: Provisioner Role**
  - PB-ADV and PB-GATT
  - OOB Authentication

- **Networking**
  - Relay
  - Segmentation and Reassembly
  - Key Refresh Procedure
  - IV Update Procedure
  - Friend
  - Low Power
  - Proxy Server
  - Proxy Client

- **Multiple Client Models Run Simultaneously**
  - Support multiple client models send packets to different nodes simultaneously
  - No blocking between client model and server model

- **NVS Storing**
  - Store provisioning and configuration information of ESP-BLE-MESH Node

**Mesh Models**

- **Foundation models**
  - Configuration Server model
  - Configuration Client model
  - Health Server model
  - Health Client model

- **Generic client models**
  - Generic OnOff Client
  - Generic Level Client
  - Generic Default Transition Time Client
  - Generic Power OnOff Client
  - Generic Power Level Client
  - Generic Battery Client
  - Generic Location Client
  - Generic Property Client

- **Sensor client models**
  - Sensor Client

- **Time and Scenes client models**
  - Time Client
  - Scene Client
  - Scheduler Client

- **Lighting client models**
  - Light Lightness Client
  - Light CTL Client
  - Light HSL Client
  - Light xyl Client
  - Light LC Client

- **Generic server models**

ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

- ESP-BLE-MESH Architecture Overview
  - Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
- ESP-BLE-MESH Architecture Implementation
  - Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
- ESP-BLE-MESH Auxiliary Routines
  - Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

1. ESP-BLE-MESH Architecture Overview

Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth certification.

ESP-BLE-MESH architecture includes five key parts:

- Mesh Protocol Stack
  - Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
  - Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
  - Mesh Models is responsible for the implementation of SIG-defined models.
- Network Management
  - Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
- Features
  - Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
- Mesh Bearer Layer
  - Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.
- Applications
  - Based on ESP-BLE-MESH protocol stack and Mesh Models.
  - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

1.1 Mesh Protocol Stack
Fig. 14: Figure 1.1 ESP-BLE-MESH Architecture Diagram
1.1.1 Mesh Networking  Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Layer</td>
<td>Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.</td>
</tr>
<tr>
<td>Upper Transport Layer</td>
<td>Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages”, including messages related to “friendship” and heartbeat messages.</td>
</tr>
<tr>
<td>Lower Transport Layer</td>
<td>Lower Transport Layer handles segmentation and reassembly of PDU.</td>
</tr>
<tr>
<td>Network Layer</td>
<td>Network Layer defines the address type and format of the network messages, and implements the relay function of the device.</td>
</tr>
</tbody>
</table>

1.1.2 Mesh Provisioning  Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>Provisioning PDUs from different layers are handled using provisioning protocol.</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT</td>
<td>These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.</td>
</tr>
</tbody>
</table>

1.1.3 Mesh Models  Mesh Models in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:
Table 4: Table 1.3 Mesh Models Architecture Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model Layer</td>
<td>Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.</td>
</tr>
<tr>
<td>Foundation Model Layer</td>
<td>Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.</td>
</tr>
</tbody>
</table>

1.2 Mesh Network Management  Network Management implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node’s IV Index.
- IV update procedure is used to update the nodes’ IV Index.
- Key refresh procedure is used to update the nodes’ NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node’s networking information.

1.3 Mesh Features  Features includes the following options:

- Low Power feature is used to reduce node’s power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

1.4 Mesh Bearer Layer  Bearers in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

Bearers can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

Table 5: Table 1.3 Mesh Bearers Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT Bearer</td>
<td>The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.</td>
</tr>
<tr>
<td>Advertising Bearer</td>
<td>When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.</td>
</tr>
</tbody>
</table>

1.5 Mesh Applications  The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
  - Call the provisioning-related API for provisioning.
  - Call the model-related API to send messages.
  - Call the device-attributes-related API to get local information about the device.
- Application layer processes Event
  The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.
  - The events completed by calling API.
    * Such as nodes sending messages.
  - The events that the protocol stack actively reports to the application layer.
    * The Event that the protocol stack actively reports.
* The Event that Model actively reports.
  * The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between API / Event and ESP-BLE-MESH protocol stack

  * API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
  * The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.

2. ESP-BLE-MESH Architecture Implementation

The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

  * **Layer-based Approach:** With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.
  * **Module-based Approach:** Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

2.1 Mesh Protocol Stack Implementation

2.1.1 Mesh Networking Implementation

The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>ESP-BLE-MESH Access Layer</td>
</tr>
<tr>
<td>transport.c</td>
<td>ESP-BLE-MESH Lower/Upper Transport Layer</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Network Layer</td>
</tr>
<tr>
<td>adv.c</td>
<td>A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers</td>
</tr>
</tbody>
</table>

2.1.2 Mesh Provisioning Implementation

The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>ESP-BLE-MESH Node provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>beacon.c</td>
<td>APIs used to handle ESP-BLE-MESH Beacons</td>
</tr>
</tbody>
</table>

Specific files that implement functions of Provisioner are shown in Table 2.3:
### Table 8: Table 2.3 Mesh Provisioning (Provisioner) File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>ESP-BLE-MESH Provisioner provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>ESP-BLE-MESH Provisioner networking related functionalities</td>
</tr>
</tbody>
</table>

#### 2.1.3 Mesh Models Implementation

Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

### Table 9: Table 2.4 Mesh Models File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg_cli.c</td>
<td>Send Configuration Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>cfg_srv.c</td>
<td>Receive Configuration Client messages and send proper response messages</td>
</tr>
<tr>
<td>health_cli.c</td>
<td>Send Health Client messages and receive corresponding response messages</td>

#### 2.2 Mesh Bearers Implementation

Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify mesh_bearer_adapt.c (example of NimBLE version).

### Table 10: Table 2.5 Mesh Bearers File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>

<tbody>
<tr>
<td>mesh_bearer_adapt.c</td>
<td>ESP-BLE-MESH Bearer Layer adapter, This file provides the interfaces used to receive and send ESP-BLE-MESH ADV &amp; GATT related packets.</td>
</tr>
</tbody>
</table>

**Note:** mesh_bearer_adapt.c is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

#### 2.3 Mesh Applications Implementation

We have provided a series of application examples for customer development, and users can develop products based on ESP-BLE-MESH Examples.

#### 3. Auxiliary Routine

Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through CONFIG_BLE_MESH.
3.1 Features
- Low Power
- Friend
- Relay
- Proxy Client/Server

3.2 Network Management
- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

3.3 Auxiliary Routine Implementation
When adopting the design of independent module, the two main factors should be considered:
- The module cannot be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

<table>

ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:
- 1. Provisioner Development
- 2. Node Development
- 3. ESP-BLE-MESH and Wi-Fi Coexistence
- 4. Fast Provisioning
- 5. Log Help
- 6. Example Help
- 7. Others

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

1. Provisioner Development
   Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.
1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.
- The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

- Client model that corresponds to server model of the node is required.
- NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
- The address owned by the node shall be known, which could be its unicast address or subscription address.

1.3 How can NetKey and AppKey be used?

- NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
- AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

- The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
- The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can’t be changed afterwards.

1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message?

The unicast address of Provisioner can be set only once during initialization and can’t be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address. Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.

1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can’t be changed afterwards.

1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.
1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner set to unprovisioned device during provisioning. It can be set only once during initialization and can’t be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.

1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples?

There are four authentication methods, i.e. No OOB, Static OOB, Output OOB and Input OOB. In the provided examples, No OOB is used.

1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?

- Device UUID
- OOB Info
- URL Hash (optional)

1.12 Can such information be used for device identification?

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?

- Provisioner can get the Composition Data of nodes using the `Configuration Client Model` API `esp_ble_mesh_config_client_set_state()` with `comp_data_get` in the parameter `esp_ble_mesh_cfg_client_get_state_t` set properly.
- Users can refer to the following code to parse the Composition Data:

```c
#include <stdio.h>
#include <string.h>
#include <stdint.h>

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000, 0x1003
```

(continues on next page)
// The Vendor Models supported are: Company Identifier 0x003F and Model Identifier 0x002A

typedef struct {
    int16_t cid;
    int16_t pid;
    int16_t vid;
    int16_t crpl;
    int16_t features;
    int16_t all_models;
    uint8_t sig_models;
    uint8_t vnd_models;
} esp_ble_mesh_composition_head;

typedef struct {
    uint16_t model_id;
    uint16_t vendor_id;
} tsModel;

typedef struct {
    // reserve space for up to 20 SIG models
    uint16_t SIG_models[20];
    uint8_t numSIGModels;

    // reserve space for up to 4 vendor models
    tsModel Vendor_models[4];
    uint8_t numVendorModels;
} esp_ble_mesh_composition_decode;

int decode_comp_data(esp_ble_mesh_composition_head *head, esp_ble_mesh_composition_decode *data, uint8_t *mystr, int size) {
    int pos_sig_base;
    int pos_vnd_base;
    int i;

    memcpy(head, mystr, sizeof(*head));

    if (size < sizeof(*head) + head->sig_models * 2 + head->vnd_models * 4) {
        return -1;
    }

    pos_sig_base = sizeof(*head) - 1;

    for(i = 1; i < head->sig_models * 2; i = i + 2) {
        uint16_t sig_models = mystr[i + pos_sig_base] | (mystr[i + pos_sig_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, (uint16_t)*data->SIG_models[i/2]);
    }

    pos_vnd_base = head->sig_models * 2 + pos_sig_base;

    for(i = 1; i < head->vnd_models * 2; i = i + 2) {
        uint16_t vendor_id = mystr[i + pos_vnd_base] | (mystr[i + pos_vnd_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, (uint16_t)*data->Vendor_models[i/2].vendor_id);
    }

    return 0;
}
1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the `Configuration Client Model API esp_ble_mesh_config_client_set_state()`.

- Add AppKey to nodes with `app_key_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t set` properly.
- Add subscription address to the models of nodes with `model_sub_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t set` properly.
- Set publication information to the models of nodes with `model_pub_set` in the parameter `esp_ble_mesh_cfg_client_set_state_t set` properly.

1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t --group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        // Add configuration to group address
    }
}
```
element = &comp->elements[i];
model = esp_ble_mesh_find_sig_model(element, model_id);
if (!model) {
    continue;
}
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == group_addr) {
        break;
    }
}
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGW(TAG, "%s: Group address already exists, element...
            __index: %d", __func__, i);
    continue;
}
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
        model->groups[j] = group_addr;
        break;
    }
}
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element...
            __index: %d", __func__, i);
}
return ESP_OK;

1.17 How does Provisioner control nodes by grouping?

Generally there are two approaches to implement group control in ESP-BLE-MESH network, group address approach and virtual address approach. And supposing there are 10 devices, i.e., five devices with blue lights and five devices with red lights.

- Method 1: 5 blue lights can subscribe to a group address, 5 red lights subscribe to another one. By sending messages to different group addresses, Provisioner can realize group control.
- Method 2: 5 blue lights can subscribe to a virtual address, 5 red lights subscribe to another one. By sending messages to different virtual addresses, Provisioner can realize group control.

1.18 How does Provisioner add nodes to multiple subnets?

Provisioner can add multiple NetKeys to nodes during configuration, and nodes sharing the same NetKey belong to the same subnet. Provisioner can communicate with nodes on different subnets by using different NetKeys.

1.19 How does Provisioner know if a node in the mesh network is offline?

Node offline is usually defined as: the condition that the node cannot be properly communicated with other nodes in the mesh network due to power failure or some other reasons.

There is no connection between nodes and nodes in the ESP-BLE-MESH network. They communicate with each other through advertising channels.
An example is given here to show how to detect a node is offline by Provisioner.

- The node can periodically send heartbeat messages to Provisioner. And if Provisioner failed to receive heartbeat messages in a certain period, the node is considered to be offline.

**Note:** The heartbeat message should be designed into a single package (less than 11 bytes), so the transmission and reception of it can be more efficient.

1.20 What operations should be performed when Provisioner removes nodes from the network?

Usually when Provisioner tries to remove node from the mesh network, the procedure includes three main steps:

- Firstly, Provisioner adds the node that need to be removed to the “blacklist”.
- Secondly, Provisioner performs the **Key Refresh procedure**.
- Lastly, the node performs node reset procedure, and switches itself to an unprovisioned device.

1.21 In the Key Refresh procedure, how does Provisioner update the Netkey owned by nodes?

- Provisioner updates the NetKey of nodes using the **Configuration Client Model** API `esp_ble_mesh_config_client_set_state()` with `net_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Provisioner updates the AppKey of nodes using the **Configuration Client Model** API `esp_ble_mesh_config_client_set_state()` with `app_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

1.22 How does Provisioner manage nodes in the mesh network?

ESP-BLE-MESH implements several functions related to basic node management in the example, such as `esp_ble_mesh_store_node_info()`. And ESP-BLE-MESH also provides the API `esp_ble_mesh_provisioner_set_node_name()` which can be used to set the node’s local name and the API `esp_ble_mesh_provisioner_get_node_name()` which can be used to get the node’s local name.

1.23 What does Provisioner need when trying to control the server model of nodes?

Provisioner must include corresponding client model before controlling the server model of nodes.

Provisioner shall add its local NetKey and AppKey.

- Provisioner add NetKey by calling the API `esp_ble_mesh_provisioner_add_local_net_key()`.
- Provisioner add AppKey by calling the API `esp_ble_mesh_provisioner_add_local_app_key()`.

Provisioner shall configure its own client model.

- Provisioner bind AppKey to its own client model by calling the API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()`.

1.24 How does Provisioner control the server model of nodes?

ESP-BLE-MESH supports all SIG-defined client models. Provisioner can use these client models to control the server models of nodes. And the client models are divided into 6 categories with each category has the corresponding functions.

- **Configuration Client Model**
  - The API `esp_ble_mesh_config_client_get_state()` can be used to get the `esp_ble_mesh_cfg_client_get_state_t` values of Configuration Server Model.
  - The API `esp_ble_mesh_config_client_set_state()` can be used to set the `esp_ble_mesh_cfg_client_set_state_t` values of Configuration Server Model.
• Health Client Model
  – The API `esp_ble_mesh_health_client_get_state()` can be used to get the `esp_ble_mesh_health_client_get_state_t` values of Health Server Model.
  – The API `esp_ble_mesh_health_client_set_state()` can be used to set the `esp_ble_mesh_health_client_set_state_t` values of Health Server Model.

• Generic Client Models
  – The API `esp_ble_mesh_generic_client_get_state()` can be used to get the `esp_ble_mesh_generic_client_get_state_t` values of Generic Server Models.
  – The API `esp_ble_mesh_generic_client_set_state()` can be used to set the `esp_ble_mesh_generic_client_set_state_t` values of Generic Server Models.

• Lighting Client Models
  – The API `esp_ble_mesh_light_client_get_state()` can be used to get the `esp_ble_mesh_light_client_get_state_t` values of Lighting Server Models.
  – The API `esp_ble_mesh_light_client_set_state()` can be used to set the `esp_ble_mesh_light_client_set_state_t` values of Lighting Server Models.

• Sensor Client Models
  – The API `esp_ble_mesh_sensor_client_get_state()` can be used to get the `esp_ble_mesh_sensor_client_get_state_t` values of Sensor Server Model.
  – The API `esp_ble_mesh_sensor_client_set_state()` can be used to set the `esp_ble_mesh_sensor_client_set_state_t` values of Sensor Server Model.

• Time and Scenes Client Models
  – The API `esp_ble_mesh_time_scene_client_get_state()` can be used to get the `esp_ble_mesh_time_scene_client_get_state_t` values of Time and Scenes Server Models.
  – The API `esp_ble_mesh_time_scene_client_set_state()` can be used to set the `esp_ble_mesh_time_scene_client_set_state_t` values of Time and Scenes Server Models.

2. Node Development

2.1 What kind of models are included by nodes?
  • In ESP-BLE-MESH, nodes are all composed of a series of models with each model implements some functions of the node.
  • Model has two types, client model and server model. Client model can get and set the states of server model.
  • Model can also be divided into SIG model and vendor model. All behaviors of SIG models are officially defined while behaviors of vendor models are defined by users.

2.2 Is the format of messages corresponding to each model fixed?
  • Messages, which consist of opcode and payload, are divided by opcode.
  • The type and the format of the messages corresponding to models are both fixed, which means the messages transmitted between models are fixed.

2.3 Which functions can be used to send messages with the models of nodes?
  • For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` to send messages.
  • For server models, users can use the API `esp_ble_mesh_server_model_send_msg()` to send messages.
  • For publication, users call the API `esp_ble_mesh_model_publish()` to publish messages.

2.4 How to achieve the transmission of messages without packet loss?
Chapter 4. API Guides

Acknowledged message is needed if users want to transmit messages without packet loss. The default time to wait for corresponding response is set in `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`. If the sender waits for the response until the timer expires, the corresponding timeout event would be triggered.

**Note:** Response timeout can be set in the API `esp_ble_mesh_client_model_send_msg()`. The default value (4 seconds) would be applied if the parameter `msg_timeout` is set to 0.

### 2.5 How to send unacknowledged messages?

For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` to send unacknowledged messages.

For server models, the messages sent by using the API `esp_ble_mesh_server_model_send_msg()` are always unacknowledged messages.

### 2.6 How to add subscription address to models?

Subscription address can be added through Configuration Client Model.

### 2.7 What is the difference between messages sent and published by models?

Messages sent by calling the API `esp_ble_mesh_client_model_send_msg()` or `esp_ble_mesh_server_model_send_msg()` will be sent in the duration determined by the Network Transmit state.

Messages published by calling the API `esp_ble_mesh_model_publish()` will be published determined by the Model Publication state. And the publication of messages is generally periodic or with a fixed number of counts. The publication period and publication count are controlled by the Model Publication state, and can be configured through Configuration Client Model.

### 2.8 How many bytes can be carried when sending unsegmented messages?

The total payload length (which can be set by users) of unsegmented message is 11 octets, so if the opcode of the message is 2 octets, then the message can carry 9 octets of valid information. For vendor messages, due to the 3-octets opcode, the remaining payload length is 8 octets.

### 2.9 When should the Relay feature of nodes be enabled?

Users can enable the Relay feature of all nodes when nodes detected in the mesh network are sparse.

For dense mesh network, users can choose not to enable the Relay feature of several nodes.

And users can enable the Relay feature by default if the mesh network size is unknown.

### 2.10 When should the Proxy feature of node be enabled?

If the unprovisioned device is expected to be provisioned by a phone, then it should enable the Proxy feature since almost all the phones do not support sending ESP-BLE-MESH packets through advertising bearer currently. And after the unprovisioned device is provisioned successfully and becoming a Proxy node, it will communicate with the phone using GATT bearer and using advertising bearer to communicate with other nodes in the mesh network.

### 2.11 How to use the Proxy filter?

The Proxy filter is used to reduce the number of Network PDUs exchanged between a Proxy Client (e.g. the phone) and a Proxy Server (e.g. the node). And with the Proxy filter, Proxy Client can explicitly request to receive only mesh messages with certain destination addresses from Proxy Server.
2.12 When a message can be relayed by a Relay node?

If a message need to be relayed, the following conditions should be met.

- The message is in the mesh network.
- The message is not sent to the unicast address of the node.
- The value of TTL in the message is greater than 1.

2.13 If a message is segmented into several segments, should the other Relay nodes just relay when one of these segments is received or wait until the message is received completely?

Relay nodes will forward segments when one of them are received rather than keeping waiting until all the segments are received.

2.14 What is the principle of reducing power consumption using Low Power feature?

- When the radio is turned on for listening, the device is consuming energy. When low power feature of the node is enabled, it will turn off its radio in the most of the time.
- And cooperation is needed between low power node and friend node, thus low power node can receive messages at an appropriate or lower frequency without the need to keep listening.
- When there are some new messages for low power node, its friend node will store the messages for it. And low power node can poll friend nodes to see if there are new messages at a fixed interval.

2.15 How to continue the communication on the network after powering-down and powering-up again?

Enable the configuration Store ESP-BLE-MESH Node configuration persistently in menuconfig.

2.16 How to send out the self-test results of nodes?

It is recommended that nodes can publish its self-test results periodically through Health Server Model.

2.17 How to transmit information between nodes?

One possible application scenario for transmitting information between nodes is that spray nodes would be triggered once smoke alarm detected high smoke concentration. There are two approaches in implementation.

- Approach 1 is that spray node subscribes to a group address. When smoke alarm detects high smoke concentration, it will publish a message whose destination address is the group address which has been subscribed by spray node.
- Approach 2 is that Provisioner can configure the unicast address of spray node to the smoke alarm. When high smoke concentration is detected, smoke alarm can use send messages to the spray node with the spray node’s unicast address as the destination address.

2.18 Is gateway a must for nodes communication?

- Situation 1: nodes only communicate within the mesh network. In this situation, no gateway is need. ESP-BLE-MESH network is a flooded network, messages in the network have no fixed paths, and nodes can communicate with each other freely.
- Situation 2: if users want to control the nodes remotely, for example turn on some nodes before getting home, then a gateway is needed.

2.19 When will the IV Update procedure be performed?

IV Update procedure would be performed once sequence number of messages sent detected by the bottom layer of node reached a critical value.
2.20 How to perform IV Update procedure?

Nodes can perform IV Update procedure with Secure Network Beacon.

3. ESP-BLE-MESH and Wi-Fi Coexistence

3.1 Which modes does Wi-Fi support when it coexists with ESP-BLE-MESH?

Currently only Wi-Fi station mode supports the coexistence.

3.2 Why is the Wi-Fi throughput so low when Wi-Fi and ESP-BLE-MESH coexist?

The ESP32-DevKitC board without PSRAM can run properly but the throughput of it is low since it has no PSRAM. When Bluetooth and Wi-Fi coexist, the throughput of ESP32-DevKitC with PSRAM can be stabilized to more than 1Mbps.

And some configurations in menuconfig shall be enabled to support PSRAM.

- ESP32-specific --- Support for external, SPI-connected RAM --- Try to allocate memories of Wi-Fi and LWIP...
- Bluetooth --> Bluedroid Enable --> BT/BLE will first malloc the memory from the PSRAM
- Bluetooth --> Bluedroid Enable --> Use dynamic memory allocation in BT/BLE stack.
- Bluetooth --> Bluetooth controller --> BLE full scan feature supported.
- Wi-Fi --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi

4. Fast Provisioning

4.1 Why is fast provisioning needed?

Normally when they are several unprovisioned devices, users can provision them one by one. But when it comes to a large number of unprovisioned devices (e.g. 100), provisioning them one by one will take huge amount of time. With fast provisioning, users can provision 100 unprovisioned devices in about 50 seconds.

4.2 Why EspBleMesh App would wait for a long time during fast provisioning?

After the App provisioned one Proxy node, it will disconnect from the App during fast provisioning, and reconnect with the App when all the nodes are provisioned.

4.3 Why is the number of node addresses displayed in the App is more than that of existing node addresses?

Each time after a fast provisioning process, and before starting a new one, the node addresses in the App should be cleared, otherwise the number of the node address will be incorrect.

4.4 What is the usage of the count value which was input in EspBleMesh App?

The count value is provided to the Proxy node which is provisioned by the App so as to determine when to start Proxy advertising in advance.

4.5 When will Configuration Client Model of the node running fast_prov_server example start to work?

Configuration Client Model will start to work after the Temporary Provisioner functionality is enabled.
4.6 Will the Temporary Provisioner functionality be enabled all the time?

After the nodes receive messages used to turn on/off lights, all the nodes will disable its Temporary Provisioner functionality and become nodes.

5. Log Help You can find meaning of errors or warnings when they appear at the bottom of ESP-BLE-MESH stack.

5.1 What is the meaning of warning ran out of retransmit attempts?

When the node transmits a segmented message, and due to some reasons, the receiver doesn’t receive the complete message. Then the node will retransmit the message. When the retransmission count reaches the maximum number, which is 4 currently, then this warning will appear.

5.2 What is the meaning of warning Duplicate found in Network Message Cache?

When the node receives a message, it will compare the message with the ones stored in the network cache. If the same has been found in the cache, which means it has been received before, then the message will be dropped.

5.3 What is the meaning of warning Incomplete timer expired?

When the node doesn’t receive all the segments of a segmented message during a certain period (e.g. 10 seconds), then the Incomplete timer will expire and this warning will appear.

5.4 What is the meaning of warning No matching TX context for ack?

When the node receives a segment ack and it doesn’t find any self-send segmented message related with this ack, then this warning will appear.

5.5 What is the meaning of warning No free slots for new incoming segmented messages?

When the node has no space for receiving new segmented message, this warning will appear. Users can make the space larger through the configuration `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`.

5.6 What is the meaning of error Model not bound to Appkey 0x0000?

When the node sends messages with a model and the model has not been bound to the AppKey with AppKey Index 0x000, then this error will appear.

5.7 What is the meaning of error Busy sending message to DST xxxx?

This error means client model of the node has transmitted a message to the target node and now is waiting for a response, users can not send messages to the same node with the same unicast address. After the corresponding response is received or timer is expired, then another message can be sent.

6. Example Help

6.1 How are the ESP-BLE-MESH callback functions classified?

- The API `esp_ble_mesh_register_prov_callback()` is used to register callback function used to handle provisioning and networking related events.
- The API `esp_ble_mesh_register_config_client_callback()` is used to register callback function used to handle Configuration Client Model related events.
- The API `esp_ble_mesh_register_config_server_callback()` is used to register callback function used to handle Configuration Server Model related events.
Chapter 4. API Guides

- The API `esp_ble_mesh_register_health_client_callback()` is used to register callback function used to handle Health Client Model related events.
- The API `esp_ble_mesh_register_health_server_callback()` is used to register callback function used to handle Health Server Model related events.
- The API `esp_ble_mesh_register_generic_client_callback()` is used to register callback function used to handle Generic Client Models related events.
- The API `esp_ble_mesh_register_light_client_callback()` is used to register callback function used to handle Lighting Client Models related events.
- The API `esp_ble_mesh_register_sensor_client_callback()` is used to register callback function used to handle Sensor Client Model related events.
- The API `esp_ble_mesh_register_time_scene_client_callback()` is used to register callback function used to handle Time and Scenes Client Models related events.
- The API `esp_ble_mesh_register_custom_model_callback()` is used to register callback function used to handle vendor model and unrealized server models related events.

7. Others

7.1 How to print the message context?

The examples use `ESP_LOG_BUFFER_HEX()` to print the message context while the ESP-BLE-MESH protocol stack uses `bt_hex()`.

7.2 Which API can be used to restart ESP32?

The API `esp_restart()`.

7.3 How to monitor the remaining space of the stack of a task?

The API `vTaskList()` can be used to print the remaining space of the task stack periodically.

7.4 How to change the level of log without changing the menuconfig output level?

The API `esp_log_level_set()` can be used to change the log output level rather than using menuconfig to change it.
## ESP-BLE-MESH Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unprovisioned Device</td>
<td>A device that is not a member of a mesh network is known as an unprovisioned device.</td>
<td>Examples: lighting devices, temperature control devices, manufacturing equipments and electric doors, etc.</td>
</tr>
<tr>
<td>Node</td>
<td>A node is a provisioned device.</td>
<td>The role of unprovisioned device will change to node after being provisioned to ESP-BLE-MESH network. Nodes (such as lighting devices, temperature control devices, manufacturing equipments, and electric doors) are devices that can send, receive, or relay messages in ESP-BLE-MESH network, and they can optionally support one or more subnets.</td>
</tr>
<tr>
<td>Relay Node</td>
<td>A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.</td>
<td>Relay nodes can receive and resend ESP-BLE-MESH messages, so the messages can be transferred further. Users can decide whether or not to enable forwarding function of nodes according to nodes’ status. Messages can be relayed for multiple times, and each relay is considered as a “hop”. Messages can hop up to 126 times, which is enough for message transmission in a wide area.</td>
</tr>
<tr>
<td>Proxy Node</td>
<td>A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.</td>
<td>Proxy nodes receive messages from one bearer (it generally includes advertising bearer and GATT bearer) and resend it from another one. The purpose is to connect communication equipments that only support GATT bearer to ESP-BLE-MESH network. Generally, mobile apps need a Proxy node to access Mesh network. Without Proxy nodes, mobile apps cannot communicate with members in Mesh network.</td>
</tr>
<tr>
<td>Friend Node</td>
<td>A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.</td>
<td>Friend node, like the backup of Low Power node (LPN), can store messages that are sent to Low Power node and security updates; the stored information will be transferred to Low Power node when Low Power node needs it. Low Power node must establish “friendship” with another node that supports the Friend Feature to reduce duty cycle of its receiver, thus power consumption of Low Power node can be reduced. Low Power node needs to find a Friend node to establish a friendship with it. The process involved is called “friendship establishment”. Cooperation between Low Power node and Friend nodes enables Low Power node to schedule the use of the radio, thus Low Power node can receive messages at an appropriate or lower frequency without theneed of keeping listening. Low Power node will poll Friend node to see if there is new message.</td>
</tr>
<tr>
<td>Low Power Node</td>
<td>A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.</td>
<td>By polling, Low Power node gets information from Friend node, such as messages, security updates, and etc.</td>
</tr>
<tr>
<td>Provisioner</td>
<td>A node that is capable of adding a device to a mesh network.</td>
<td>The device that can provision unprovisioned devices is called a Provisioner. This process usually needs to be implemented through an app that is typically provided by the product manufacturer and can be used on a gateway, a smartphone, tablet or other carriers.</td>
</tr>
</tbody>
</table>
Table 13: Table 2 ESP-BLE-MESH Terminology - Composition

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>A value representing a condition of an element that is exposed by an element of a node.</td>
<td>Each node in a ESP-BLE-MESH network has an independent set of state values that indicate certain states of the device, like brightness, and color of lighting device. Change of state value will lead to change of the physical state of devices. For example, changing the on/off state of a device is actually turning on/off the device.</td>
</tr>
<tr>
<td>Model</td>
<td>A model defines the basic functionality of a node.</td>
<td>A node may contain multiple models, and each model defines basic functionalities of nodes, like the states needed by the nodes, the messages controlling the states, and actions resulted from messages handling. The function implementation of the nodes is based on models, which can be divided into SIG Model and Vendor Model, with the former defined by SIG and latter defined by users.</td>
</tr>
<tr>
<td>Element</td>
<td>An addressable entity within a device.</td>
<td>A node can contain one or more elements, with each having a unicast address and one or more models, and the models contained by the same element must not be the same.</td>
</tr>
<tr>
<td>Composition</td>
<td>The Composition Data state contains information about a node, the elements it includes, and the supported models.</td>
<td>By reading the value of the Composition Data state, users can know basic information of the node, such as the number of elements, and the models in each element. Provisioner gets this message to further provision the device, such as configuring subscription address and publishing address of nodes.</td>
</tr>
</tbody>
</table>

Table 14: Table 3 ESP-BLE-MESH Terminology - Features

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Power Feature</td>
<td>The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.</td>
<td>Low Power feature reduces power consumption of nodes. When a Low Power node is searching for a Friend node, and there are multiple Friend nodes nearby, it selects the most suitable Friend node through algorithm.</td>
</tr>
<tr>
<td>Friend Feature</td>
<td>The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.</td>
<td>By enabling friend feature, the node can help to store information for Low Power node. The nodes enabled with friend feature may cause more power and memory consumption.</td>
</tr>
<tr>
<td>Relay Feature</td>
<td>The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.</td>
<td>The relay feature enables ESP-BLE-MESH messages to hop among nodes for multiple times, and the transmission distance can exceed the range of direct radio transmission between two nodes, thereby covering the entire network. When a node is enabled with the relay feature to relay messages, it only relays the messages of its own subnet, and does not relay the messages of other subnets. The data integrity will not be considered when the node enabled with relay feature relays segmented messages. The node would relay every segmented message once it receives one rather than waiting for the complete message.</td>
</tr>
<tr>
<td>Proxy Feature</td>
<td>The ability to receive and retransmit mesh messages between GATT and advertising bearers.</td>
<td>The purpose of the proxy feature is to allow nodes without an advertising bearer to access the ESP-BLE-MESH network. The proxy feature is typically used in nodes that need to connect to mobile apps.</td>
</tr>
</tbody>
</table>
### Table 15: Table 4 ESP-BLE-MESH Terminology - Provisioning

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>PB-ADV</td>
<td>PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.</td>
<td>PB-ADV transfers packets generated during the provisioning process over the advertising channels. This way can only be used for provisioning when provisioner and unprovisioned device both support PB-ADV.</td>
</tr>
<tr>
<td>PB-GATT</td>
<td>PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.</td>
<td>PB-GATT uses connection channels to transfer packets generated during the provisioning process. If an unprovisioned device wants to be provisioned through this method, it needs to implement the related Mesh Provisioning Service. Unprovisioned devices which don’t implement such service cannot be provisioned into mesh network through PB-GATT bearer.</td>
</tr>
<tr>
<td>Provisioning</td>
<td>Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.</td>
<td>The process of provisioning turns the “unprovisioned device” into a “node”, making it a member of the ESP-BLE-MESH network.</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Authentication is a step during the provisioning of nodes.</td>
<td>There are four authentication methods for unprovisioned devices: Output OOB, Input OOB, Static OOB, and No OOB.</td>
</tr>
<tr>
<td>Input OOB</td>
<td>Input Out-of-Band</td>
<td>For example, a Provisioner generates and displays a random number, and then prompts users to take appropriate actions to input the random number into the unprovisioned device. Taking lighting switch as an example, users can press the button for several times in a certain period of time to input the random number displayed on the Provisioner. Authentication method of the Input OOB is similar to that of Output OOB, but the role of the device is reversed.</td>
</tr>
<tr>
<td>Output OOB</td>
<td>Output Out-of-Band</td>
<td>For example, an unprovisioned device will choose a random number and output the number in a way that is compatible with its functionality. If the unprovisioned device is a bulb, it can flash a specified number of times. If the unprovisioned device has an LCD screen, the random number can display as a multi-digit value. Users who start provisioning should input the observed number to authenticate the unprovisioned device.</td>
</tr>
<tr>
<td>Static OOB</td>
<td>Static Out-of-Band</td>
<td>Authentication method of Static OOB: use Static OOB information. Use 0 as Static OOB information if No OOB information is needed. Use Static OOB information to authenticate devices which are going through provisioning if OOB information is needed.</td>
</tr>
<tr>
<td>No OOB</td>
<td>No Out-of-Band</td>
<td>Authentication method of No OOB: Set the value of the Static OOB field to 0. Using this way is like not authenticating the unprovisioned devices.</td>
</tr>
<tr>
<td>Term</td>
<td>Official Definition</td>
<td>Detailed Explanation</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unassigned Address</td>
<td>This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.</td>
<td>The addresses owned by elements which has not been configured yet or no address has been allocated are unassigned addresses. These elements will not be used for messages transfer because they have no fixed address. Unassigned address is recommended to set as the value of the address before setting the address of user code.</td>
</tr>
<tr>
<td>Unicast Address</td>
<td>A unicast address is a unique address allocated to each element.</td>
<td>During provisioning, the Provisioner will assign a unicast address to each element of node within the life cycle of the nodes in the network. A unicast address may appear in the source/destination address field of a message. Messages sent to a unicast address can only be processed by the element that owns the unicast address.</td>
</tr>
<tr>
<td>Virtual Address</td>
<td>A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.</td>
<td>Associated with specific UUID labels, a virtual address may serve as the publishing or subscription address of the model. A UUID label is a 128-bit value associated with elements of one or more nodes. For virtual addresses, the 15th and 14th bits are set to 1 and 0 respectively; bits from 13th to 0 are set to hash values (providing 16384 hash values). The hash is a derivation of the Label UUID. To use subscribing elements to check the full 128-bit UUID is very inefficient while hash values provide a more efficient way to determine which elements that which messages are finally sent to.</td>
</tr>
<tr>
<td>Group Address</td>
<td>A group address is an address that is programmed into zero or more elements</td>
<td>Group address is another kind of multicast address in the ESP-BLE-MESH network, which is usually used to group nodes. A message sent to the all-proxies address shall be processed by the primary element of all nodes that have the proxy functionality enabled. A message sent to the all-friends address shall be processed by the primary element of all nodes that have the friend functionality enabled. A message sent to the all-relays address shall be processed by the primary element of all nodes that have the relay functionality enabled. A message sent to the all-nodes address shall be processed by the primary element of all nodes.</td>
</tr>
</tbody>
</table>
### Table 17: Table 6 ESP-BLE-MESH Terminology - Security

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device Key (De-vKey)</strong></td>
<td></td>
<td>There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client. The device key enables you to provision the devices, configure the nodes. The device key is used to encrypt Configuration Messages, i.e. the message transferred between the Provisioner and the node when the device is configured.</td>
</tr>
<tr>
<td><strong>Application Key (App-Key)</strong></td>
<td></td>
<td>Application keys are used to secure communications at the upper transport layer. Application key is used for decryption of application data before delivering application data to application layer and encryption of them during the delivery of application layer. Some nodes in the network have a specific purpose and can restrict access to potentially sensitive data based on the needs of the application. With specific application keys, these nodes are associated with specific applications. Generally speaking, the fields using different application keys include security (access control of buildings, machine rooms and CEO offices), lighting (plant, exterior building and sidewalks) and HVAC systems. Application keys are bound to Network keys. This means application keys are only used in a context of a Network key they are bound to. An application key shall only be bound to a single Network key.</td>
</tr>
<tr>
<td><strong>Master Security Material</strong></td>
<td></td>
<td>The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network. The corresponding friendship messages encrypted with the friendship security material: 1. Friend Poll, 2. Friend Update, 3. Friend Subscription List, add/delete/confirm, 4. The Stored Messages sent by friend nodes to Low Power node. The corresponding friendship messages encrypted with the master security material: 1. Friend Clear, 2. Friend Clear Confirm. Based on the setup of the applications, the messages sent from the Low Power node to the friend nodes will be encrypted with the friendship security material or master security material, with the former being used by the messages transmitted between Low Power node and friend nodes and the latter being used by other network messages.</td>
</tr>
</tbody>
</table>

### Table 18: Table 7 ESP-BLE-MESH Terminology - Message

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Reassembly / Segmentation</strong></td>
<td></td>
<td>Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and reassembled in a proper order at the communication receiving end. The lower transport layer will automatically segment the message whose size is too big. The receiving end will return a response message, and the transmitting end will send the data packet again that the receiving end does not receive according to the response message. This is automatically completed by the lower transport layer. Unsegmented messages have at most 15 bytes, of which 4 bytes are transMIC, so the remaining is 11 bytes; in the case of segmentation, there are 12 valid bytes in the first several packets, and 8 in the last one. Special case: A shorter packet requires mandatory segmentation from lower transport layer, in which case the valid byte is 8 bytes.</td>
</tr>
<tr>
<td><strong>Unacknowledged / Acknowledged</strong></td>
<td></td>
<td>There are two types of messages: Unacknowledged or Acknowledged. Based on the whether or not the receiving end needs to send the response message, the messages sent are divided into two kinds. The sending end should set the maximum number of retransmission.</td>
</tr>
</tbody>
</table>
Table 19: Table 8 ESP-BLE-MESH Terminology - Foundation Models

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Server Model</td>
<td>This model is used to represent a mesh network configuration of a device.</td>
<td>The node must contain the Configuration Server Model, which is responsible for maintaining configuration-related states. The states that Configuration Server Model maintains include: NetKey List, AppKey List, Model to AppKey List, Node Identity, Key Refresh Phase, Heartbeat Publish, Heartbeat Subscription, Network Transmit, Relay Retransmit etc.</td>
</tr>
<tr>
<td>Configuration Client Model</td>
<td>The model is used to represent an element that can control and monitor the configuration of a node.</td>
<td>The Configuration Client Model uses messages to control the state maintained by the Configuration Server Model. The Provisioner must contain the Configuration Client Model, with which the configuration messages, like Configuration Composition Data Get can be sent.</td>
</tr>
<tr>
<td>Health Server Model</td>
<td>This model is used to represent a mesh network diagnostics of a device.</td>
<td>The Health Server Model is primarily used by devices to check their states and see if there is an error. The states maintained by Health Server model include: Current Fault, Registered Fault, Health Period, and Attention Timer.</td>
</tr>
<tr>
<td>Health Client Model</td>
<td>The model is used to represent an element that can control and monitor the health of a node.</td>
<td>The Health Client Model uses messages to control the state maintained by the Health Server Model. The model can get the self-test information of other nodes through the message “Health Fault Get”.</td>
</tr>
</tbody>
</table>

Table 20: Table 9 ESP-BLE-MESH Terminology - Network Management

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Refresh procedure</td>
<td>This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.</td>
<td>Key Refresh Procedure is used to update network key and application key of ESP-BLE-MESH network. Key Refresh Procedure is used when the security of one or more network keys and/or one or more application keys is threatened or potentially threatened. Keys are usually updated after some nodes in the network are removed.</td>
</tr>
<tr>
<td>IV Update procedure</td>
<td>A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.</td>
<td>The IV Update procedure is used to update the value of ESP-BLE-MESH network’s IV Index. This value is related to the random number required for message encryption. To ensure that the value of the random number is not repeated, this value is periodically incremented. IV Index is a 32-bit value and a shared network resource. For example, all nodes in a mesh network share the same IV Index value. Starting from 0x00000000, the IV Index increments during the IV Update procedure and maintained by a specific process, ensuring the IV Index shared in the mesh network is the same. This can be done when the node believes that it has the risk of exhausting its sequence number, or when it determines that another node is nearly exhausting its sequence number. Note: The update time must not be less than 96 hours. It can be triggered when a secure network beacon is received, or when the node determines that its sequence number is greater than a certain value.</td>

4.9 ESP-MESH

This guide provides information regarding the ESP-MESH protocol. Please see the MESH API Reference for more information about API usage.

4.9.1 Overview

ESP-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-MESH guide is split into the following sections:

1. Introduction
2. ESP-MESH Concepts
3. Building a Network
4. Managing a Network
5. Data Transmission
6. Channel Switching
7. Performance
8. Further Notes

4.9.2 Introduction

![Traditional Wi-Fi Network Architecture](image)

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and
forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

ESP-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for relaying each others transmissions. This allows an ESP-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

4.9.3 ESP-MESH Concepts
### Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node</td>
<td>Any device that is or <strong>can be</strong> part of an ESP-MESH network</td>
</tr>
<tr>
<td>Root Node</td>
<td>The top node in the network</td>
</tr>
<tr>
<td>Child Node</td>
<td>A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).</td>
</tr>
<tr>
<td>Parent Node</td>
<td>The converse notion of a child node</td>
</tr>
<tr>
<td>Descendant Node</td>
<td>Any node reachable by repeated proceeding from parent to child</td>
</tr>
<tr>
<td>Sibling Nodes</td>
<td>Nodes that share the same parent node</td>
</tr>
<tr>
<td>Connection</td>
<td>A traditional Wi-Fi association between an AP and a station. A node in ESP-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.</td>
</tr>
<tr>
<td>Upstream Connection</td>
<td>The connection from a node to its parent node</td>
</tr>
<tr>
<td>Downstream Connection</td>
<td>The connection from a node to one of its child nodes</td>
</tr>
<tr>
<td>Wireless Hop</td>
<td>The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as <strong>single-hop</strong> whereas traversing multiple connections is known as <strong>multi-hop</strong>.</td>
</tr>
<tr>
<td>Subnetwork</td>
<td>A subnetwork is subdivision of an ESP-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-MESH network.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Media Access Control Address used to uniquely identify each node or router within an ESP-MESH network.</td>
</tr>
<tr>
<td>DS</td>
<td>Distribution System (External IP Network)</td>
</tr>
</tbody>
</table>

### Tree Topology

ESP-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-MESH can have **multiple downstream connections using its softAP interface**, whilst simultaneously having a **single upstream connection using its station interface**. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-MESH network can communicate.

**Note:** The size (total number of nodes) in an ESP-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.
**Node Types**

**Root Node:** The root node is the top node in the network and serves as the only interface between the ESP-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-MESH network. **There can only be one root node within an ESP-MESH network** and the root node’s upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.

**Leaf Nodes:** A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network’s maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the network’s maximum permitted layer hence have been assigned as leaf nodes.

**Intermediate Parent Nodes:** Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

**Idle Nodes:** Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see **Automatic Root Node Selection**). Referring to the diagram above, nodes K and O are idle nodes.

**Beacon Frames & RSSI Thresholding**

Every node in ESP-MESH that is able to form downstream connections (i.e. has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)
Fig. 19: ESP-MESH Node Types

- Current layer of Node
- Maximum number of layers permitted in the network
- Current number of child nodes
- Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

Panel A of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has.

Panel B of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

Note: Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.

Preferred Parent Node

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the preferred parent node. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has

The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-MESH network.
when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

Panel A of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due it having fewer downstream connections (fewer child nodes) compared to node B.

Panel B of the illustration above demonstrates the case where the root node is within range of the idle node G. In other words, the root node’s beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-MESH network hence is always the preferred parent node given multiple
parent node candidates.

**Note:** Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the Mesh Manual Networking Example).

## Routing Tables

Each node within an ESP-MESH network will maintain its individual routing table used to correctly route ESP-MESH packets (see ESP-MESH Packet) to the correct destination node. The routing table of a particular node will consist of the MAC addresses of all nodes within the particular node’s subnetwork (including the MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

![Routing Table Diagram](image)

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e. equivalent to the subnetwork of node B). Node B’s routing table is internally partitioned into two subtables containing of nodes C to F and nodes G to I (i.e. equivalent to the subnetworks of nodes C and G respectively).

**ESP-MESH utilizes routing tables to determine whether an ESP-MESH packet should be forwarded upstream or downstream based on the following rules.**

1. If the packet’s destination MAC address is within the current node’s routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.

2. If the destination MAC address is not within the current node’s routing table, forward the data packet upstream to the current node’s parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

**Note:** Users can call `esp_mesh_get_routing_table()` to obtain a node’s routing table, or `esp_mesh_get_routing_table_size()` to obtain the size of a node’s routing table. `esp_mesh_get_subnet_nodes_list()` can be used to obtain the corresponding subtable of a specific child node. Likewise `esp_mesh_get_subnet_nodes_num()` can be used to obtain the size of the subtable.
4.9.4 Building a Network

General Process

**Warning:** Before the ESP-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with the same Mesh Network ID, router configuration, and softAP configuration.

An ESP-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-MESH network building process can be generalized into the following steps:

1. **Root Node Selection**
   - The root node can be designated during configuration (see section on User Designated Root Node), or dynamically elected based on the signal strength between each node and the router (see Automatic Root Node Selection). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

2. **Second Layer Formation**
   - Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected, these second layer nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore nodes B to D form upstream connections with the root node and become intermediate parent nodes.

3. **Formation of remaining layers**
   - The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idle nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.
4. Limiting Tree Depth  To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer form forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network’s number of maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. The MAC address is used to uniquely identify each node in the network whilst the router RSSI is used to indicate a node’s signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e. voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its vote percentage (number of votes/number of nodes participating in election) to determine if it should become the root node. If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.

The following diagram demonstrates how an ESP-MESH network is built when the root node is automatically selected.

![Fig. 24: Root Node Election Example](image)

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.

2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10 dB) hence its beacon frame is propagated throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.

3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e. the shallowest node). Nodes A/B/D/E form the second layer of the network.
4. Node F and G connect with nodes D and E respectively and the network building process is complete.

**Note:** The minimum number of iterations for the election process can be configured using `esp_mesh_set_attempts()`. Users should adjust the number of iterations based on the number of nodes within the network (i.e., the larger the network the larger number of scan iterations required).

**Warning:** Vote percentage threshold can also be configured using `esp_mesh_set_vote_percentage()`. Setting a low vote percentage threshold can result in two or more nodes becoming root nodes within the same ESP-MESH network leading to the building of multiple networks. If such is the case, ESP-MESH has internal mechanisms to autonomously resolve the root node conflict. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

**User Designated Root Node**

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-MESH network is built when the root node is designated by the user.

![Root Node Designation Example](image)

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.
2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.
3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.
4. Node G connects with node E, forming the fourth layer of the network. However, the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.
Note: When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.

Parent Node Selection

By default, ESP-MESH is self-organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-MESH network and to balance the number of downstream connections between potential parent nodes (see section on Preferred Parent Node).

However ESP-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the Mesh Manual Networking Example).

Asynchronous Power-on Reset

ESP-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e. separated by several minutes), the final structure of the network could differ from the ideal case where all nodes are powered on synchronously. Nodes that are delayed in powering on will adhere to the following rules:

**Rule 1:** If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

**Rule 2:** If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e. being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see Parent Node Switching).

**Rule 3:** If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.

1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.

2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.

3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20 dB and -10 dB) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both nodes B/E become intermediate parent nodes after connecting.

4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.

**Synchronous Power-On:** Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10 dB). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. However the synchronous power-on network layout can still be reached if the user manually switches the root node (see `esp_mesh_waive_root()`).
Fig. 26: Network Building with Asynchronous Power On Example

2. Idle Node
3. Root Node
4. Intermediate Parent Node

Synchronous Power-On
Chapter 4. API Guides

Note: Differences in parent node selection caused by asynchronous power-on are autonomously corrected for to some extent in ESP-MESH (see Parent Node Switching)

Loop-back Avoidance, Detection, and Handling

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node’s subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node’s routing table (see Routing Tables) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

4.9.5 Managing a Network

ESP-MESH is a self-healing network meaning it can detect and correct for failures in network routing. Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

Root Node Failure

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. The second layer node with the strongest router RSSI will be elected as the new root node whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g. root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.

Fig. 27: Self Healing From Root Node Failure
3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

**Note:** If a designated root node breaks down, the remaining nodes will not autonomously attempt to elect a new root node as an election process will never be attempted whilst a designated root node is used.

### Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see *Beacon Frames & RSSI Thresholding*).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see *Preferred Parent Node*) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

![Diagram of self healing from Intermediate Parent Node failure](image)

1. The following branch of the network consists of nodes A to G.
2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.
3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

**Note:** If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.

### Root Node Switching

ESP-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node’s router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.
To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see Automatic Root Node Selection) whilst remaining connected to the network (i.e., not idle). If another node receives more votes than the current root node, a root node switch will be initiated. The root node will remain unchanged otherwise.

A newly elected root node sends a switch request to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router whilst maintaining all of its downstream connections and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

![Fig. 29: Root Node Switch Example](image)

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames whilst still being connected.

2. After multiple rounds of transmission and scanning, node B is selected as the new root node. Node B sends node C a switch request and node C responds with an acknowledgment.

3. Node B disconnects from its parent and connects with the router becoming the network’s new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. Node C maintains all its downstream connections throughout this process.

4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C’s subnetwork has been placed one layer deeper as a result of the switch. Parent Node Switching may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.

**Note:** Root node switching must require an election hence is only supported when using a self-organized ESP-MESH network. In other words, root node switching cannot occur if a designated root node is used.
Parent Node Switching

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e. due to a Asynchronous Power-on Reset).

All potential parent nodes periodically transmit beacon frames (see Beacon Frames & RSSI Thresholding) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

4.9.6 Data Transmission

ESP-MESH Packet

ESP-MESH network data transmissions use ESP-MESH packets. ESP-MESH packets are entirely contained within the frame body of a Wi-Fi data frame. A multi-hop data transmission in an ESP-MESH network will involve a single ESP-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-MESH packet and its relation with a Wi-Fi data frame.

![Fig. 30: ESP-MESH Packet](image)

The **header** of an ESP-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-MESH packets such as a group transmission or a packet originating from the external IP network (see MESH_OPT_SEND_GROUP and MESH_OPT_RECV_DS_ADDR).

The **payload** of an ESP-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see mesh_proto_t).

**Note:** When sending an ESP-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see mesh_addr_t). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

Group Control & Multicasting

Multicasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-MESH can be achieved by either specifying a list of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via esp_mesh_send().

To multicast by specifying a list of target nodes, users must first set the ESP-MESH packet’s destination address to the **Multicast-Group Address** (01:00:5E:xx:xx:xx). This signifies that the ESP-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see mesh_opt_t and MESH_OPT_SEND_GROUP)
method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node’s MAC address must be listed in the options field of the header.

Multicasting by group allows a ESP-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via `esp_mesh_set_group_id()`. Multicasting to a group involves setting the destination address of the ESP-MESH packet to the target group ID. Furthermore, the `MESH_DATA_GROUP` flag must set. Using groups to multicast incurs less overhead, but requires nodes to previously added into groups.

**Note:** During a multicast, all nodes within the network still receive the ESP-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

### Broadcasting

Broadcasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to its parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet.

### Upstream Flow Control

ESP-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node’s message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a receiving window for each of its child nodes. Each child node must apply for a receiving window before it is permitted to transmit upstream. The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node’s data packet that is pending transmission.
2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.
3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving windows by sending a request before it is permitted to continue transmitting.
Note: ESP-MESH does not support any downstream flow control.

Warning: Due to Parent Node Switching, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node’s connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling `esp_mesh_post_toDS_state()`.

Bi-Directional Data Stream

The following diagram illustrates the various network layers involved in an ESP-MESH Bidirectional Data Stream.

![Bi-Directional Data Stream Diagram](image)

Due to the use of Routing Tables, ESP-MESH is able to handle packet forwarding entirely on the mesh layer. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP network.

4.9.7 Channel Switching

Background

In traditional Wi-Fi networks, channels are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.

In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for network channel switching. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a Channel Switch Announcement (CSA) element within the AP’s periodically transmitted beacon.
frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the **New Channel Number** and a **Channel Switch Count** which indicates the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

**ESP-MESH Network Channel Switching**

ESP-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-MESH is more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e. in a single hop). Therefore, an ESP-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e. with the same **New Channel Number** and **Channel Switch Count**). Given that all nodes within an ESP-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-MESH network channel switch can be triggered by either the router or the root node.

**Root Node Triggered**  A root node triggered channel switch can only occur when the ESP-MESH network is not connected to a router. By calling `esp_mesh_switch_channel()`, the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in the their own beacon frames.

**Router Triggered**  When an ESP-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, the root node will not be permitted to trigger a channel switch when it is connected to a router.

When the root node receives beacon frame containing a CSA element from the router, the root node will set **Channel Switch Count value in the CSA element to a custom value before forwarding it downstream via beacon frames**. It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by the router is irrelevant to an ESP-MESH network. By using a custom value, nodes within the ESP-MESH network are able to switch channels synchronously relative to the ESP-MESH network’s beacon interval. However, this will also result in the ESP-MESH network’s channel switch being unsynchronized with the channel switch of the router and its connected stations.

**Impact of Network Channel Switching**

- Due to the ESP-MESH network channel switch being unsynchronized with the router’s channel switch, there will be a

  - The ESP-MESH network’s channel switch time is dependent on the ESP-MESH network’s beacon interval and the root node’s custom Channel Switch Count value.
  - The channel discrepancy prevents any data exchange between the root node and the router during that ESP-MESH network’s switch.
  - In the ESP-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the **Channel Switch Mode** field in the CSA element to 1.
  - Frequent router triggered network channel switches can degrade the ESP-MESH network’s performance. Note that this can be caused by the ESP-MESH network itself (e.g. due to wireless medium
contention with ESP-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.

**When there is a temporary channel discrepancy, the root node remains technically connected to the router.**

- Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.
- Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.

**If the root node is unable to receive any of the router’s CSA beacon frames (e.g. due to short switch time given by the network).**

- After the router switches channels, the root node will no longer be able to receive the router’s beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.
- The root node will re-scan all channels for the router after disconnection.
- The root node will maintain downstream connections throughout this process.

---

**Note:** Although ESP-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g. due to reasons such as node failures).

---

**Channel and Router Switching Configuration**

ESP-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e. when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

**Allow Channel Switch:** This parameter is set via the allow_channel_switch field of the mesh_cfg_t structure and permits an ESP-MESH network to dynamically switch channels when set.

**Preset Channel:** An ESP-MESH network can have a preset channel by setting the channel field of the mesh_cfg_t structure to the desired channel number. If this field is unset, the allow_channel_switch parameter is overridden such that channel switches are always permitted.

**Allow Router Switch:** This parameter is set via the allow_router_switch field of the mesh_router_t structure and permits an ESP-MESH network to dynamically switch to a different router when set.

**Preset Router BSSID:** An ESP-MESH network can have a preset router by setting the bssid field of the mesh_router_t structure to the BSSID of the desired router. If this field is unset, the allow_router_switch parameter is overridden such that router switches are always permitted.

**Root Node Present:** The presence of a root node will also affect whether a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that $X$ represents a “don’t care” for the parameter.

### 4.9.8 Performance

The performance of an ESP-MESH network can be evaluated based on multiple metrics such as the following:

**Network Building Time:** The amount of time taken to build an ESP-MESH network from scratch.

**Healing Time:** The amount of time taken for the network to detect a node break down and carry out appropriate actions to heal the network (such as generating a new root node or forming new connections).

**Per-hop latency:** The latency of data transmission over one wireless hop. In other words, the time taken to transmit a data packet from a parent node to a child node or vice versa.

**Network Node Capacity:** The total number of nodes the ESP-MESH network can simultaneously support. This number is determined by the maximum number of downstream connections a node can accept and the maximum number of layers permissible in the network.

The following table lists the common performance figures of an ESP-MESH network:

- Network Building Time: <60 seconds
- **Healing time:**
  - Root node break down: < 10 seconds
  - Child node break down: < 5 seconds
- Per-hop latency: 10 to 30 milliseconds

**Note:** The following test conditions were used to generate the performance figures above.

- Number of test devices: **100**
- Maximum Downstream Connections to Accept: **6**
- Maximum Permissible Layers: **6**

**Note:** Throughput depends on packet error rate and hop count.

**Note:** The throughput of root node’s access to the external IP network is directly affected by the number of nodes in the ESP-MESH network and the bandwidth of the router.
Chapter 4. API Guides

Note: The performance figures can vary greatly between installations based on network configuration and operating environment.

4.9.9 Further Notes

• Data transmission uses Wi-Fi WPA2-PSK encryption
• Mesh networking IE uses AES encryption

4.10 Core Dump

4.10.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. ESP-IDF provides special script espcoredump.py to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

• info_corefile - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
• dbg_corefile - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

4.10.2 Configuration

There are a number of core dump related configuration options which user can choose in project configuration menu (idf.py menuconfig).

1. Core dump data destination (Components -> Core dump -> Data destination):
   • Save core dump to Flash (Flash)
   • Print core dump to UART (UART)
   • Disable core dump generation (None)

2. Core dump data format (Components -> Core dump -> Core dump data format):
   • ELF format (Executable and Linkable Format file for core dump)
   • Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. It also stores SHA256 of crashed application image. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions. The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

3. Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks).
4. Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART). Value is in ms.
5. Type of data integrity check for core dump (Components -> Core dump -> Core dump data integrity check).
   • Use CRC32 for core dump integrity verification
   • Use SHA256 for core dump integrity verification
The SHA256 hash algorithm provides greater probability of detecting corruption than a CRC32 with multiple bit errors. The CRC32 option provides better calculation performance and consumes less memory for storage.

### 4.10.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash. But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: `espcoredump.py -p /path/to/serial/port info_corefile /path/to/program/elf/file` or `espcoredump.py -p /path/to/serial/port dbg_corefile /path/to/program/elf/file`

### 4.10.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: `espcoredump.py info_corefile -t b64 -c /path/to/saved/base64/text /path/to/program/elf/file` or `espcoredump.py dbg_corefile -t b64 -c /path/to/saved/base64/text /path/to/program/elf/file`

Base64-encoded body of core dump will be between the following header and footer:

```
-------------- CORE DUMP START --------------

<body of base64-encoded core dump, save it to file on disk>

-------------- CORE DUMP END --------------
```

The `CORE DUMP START` and `CORE DUMP END` lines must not be included in core dump text file.

### 4.10.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32_rom.elf) and pass it to ‘espcoredump.py’.

### 4.10.6 Running ‘espcoredump.py’

Generic command syntax:

```
espcoredump.py [options] command [args]
```

**Script Options**

- `--chip,-c {auto,esp32}`. Target chip type. Supported values are `auto` and `esp32`.
Chapter 4. API Guides

- `-port, p PORT`. Serial port device.
- `-baud, b BAUD`. Serial port baud rate used when flashing/reading.

**Commands**
- `info_corefile`. Retrieve core dump and print useful info.
- `dbg_corefile`. Retrieve core dump and start GDB session with it.

**Command Arguments**
- `-debug, d DEBUG`. Log level (0..3).
- `-gdb, g GDB`. Path to gdb to use for data retrieval.
- `-core, c CORE`. Path to core dump file to use (if skipped core dump will be read from flash).
- `-core-format, t CORE_FORMAT`. Specifies that file passed with “-c” is an ELF ("elf") , dumped raw binary ("raw") or base64-encoded ("b64") format.
- `-off, o OFF`. Offset of coredump partition in flash (type `idf.py partition_table` to see it).
- `-save-core, s SAVE_CORE`. Save core to file. Otherwise temporary core file will be deleted. Ignored with “-c”.
- `-rom-elf, r ROM_ELF`. Path to ROM ELF file to use (if skipped “esp32_rom.elf” is used).
- `-print-mem, m Print memory dump. Used only with “info_corefile”.
- `<prog>` Path to program ELF file.

### 4.11 Event Handling

Several ESP-IDF components use *events* to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

#### 4.11.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of *esp_event library*, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called *legacy event loop*. The following sections explain each of the methods.

**esp_event Library Event Loop**

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in `system_event_id_t` enumeration and `system_event_info_t` union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See *esp_event library API reference* for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the *default event loop* provided by this library.

**Legacy Event Loop**

This event loop implementation is started using `esp_event_loop_init()` function. Application typically supplies an *event handler*, a function with the following signature:

```c
esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to `esp_event_loop_init()`.

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority event task via a queue. Application-provided event handler function is called in the context of this task. Event task stack
size and event queue size can be adjusted using `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE` and `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE` options, respectively.

Event handler receives a pointer to the event structure (`system_event_t`) which describes current event. This structure follows a tagged union pattern: `event_id` member indicates the type of event, and `event_info` member is a union of description structures. Application event handler will typically use `switch(event->event_id)` to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

Chapter 4. API Guides

4.11.2 Mesh Events

ESP-MESH uses a system similar to the Legacy Event Loop to deliver events to the application. See System Events for details.

4.11.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameter type.

- **BLE GAP**: 
  esp_ble_gap_register_callback(), esp_gap_ble_cb_event_t, esp_gap_ble_cb_param_t.
- **BT GAP**: 
  esp_bt_gap_register_callback(), esp_bt_gap_cb_event_t, esp_bt_gap_cb_param_t.
- **GATT**: 
  esp_ble_gattc_register_callback(), esp_bt_gattc_cb_event_t, esp_bt_gattc_cb_param_t.
- **GATTS**: 
  esp_ble_gatts_register_callback(), esp_bt_gatts_cb_event_t, esp_bt_gatts_cb_param_t.
- **SPP**: 
  esp_spp_register_callback(), esp_spp_cb_event_t, esp_spp_cb_param_t.
- **Blufi**: 
  esp_blufi_register_callbacks(), esp_blufi_cb_event_t, esp_blufi_cb_param_t.
- **A2DP**: 
  esp_a2d_register_callback(), esp_a2d_cb_event_t, esp_a2d_cb_param_t.
- **AVRC**: 
  esp_avrc_ct_register_callback(), esp_avrc_ct_cb_event_t, esp_avrc_ct_cb_param_t.
- **HFP Client**: 
  esp_hf_client_register_callback(), esp_hf_client_cb_event_t, esp_hf_client_cb_param_t.
- **HFP AG**: 
  esp_hf_ag_register_callback(), esp_hf_ag_cb_event_t, esp_hf_ag_cb_param_t.

4.12 Support for external RAM

4.12.1 Introduction

ESP32 has a few hundred kilobytes of internal RAM, residing on the same die as the rest of the chip components. It can be insufficient for some purposes, so ESP32 has the ability to also use up to 4 MB of external SPI RAM memory. The external memory is incorporated in the memory map and, with certain restrictions, is usable in the same way as internal data RAM.

4.12.2 Hardware

ESP32 supports SPI PSRAM connected in parallel with the SPI flash chip. While ESP32 is capable of supporting several types of RAM chips, ESP-IDF only supports the ESP-PSRAM32 chip at the moment.

The ESP-PSRAM32 chip is a 1.8 V device which can only be used in parallel with a 1.8 V flash component. Make sure to either set the MTD1 pin to a high signal level on bootup, or program ESP32 eFuses to always use the VDD_SIO level of 1.8 V. Not doing this can damage the PSRAM and/or flash chip.

4.12.3 Configuring External RAM

ESP-IDF fully supports the use of external memory in applications. Once the external RAM is initialized at startup, ESP-IDF can be configured to handle it in several ways:

- Integrate RAM into the ESP32 memory map
- Add external RAM to the capability allocator
• Provide external RAM via malloc() (default)
• Allow .bss segment placed in external memory

Integrate RAM into the ESP32 memory map

Select this option by choosing “Integrate RAM into memory map” from CONFIG_SPIRAM_USE.

This is the most basic option for external SPI RAM integration. Most likely, you will need another, more advanced option.

During the ESP-IDF startup, external RAM is mapped into the data address space, starting at address 0x3F800000 (byte-accessible). The length of this region is the same as the SPI RAM size (up to the limit of 4 MB).

Applications can manually place data in external memory by creating pointers to this region. So if an application uses external memory, it is responsible for all management of the external SPI RAM: coordinating buffer usage, preventing corruption, etc.

Add external RAM to the capability allocator

Select this option by choosing “Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM)” from CONFIG_SPIRAM_USE.

When enabled, memory is mapped to address 0x3F800000 and also added to the capabilities-based heap memory allocator using MALLOC_CAP_SPIRAM.

To allocate memory from external RAM, a program should call heap_caps_malloc(size, MALLOC_CAP_SPIRAM). After use, this memory can be freed by calling the normal free() function.

Provide external RAM via malloc()

Select this option by choosing “Make RAM allocatable using malloc() as well” from CONFIG_SPIRAM_USE. This is the default option.

In this case, memory is added to the capability allocator as described for the previous option. However, it is also added to the pool of RAM that can be returned by the standard malloc() function.

This allows any application to use the external RAM without having to rewrite the code to use heap_caps_malloc(..., MALLOC_CAP_SPIRAM).

An additional configuration item, CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL, can be used to set the size threshold when a single allocation should prefer external memory:

• When allocating a size less than the threshold, the allocator will try internal memory first.
• When allocating a size equal to or larger than the threshold, the allocator will try external memory first.

If a suitable block of preferred internal/external memory is not available, the allocator will try the other type of memory.

Because some buffers can only be allocated in internal memory, a second configuration item CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL defines a pool of internal memory which is reserved for only explicitly internal allocations (such as memory for DMA use). Regular malloc() will not allocate from this pool. The MALLOC_CAP_DMA and MALLOC_CAP_INTERNAL flags can be used to allocate memory from this pool.

Allow .bss segment placed in external memory

Enable this option by checking CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY. This configuration setting is independent of the other three.

If enabled, a region of the address space starting from 0x3F800000 will be used to store zero-initialized data (BSS segment) from the lwIP, net80211, libpp, and blueyroid ESP-IDF libraries.
Additional data can be moved from the internal BSS segment to external RAM by applying the macro `EXT_RAM_ATTR` to any static declaration (which is not initialized to a non-zero value).

This option reduces the internal static memory used by the BSS segment.

Remaining external RAM can also be added to the capability heap allocator using the method shown above.

### 4.12.4 Restrictions

External RAM use has the following restrictions:

- When flash cache is disabled (for example, if the flash is being written to), the external RAM also becomes inaccessible; any reads from or writes to it will lead to an illegal cache access exception. This is also the reason why ESP-IDF does not by default allocate any task stacks in external RAM (see below).
- External RAM cannot be used as a place to store DMA transaction descriptors or as a buffer for a DMA transfer to read from or write into. Any buffers that will be used in combination with DMA must be allocated using `heap_caps_malloc(size, MALLOC_CAP_DMA)` and can be freed using a standard `free()` call.
- External RAM uses the same cache region as the external flash. This means that frequently accessed variables in external RAM can be read and modified almost as quickly as in internal ram. However, when accessing large chunks of data (>32 KB), the cache can be insufficient, and speeds will fall back to the access speed of the external RAM. Moreover, accessing large chunks of data can “push out” cached flash, possibly making the execution of code slower afterwards.
- External RAM cannot be used as task stack memory. Due to this, `xTaskCreate()` and similar functions will always allocate internal memory for stack and task TCBs, and functions such as `xTaskCreateStatic()` will check if the buffers passed are internal.
- By default, failure to initialize external RAM will cause the ESP-IDF startup to abort. This can be disabled by enabling the config item `CONFIG_SPIRAM_IGNORE_NOTFOUND`. If `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` is enabled, the option to ignore failure is not available as the linker will have assigned symbols to external memory addresses at link time.
- Regarding stacks in PSRAM: For tasks not calling on code in ROM in any way, directly or indirectly, the menuconfig option `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` will eliminate the check in `xTaskCreateStatic`, allowing a task’s stack to be in external RAM. Using this is not advised, however.
- When used at 80 MHz clock speed, external RAM must also occupy either the HSPI or VSPI bus. Select which SPI host will be used by `CONFIG_SPIRAM_OCCUPY_SPI_HOST`.

### 4.12.5 Chip revisions

There are some issues with certain revisions of ESP32 that have repercussions for use with external RAM. The issues are documented in the ESP32 ECO document. In particular, ESP-IDF handles the bugs mentioned in the following ways:

**ESP32 rev v0**

ESP-IDF has no workaround for the bugs in this revision of silicon, and it cannot be used to map external PSRAM into ESP32’s main memory map.

**ESP32 rev v1**

The bugs in this revision of silicon cause issues if certain sequences of machine instructions operate on external memory. (ESP32 ECO 3.2). As a workaround, the GCC compiler received the flag `-mfix-esp32-psram-cache-issue` to filter these sequences and only output the code that can safely be executed. Enable this flag by checking `CONFIG_SPIRAM_CACHE_WORKAROUND`.

Aside from linking to a recompiled version of Newlib with the additional flag, ESP-IDF also does the following:

- Avoids using some ROM functions
- Allocates static memory for the WiFi stack
4.13 Fatal Errors

4.13.1 Overview

In certain situations, execution of the program cannot be continued in a well defined way. In ESP-IDF, these situations include:

- CPU Exceptions: Illegal Instruction, Load/Store Alignment Error, Load/Store Prohibited error, Double Exception.
- System level checks and safeguards:
  - Interrupt watchdog timeout
  - Task watchdog timeout (only fatal if CONFIG_ESP_TASK_WDT_PANIC is set)
  - Cache access error
  - Brownout detection event
  - Stack overflow
  - Stack smashing protection check
  - Heap integrity check
- Failed assertions, via assert, configASSERT and similar macros.

This guide explains the procedure used in ESP-IDF for handling these errors, and provides suggestions on troubleshooting the errors.

4.13.2 Panic Handler

Every error cause listed in the Overview will be handled by panic handler.

Panic handler will start by printing the cause of the error to the console. For CPU exceptions, the message will be similar to:

Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was...

For some of the system level checks (interrupt watchdog, cache access error), the message will be similar to:

Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory region...unaccessed)

In all cases, error cause will be printed in parens. See Guru Meditation Errors for a list of possible error causes.

Subsequent behavior of the panic handler can be set using CONFIG_ESP_SYSTEM_PANIC configuration choice. The available options are:

- Print registers and reboot (CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT) — default option.
  This will print register values at the point of the exception, print the backtrace, and restart the chip.
- Print registers and halt (CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT)
  Similar to the above option, but halt instead of rebooting. External reset is required to restart the program.
- Silent reboot (CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Don’t print registers or backtrace, restart the chip immediately.
-Invoke GDB Stub (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)
  Start GDB server which can communicate with GDB over console UART port. See GDB Stub for more details.

Behavior of panic handler is affected by two other configuration options.
• If `CONFIG_ESP32_DEBUG_OCDAWARE` is enabled (which is the default), panic handler will detect whether a JTAG debugger is connected. If it is, execution will be halted and control will be passed to the debugger. In this case registers and backtrace are not dumped to the console, and GDBStub / Core Dump functions are not used.

• If Core Dump feature is enabled, then system state (task stacks and registers) will be dumped either to Flash or UART, for later analysis.

The following diagram illustrates panic handler behavior:

![Panic Handler Flowchart](image)

**Fig. 32: Panic Handler Flowchart (click to enlarge)**

### 4.13.3 Register Dump and Backtrace

Unless `CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT` option is enabled, panic handler prints some of the CPU registers, and the backtrace, to the console:

Backtrace: 0x400e14ed:0x3fffb5030 0x400d0802:0x3fffb5050

Register values printed are the register values in the exception frame, i.e. values at the moment when CPU exception or other fatal error has occurred.

Register dump is not printed if the panic handler was executed as a result of an abort() call.

In some cases, such as interrupt watchdog timeout, panic handler may print additional CPU registers (EPC1-EPC4) and the registers/backtrace of the code running on the other CPU.

Backtrace line contains PC:SP pairs, where PC is the Program Counter and SP is Stack Pointer, for each stack frame of the current task. If a fatal error happens inside an ISR, the backtrace may include PC:SP pairs both from the task which was interrupted, and from the ISR.

If IDF Monitor is used, Program Counter values will be converted to code locations (function name, file name, and line number), and the output will be annotated with additional lines:

```
Core 0 register dump:

PC : 0x400e14ed PS : 0x00060030 A0 : 0x800d0805 A1 :

0x400d0802: main_task at /Users/user/esp/esp-idf/components/esp32/cpu_start.c:470
```

To find the location where a fatal error has happened, look at the lines which follow the “Backtrace” line. Fatal error location is the top line, and subsequent lines show the call stack.

### 4.13.4 GDB Stub

If CONFIG_ESP_SYSTEM_PANIC_GDBSTUB option is enabled, panic handler will not reset the chip when fatal error happens. Instead, it will start GDB remote protocol server, commonly referred to as GDB Stub. When this happens, GDB instance running on the host computer can be instructed to connect to the ESP32 UART port.
If **IDF Monitor** is used, GDB is started automatically when GDB Stub prompt is detected on the UART. The output would look like this:

```
Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-
! esp32-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
Find the GDB manual and other documentation resources online at:
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
at /Users/user/esp/example/main/main.cpp:36
36 *((int*) 0) = 0;
(gdb)
```

GDB prompt can be used to inspect CPU registers, local and static variables, state of created tasks by issuing “info thread” command on the GDB prompt, and arbitrary locations in memory. It is not possible to set breakpoints, change PC, or continue execution. To reset the program, exit GDB and perform external reset: Ctrl-T Ctrl-R in IDF Monitor, or using external reset button on the development board.

### 4.13.5 Guru Meditation Errors

This section explains the meaning of different error causes, printed in parens after Guru Meditation Error: Core panic’d message.

**Note:** See **Wikipedia article** for historical origins of “Guru Meditation”.

**IllegalInstruction**

This CPU exception indicates that the instruction which was executed was not a valid instruction. Most common reasons for this error include:

- FreeRTOS task function has returned. In FreeRTOS, if task function needs to terminate, it should call `vTaskDelete()` function and delete itself, instead of returning.
- Failure to load next instruction from SPI flash. This usually happens if:
  - Application has reconfigured SPI flash pins as some other function (GPIO, UART, etc.). Consult Hardware Design Guidelines and the Datasheet for the chip or module for details about SPI flash pins.
  - Some external device was accidentally connected to SPI flash pins, and has interfered with communication between ESP32 and SPI flash.

**InstrFetchProhibited**

This CPU exception indicates that CPU could not load an instruction because the the address of the instruction did not belong to a valid region in instruction RAM or ROM.
Usually this means an attempt to call a function pointer, which does not point to valid code. PC (Program Counter) register can be used as an indicator: it will be zero or will contain garbage value (not 0x4xxxxxxx).

**LoadProhibited, StoreProhibited**

This CPU exception happens when application attempts to read from or write to an invalid memory location. The address which was written/read is found in EXCVADDR register in the register dump. If this address is zero, it usually means that application attempted to dereference a NULL pointer. If this address is close to zero, it usually means that application attempted to access member of a structure, but the pointer to the structure was NULL. If this address is something else (garbage value, not in 0x3fxxxxxx - 0x6xxxxxxx range), it likely means that the pointer used to access the data was either not initialized or was corrupted.

**IntegerDivideByZero**

Application has attempted to do integer division by zero.

**LoadStoreAlignment**

Application has attempted to read or write memory location, and address alignment did not match load/store size. For example, 32-bit load can only be done from 4-byte aligned address, and 16-bit load can only be done from a 2-byte aligned address.

**LoadStoreError**

Application has attempted to do a 8- or 16- bit load/store from a memory region which only supports 32-bit loads/stores. For example, dereferencing a char* pointer which points into instruction memory will result in such an error.

**Unhandled debug exception**

This will usually be followed by a message like:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

This error indicates that application has written past the end of the stack of task_name task. Note that not every stack overflow is guaranteed to trigger this error. It is possible that the task writes to stack beyond the stack canary location, in which case the watchpoint will not be triggered.

**Interrupt wdt timeout on CPU0 / CPU1**

Indicates that interrupt watchdog timeout has occurred. See Watchdogs for more information.

**Cache disabled but cached memory region accessed**

In some situations ESP-IDF will temporarily disable access to external SPI Flash and SPI RAM via caches. For example, this happens with spi_flash APIs are used to read/write/erase/mmap regions of SPI Flash. In these situations, tasks are suspended, and interrupt handlers not registered with ESP_INTR_FLAG_IRAM are disabled. Make sure that any interrupt handlers registered with this flag have all the code and data in IRAM/DRAM. Refer to the SPI flash API documentation for more details.
4.13.6 Other Fatal Errors

Brownout

ESP32 has a built-in brownout detector, which is enabled by default. Brownout detector can trigger system reset if supply voltage goes below safe level. Brownout detector can be configured using `CONFIG_ESP32_BROWNOUT_DET` and `CONFIG_ESP32_BROWNOUT_DET_LVL_SEL` options.

When brownout detector triggers, the following message is printed:

```
Brownout detector was triggered
```

Chip is reset after the message is printed.

Note that if supply voltage is dropping at a fast rate, only part of the message may be seen on the console.

Corrupt Heap

ESP-IDF heap implementation contains a number of run-time checks of heap structure. Additional checks (“Heap Poisoning”) can be enabled in menuconfig. If one of the checks fails, message similar to the following will be printed:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

Consult Heap Memory Debugging documentation for further information.

Stack Smashing

Stack smashing protection (based on GCC `-fstack-protector*` flags) can be enabled in ESP-IDF using `CONFIG_COMPILER_STACK_CHECK_MODE` option. If stack smashing is detected, message similar to the following will be printed:

```
Stack smashing protect failure!
abort() was called at PC 0x400d2138 on core 0
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3fff17a0 0x400d2138:0x3fff17c0...
0x400e1916:0x3ffe19f0 0x400d2c44:0x3ffe1a80
```

The backtrace should point to the function where stack smashing has occurred. Check the function code for unbounded access to local arrays.

4.14 Flash Encryption

This is a quick start guide to ESP32’s flash encryption feature. Using an application code example, it demonstrates how to test and verify flash encryption operations during development and production.

4.14.1 Introduction

Flash encryption is intended for encrypting the contents of the ESP32’s off-chip flash memory. Once this feature is enabled, firmware is flashed as plaintext, and then the data is encrypted in place on the first boot. As a result, physical readout of flash will not be sufficient to recover most flash contents.
Chapter 4. API Guides

With flash encryption enabled, the following types of data are encrypted by default:

- Firmware bootloader
- Partition Table
- All “app” type partitions

Other types of data can be encrypted conditionally:

- Any partition marked with the encrypted flag in the partition table. For details, see Encrypted Partition Flag.
- Secure Boot bootloader digest if Secure Boot is enabled (see below).

**Important:** For production use, flash encryption should be enabled in the “Release” mode only.

**Important:** Enabling flash encryption limits the options for further updates of ESP32. Before using this feature, read the document and make sure to understand the implications.

### 4.14.2 Relevant eFuses

The flash encryption operation is controlled by various eFuses available on ESP32. The list of eFuses and their descriptions is given in the table below.

### 4.14.3 Flash Encryption Process

Assuming that the eFuse values are in their default states and the firmware bootloader is compiled to support flash encryption, the flash encryption process executes as shown below:

During the development stage, there is a frequent need to program different plaintext flash images and test the flash encryption process. This requires that Firmware Download mode is able to load new plaintext images as many times as it might be needed. However, during manufacturing or production stages, Firmware Download mode should not be allowed to access flash contents for security reasons.

Hence, two different flash encryption configurations were created: for development and for production. For details on these configurations, see Section Flash Encryption Configuration.

### 4.14.4 Flash Encryption Configuration

The following flash encryption modes are available:

- **Development Mode** - recommended for use ONLY DURING DEVELOPMENT, as it does not prevent modification and possible readout of encrypted flash contents.
- **Release Mode** - recommended for manufacturing and production to prevent physical readout of encrypted flash contents.

This section provides information on the mentioned flash encryption modes and step by step instructions on how to use them.

**Development Mode**

During development, you can encrypt flash using either an ESP32 generated key or external host-generated key.
Using ESP32 Generated Key

Development mode allows you to download multiple plaintext images using Firmware Download mode.

To test flash encryption process, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses.

   See how to check ESP32 Flash Encryption Status.

2. In Project Configuration Menu, do the following:
   - Enable flash encryption on boot
   - Select encryption mode (Development mode by default)
   - Select the appropriate bootloader log verbosity
   - Save the configuration and exit.

3. Run the command given below to build and flash the complete image.

   ```
   idf.py flash monitor
   ```

   The image will include the firmware bootloader, partition table, application, and other partitions marked by the user as encrypted. These binaries will be written to flash memory unencrypted. Once the flashing is complete, your device will reset. On the next boot, the firmware bootloader encrypts the flash application partition and then resets. After that, the sample application is decrypted at runtime and executed.

A sample output of the first ESP32 boot after enabling flash encryption is given below:

--- idf_monitor on /dev/cu.SLAB_USBtoUART 115200 ---
--- Quit: Ctrl+| Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---

Sample program to check Flash Encryption
This is ESP32 chip with 2 CPU cores, WiFi/RT/BLE, silicon revision 1, 4MB...
Flash encryption feature is enabled
Flash encryption mode is DEVELOPMENT
Flash in encrypted mode with flash_crypt_cnt = 1
Halting...

At this stage, if you need to update and re-flash binaries, see Re-flashing Updated Partitions.

Using Host Generated Key  It is possible to pre-generate a flash encryption key on the host computer and burn it into the eFuse. This allows you to pre-encrypt data on the host and flash already encrypted data without needing a plaintext flash update. This feature can be used in both Development Mode and Release Mode. Without a pre-generated key, data is flashed in plaintext and then ESP32 encrypts the data in-place.

Note: This option is not recommended for production, unless a separate key is generated for each individual device.

To use a host generated key, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses. See how to check ESP32 Flash Encryption Status.
2. Generate a random key by running:
   ```
   espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
   ```
3. Before the first encrypted boot, burn the key into your device’s BLOCK1 eFuse using the command below. This action can be done only once.
   ```
   espefuse.py --port PORT burn_key flash_encryption my_flash_encryption_key.bin
   ```
   If the key is not burned and the device is started after enabling flash encryption, the ESP32 will generate a random key that software cannot access or modify.
4. In Project Configuration Menu, do the following:
   - Enable flash encryption on boot
   - Select encryption mode (Development mode by default)
   - Select the appropriate bootloader log verbosity
   - Save the configuration and exit.
5. Run the command given below to build and flash the complete.
   ```
   idf.py flash monitor
   ```
   The image will include the firmware bootloader, partition table, application, and other partitions marked by the user as encrypted. These binaries will be written to flash memory unencrypted. Once the flashing is complete, your device will reset. On the next boot, the firmware bootloader encrypts the flash application partition and then resets. After that, the sample application is decrypted at runtime and executed.
At this stage, if you need to update and re-flash binaries, see Re-flashing Updated Partitions.

Re-flashing Updated Partitions  If you update your application code (done in plaintext) and want to re-flash it, you will need to encrypt it before flashing. To encrypt the application and flash it in one step, run:

```
idf.py encrypted-app-flash monitor
```

If all partitions needs to be updated in encrypted format, run:
Chapter 4. API Guides

Release Mode

In Release mode, UART bootloader cannot perform flash encryption operations. New plaintext images can ONLY be downloaded using the over-the-air (OTA) scheme which will encrypt the plaintext image before writing to flash.

To use this mode, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses. See how to check ESP32 Flash Encryption Status.

2. In Project Configuration Menu, do the following:
   - Enable flash encryption on boot
   - Select Release mode (Note that once Release mode is selected, the download_dis_encrypt and download_dis_decrypt eFuse bits will be burned to disable UART bootloader access to flash contents)
   - Select the appropriate bootloader log verbosity
   - Save the configuration and exit.

3. Run the command given below to build and flash the complete image.

   ```
   idf.py flash monitor
   ```

   The image will include the firmware bootloader, partition table, application, and other partitions marked by the user as encrypted. These binaries will be written to flash memory unencrypted. Once the flashing is complete, your device will reset. On the next boot, the firmware bootloader encrypts the flash application partition and then resets. After that, the sample application is decrypted at runtime and executed.

Once the flash encryption is enabled in Release mode, the bootloader will write-protect the FLASH_CRYPT_CNT eFuse.

For subsequent plaintext field updates, use OTA scheme.

4.14.5 Possible Failures

Once flash encryption is enabled, the FLASH_CRYPT_CNT eFuse value will have an odd number of bits set. It means that all the partitions marked with the encryption flag are expected to contain encrypted ciphertext. Below are the three typical failure cases if the ESP32 is erroneously loaded with plaintext data:

1. If the bootloader partition is re-flashed with a plaintext firmware bootloader image, the ROM bootloader will fail to load the firmware bootloader resulting in the following failure:

   ```
   rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT) flash read err, 1000 ets_main.c 371 ets Jun 8 2016 00:22:57
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT) flash read err, 1000 ets_main.c 371 ets Jun 8 2016 00:22:57
   ```

(continues on next page)
Note: This error also appears if the flash contents are erased or corrupted.

2. If the firmware bootloader is encrypted, but the partition table is re-flashed with a plaintext partition table image, the bootloader will fail to read the partition table resulting in the following failure:

```
rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
confsip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00

I (109) boot: End of partition table
```

(continues on next page)
### 4.14.6 ESP32 Flash Encryption Status

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses.

To check if flash encryption on your ESP32 device is enabled, do one of the following:

- **flash** the application example `security/flash_encryption` onto your device. This application prints the `FLASH_CRYPT_CNT` eFuse value and if flash encryption is enabled or disabled.
- **Find the serial port name** under which your ESP32 device is connected, replace `PORT` with your port name in the following command, and run it:

  ```
  espefuse.py -p PORT summary
  ```

### 4.14.7 Reading and Writing Data in Encrypted Flash

ESP32 application code can check if flash encryption is currently enabled by calling `esp_flash_encryption_enabled()`. Also, a device can identify the flash encryption mode by calling `esp_get_flash_encryption_mode()`.

Once flash encryption is enabled, be more careful with accessing flash contents from code.

#### Scope of Flash Encryption

Whenever the `FLASH_CRYPT_CNT` eFuse is set to a value with an odd number of bits, all flash content accessed via the MMU in flash cache is transparently decrypted. It includes:

- Executable application code in flash (IROM).
- All read-only data stored in flash (DROM).
- Any data accessed via `spi_flash_mmap()`.
- The firmware bootloader image when it is read by the ROM bootloader.

**Important:** The MMU flash cache unconditionally decrypts all existing data. Data which is stored unencrypted in flash memory will also be “transparently decrypted” via the flash cache and will appear to software as random garbage.

#### Reading from Encrypted Flash

To read data without using a flash cache MMU mapping, you can use the partition read function `esp_partition_read()`. This function will only decrypt data when it is read from an encrypted partition. Data read from unencrypted partitions will not be decrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also use the following SPI flash API functions:

- `esp_flash_read()` to read raw (encrypted) data which will not be decrypted
- `esp_flash_read_encrypted()` to read and decrypt data
Chapter 4. API Guides

The ROM function `SPIRead()` can read data without decryption, however, this function is not supported in esp-idf applications.

Data stored using the Non-Volatile Storage (NVS) API is always stored and read decrypted from the perspective of flash encryption. It is up to the library to provide encryption feature if required. Refer to NVS Encryption for more details.

Writing to Encrypted Flash

It is recommended to use the partition write function `esp_partition_write()`. This function will only encrypt data when it is written to an encrypted partition. Data written to unencrypted partitions will not be encrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also pre-encrypt and write data using the function `esp_flash_write_encrypted()`.

Also, the following ROM function exist but not supported in esp-idf applications:

- `esp_rom_spiflash_write_encrypted` pre-encrypts and writes data to flash
- `SPIWrite` writes unencrypted data to flash

Since data is encrypted in blocks, the minimum write size for encrypted data is 16 bytes and the alignment is also 16 bytes.

4.14.8 Updating Encrypted Flash

OTA Updates

OTA updates to encrypted partitions will automatically write encrypted data if the function `esp_partition_write()` is used.

Before building the application image for OTA updating of an already encrypted device, enable the option Enable flash encryption on boot in project configuration menu.

For general information about ESP-IDF OTA updates, please refer to OTA

4.14.9 Disabling Flash Encryption

If flash encryption was enabled accidentally, flashing of plaintext data will soft-brick the ESP32. The device will reboot continuously, printing the error `flash read err, 1000`.

1. In Project Configuration Menu, disable Enable flash encryption on boot, then save and exit.
2. Open project configuration menu again and double-check that you have disabled this option! If this option is left enabled, the bootloader will immediately re-enable encryption when it boots.
3. With flash encryption disabled, build and flash the new bootloader and application by running `idf.py flash`.
4. Use `espefuse.py` (in components/esptool_py/esptool) to disable the FLASH_CRYPT_CNT by running:

   ```bash
   espefuse.py burn_efuse FLASH_CRYPT_CNT
   ```

Reset the ESP32. Flash encryption will be disabled, and the bootloader will boot as usual.

4.14.10 Key Points About Flash Encryption

- Flash memory contents are encrypted using AES-256. The flash encryption key is stored in the BLOCK1 eFuse internal to the chip and, by default, is protected from software access.
- The flash encryption algorithm is AES-256, where the key is “tweaked” with the offset address of each 32 byte block of flash. This means that every 32-byte block (two consecutive 16 byte AES blocks) is encrypted with a unique key derived from the flash encryption key.
Chapter 4. API Guides

- Flash access is transparent via the flash cache mapping feature of ESP32 - any flash regions which are mapped to the address space will be transparently decrypted when read. Some data partitions might need to remain unencrypted for ease of access or might require the use of flash-friendly update algorithms which are ineffective if the data is encrypted. NVS partitions for non-volatile storage cannot be encrypted since the NVS library is not directly compatible with flash encryption. For details, refer to NVS Encryption.
- If flash encryption might be used in future, the programmer must keep it in mind and take certain precautions when writing code that uses encrypted flash.
- If secure boot is enabled, re-flashing the bootloader of an encrypted device requires a “Re-flashable” secure boot digest (see Flash Encryption and Secure Boot).

**Important:** Do not interrupt power to the ESP32 while the first boot encryption pass is running. If power is interrupted, the flash contents will be corrupted and will require flashing with unencrypted data again. In this case, re-flashing will not count towards the flashing limit.

### 4.14.11 Limitations of Flash Encryption

Flash encryption protects firmware against unauthorised readout and modification. It is important to understand the limitations of the flash encryption feature:

- **Flash encryption is only as strong as the key.** It is recommended to generate keys on the device during first boot (default behaviour). If generating keys on a host computer, ensure to follow a proper procedure and do not use the same key for produced devices.
- **Not all data is stored encrypted.** If storing data in flash memory, make sure that the method you are using (library, API, etc.) supports flash encryption.
- **Flash encryption does not mask the high-level layout of flash.** This is because the same AES key is used for every pair of adjacent 16-byte AES blocks. If these blocks have identical content (such as empty or padding areas), these will produce matching pairs of encrypted blocks. It might allow an attacker to make high-level comparisons of firmware on encrypted devices, i.e., to tell if two devices are probably running the same firmware version.
- **Flash encryption does not mask the high-level layout of flash.** Each pair of adjacent 16-byte AES blocks is encrypted with the same AES key. If these blocks have identical content (such as empty or padding areas), the result will be matching pairs of encrypted blocks. It might allow an attacker to make high-level comparisons of firmware on encrypted devices, i.e., to tell if two devices are probably running the same firmware version.
- **An attacker can tell if a pair of adjacent 16-byte blocks (32 byte aligned) contains two identical 16-byte sequences** (the same reason as the previous bullet point). Keep this in mind if storing sensitive data in flash memory. While designing your flash storage, it is sufficient to use a counter byte or some other non-identical value every 16 bytes. NVS Encryption deals with this and is suitable for many uses.
- **Flash encryption alone may not prevent an attacker from modifying the firmware on the device.** To prevent unauthorized firmware from running on the device, use flash encryption in combination with Secure Boot.

### 4.14.12 Flash Encryption and Secure Boot

It is recommended to use flash encryption in combination with Secure Boot. However, if Secure Boot is enabled, additional restrictions apply to device re-flashing:

- **OTA Updates** are not restricted, provided that the new app is signed correctly with the Secure Boot signing key.

### 4.14.13 Advanced Features

The following section covers advanced features of flash encryption.
Chapter 4. API Guides

Encrypted Partition Flag

Some partitions are encrypted by default. Other partitions can be marked in the partition table description as requiring encryption by adding the flag `encrypted` to the partitions’ flag field. As a result, data in these marked partitions will be treated as encrypted in the same manner as an app partition.

<table>
<thead>
<tr>
<th>Name, Type, SubType, Offset, Size, Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs, data, nvs, 0x9000, 0x6000</td>
</tr>
<tr>
<td>phy_init, data, phy, 0xf000, 0x1000</td>
</tr>
<tr>
<td>factory, app, factory, 0x10000, 1M</td>
</tr>
<tr>
<td>secret_data, 0x40, 0x01, 0x20000, 256K, encrypted</td>
</tr>
</tbody>
</table>

For details on partition table description, see partition table.

Further information about encryption of partitions:

- Default partition tables do not include any encrypted data partitions.
- With flash encryption enabled, the app partition is always treated as encrypted and does not require marking.
- If flash encryption is not enabled, the flag “encrypted” has no effect.
- You can also consider protecting phy_init data from physical access, readout, or modification, by marking the optional phy partition with the flag encrypted.
- The nvs partition cannot be encrypted, because the NVS library is not directly compatible with flash encryption.

Enabling UART Bootloader Encryption/Decryption

On the first boot, the flash encryption process burns by default the following eFuses:

However, before the first boot you can choose to keep any of these features enabled by burning only selected eFuses and write-protect the rest of eFuses with unset value 0. For example:

Setting FLASH_CRYPT_CONFIG

The eFuse FLASH_CRYPT_CONFIG determines the number of bits in the flash encryption key which are “tweaked” with the block offset. For details, see Flash Encryption Algorithm.

On the first boot or the firmware bootloader, this value is set to the maximum 0xF.

It is possible to burn this eFuse manually and write protect it before the first boot in order to select different tweak values. However, this is not recommended.

It is strongly recommended to never write-protect FLASH_CRYPT_CONFIG when it is unset. Otherwise, its value will remain zero permanently, and no bits in the flash encryption key will be tweaked. As a result, the flash encryption algorithm will be equivalent to AES ECB mode.

JTAG Debugging

By default, when Flash Encryption is enabled (in either Development or Release mode) then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables flash encryption.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with Flash Encryption.

4.14.14 Technical Details

The following sections provide some reference information about the operation of flash encryption.
Flash Encryption Algorithm

- AES-256 operates on 16-byte blocks of data. The flash encryption engine encrypts and decrypts data in 32-byte blocks - two AES blocks in series.
- The main flash encryption key is stored in the BLOCK1 eFuse and, by default, is protected from further writes or software readout.
- AES-256 key size is 256 bits (32 bytes) read from the BLOCK1 eFuse. The hardware AES engine uses the key in reversed byte order as compared to the storage order in BLOCK1.
  - If the CODING_SCHEME eFuse is set to 0 (default, “None” Coding Scheme) then the eFuse key block is 256 bits and the key is stored as-is (in reversed byte order).
  - If the CODING_SCHEME eFuse is set to 1 (3/4 Encoding) then the eFuse key block is 192 bits (in reversed byte order), so overall entropy is reduced. The hardware flash encryption still operates on a 256-bit key, after being read (and un-reversed), the key is extended as $key = key[0:255] + key[64:127]$.
- AES algorithm is used inverted in flash encryption, so the flash encryption “encrypt” operation is AES decrypt and the “decrypt” operation is AES encrypt. This is for performance reasons and does not alter the efficiency of the algorithm.
- Each 32-byte block (two adjacent 16-byte AES blocks) is encrypted with a unique key. The key is derived from the main flash encryption key in BLOCK1, XORed with the offset of this block in the flash (a “key tweak”).
  - The specific tweak depends on the FLASHCRYPT_CONFIG eFuse setting. This is a 4-bit eFuse where each bit enables XORing of a particular range of the key bits:
    - Bit 1, bits 0-66 of the key are XORed.
    - Bit 2, bits 67-131 of the key are XORed.
    - Bit 3, bits 132-194 of the key are XORed.
    - Bit 4, bits 195-256 of the key are XORed.
It is recommended that FLASHCRYPT_CONFIG is always left at the default value 0xF, so that all key bits are XORed with the block offset. For details, see Setting FLASHCRYPT_CONFIG.
- The high 19 bits of the block offset (bit 5 to bit 23) are XORed with the main flash encryption key. This range is chosen for two reasons: the maximum flash size is 16MB (24 bits), and each block is 32 bytes so the least significant 5 bits are always zero.
- There is a particular mapping from each of the 19 block offset bits to the 256 bits of the flash encryption key to determine which bit is XORed with which. See the variable _FLASH_ENCRYPTION_TWEAK_PATTERN in the espsecure.py source code for complete mapping.
- To see the full flash encryption algorithm implemented in Python, refer to the _flash_encryption_operation() function in the espsecure.py source code.

4.15 ESP-IDF FreeRTOS SMP Changes

4.15.1 Overview

The ESP-IDF FreeRTOS is a modified version of vanilla FreeRTOS which supports symmetric multiprocessing (SMP). ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0. This guide outlines the major differences between vanilla FreeRTOS and ESP-IDF FreeRTOS. The API reference for vanilla FreeRTOS can be found via https://www.freertos.org/a00106.html.

For information regarding features that are exclusive to ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS Additions.

Backported Features: Although ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0, a number of FreeRTOS v9.0.0 features have been backported to ESP-IDF.

Task Deletion: Task deletion behavior has been backported from FreeRTOS v9.0.0 and modified to be SMP compatible. Task memory will be freed immediately when vTaskDelete() is called to delete a task that is not currently running and not pinned to the other core. Otherwise, freeing of task memory will still be delegated to the Idle Task.

Thread Local Storage Pointers & Deletion Callbacks: ESP-IDF FreeRTOS has backported the Thread Local Storage Pointers (TLSP) feature. However the extra feature of Deletion Callbacks has been added. Deletion callbacks are called automatically during task deletion and are used to free memory pointed to by TLSP. Call vTaskSetThreadLocalStoragePointerAndDelCallback() to set TLSP and Deletion Callbacks.
Chapter 4. API Guides

Configuring ESP-IDF FreeRTOS: Several aspects of ESP-IDF FreeRTOS can be set in the project configuration (idf.py menuconfig) such as running ESP-IDF in Unicore (single core) Mode, or configuring the number of Thread Local Storage Pointers each task will have.

4.15.2 Backported Features

The following features have been backported from FreeRTOS v9.0.0 to ESP-IDF.

Static Allocation

This feature has been backported from FreeRTOS v9.0.0 to ESP-IDF. The CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION option must be enabled in menuconfig in order for static allocation functions to be available. Once enabled, the following functions can be called:

- `xTaskCreateStatic()` (see Backporting Notes below)
- `xQueueCreateStatic`
- `xSemaphoreCreateBinaryStatic`
- `xSemaphoreCreateCountingStatic`
- `xSemaphoreCreateMutexStatic`
- `xSemaphoreCreateRecursiveMutexStatic`
- `xTimerCreateStatic()` (see Backporting Notes below)
- `xEventGroupCreateStatic()`

Other Features

- `vTaskSetThreadLocalStoragePointer()` (see Backporting Notes below)
- `pvTaskGetThreadLocalStoragePointer()` (see Backporting Notes below)
- `vTimerSetTimerID()`
- `xTimerGetPeriod()`
- `xTimerGetExpiryTime()`
- `pcQueueGetName()`
- `uxSemaphoreGetCount`

Backporting Notes

1) `xTaskCreateStatic()` has been made SMP compatible in a similar fashion to `xTaskCreate()` (see Tasks and Task Creation). Therefore `xTaskCreateStaticPinnedToCore()` can also be called.

2) Although vanilla FreeRTOS allows the Timer feature’s daemon task to be statically allocated, the daemon task is always dynamically allocated in ESP-IDF. Therefore `vApplicationGetTimerTaskMemory` does not need to be defined when using statically allocated timers in ESP-IDF FreeRTOS.

3) The Thread Local Storage Pointer feature has been modified in ESP-IDF FreeRTOS to include Deletion Callbacks (see Thread Local Storage Pointers & Deletion Callbacks). Therefore the function `vTaskSetThreadLocalStoragePointerAndDelCallback()` can also be called.

4.15.3 Tasks and Task Creation

Tasks in ESP-IDF FreeRTOS are designed to run on a particular core, therefore two new task creation functions have been added to ESP-IDF FreeRTOS by appending PinnedToCore to the names of the task creation functions in vanilla FreeRTOS. The vanilla FreeRTOS functions of `xTaskCreate()` and `xTaskCreateStatic()` have led to the addition of `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS (see Backported Features).

For more details see freertos/tasks.c
Chapter 4. API Guides

The ESP-IDF FreeRTOS task creation functions are nearly identical to their vanilla counterparts with the exception of the extra parameter known as xCoreID. This parameter specifies the core on which the task should run on and can be one of the following values:

- 0 pins the task to PRO_CPU
- 1 pins the task to APP_CPU
- tskNO_AFFINITY allows the task to be run on both CPUs

For example, `xTaskCreatePinnedToCore(tsk_callback, “APP_CPU Task”, 1000, NULL, 10, NULL, 1)` creates a task of priority 10 that is pinned to APP_CPU with a stack size of 1000 bytes. It should be noted that the uxStackDepth parameter in vanilla FreeRTOS specifies a task’s stack depth in terms of the number of words, whereas ESP-IDF FreeRTOS specifies the stack depth in terms of bytes.

Note that the vanilla FreeRTOS functions `xTaskCreate()` and `xTaskCreateStatic()` have been defined in ESP-IDF FreeRTOS as inline functions which call `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` respectively with tskNO_AFFINITY as the xCoreID value.

Each Task Control Block (TCB) in ESP-IDF stores the xCoreID as a member. Hence when each core calls the scheduler to select a task to run, the xCoreID member will allow the scheduler to determine if a given task is permitted to run on the core that called it.

### 4.15.4 Scheduling

The vanilla FreeRTOS implements scheduling in the `vTaskSwitchContext()` function. This function is responsible for selecting the highest priority task to run from a list of tasks in the Ready state known as the Ready Tasks List (described in the next section). In ESP-IDF FreeRTOS, each core will call `vTaskSwitchContext()` independently to select a task to run from the Ready Tasks List which is shared between both cores. There are several differences in scheduling behavior between vanilla and ESP-IDF FreeRTOS such as differences in Round Robin scheduling, scheduler suspension, and tick interrupt synchronicity.

#### Round Robin Scheduling

Given multiple tasks in the Ready state and of the same priority, vanilla FreeRTOS implements Round Robin scheduling between each task. This will result in running those tasks in turn each time the scheduler is called (e.g. every tick interrupt). On the other hand, the ESP-IDF FreeRTOS scheduler may skip tasks when Round Robin scheduling multiple Ready state tasks of the same priority.

The issue of skipping tasks during Round Robin scheduling arises from the way the Ready Tasks List is implemented in FreeRTOS. In vanilla FreeRTOS, `pxReadyTasksList` is used to store a list of tasks that are in the Ready state. The list is implemented as an array of length `configMAX_PRIORITIES` where each element of the array is a linked list. Each linked list is of type `List_t` and contains TCBs of tasks of the same priority that are in the Ready state. The following diagram illustrates the `pxReadyTasksList` structure.

Each linked list also contains a `pxIndex` which points to the last TCB returned when the list was queried. This index allows the `vTaskSwitchContext()` to start traversing the list at the TCB immediately after `pxIndex` hence implementing Round Robin Scheduling between tasks of the same priority.

In ESP-IDF FreeRTOS, the Ready Tasks List is shared between cores hence `pxReadyTasksList` will contain tasks pinned to different cores. When a core calls the scheduler, it is able to look at the xCoreID member of each TCB in the list to determine if a task is allowed to run on calling the core. The ESP-IDF FreeRTOS `pxReadyTasksList` is illustrated below.

Therefore when PRO_CPU calls the scheduler, it will only consider the tasks in blue or purple. Whereas when APP_CPU calls the scheduler, it will only consider the tasks in orange or purple.

Although each TCB has an xCoreID in ESP-IDF FreeRTOS, the linked list of each priority only has a single `pxIndex`. Therefore when the scheduler is called from a particular core and traverses the linked list, it will skip all TCBs pinned to the other core and point the `pxIndex` at the selected task. If the other core then calls the scheduler, it will traverse the linked list starting at the TCB immediately after `pxIndex`. Therefore, TCBs skipped on the previous scheduler call from the other core would not be considered on the current scheduler call. This issue is demonstrated in the following illustration.
Fig. 33: Illustration of FreeRTOS Ready Task List Data Structure

Fig. 34: Illustration of FreeRTOS Ready Task List Data Structure in ESP-IDF

Fig. 35: Illustration of pxIndex behavior in ESP-IDF FreeRTOS
Referring to the illustration above, assume that priority 9 is the highest priority, and none of the tasks in priority 9 will block hence will always be either in the running or Ready state.

1) **PRO_CPU** calls the scheduler and selects Task A to run, hence moves pxIndex to point to Task A

2) **APP_CPU** calls the scheduler and starts traversing from the task after pxIndex which is Task B. However Task B is not selected to run as it is not pinned to **APP_CPU** hence it is skipped and Task C is selected instead. pxIndex now points to Task C

3) **PRO_CPU** calls the scheduler and starts traversing from Task D. It skips Task D and selects Task E to run and points pxIndex to Task E. Notice that Task B isn’t traversed because it was skipped the last time **APP_CPU** called the scheduler to traverse the list.

4) The same situation with Task D will occur if **APP_CPU** calls the scheduler again as pxIndex now points to Task E

One solution to the issue of task skipping is to ensure that every task will enter a blocked state so that they are removed from the Ready Task List. Another solution is to distribute tasks across multiple priorities such that a given priority will not be assigned multiple tasks that are pinned to different cores.

**Scheduler Suspension**

In vanilla FreeRTOS, suspending the scheduler via `vTaskSuspendAll()` will prevent calls of `vTaskSwitchContext()` from context switching until the scheduler has been resumed with `xTaskResumeAll()`. However servicing ISRs are still permitted. Therefore any changes in task states as a result from the current running task or ISRs will not be executed until the scheduler is resumed. Scheduler suspension in vanilla FreeRTOS is a common protection method against simultaneous access of data shared between tasks, whilst still allowing ISRs to be serviced.

In ESP-IDF FreeRTOS, `xTaskSuspendAll()` will only prevent calls of `vTaskSwitchContext()` from switching contexts on the core that called for the suspension. Hence if **PRO_CPU** calls `vTaskSuspendAll()`, **APP_CPU** will still be able to switch contexts. If data is shared between tasks that are pinned to different cores, scheduler suspension is **NOT** a valid method of protection against simultaneous access. Consider using critical sections (disables interrupts) or semaphores (does not disable interrupts) instead when protecting shared resources in ESP-IDF FreeRTOS.

In general, it’s better to use other RTOS primitives like mutex semaphores to protect against data shared between tasks, rather than `vTaskSuspendAll()`.

**Tick Interrupt Synchronicity**

In ESP-IDF FreeRTOS, tasks on different cores that unblock on the same tick count might not run at exactly the same time due to the scheduler calls from each core being independent, and the tick interrupts to each core being unsynchronized.

In vanilla FreeRTOS the tick interrupt triggers a call to `xTaskIncrementTick()` which is responsible for incrementing the tick counter, checking if tasks which have called `vTaskDelay()` have fulfilled their delay period, and moving those tasks from the Delayed Task List to the Ready Task List. The tick interrupt will then call the scheduler if a context switch is necessary.

In ESP-IDF FreeRTOS, delayed tasks are unblocked with reference to the tick interrupt on **PRO_CPU** as **PRO_CPU** is responsible for incrementing the shared tick count. However tick interrupts to each core might not be synchronized (same frequency but out of phase) hence when **PRO_CPU** receives a tick interrupt, **APP_CPU** might not have received it yet. Therefore if multiple tasks of the same priority are unblocked on the same tick count, the task pinned to **PRO_CPU** will run immediately whereas the task pinned to **APP_CPU** must wait until **APP_CPU** receives its out of sync tick interrupt. Upon receiving the tick interrupt, **APP_CPU** will then call for a context switch and finally switches contexts to the newly unblocked task.

Therefore, task delays should **NOT** be used as a method of synchronization between tasks in ESP-IDF FreeRTOS. Instead, consider using a counting semaphore to unblock multiple tasks at the same time.
4.15.5 Critical Sections & Disabling Interrupts

Vanilla FreeRTOS implements critical sections in `vTaskEnterCritical` which disables the scheduler and calls `portDISABLE_INTERRUPTS`. This prevents context switches and servicing of ISRs during a critical section. Therefore, critical sections are used as a valid protection method against simultaneous access in vanilla FreeRTOS.

For this reason, ESP-IDF FreeRTOS implements critical sections using special mutexes, referred by `portMUX_Type` objects on top of specific spinlock component and calls to enter or exit a critical must provide a spinlock object that is associated with a shared resource requiring access protection. When entering a critical section in ESP-IDF FreeRTOS, the calling core will disable its scheduler and interrupts similar to the vanilla FreeRTOS implementation. However, the calling core will also take the locks whilst the other core is left unaffected during the critical section. If the other core attempts to take the spinlock, it will spin until the lock is released. Therefore, the ESP-IDF FreeRTOS implementation of critical sections allows a core to have protected access to a shared resource without disabling the other core. The other core will only be affected if it tries to concurrently access the same resource.

The ESP-IDF FreeRTOS critical section functions have been modified as follows:

- `taskENTER_CRITICAL(mux)`, `taskENTER_CRITICAL_ISR(mux)`, `portENTER_CRITICAL(mux)`, `portENTER_CRITICAL_ISR(mux)` are all macro defined to call `vTaskEnterCritical()`.
- `taskEXIT_CRITICAL(mux)`, `taskEXIT_CRITICAL_ISR(mux)`, `portEXIT_CRITICAL(mux)`, `portEXIT_CRITICAL_ISR(mux)` are all macro defined to call `vTaskExitCritical()`.
- `portENTER_CRITICAL_SAFE(mux)`, `portEXIT_CRITICAL_SAFE(mux)` macro identifies the context of execution, i.e ISR or Non-ISR, and calls appropriate critical section functions (`port_*CRITICAL` in Non-ISR and `port_*CRITICAL_ISR` in ISR) in order to be in compliance with Vanilla FreeRTOS.

For more details see `soc/include/soc/spinlock.h` and `freertos/tasks.c`

It should be noted that when modifying vanilla FreeRTOS code to be ESP-IDF FreeRTOS compatible, it is trivial to modify the type of critical section called as they are all defined to call the same function. As long as the same spinlock is provided upon entering and exiting, the type of call should not matter.

4.15.6 Floating Point Arithmetic

ESP-IDF FreeRTOS implements Lazy Context Switching for FPUs. In other words, the state of a core’s FPU registers are not immediately saved when a context switch occurs. Therefore, tasks that utilize `float` must be pinned to a particular core upon creation. If not, ESP-IDF FreeRTOS will automatically pin the task in question to whichever core the task was running on upon the task’s first use of `float`. Likewise due to Lazy Context Switching, only interrupt service routines of lowest priority (that is it the Level 1) can use `float`, higher priority interrupts do not support FPU usage.

ESP32 does not support hardware acceleration for double precision floating point arithmetic (`double`). Instead `double` is implemented via software hence the behavioral restrictions with regards to `float` do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations may consume significantly larger amount of CPU time in comparison to `float`.

4.15.7 Task Deletion

FreeRTOS task deletion prior to v9.0.0 delegated the freeing of task memory entirely to the Idle Task. Currently, the freeing of task memory will occur immediately (within `vTaskDelete()` if the task being deleted is not currently running or is not pinned to the other core (with respect to the core `vTaskDelete()` is called on). TLSP deletion callbacks will also run immediately if the same conditions are met.

However, calling `vTaskDelete()` to delete a task that is either currently running or pinned to the other core will still result in the freeing of memory being delegated to the Idle Task.
4.15.8 Thread Local Storage Pointers & Deletion Callbacks

Thread Local Storage Pointers (TLSP) are pointers stored directly in the TCB. TLSP allow each task to have its own unique set of pointers to data structures. However task deletion behavior in vanilla FreeRTOS does not automatically free the memory pointed to by TLSP. Therefore if the memory pointed to by TLSP is not explicitly freed by the user before task deletion, memory leak will occur.

ESP-IDF FreeRTOS provides the added feature of Deletion Callbacks. Deletion Callbacks are called automatically during task deletion to free memory pointed to by TLSP. Each TLSP can have its own Deletion Callback. Note that due to the to Task Deletion behavior, there can be instances where Deletion Callbacks are called in the context of the Idle Tasks. Therefore Deletion Callbacks should never attempt to block and critical sections should be kept as short as possible to minimize priority inversion.

Deletion callbacks are of type `void (*TlsDeleteCallbackFunction_t)( int, void * )` where the first parameter is the index number of the associated TLSP, and the second parameter is the TLSP itself.

Deletion callbacks are set alongside TLSP by calling `vTaskSetThreadLocalStoragePointerAndDeleteCallback()`. Calling the vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP’s associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion. If a deletion callback is `NULL`, users should manually free the memory pointed to by the associated TLSP before task deletion in order to avoid memory leak.

`CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` in menuconfig can be used to configure the number of TLSP and Deletion Callbacks a TCB will have.

For more details see FreeRTOS API reference.

4.15.9 Configuring ESP-IDF FreeRTOS

The ESP-IDF FreeRTOS can be configured in the project configuration menu (`idf.py menuconfig`) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see FreeRTOS.

`CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` will define the number of Thread Local Storage Pointers each task will have in ESP-IDF FreeRTOS.

`CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION` will enable the backported functionality of `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS.

`CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION` will trigger a halt in particular functions in ESP-IDF FreeRTOS which have not been fully tested in an SMP context.

`CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER` will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

4.16 General Notes About ESP-IDF Programming

4.16.1 Application startup flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. First-stage bootloader in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. Second-stage bootloader loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. Main app image executes. At this point the second CPU and RTOS scheduler can be started. This process is explained in detail in the following sections.

First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located at address 0x40000400 in the mask ROM of the ESP32 chip and can not be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrappin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.

2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if UART or SDIO download mode is requested. If this is the case, configure UART or SDIO, and wait for code to be downloaded. Otherwise, proceed with boot as if it was due to software CPU reset.

3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs. If loading code from flash fails, unpack BASIC interpreter into the RAM and start it. Note that RTC watchdog is still enabled when this happens, so unless any input is received by the interpreter, watchdog will reset the SOC in a few hundred milliseconds, repeating the whole process. If the interpreter receives any input from the UART, it disables the watchdog.

Application binary image is loaded from flash starting at address 0x1000. First 4kB sector of flash is used to store secure boot IV and signature of the application image. Please check secure boot documentation for details about this.

Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in components/bootloader directory of ESP-IDF. Note that this arrangement is not the only one possible with the ESP32 chip. It is possible to write a fully featured application which would work when flashed to offset 0x1000, but this is out of scope of this document. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found at offset 0x8000. See partition tables documentation for more information. The bootloader finds factory and OTA partitions, and decides which one to boot based on data found in OTA info partition.

For the selected partition, second stage bootloader copies data and code sections which are mapped into IRAM and DRAM to their load addresses. For sections which have load addresses in DROM and IROM regions, flash MMU is configured to provide the correct mapping. Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application. Once code is loaded and flash MMU is set up, second stage bootloader jumps to the application entry point found in the binary image header.

Currently it is not possible to add application-defined hooks to the bootloader to customize application partition selection logic. This may be required to load different application image depending on a state of a GPIO, for example. Such customization features will be added to ESP-IDF in the future. For now, bootloader can be customized by
copying bootloader component into application directory and making necessary changes there. ESP-IDF build system will compile the component in application directory instead of ESP-IDF components directory in this case.

Application startup

ESP-IDF application entry point is `call_start_cpu0` function found in `components/esp32/cpu_start.c`. Two main things this function does are to enable heap allocator and to make APP CPU jump to its entry point, `call_start_cpu1`. The code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, PRO CPU jumps to `start_cpu0` function, and APP CPU jumps to `start_cpu1` function.

Both `start_cpu0` and `start_cpu1` are weak functions, meaning that they can be overridden in the application, if some application-specific change to initialization sequence is needed. Default implementation of `start_cpu0` enables or initializes components depending on choices made in `menuconfig`. Please see source code of this function in `components/esp32/cpu_start.c` for an up to date list of steps performed. Note that any C++ global constructors present in the application will be called at this stage. Once all essential components are initialized, main task is created and FreeRTOS scheduler is started.

While PRO CPU does initialization in `start_cpu0` function, APP CPU spins in `start_cpu1` function, waiting for the scheduler to be started on the PRO CPU. Once the scheduler is started on the PRO CPU, code on the APP CPU starts the scheduler as well.

Main task is the task which runs `app_main` function. Main task stack size and priority can be configured in `menuconfig`. Application can use this task for initial application-specific setup, for example to launch other tasks. Application can also use main task for event loops and other general purpose activities. If `app_main` function returns, main task is deleted.

4.16.2 Application memory layout

ESP32 chip has flexible memory mapping features. This section describes how ESP-IDF uses these features by default.

Application code in ESP-IDF can be placed into one of the following memory regions.

IRAM (instruction RAM)

ESP-IDF allocates part of Internal SRAM0 region (defined in the Technical Reference Manual) for instruction RAM. Except for the first 64 kB block which is used for PRO and APP CPU caches, the rest of this memory range (i.e. from 0x40080000 to 0x400A0000) is used to store parts of application which need to run from RAM.

A few components of ESP-IDF and parts of WiFi stack are placed into this region using the linker script.

If some application code needs to be placed into IRAM, it can be done using `IRAM_ATTR` define:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

Here are the cases when parts of application may or should be placed into IRAM.

- Interrupt handlers must be placed into IRAM if `ESP_INTR_FLAG_IRAM` is used when registering the interrupt handler. In this case, ISR may only call functions placed into IRAM or functions present in ROM. Note 1: all FreeRTOS APIs are currently placed into IRAM, so are safe to call from interrupt handlers. If the ISR is placed into IRAM, all constant data used by the ISR and functions called from ISR (including, but not limited to, const char arrays), must be placed into DRAM using `DRAM_ATTR`.
**API Guides**

- Some timing critical code may be placed into IRAM to reduce the penalty associated with loading the code from flash. ESP32 reads code and data from flash via a 32 kB cache. In some cases, placing a function into IRAM may reduce delays caused by a cache miss.

**IROM (code executed from Flash)**

If a function is not explicitly placed into IRAM or RTC memory, it is placed into flash. The mechanism by which Flash MMU is used to allow code execution from flash is described in the Technical Reference Manual. ESP-IDF places the code which should be executed from flash starting from the beginning of 0x400D0000 — 0x40400000 region. Upon startup, second stage bootloader initializes Flash MMU to map the location in flash where code is located into the beginning of this region. Access to this region is transparently cached using two 32kB blocks in 0x40070000 — 0x40080000 range.

Note that the code outside 0x40000000 — 0x40400000 region may not be reachable with Window ABI CALLx instructions, so special care is required if 0x40400000 — 0x40800000 or 0x40800000 — 0x40C00000 regions are used by the application. ESP-IDF doesn’t use these regions by default.

**RTC fast memory**

The code which has to run after wake-up from deep sleep mode has to be placed into RTC memory. Please check detailed description in deep sleep documentation.

**DRAM (data RAM)**

Non-constant static data and zero-initialized data is placed by the linker into the 256 kB 0x3FFB0000 — 0x3FFF0000 region. Note that this region is reduced by 64kB (by shifting start address to 0x3FFC0000) if Bluetooth stack is used. Length of this region is also reduced by 16 kB or 32kB if trace memory is used. All space which is left in this region after placing static data there is used for the runtime heap.

Constant data may also be placed into DRAM, for example if it is used in an ISR (see notes in IRAM section above). To do that, **DRAM_ATTR** define can be used:

```c
DRAM_ATTR const char[] format_string = "%p %x";
char buffer[64];
sprintf(buffer, format_string, ptr, val);
```

Needless to say, it is not advised to use printf and other output functions in ISRs. For debugging purposes, use **ESP_EARLY_LOGx** macros when logging from ISRs. Make sure that both **TAG** and format string are placed into **DRAM** in that case.

The macro **__NOINIT_ATTR** can be used as attribute to place data into .noinit section. The values placed into this section will not be initialized at startup and keep its value after software restart.

Example:

```c
__NOINIT_ATTR uint32_t noinit_data;
```

**DROM (data stored in Flash)**

By default, constant data is placed by the linker into a 4 MB region (0x3F400000 — 0x3F800000) which is used to access external flash memory via Flash MMU and cache. Exceptions to this are literal constants which are embedded by the compiler into application code.
**RTC slow memory**

Global and static variables used by code which runs from RTC memory (i.e. deep sleep stub code) must be placed into RTC slow memory. Please check detailed description in deep sleep documentation.

The attribute macro named \texttt{RTC\_NOINIT\_ATTR} can be used to place data into this type of memory. The values placed into this section keep their value after waking from deep sleep.

Example:

\begin{verbatim}
RTC\_NOINIT\_ATTR uint32_t rtc_noinit_data;
\end{verbatim}

**4.16.3 DMA Capable Requirement**

Most DMA controllers (e.g. SPI, sdmmc, etc.) have requirements that sending/receiving buffers should be placed in DRAM and word-aligned. We suggest to place DMA buffers in static variables rather than in the stack. Use macro \texttt{DMA\_ATTR} to declare global/local static variables like:

\begin{verbatim}
DMA\_ATTR uint8_t buffer[]="I want to send something";
void app_main()
{
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // other stuff
}
\end{verbatim}

Or:

\begin{verbatim}
void app_main()
{
    DMA\_ATTR static uint8_t buffer[]="I want to send something";
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // other stuff
}
\end{verbatim}

Placing DMA buffers in the stack is still allowed, though you have to keep in mind:

1. Never try to do this if the stack is in the pSRAM. If the stack of a task is placed in the pSRAM, several steps have to be taken as described in \textit{Support for external RAM} (at least SPI\_RAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY option enabled in the menuconfig). Make sure your task is not in the pSRAM.
2. Use macro \texttt{WORD\_ALIGNED\_ATTR} in functions before variables to place them in proper positions like:

\begin{verbatim}
void app_main()
{
    uint8_t stuff;
    WORD\_ALIGNED\_ATTR uint8_t buffer[]="I want to send something";  // or the...
    // buffer will be placed right after stuff.
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
    }
}
\end{verbatim}

(continues on next page)
Chapter 4. API Guides

4.17 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 8 levels, plus an assortment of exceptions. On the ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the interrupt allocator. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, allowing for very low interrupt latencies.

### 4.17.1 Interrupt Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Symbol</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>Exception and level 0 interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>2-3</td>
<td>N/A</td>
<td>Medium level interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>4</td>
<td>xt_highint4</td>
<td>Normally used by ESP-IDF debug logic</td>
</tr>
<tr>
<td>5</td>
<td>xt_highint5</td>
<td>Free to use</td>
</tr>
<tr>
<td>NMI</td>
<td>xt_nmi</td>
<td>Free to use</td>
</tr>
<tr>
<td>dbg</td>
<td>xt_debugexception</td>
<td>Debug exception. Called on e.g. a BREAK instruction.</td>
</tr>
</tbody>
</table>

Using these symbols is done by creating an assembly file (suffix .S) and defining the named symbols, like this:

```assembly
.section .iram1,"ax"
.global xt_highint5
.type xt_highint5, @function
.align 4
xt_highint5:
... your code here
rsr a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the `esp32/dport_panic_highint_hdl.S` file; the panic handler interrupt is implemented there.

### 4.17.2 Notes

- Do not call C code from a high-level interrupt; because these interrupts still run in critical sections, this can cause crashes. (The panic handler interrupt does call normal C code, but this is OK because there is no intention of returning to the normal code flow afterwards.)
- Make sure your assembly code gets linked in. If the interrupt handler symbol is the only symbol the rest of the code uses from this file, the linker will take the default ISR instead and not link the assembly file into the final project. To get around this, in the assembly file, define a symbol, like this:

```assembly
.global ld_include_my_isr_file
ld_include_my_isr_file:
```

(The symbol is called `ld_include_my_isr_file` here but can have any arbitrary name not defined anywhere else.) Then, in the component.mk, add this file as an unresolved symbol to the ld command line arguments:
This should cause the linker to always include a file defining \texttt{ld\_include\_my\_isr\_file}, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using \texttt{esp\_intr\_alloc} and associated functions. The handler and handler arguments to \texttt{esp\_intr\_alloc} must be \texttt{NULL}, however.
- In theory, medium priority interrupts could also be handled in this way. For now, ESP-IDF does not support this.

### 4.18 JTAG Debugging

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB. The document is structured as follows:

**Introduction** Introduction to the purpose of this guide.

**How it Works?** Description how ESP32, JTAG interface, OpenOCD and GDB are interconnected and working together to enable debugging of ESP32.

**Selecting JTAG Adapter** What are the criteria and options to select JTAG adapter hardware.

**Setup of OpenOCD** Procedure to install OpenOCD and verify that it is installed.

**Configuring ESP32 Target** Configuration of OpenOCD software and set up JTAG adapter hardware that will make together a debugging target.

**Launching Debugger** Steps to start up a debug session with GDB from \textit{Eclipse} and from \textit{Command Line}.

**Debugging Examples** If you are not familiar with GDB, check this section for debugging examples provided from \textit{Eclipse} as well as from \textit{Command Line}.

**Building OpenOCD from Sources** Procedure to build OpenOCD from sources for \textit{Windows}, \textit{Linux} and \textit{MacOS} operating systems.

**Tips and Quirks** This section provides collection of tips and quirks related JTAG debugging of ESP32 with OpenOCD and GDB.

#### 4.18.1 Introduction

Espressif has ported OpenOCD to support the ESP32 processor and the multicore FreeRTOS, which will be the foundation of most ESP32 apps, and has written some tools to help with features OpenOCD does not support natively.

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB under Linux, Windows and MacOS. Except for OS specific installation procedures, the s/w user interface and use procedures are the same across all supported operating systems.

\textbf{Note:} Screenshots presented in this document have been made for Eclipse Neon 3 running on Ubuntu 16.04 LTE. There may be some small differences in what a particular user interface looks like, depending on whether you are using Windows, MacOS or Linux and / or a different release of Eclipse.

#### 4.18.2 How it Works?

The key software and hardware to perform debugging of ESP32 with OpenOCD over JTAG (Joint Test Action Group) interface is presented below and includes xtensa-esp32-elf-gdb debugger, OpenOCD on chip debugger and JTAG adapter connected to ESP32 target.

Under “Application Loading and Monitoring” there is another software and hardware to compile, build and flash application to ESP32, as well as to provide means to monitor diagnostic messages from ESP32.

Debugging using JTAG and application loading / monitoring is integrated under the \textit{Eclipse} environment, to provide quick and easy transition from writing, compiling and loading the code to debugging, back to writing the code, and so on. All the software is available for Windows, Linux and MacOS platforms.
Depending on user preferences, both debugger and idf.py build can be operated directly from terminal/command line, instead from Eclipse.

### 4.18.3 Selecting JTAG Adapter

The quickest and most convenient way to start with JTAG debugging is by using ESP-WROVER-KIT. Each version of this development board has JTAG interface already built in. No need for an external JTAG adapter and extra wiring / cable to connect JTAG to ESP32. WROVER KIT is using FT2232H JTAG interface operating at 20 MHz clock speed, which is difficult to achieve with an external adapter.

If you decide to use separate JTAG adapter, look for one that is compatible with both the voltage levels on the ESP32 as well as with the OpenOCD software. The JTAG port on the ESP32 is an industry-standard JTAG port which lacks (and does not need) the TRST pin. The JTAG I/O pins all are powered from the VDD_3P3_RTC pin (which normally would be powered by a 3.3 V rail) so the JTAG adapter needs to be able to work with JTAG pins in that voltage range.

On the software side, OpenOCD supports a fair amount of JTAG adapters. See [http://openocd.org/doc/html/Debug-Adapter-Hardware.html](http://openocd.org/doc/html/Debug-Adapter-Hardware.html) for an (unfortunately slightly incomplete) list of the adapters OpenOCD works with. This page lists SWD-compatible adapters as well; take note that the ESP32 does not support SWD. JTAG adapters that are hardcoded to a specific product line, e.g. ST-LINK debugging adapters for STM32 families, will not work.

The minimal signalling to get a working JTAG connection are TDI, TDO, TCK, TMS and GND. Some JTAG debuggers also need a connection from the ESP32 power line to a line called e.g. Vtart to set the working voltage. SRST can optionally be connected to the CH_PD of the ESP32, although for now, support in OpenOCD for that line is pretty minimal.

### 4.18.4 Setup of OpenOCD

If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then OpenOCD is already installed. After setting up the environment in your terminal, you should be able to run OpenOCD. Check this by executing the following command:

```
openocd --version
```

The output should be as follows (although the version may be more recent than listed here):
You may also verify that OpenOCD knows where its configuration scripts are located by printing the value of OPENOCD_SCRIPTS environment variable, by typing echo $OPENOCD_SCRIPTS (for Linux and macOS) or echo %OPENOCD_SCRIPTS% (for Windows). If a valid path is printed, then OpenOCD is set up correctly.

If any of these steps do not work, please go back to the setting up the tools section of the Getting Started Guide.

**Note:** It is also possible to build OpenOCD from source. Please refer to Building OpenOCD from Sources section for details.

### 4.18.5 Configuring ESP32 Target

Once OpenOCD is installed, move to configuring ESP32 target (i.e ESP32 board with JTAG interface). You will do it in the following three steps:

- Configure and connect JTAG interface
- Run OpenOCD
- Upload application for debugging

#### Configure and connect JTAG interface

This step depends on JTAG and ESP32 board you are using - see the two cases described below.

**Configure WROVER JTAG Interface** All versions of ESP-WROVER-KIT boards have built-in JTAG functionality. Putting it to work requires setting jumpers to enable JTAG functionality, setting SPI flash voltage and configuring USB drivers. Please refer to step by step instructions below.

**Configure Hardware**

1. Enable on-board JTAG functionality by setting JP8 according to ESP-WROVER-KIT V4.1 Getting Started Guide, Section Setup Options.
2. Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation:

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 CHIP PU</td>
<td>TRST N</td>
</tr>
<tr>
<td>2 MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>3 MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>4 MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>5 MTMS / GPIO14</td>
<td>TMS</td>
</tr>
</tbody>
</table>

**Configure USB Drivers** Install and configure USB drivers, so OpenOCD is able to communicate with JTAG interface on ESP-WROVER-KIT board as well as with UART interface used to upload application for flash. Follow steps below specific to your operating system.

**Note:** ESP-WROVER-KIT uses an FT2232 adapter. The following instructions can also be used for other FT2232 based JTAG adapters.
**Windows**

1. Using standard USB A / micro USB B cable connect ESP-WROVER-KIT to the computer. Switch the WROVER KIT on.
2. Wait until USB ports of WROVER KIT are recognized by Windows and drives are installed. If they do not install automatically, then download them from [https://www.ftdichip.com/Drivers/D2XX.htm](https://www.ftdichip.com/Drivers/D2XX.htm) and install manually.
3. Download Zadig tool (Zadig_X.X.exe) from [https://zadig.akeo.ie/](https://zadig.akeo.ie/) and run it.
4. In Zadig tool go to “Options” and check “List All Devices”.
5. Check the list of devices that should contain two WROVER specific USB entries: “Dual RS232-HS (Interface 0)” and “Dual RS232-HS (Interface 1)”. The driver name would be “FTDIBUS (vxxxx)” and USB ID: 0403 6010.

![Configuration of JTAG USB driver in Zadig tool](image)

6. The first device (Dual RS232-HS (Interface 0)) is connected to the JTAG port of the ESP32. Original “FTDIBUS (vxxxx)” driver of this device should be replaced with “WinUSB (v6xxxxx)”. To do so, select “Dual RS232-HS (Interface 0) and reinstall attached driver to the “WinUSB (v6xxxxx)” , see picture above.

**Note:** Do not change the second device “Dual RS232-HS (Interface 1)”. It is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section *Run OpenOCD*.

**Linux**

2. Open a terminal, enter `ls -l /dev/ttyUSB*` command and check, if board’s USB ports are recognized by the OS. You are looking for similar result:

```bash
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
```

3. Following section “Permissions delegation” in OpenOCD’s README, set up the access permissions to both USB ports.
4. Log off and login, then cycle the power to the board to make the changes effective. In terminal enter again `ls -l /dev/ttyUSB*` command to verify, if group-owner has changed from dialout to plugdev:
If you see similar result and you are a member of plugdev group, then the setup is complete. The `/dev/ttyUSBn` interface with lower number is used for JTAG communication. The other interface is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section Run OpenOCD.

**MacOS** On macOS, using FT2232 for JTAG and serial port at the same time needs some additional steps. When the OS loads FTDI serial port driver, it does so for both channels of FT2232 chip. However only one of these channels is used as a serial port, while the other is used as JTAG. If the OS has loaded FTDI serial port driver for the channel used for JTAG, OpenOCD will not be able to connect to the chip. There are two ways around this:

1. Manually unload the FTDI serial port driver before starting OpenOCD, start OpenOCD, then load the serial port driver.
2. Modify FTDI driver configuration so that it doesn’t load itself for channel B of FT2232 chip, which is the channel used for JTAG on WROVER KIT.

**Manually unloading the driver**

1. Install FTDI driver from [https://www.ftdichip.com/Drivers/VCP.htm](https://www.ftdichip.com/Drivers/VCP.htm)
2. Connect USB cable to the WROVER KIT.
3. Unload the serial port driver:
   ```sh
sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
   ```
   In some cases you may need to unload Apple’s FTDI driver as well:
   ```sh
sudo kextunload -b com.apple.driver.AppleUSBFTDI
   ```
4. Run OpenOCD:
   ```sh
bin/openocd -f board/esp32-wrover-kit-3.3v.cfg
   ```
5. In another terminal window, load FTDI serial port driver again:
   ```sh
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
   ```

**Note:** If you need to restart OpenOCD, there is no need to unload FTDI driver again — just stop OpenOCD and start it again. The driver only needs to be unloaded if WROVER KIT was reconnected or power was toggled.

This procedure can be wrapped into a shell script, if desired.

**Modifying FTDI driver** In a nutshell, this approach requires modification to FTDI driver configuration file, which prevents the driver from being loaded for channel B of FT2232H.

**Note:** Other boards may use channel A for JTAG, so use this option with caution.

**Warning:** This approach also needs signature verification of drivers to be disabled, so may not be acceptable for all users.

1. Open FTDI driver configuration file using a text editor (note `sudo`):
2. Find and delete the following lines:

   <key>FT2232H_B</key>
   <dict>
     <key>CFBundleIdentifier</key>
     <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
     <key>IOClass</key>
     <string>FTDIUSBSerialDriver</string>
     <key>IOProviderClass</key>
     <string>IOUSBInterface</string>
     <key>bConfigurationValue</key>
     <integer>1</integer>
     <key>bInterfaceNumber</key>
     <integer>1</integer>
     <key>bcdDevice</key>
     <integer>1792</integer>
     <key>idProduct</key>
     <integer>24592</integer>
     <key>idVendor</key>
     <integer>1027</integer>
   </dict>

3. Save and close the file.

4. Disable driver signature verification:
   1. Open Apple logo menu, choose “Restart...”
   2. When you hear the chime after reboot, press CMD+R immediately
   3. Once Recovery mode starts up, open Terminal
   4. Run the command:

   ```bash
csrutil enable --without kext
   ```

5. Restart again

After these steps, serial port and JTAG can be used at the same time.

To carry on with debugging environment setup, proceed to section Run OpenOCD.

**Configure Other JTAG Interface** Refer to section Selecting JTAG Adapter for guidance what JTAG interface to select, so it is able to operate with OpenOCD and ESP32. Then follow three configuration steps below to get it working.

**Configure Hardware**

1. Identify all pins / signals on JTAG interface and ESP32 board, that should be connected to establish communication.
2. Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation.
3. Connect identified pin / signals of ESP32 and JTAG interface.

**Configure Drivers** You may need to install driver s/w to make JTAG work with computer. Refer to documentation of JTAG adapter, that should provide related details.

**Connect** Connect JTAG interface to the computer. Power on ESP32 and JTAG interface boards. Check if JTAG interface is visible by computer.

To carry on with debugging environment setup, proceed to section Run OpenOCD.
Run OpenOCD

Once target is configured and connected to computer, you are ready to launch OpenOCD.

Open a terminal and set it up for using the ESP-IDF as described in the setting up the environment section of the Getting Started Guide. Then run OpenOCD (this command works on Windows, Linux, and macOS):

```plaintext
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

**Note:** The files provided after `-f` above are specific for ESP-WROVER-KIT with esp32-wroom-32 module. You may need to provide different files depending on used hardware. For guidance see Configuration of OpenOCD for specific target.

You should now see similar output (this log is for ESP-WROVER-KIT):

```plaintext
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32-wrover-kit-3.3v.cfg
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
http://openocd.org/doc/doxygen/bugs.html
none separate
adapter speed: 20000 kHz
force hard breakpoints
Info : ftdi: if you experience problems at higher adapter clocks, try the command
"ftdi_tdo_sample_edge falling"
Info : clock speed 20000 kHz
Info : JTAG tap: esp32.cpu0 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
part: 0x2003, ver: 0x1)
Info : JTAG tap: esp32.cpu1 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
part: 0x2003, ver: 0x1)
Info : esp32: Debug controller was reset (pwrstat=0x5F, after clear 0x0F).
Info : esp32: Core was reset (pwrstat=0x5F, after clear 0x0F).
```

- If there is an error indicating permission problems, please see the “Permissions delegation” bit in the OpenOCD README file in ~/esp/openocd-esp32 directory.
- In case there is an error finding configuration files, e.g. Can't find board/esp32-wrover-kit-3.3v.cfg, check the path after `-s`. This path is used by OpenOCD to look for the files specified after `-f`. Also check if the file is indeed under provided path.
- If you see JTAG errors (all ones/all zeroes) please check your connections, whether no other signals are connected to JTAG besides ESP32’s pins, and see if everything is powered on.

Upload application for debugging

Build and upload your application to ESP32 as usual, see Step 8. Build the Project.

Another option is to write application image to flash using OpenOCD via JTAG with commands like this:

```plaintext
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "program_esp filename.bin 0x10000
verify exit"
```

OpenOCD flashing command program_esp has the following format:

```plaintext
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - Path to program image file.
- `offset` - Offset in flash bank to write image.
- `verify` - Optional. Verify flash contents after writing.
- `reset` - Optional. Reset target after programming.
- `exit` - Optional. Finally exit OpenOCD.

You are now ready to start application debugging. Follow steps described in section below.
Chapter 4. API Guides

4.18.6 Launching Debugger

The toolchain for ESP32 features GNU Debugger, in short GDB. It is available with other toolchain programs under filename: xtensa-esp32-elf-gdb. GDB can be called and operated directly from command line in a terminal. Another option is to call it from within IDE (like Eclipse, Visual Studio Code, etc.) and operate indirectly with help of GUI instead of typing commands in a terminal.

Both options of using debugger are discussed under links below.

- Eclipse
- Command Line

It is recommended to first check if debugger works from Command Line and then move to using Eclipse.

4.18.7 Debugging Examples

This section is intended for users not familiar with GDB. It presents example debugging session from Eclipse using simple application available under get-started/blink and covers the following debugging actions:

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting the target manually
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Similar debugging actions are provided using GDB from Command Line.

Before proceeding to examples, set up your ESP32 target and load it with get-started/blink.

4.18.8 Building OpenOCD from Sources

Please refer to separate documents listed below, that describe build process.

Building OpenOCD from Sources for Windows

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

Note: Following instructions are assumed to be runned in MSYS2 environment with MINGW32 subsystem!

Install Dependencies  Install packages that are required to compile OpenOCD:

```bash
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winpthreads-git \
p7zip
```
Download Sources of OpenOCD  The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```
$ cd ~/esp
$ git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

Downloading libusb  Build and export variables for a following OpenOCD compilation:

```
$ wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
$ 7z x -olibusb ./libusb-1.0.22.7z
$ export CPPFLAGS="$CPPFLAGS -I$(PWD)/libusb/include/libusb-1.0"
$ export LDFLAGS="$LDFLAGS -L$(PWD)/libusb/MinGW32/.libs/dll"
```

Build OpenOCD  Proceed with configuring and building OpenOCD:

```
$ cd ~/esp/openocd-esp32
$ export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"
$ export CFLAGS="$CFLAGS -Wno-error"
$ ./bootstrap
$ ./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build-i686-w64-mingw32 --host-i686-w64-mingw32
$ make
$ cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
$ cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

Optionally you can add `make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten. Also you could use `export DESTDIR="/custom/install/dir"; make install`.

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please `cd` to the openocd-esp32 directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under `OpenOCD configuration summary`.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `./openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to openocd-esp32/README.Windows.
- Don’t forget to copy `libusb-1.0.dll` and `libwinpthread-1.dll` into `OOCD_INSTALLDIR/bin` from `~/esp/openocd-esp32/src`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src` directory.

**Full Listing**  A complete described previously process is provided below for the faster execution, e.g. as a shell script:

```
$ pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-i686-cross-winpthreads-git p7zip
$ cd ~/esp
$ git clone --recursive https://github.com/espressif/openocd-esp32.git
```

(continues on next page)
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I$PWD/libusb/include/libusb-1.0"; export LDFLAGS="-L$pwd/libusb/MinGW32/.libs/dll"

export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="-SCFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build-i686-w64-mingw32 --host-i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="$PWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin

Next Steps To carry on with debugging environment setup, proceed to section Configuring ESP32 Target.

Building OpenOCD from Sources for Linux

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

Download Sources of OpenOCD The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

Install Dependencies Install packages that are required to compile OpenOCD.

Note: Install the following packages one by one, check if installation was successful and then proceed to the next package. Resolve reported problems before moving to the next step.

sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0

Note:
• Version of pkg-config should be 0.2.3 or above.
• Version of autoconf should be 2.6.4 or above.
• Version of automake should be 1.9 or above.
• When using USB-Blaster, ASIX Presto, OpenJTAG and FT2232 as adapters, drivers libFTDI and FTD2XX need to be downloaded and installed.
• When using CMSIS-DAP, HIDAPI is needed.

Build OpenOCD

Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

**Note:**

• Should an error occur, resolve it and try again until the command `make` works.
• If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
• If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
• If the information of your device is not shown in the log, use `./configure` to enable it as described in `./openocd-esp32/doc/INSTALL.txt`.
• For details concerning compiling OpenOCD, please refer to `openocd-esp32/README`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/openocd-esp32/bin` directory.

**Next Steps**

To carry on with debugging environment setup, proceed to section *Configuring ESP32 Target*.

**Building OpenOCD from Sources for MacOS**

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section *Setup of OpenOCD*.

**Download Sources of OpenOCD**

The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under [https://github.com/espressif/openocd-esp32](https://github.com/espressif/openocd-esp32). To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in `~/esp/openocd-esp32` directory.

**Install Dependencies**

Install packages that are required to compile OpenOCD using Homebrew:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

**Build OpenOCD**

Proceed with configuring and building OpenOCD:
Optional, you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

**Note:**

- Should an error occur, resolve it and try again until the command *make* works.
- If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under *OpenOCD configuration summary*.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `./openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.OSX`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src/openocd` directory.

**Next Steps** To carry on with debugging environment setup, proceed to section *Configuring ESP32 Target*.

The examples of invoking OpenOCD in this document assume using pre-built binary distribution described in section *Setup of OpenOCD*.

To use binaries build locally from sources, change the path to OpenOCD executable to `src/openocd` and set the `OPENOCD_SCRIPTS` environment variable so that OpenOCD can find the configuration files. For Linux and macOS:

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

For Windows:

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

Example of invoking OpenOCD build locally from sources, for Linux and macOS:

```
src/openocd -f board/esp32-wrover-kit-3.3v.cfg
```

and Windows:

```
src\openocd -f board\esp32-wrover-kit-3.3v.cfg
```

**4.18.9 Tips and Quirks**

This section provides collection of links to all tips and quirks referred to from various parts of this guide.

**Tips and Quirks**

This section provides collection of all tips and quirks referred to from various parts of this guide.
Breakpoints and watchpoints available  ESP32 debugger supports 2 hardware implemented breakpoints and 64 software ones. Hardware breakpoints are implemented by ESP32 chip’s logic and can be set anywhere in the code: either in flash or IRAM program’s regions. Additionally there are 2 types of software breakpoints implemented by OpenOCD: flash (up to 32) and IRAM (up to 32) breakpoints. Currently GDB can not set software breakpoints in flash. So until this limitation is removed those breakpoints have to be emulated by OpenOCD as hardware ones (see below for details). ESP32 also supports two watchpoints, so two variables can be watched for change or read by the GDB command watch myVariable. Note that menuconfig option CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK uses the 2nd watchpoint and will not provide expected results, if you also try to use it within OpenOCD / GDB. See menuconfig’s help for detailed description.

What else should I know about breakpoints?  Emulating part of hardware breakpoints using software flash ones means that the GDB command hb myFunction which is invoked for function in flash will use pure hardware breakpoint if it is available otherwise one of the 32 software flash breakpoints is used. The same rule applies to b myFunction-like commands. In this case GDB will decide what type of breakpoint to set itself. If myFunction is resided in writable region (IRAM) software IRAM breakpoint will be used otherwise hardware or software flash breakpoint is used as it is done for hb command.

Flash Mappings vs SW Flash Breakpoints  In order to set/clear software breakpoints in flash, OpenOCD needs to know their flash addresses. To accomplish conversion from the ESP32 address space to the flash one, OpenOCD uses mappings of program’s code regions resided in flash. Those mappings are kept in the image header which is prepended to program binary data (code and data segments) and is specific to every application image written to the flash. So to support software flash breakpoints OpenOCD should know where application image under debugging is resided in the flash. By default OpenOCD reads partition table at 0x8000 and uses mappings from the first found application image, but there can be the cases when it will not work, e.g. partition table is not at standard flash location or even there can be multiple images: one factory and two OTA and you may want to debug any of them. To cover all possible debugging scenarios OpenOCD supports special command which can be used to set arbitrary location of application image to debug. The command has the following format:

```bash
esp32 appimage_offset <offset>
```

Offset should be in hex format. To reset to the default behaviour you can specify -1 as offset.

**Note:** Since GDB requests memory map from OpenOCD only once when connecting to it, this command should be specified in one of the TCL configuration files, or passed to OpenOCD via its command line. In the latter case command line should look like below:

```bash
openocd -f board/esp32-wrover-kit-3.3v.cfg.cfg -c "init; halt; esp32 appimage_offset 0x210000"
```

Another option is to execute that command via OpenOCD telnet session and then connect GDB, but it seems to be less handy.

Why stepping with “next” does not bypass subroutine calls?  When stepping through the code with next command, GDB is internally setting a breakpoint (one out of two available) ahead in the code to bypass the subroutine calls. This functionality will not work, if the two available breakpoints are already set somewhere in the code. If this is the case, delete breakpoints to have one “spare”. With both breakpoints already used, stepping through the code with next command will work as like with step command and debugger will step inside subroutine calls.

Support options for OpenOCD at compile time  ESP-IDF has some support options for OpenOCD debugging which can be set at compile time:

- **CONFIG_ESP32_DEBUG_OCDAWARE** is enabled by default. If a panic or unhandled exception is thrown and a JTAG debugger is connected (ie OpenOCD is running), ESP-IDF will break into the debugger.
- **CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK** (disabled by default) sets watchpoint index 1 (the second of two) at the end of any task stack. This is the most accurate way to debug task stack overflows. Click the link for more details.
Please see the project configuration menu menu for more details on setting compile-time options.

FreeRTOS support  OpenOCD has explicit support for the ESP-IDF FreeRTOS. GDB can see FreeRTOS tasks as threads. Viewing them all can be done using the GDB `i threads` command, changing to a certain task is done with `thread n`, with `n` being the number of the thread. FreeRTOS detection can be disabled in target’s configuration. For more details see Configuration of OpenOCD for specific target.

Why to set SPI flash voltage in OpenOCD configuration?  The MTDI pin of ESP32, being among four pins used for JTAG communication, is also one of ESP32’s bootstrapping pins. On power up ESP32 is sampling binary level on MTDI to set it’s internal voltage regulator used to supply power to external SPI flash chip. If binary level on MTDI pin on power up is low, the voltage regulator is set to deliver 3.3 V, if it is high, then the voltage is set to 1.8 V. The MTDI pin should have a pull-up or may rely on internal weak pull down resistor (see ESP32 Series Datasheet for details), depending on the type of SPI chip used. Once JTAG is connected, it overrides the pull-up or pull-down resistor that is supposed to do the bootstrapping.

To handle this issue OpenOCD’s board configuration file (e.g. `boards\esp-wroom-32.cfg` for ESP32-WROOM-32 module) provides `ESP32_FLASH_VOLTAGE` parameter to set the idle state of the TDO line to a specified binary level, therefore reducing the chance of a bad bootup of application due to incorrect flash voltage.

Check specification of ESP32 module connected to JTAG, what is the power supply voltage of SPI flash chip. Then set `ESP32_FLASH_VOLTAGE` accordingly. Most WROOM modules use 3.3 V flash, while WROVER modules use 1.8 V flash.

Optimize JTAG speed  In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG. To do so use the following tips.

1. The upper limit of JTAG clock frequency is 20 MHz if CPU runs at 80 MHz, or 26 MHz if CPU runs at 160 MHz or 240 MHz.
2. Depending on particular JTAG adapter and the length of connecting cables, you may need to reduce JTAG frequency below 20 / 26 MHz.
3. In particular reduce frequency, if you get DSR/DIR errors (and they do not relate to OpenOCD trying to read from a memory range without physical memory being present there).
4. ESP-WROVER-KIT operates stable at 20 / 26 MHz.

What is the meaning of debugger’s startup commands?  On startup, debugger is issuing sequence of commands to reset the chip and halt it at specific line of code. This sequence (shown below) is user defined to pick up at most convenient / appropriate line and start debugging.

- `set remote hardware-watchpoint-limit 2` — Restrict GDB to using two hardware watchpoints supported by the chip, 2 for ESP32. For more information see https://sourceware.org/gdb/onlinedocs/gdb/Remote-Configuration.html.
- `mon reset halt` — reset the chip and keep the CPUs halted
- `flushregs` — monitor (mon) command can not inform GDB that the target state has changed. GDB will assume that whatever stack the target had before `mon reset halt` will still be valid. In fact, after reset the target state will change, and executing `flushregs` is a way to force GDB to get new state from the target.
- `thb app_main` — insert a temporary hardware breakpoint at `app_main`, put here another function name if required
- `c` — resume the program. It will then stop at breakpoint inserted at `app_main`.

Configuration of OpenOCD for specific target  OpenOCD needs to be told what JTAG adapter to use and processor the JTAG adapter is connected to. To do so, use existing `board` configuration files located in OpenOCD’s share/openocd/scripts/board folder.

For example, if you connect to ESP-WROVER-KIT with ESP-WROOM-32 module installed, use the following configuration files:

- `board/esp32-wrover-kit-3.3v.cfg`
Optionally prepare configuration by yourself. To do so, you can check existing files and modify them to match your specific hardware. Below is the summary of available configuration parameters for board configuration.

**Adapter’s clock speed**

```
adapter_khz 20000
```

See *Optimize JTAG speed* for guidance how to set this value.

**Single core debugging**

```
set ESP32_ONLYCPU 1
```

Comment out this line for dual core debugging.

**Disable RTOS support**

```
set ESP32_RTOS none
```

Comment out this line to have RTOS support.

**Power supply voltage of ESP32’s SPI flash chip**

```
set ESP32_FLASH_VOLTAGE 1.8
```

Comment out this line to set 3.3 V, ref: *Why to set SPI flash voltage in OpenOCD configuration?*

**Configuration file for ESP32 targets**

```
source [find target/esp32.cfg]
```

**Note:** Do not change `source [find target/esp32.cfg]` line unless you are familiar with OpenOCD internals.

Currently `target/esp32.cfg` remains the only configuration file for ESP32 targets (esp108 and esp32). The matrix of supported configurations is as follows:

<table>
<thead>
<tr>
<th>Dual/single</th>
<th>RTOS</th>
<th>Target used</th>
</tr>
</thead>
<tbody>
<tr>
<td>dual</td>
<td>FreeRTOS</td>
<td>esp32</td>
</tr>
<tr>
<td>single</td>
<td>FreeRTOS</td>
<td>esp108 (*)</td>
</tr>
<tr>
<td>dual</td>
<td>none</td>
<td>esp108</td>
</tr>
<tr>
<td>single</td>
<td>none</td>
<td>esp108</td>
</tr>
</tbody>
</table>

(*) — we plan to fix this and add support for single core debugging with esp32 target in a subsequent commits.

Look inside `board/esp-wroom-32.cfg` for additional information provided in comments besides each configuration parameter.

**How debugger resets ESP32?** The board can be reset by entering `mon reset` or `mon reset halt` into GDB.
Do not use JTAG pins for something else  
Operation of JTAG may be disturbed, if some other h/w is connected to JTAG pins besides ESP32 module and JTAG adapter. ESP32 JTAG us using the following pins:

JTAG communication will likely fail, if configuration of JTAG pins is changed by user application. If OpenOCD initializes correctly (detects the two Tensilica cores), but loses sync and spews out a lot of DTR/DIR errors when the program is ran, it is likely that the application reconfigures the JTAG pins to something else, or the user forgot to connect Vtar to a JTAG adapter that needed it.

Below is an excerpt from series of errors reported by GDB after the application stepped into the code that reconfigured MTD0 / GPIO15 to be an input:

```
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!  
--an exception!  
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_  
--an overrun!  
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_  
--an overrun!  
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!  
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_  
--an exception!  
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_  
--an overrun!  
```

JTAG with Flash Encryption or Secure Boot  
By default, enabling Flash Encryption and/or Secure Boot will disable JTAG debugging. On first boot, the bootloader will burn an eFuse bit to permanently disable JTAG at the same time it enables the other features.

The project configuration option CONFIG_SECURE_BOOT_ALLOW_JTAG will keep JTAG enabled at this time, removing all physical security but allowing debugging. (Although the name suggests Secure Boot, this option can be applied even when only Flash Encryption is enabled).

However, OpenOCD may attempt to automatically read and write the flash in order to set software breakpoints. This has two problems:

- Software breakpoints are incompatible with Flash Encryption, OpenOCD currently has no support for encrypting or decrypting flash contents.
- If Secure Boot is enabled, setting a software breakpoint will change the digest of a signed app and make the signature invalid. This means if a software breakpoint is set and then a reset occurs, the signature verification will fail on boot.

To disable software breakpoints while using JTAG, add an extra argument -c 'set ESP_FLASH_SIZE 0' to the start of the OpenOCD command line. For example:

```
openocd -c 'set ESP_FLASH_SIZE 0' -f board/esp32-wrover-kit-3.3v.cfg
```

Note: For the same reason, the ESP-IDF app may fail bootloader verification of app signatures, when this option is enabled and a software breakpoint is set.

JTAG and ESP32-WROOM-32 AT firmware Compatibility Issue  
The ESP32-WROOM series of modules come pre-flashed with AT firmware. This firmware configures the pins GPIO12 to GPIO15 as SPI slave interface, which makes using JTAG impossible.

To make JTAG available, build new firmware that is not using pins GPIO12 to GPIO15 dedicated to JTAG communication. After that, flash the firmware onto your module. See also Do not use JTAG pins for something else.

Reporting issues with OpenOCD / GDB  
In case you encounter a problem with OpenOCD or GDB programs itself and do not find a solution searching available resources on the web, open an issue in the OpenOCD issue tracker under https://github.com/espressif/openocd-esp32/issues.

1. In issue report provide details of your configuration:
2. Create a simple example that is representative to observed issue. Describe steps how to reproduce it. In such an example debugging should not be affected by non-deterministic behaviour introduced by the Wi-Fi stack, so problems will likely be easier to reproduce, if encountered once.

3. Prepare logs from debugging session by adding additional parameters to start up commands.

**OpenOCD:**
```
openocd -l openocd_log.txt -d3 -f board/esp32-wrover-kit-3.3v.cfg
```
Logging to a file this way will prevent information displayed on the terminal. This may be a good thing taken amount of information provided, when increased debug level -d3 is set. If you still like to see the log on the screen, then use another command instead:
```
openocd -d3 -f board/esp32-wrover-kit-3.3v.cfg 2>&1 | tee openocd.log
```
**Debugger:**
```
xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other... --options>
```
Optionally add command remotelogfile gdb_log.txt to the gdbinit file.

4. Attach both openocd_log.txt and gdb_log.txt files to your issue report.

**Using Debugger**

This section covers configuration and running debugger from **Eclipse** or from **Command Line** or using **Using idf.py debug targets**. It is recommended to first check if debugger works from **Command Line** and then move to using Eclipse.

**Eclipse** Debugging functionality is provided out of box in standard Eclipse installation. Another option is to use pluggins like “GDB Hardware Debugging” plugin. We have found this plugin quite convenient and decided to use throughout this guide.

To begin with, install “GDB Hardware Debugging” plugin by opening Eclipse and going to Help > Install New Software.

Once installation is complete, configure debugging session following steps below. Please note that some of configuration parameters are generic and some are project specific. This will be shown below by configuring debugging for “blink” example project. If not done already, add this project to Eclipse workspace following guidance in section **Build and Flash with Eclipse IDE**. The source of get-started/blink application is available in examples directory of ESP-IDF repository.

1. In Eclipse go to Run > Debug Configuration. A new window will open. In the window’s left pane double click “GDB Hardware Debugging” (or select “GDB Hardware Debugging” and press the “New” button) to create a new configuration.
2. In a form that will show up on the right, enter the “Name:” of this configuration, e.g. “Blink checking”.
3. On the “Main” tab below, under “Project:” press “Browse” button and select the “blink” project.
4. In next line “C/C++ Application:” press “Browse” button and select “blink.elf” file. If “blink.elf” is not there, then likely this project has not been build yet. See Build and Flash with Eclipse IDE how to do it.
5. Finally, under “Build (if required) before launching” click “Disable auto build”.

A sample window with settings entered in points 1 - 5 is shown below.

7. Change default configuration of “Remote host” by entering 3333 under the “Port number”.

Configuration entered in points 6 and 7 is shown on the following picture.
Fig. 38: Configuration of GDB Hardware Debugging - Main tab
Fig. 39: Configuration of GDB Hardware Debugging - Debugger tab
8. The last tab to that requires changing of default configuration is “Startup”. Under “Initialization Commands” uncheck “Reset and Delay (seconds)” and “Halt”. Then, in entry field below, enter the following lines:

```
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2
```

**Note:** If you want to update image in the flash automatically before starting new debug session add the following lines of commands at the beginning of “Initialization Commands” textbox:

```
mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```

For description of `program_esp` command see *Upload application for debugging*.

10. Further down on the same tab, establish an initial breakpoint to halt CPUs after they are reset by debugger. The plugin will set this breakpoint at the beginning of the function entered under “Set breakpoint at:”. Checkout this option and enter `app_main` in provided field.

11. Checkout “Resume” option. This will make the program to resume after `mon reset halt` is invoked per point 8. The program will then stop at breakpoint inserted at `app_main`. Configuration described in points 8 - 11 is shown below.

If the “Startup” sequence looks convoluted and respective “Initialization Commands” are not clear to you, check *What is the meaning of debugger’s startup commands?* for additional explanation.
12. If you previously completed Configuring ESP32 Target steps described above, so the target is running and ready to talk to debugger, go right to debugging by pressing “Debug” button. Otherwise press “Apply” to save changes, go back to Configuring ESP32 Target and return here to start debugging.

Once all 1 - 12 configuration steps are satisfied, the new Eclipse perspective called “Debug” will open as shown on example picture below.

![Debug Perspective in Eclipse](image)

If you are not quite sure how to use GDB, check Eclipse example debugging session in section Debugging Examples.

Command Line

1. Begin with completing steps described under Configuring ESP32 Target. This is prerequisite to start a debugging session.

2. Open a new terminal session and go to directory that contains project for debugging, e.g.

   ```
   cd ~/esp/blink
   ```

3. When launching a debugger, you will need to provide couple of configuration parameters and commands. Instead of entering them one by one in command line, create a configuration file and name it `gdbinit`:

   ```
   target remote :3333
   set remote hardware-watchpoint-limit 2
   mon reset halt
   flushregs
   thb app_main
   c
   ```

   Save this file in current directory.

   For more details what’s inside `gdbinit` file, see What is the meaning of debugger’s startup commands?
4. Now you are ready to launch GDB. Type the following in terminal:

```
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
```

5. If previous steps have been done correctly, you will see a similar log concluded with (gdb) prompt:

```
user-name@computer-name:/esp/blink$ xtensa-esp32-elf-gdb -x gdbinit build/ -->blink.elf
GNU gdb (crosstool-NG crosstool-ng-1.22.0-61-gab8375a) 7.10

(gdb)
```

Note the third line from bottom that shows debugger halting at breakpoint established in gdbinit file at function app_main(). Since the processor is halted, the LED should not be blinking. If this is what you see as well, you are ready to start debugging.

If you are not quite sure how to use GDB, check Command Line example debugging session in section Debugging Examples.
Using `idf.py debug targets` It is also possible to execute the described debugging tools conveniently from `idf.py`. These commands are supported:

1. `idf.py openocd`

Runs OpenOCD in a console with configuration defined in the environment or via command line. It uses default script directory defined as `OPENOCD_SCRIPTS` environmental variable, which is automatically added from an Export script (export.sh or export.bat). It is possible to override the script location using command line argument `--openocd-scripts`.

As for the JTAG configuration of the current board, please use the environmental variable `OPENOCD_COMMANDS` or `--openocd-commands` command line argument. If none of the above is defined, OpenOCD is started with `-f board/esp32-wrover-kit-3.3v.cfg` board definition.

2. `idf.py gdb`

Starts the gdb the same way as the `Command Line`, but generates the initial gdb scripts referring to the current project elf file.

3. `idf.py gdtui`

The same as 2, but starts the gdb with `tui` argument allowing very simple source code view.

4. `idf.py gdbgui`

Starts `gdbgui` debugger frontend enabling out-of-the-box debugging in a browser window.

It is possible to combine these debugging actions on a single command line allowing convenient setup of blocking and non-blocking actions in one step. `idf.py` implements a simple logic to move the background actions (such as openocd) to the beginning and the interactive ones (such as gdb, monitor) to the end of the action list.

An example of a very useful combination is

```
idf.py openocd gdbgui monitor
```

The above command runs OpenOCD in the background, starts `gdbgui` to open a browser window with active debugger frontend and opens a serial monitor in the active console.

Debugging Examples

This section describes debugging with GDB from `Eclipse` as well as from `Command Line`.

**Eclipse** Verify if your target is ready and loaded with `get-started/blink` example. Configure and start debugger following steps in section `Eclipse`. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`.

Examples in this section

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting the target manually
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

**Navigating through the code, call stack and threads** When the target is halted, debugger shows the list of threads in “Debug” window. The line of code where program halted is highlighted in another window below, as shown on the following picture. The LED stops blinking.

Specific thread where the program halted is expanded showing the call stack. It represents function calls that lead up to the highlighted line of code, where the target halted. The first line of call stack under Thread #1 contains the last
Fig. 42: Debug Perspective in Eclipse
Fig. 43: Target halted during debugging
called function `app_main()`, that in turn was called from function `main_task()` shown in a line below. Each line of the stack also contains the file name and line number where the function was called. By clicking / highlighting the stack entries, in window below, you will see contents of this file.

By expanding threads you can navigate throughout the application. Expand Thread #5 that contains much longer call stack. You will see there, besides function calls, numbers like `0x4000000c`. They represent addresses of binary code not provided in source form.

![Fig. 44: Navigate through the call stack](image)

In another window on right, you can see the disassembled machine code no matter if your project provides it in source or only the binary form.

Go back to the `app_main()` in Thread #1 to familiar code of `blink.c` file that will be examined in more details in the following examples. Debugger makes it easy to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

**Setting and clearing breakpoints** When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line. Let’s establish two breakpoints when the state of LED changes. Basing on code listing above, this happens at lines 33 and 36. To do so, hold the “Control” on the keyboard and double clink on number 33 in file `blink.c` file. A dialog will open where you can confirm your selection by pressing “OK” button. If you do not like to see the dialog just double click the line number. Set another breakpoint in line 36.

Information how many breakpoints are set and where is shown in window “Breakpoints” on top right. Click “Show Breakpoints Supported by Selected Target” to refresh this list. Besides the two just set breakpoints the list may contain temporary breakpoint at function `app_main()` established at debugger start. As maximum two breakpoints are allowed (see Breakpoints and watchpoints available), you need to delete it, or debugging will fail.
Fig. 45: Setting a breakpoint

1. Hold the Control key and double-click on a line number.
2. A dialog with breakpoint at selected line will open.
Fig. 46: Three breakpoints are set / maximum two are allowed
If you now click “Resume” (click `blink_task()` under “Tread #8”), if “Resume” button is grayed out, the processor will run and halt at a breakpoint. Clicking “Resume” another time will make it run again, halt on second breakpoint, and so on.

You will be also able to see that LED is changing the state after each click to “Resume” program execution.

Read more about breakpoints under Breakpoints and watchpoints available and What else should I know about breakpoints?

**Halting the target manually**  
When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by pressing “Suspend” button.

To check it, delete all breakpoints and click “Resume”. Then click “Suspend”. Application will be halted at some random point and LED will stop blinking. Debugger will expand tread and highlight the line of code where application halted.

![Target halted manually](image_url)

In particular case above, the application has been halted in line 52 of code in file `freertos_hooks.c`. Now you can resume it again by pressing “Resume” button or do some debugging as discussed below.

**Stepping through the code**  
It is also possible to step through the code using “Step Into (F5)” and “Step Over (F6)” commands. The difference is that “Step Into (F5)” is entering inside subroutines calls, while “Step Over (F6)” steps over the call, treating it as a single source line.

Before being able to demonstrate this functionality, using information discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`.

Resume program by entering pressing F8 and let it halt. Now press “Step Over (F6)” , one by one couple of times, to see how debugger is stepping one program line at a time.
Fig. 48: Stepping through the code with "Step Over (F6)"
If you press “Step Into (F5)” instead, then debugger will step inside subroutine calls.

![Image of debugger interface with Step Into (F5) highlighted.

Fig. 49: Stepping through the code with “Step Into (F5)”

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

See Why stepping with “next” does not bypass subroutine calls? for potential limitation of using `next` command.

Checking and setting memory  To display or set contents of memory use “Memory” tab at the bottom of “Debug” perspective.

With the “Memory” tab, we will read from and write to the memory location `0x3FF44004` labeled as `GPIO_OUT_REG` used to set and clear individual GPIO’s.

For more information please refer to ESP32 Technical Reference Manual, chapter IO_MUX and GPIO Matrix.

Being in the same `blink.c` project as before, set two breakpoints right after `gpio_set_level` instruction. Click “Memory” tab and then “Add Memory Monitor” button. Enter `0x3FF44004` in provided dialog.

Now resume program by pressing F8 and observe “Monitor” tab.

You should see one bit being flipped over at memory location `0x3FF44004` (and LED changing the state) each time F8 is pressed.

To set memory use the same “Monitor” tab and the same memory location. Type in alternate bit pattern as previously observed. Immediately after pressing enter you will see LED changing the state.

Watching and setting program variables  A common debugging tasks is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file `blink.c` by adding a declaration of a global variable `int i` above definition of function `blink_task`. Then add `i++` inside `while (1)` of this function to get `i` incremented on each blink.
Chapter 4. API Guides

Fig. 50: Observing memory location 0x3FF44004 changing one bit to “ON”

Fig. 51: Observing memory location 0x3FF44004 changing one bit to “OFF”
Chapter 4. API Guides

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter a breakpoint in the line where you put `i++`.

In next step, in the window with “Breakpoints”, click the “Expressions” tab. If this tab is not visible, then add it by going to the top menu Window > Show View > Expressions. Then click “Add new expression” and enter `i`.

Resume program execution by pressing F8. Each time the program is halted you will see `i` value being incremented.

![Image of debugger interface with expressions view open]

Fig. 52: Watching program variable “i”

To modify `i` enter a new number in “Value” column. After pressing “Resume (F8)” the program will keep incrementing `i` starting from the new entered number.

**Setting conditional breakpoints** Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Right click on the breakpoint to open a context menu and select “Breakpoint Properties”. Change the selection under “Type” to “Hardware” and enter a “Condition” like `i == 2`.

If current value of `i` is less than 2 (change it if required) and program is resumed, it will blink LED in a loop until condition `i == 2` gets true and then finally halt.

**Command Line** Verify if your target is ready and loaded with get-started/blink example. Configure and start debugger following steps in section Command Line. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`:

```c
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/.//blink.c:43
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5,...
    NULL);
(gdb)
```
Fig. 53: Setting a conditional breakpoint
Chapter 4. API Guides

Examples in this section

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting and resuming the application
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Navigating through the code, call stack and threads

When you see the (gdb) prompt, the application is halted. LED should not be blinking.

To find out where exactly the code is halted, enter l or list, and debugger will show couple of lines of code around the halt point (line 43 of code in file blink.c)

```
(gdb) l
38     }
39 }
40
41 void app_main()
42 {
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5,...
44     );
45 }
(gdb)
```

Check how code listing works by entering, e.g. l 30, 40 to see particular range of lines of code.

You can use bt or backtrace to see what function calls lead up to this code:

```
(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/../blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/...-esp32/../cpu_start.c:339
(gdb)
```

Line #0 of output provides the last function call before the application halted, i.e. app_main () we have listed previously. The app_main () was in turn called by function main_task from line 339 of code located in file cpu_start.c.

To get to the context of main_task in file cpu_start.c, enter frame N, where N = 1, because the main_task is listed under #1):

```
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/...-esp32/../cpu_start.c:339
339     app_main();
(gdb)
```

Enter l and this will reveal the piece of code that called app_main() (in line 339):

```
(gdb) l
334     ;
335 }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
```

(continues on next page)
By listing some lines before, you will see the function name `main_task` we have been looking for:

```c
static void main_task(void* args) {
    // Now that the application is about to start, disable boot watchdogs
    REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
    REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
    #if !CONFIG_FREERTOS_UNICORE
        // Wait for FreeRTOS initialization to finish on APP CPU, before replacing...
        while (port_xSchedulerRunning[1] == 0) {
            ;
        }
    #endif
    // Enable allocation in region where the startup stacks were located.
    heap_caps_enable_nonos_stack_heaps();
    app_main();
    vTaskDelete(NULL);
}
```

To see the other code, enter `i threads`. This will show the list of threads running on target:

```plaintext
Id  Target Id  Frame
  8  Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=<optimized out>)
      at /home/user-name/esp/esp-idf/components/esp32./dport_access.c:170
  7  Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
      pvBuffer=0x0, xTicksToWait=1644638200,
      xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos./queue.c:1452
  6  Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos./timers.c:445
  5  Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
  4  Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
      at /home/user-name/esp/esp-idf/components/esp32./dport_access.c:150
  3  Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos./tasks.c:3282
  2  Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos./tasks.c:3282
  1  Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/main.c:43
```

The thread list shows the last function calls per each thread together with the name of C source file if available.

You can navigate to specific thread by entering `thread N`, where `N` is the thread Id. To see how it works go to thread 5:

```plaintext
(gdb) thread 5
(Switching to thread 5 (Thread 1073410208))
#0 0x4000bfea in ?? ()
```

Then check the backtrace:
As you see, the backtrace may contain several entries. This will let you check what exact sequence of function calls lead to the code where the target halted. Question marks ?? instead of a function name indicate that application is available only in binary format, without any source file in C language. The value like 0x4000bfea is the memory address of the function call.

Using bt, i threads, thread N and list commands we are now able to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

Setting and clearing breakpoints When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let’s establish two breakpoints when the state of LED changes. Basing on code listing above this happens at lines 33 and 36. Breakpoints may be established using command break M where M is the code line number:

```plaintext
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

If you now enter c, the processor will run and halt at a breakpoint. Entering c another time will make it run again, halt on second breakpoint, and so on:

```plaintext
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)  APP_CPU: PC=0x400D10D8
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./blink.c:33
  33  gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active)  APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active)  APP_CPU: PC=0x400D10D8
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./blink.c:36
  36  gpio_set_level(BLINK_GPIO, 1);
(gdb) c
```

You will be also able to see that LED is changing the state only if you resume program execution by entering c. To examine how many breakpoints are set and where, use command info break:
(gdb) info break
Num Type Disp Enb Address What
2  breakpoint keep y 0x400db6f6 in blink_task at /home/user-name/esp/
   --blink/main./blink.c:33
   breakpoint already hit 1 time
3  breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/
   --blink/main./blink.c:36
   breakpoint already hit 1 time
(gdb)

Please note that breakpoint numbers (listed under Num) start with 2. This is because first breakpoint has been already established at function app_main() by running command thb app_main on debugger launch. As it was a temporary breakpoint, it has been automatically deleted and now is not listed anymore.

To remove breakpoints enter delete N command (in short d N), where N is the breakpoint number:

(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)

Read more about breakpoints under Breakpoints and watchpoints available and What else should I know about breakpoints?

**Halting and resuming the application** When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any breakpoints defined. In such case, to go back to debugging mode, you can break program execution manually by entering Ctrl+C.

To check it delete all breakpoints and enter c to resume application. Then enter Ctrl+C. Application will be halted at some random point and LED will stop blinking. Debugger will print the following:

(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00 APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
   --components/esp32/./freertos_hooks.c:52
52   asm("waiti 0");
(gdb)

In particular case above, the application has been halted in line 52 of code in file freertos_hooks.c. Now you can resume it again by enter c or do some debugging as discussed below.

**Note:** In MSYS2 shell Ctrl+C does not halt the target but exists debugger. To resolve this issue consider debugging with Eclipse or check a workaround under [http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt](http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt).

**Stepping through the code** It is also possible to step through the code using step and next commands (in short s and n). The difference is that step is entering inside subroutines calls, while next steps over the call, treating it as a single source line.

To demonstrate this functionality, using command break and delete discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of blink.c:

(gdb) info break
Num Type Disp Enb Address What
(continues on next page)
Resume program by entering `c` and let it halt:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active) APP_CPU: PC=0x400D1128
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./blink.c:36
36   gpio_set_level(BLINK_GPIO, 1);
```

Then enter `n` couple of times to see how debugger is stepping one program line at a time:

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
37   vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
33   gpio_set_level(BLINK_GPIO, 0);
```

If you enter `s` instead, then debugger will step inside subroutine calls:

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/components/driver/./gpio.c:183
183  GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error --", ESP_ERR_INVALID_ARG);
```

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

See Why stepping with “next” does not bypass subroutine calls? for potential limitation of using `next` command.

**Checking and setting memory**

Displaying the contents of memory is done with command `x`. With additional parameters you may vary the format and count of memory locations displayed. Run `help x` to see more details. Companion command to `x` is `set` that let you write values to the memory.

We will demonstrate how `x` and `set` work by reading from and writing to the memory location 0x3FF44004 labeled as `GPIO_OUT_REG` used to set and clear individual GPIO’s.

Being in the same `blink.c` project as before, set two breakpoints right after `gpio_set_level` instruction. Enter two times `c` to get to the break point followed by `x /1wx 0x3FF44004` to display contents of `GPIO_OUT_REG` memory location:
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active) APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
  ∼blink.c:34
  34 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
  ∼blink.c:37
  37 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb)

If your are blinking LED connected to GPIO4, then you should see fourth bit being flipped each time the LED changes the state:

0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010

Now, when the LED is off, that corresponds to 0x3ff44004: 0x00000000 being displayed, try using set command to set this bit by writing 0x00000010 to the same memory location:

(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010

You should see the LED to turn on immediately after entering set {unsigned int}0x3FF44004=0x000010 command.

Watching and setting program variables A common debugging tasks is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file blink.c by adding a declaration of a global variable int i above definition of function blink_task. Then add i++ inside while(1) of this function to get i incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter the command watch i:

(gdb) watch i
Hardware watchpoint 2: i
(gdb)

This will insert so called “watchpoint” in each place of code where variable i is being modified. Now enter continue to resume the application and observe it being halted:

(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

(continues on next page)
Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
blink.c:33
 33 i++;
(gdb)

Resume application couple more times so i gets incremented. Now you can enter print i (in short p i) to check the current value of i:

(gdb) p i
$1 = 3
(gdb)

To modify the value of i use set command as below (you can then print it out to check if it has been indeed changed):

(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)

You may have up to two watchpoints, see Breakpoints and watchpoints available.

**Setting conditional breakpoints** Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Delete existing breakpoints and try this:

(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)

Above command sets conditional breakpoint to halt program execution in line 34 of blink.c if i == 2.

If current value of i is less than 2 and program is resumed, it will blink LED in a loop until condition i == 2 gets true and then finally halt:

(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active)  APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)  APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)  APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)  APP_CPU: PC=0x400D112C
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
blink.c:34
 34 gpio_set_level(BLINK_GPIO, 0);
(gdb)

**Obtaining help on commands** Commands presented so far should provide are very basis and intended to let you quickly get started with JTAG debugging. Check help what are the other commands at you disposal. To obtain help on syntax and functionality of particular command, being at (gdb) prompt type help and command name:

(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine, this command does not enter the subroutine, but instead steps over

(continues on next page)
the call, in effect treating it as a single source line.

(gdb)

By typing just help, you will get top level list of command classes, to aid you drilling down to more details. Optionally refer to available GDB cheat sheets, for instance https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf. Good to have as a reference (even if not all commands are applicable in an embedded environment).

**Ending debugger session** To quit debugger enter `q`:

```
(gdb) q
A debugging session is active.
Inferior 1 [Remote target] will be detached.
Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

### 4.19 Linker Script Generation

#### 4.19.1 Overview

There are several memory regions where code and data can be placed. Code and read-only data are placed by default in flash, writable data in RAM, etc. However, it is sometimes necessary to change these default placements. For example, it may be necessary to place critical code in RAM for performance reasons or to place code in RTC memory for use in a wake stub or the ULP coprocessor.

With the linker script generation mechanism, it is possible to specify these placements at the component level within ESP-IDF. The component presents information on how it would like to place its symbols, objects or the entire archive. During build the information presented by the components are collected, parsed and processed; and the placement rules generated is used to link the app.

#### 4.19.2 Quick Start

This section presents a guide for quickly placing code/data to RAM and RTC memory - placements ESP-IDF provides out-of-the-box.

For this guide, suppose we have the following:

```
- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig
    - src/
      - my-src1.c
      - my-src2.c
      - my-src3.c
      - my_linker_fragment_file.lf
```

- a component named `my_component` is archived as library `libmy_component.a` during build
- three source files archived under the library, `my-src1.c`, `my-src2.c` and `my-src3.c` which are compiled as `my-src1.o`, `my-src2.o` and `my-src3.o`, respectively
- under `my-src1.o`, the function `my_function1` is defined; under `my-src2.o`, the function `my_function2` is defined
there exist bool-type config PERFORMANCE_MODE (y/n) and int type config PERFORMANCE_LEVEL (with range 0-3) in my_component’s Kconfig

Creating and Specifying a Linker Fragment File

Before anything else, a linker fragment file needs to be created. A linker fragment file is simply a text file with a .lf extension upon which the desired placements will be written. After creating the file, it is then necessary to present it to the build system. The instructions for the build systems supported by ESP-IDF are as follows:

**Make**  In the component’s component.mk file, set the variable COMPONENT_ADD_LDFRAGMENTS to the path of the created linker fragment file. The path can either be an absolute path or a relative path from the component directory.

```
COMPONENT_ADD_LDFRAGMENTS += my_linker_fragment_file.lf
```

**CMake**  In the component’s CMakeLists.txt file, specify argument LDFRAGMENTS in the `idf_component_register` call. The value of LDFRAGMENTS can either be an absolute path or a relative path from the component directory to the created linker fragment file.

```
# file paths relative to CMakeLists.txt
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/another_linker_fragment_file.lf"
...)
```

Specifying placements

It is possible to specify placements at the following levels of granularity:

- object file (.obj or .o files)
- symbol (function/variable)
- archive (.a files)

**Placing object files**  Suppose the entirety of my_src1.o is performance-critical, so it is desirable to place it in RAM. On the other hand, the entirety of my_src2.o contains symbols needed coming out of deep sleep, so it needs to be put under RTC memory. In the the linker fragment file, we can write:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash) # places all my_src1 code/read-only data under IRAM/DRAM
    my_src2 (rtc) # places all my_src2 code/ data and read-only data under...
    RTC fast memory/RTC slow memory
```

What happens to my_src3.o? Since it is not specified, default placements are used for my_src3.o. More on default placements [here](#).

**Placing symbols**  Continuing our example, suppose that among functions defined under object1.o, only my_function1 is performance-critical; and under object2.o, only my_function2 needs to execute after the chip comes out of deep sleep. This could be accomplished by writing:

```
```
The default placements are used for the rest of the functions in my_src1.o and my_src2.o and the entire object3.o. Something similar can be achieved for placing data by writing the variable name instead of the function name, like so:

my_src1:my_variable (noflash)

**Warning:** There are limitations in placing code/data at symbol granularity. In order to ensure proper placements, an alternative would be to group relevant code and data into source files, and use object-granularity placements.

### Placing entire archive

In this example, suppose that the entire component archive needs to be placed in RAM. This can be written as:

```ini
[mapping:my_component]
archive: libmy_component.a
entries:
 * (noflash)
```

Similarly, this places the entire component in RTC memory:

```ini
[mapping:my_component]
archive: libmy_component.a
entries:
 * (rtc)
```

### Configuration-dependent placements

Suppose that the entire component library should only have special placement when a certain condition is true; for example, when `CONFIG_PERFORMANCE_MODE == y`. This could be written as:

```ini
[mapping:my_component]
archive: libmy_component.a
entries:
 if PERFORMANCE_MODE = y:
 * (noflash)
 else:
 * (default)
```

For a more complex config-dependent placement, suppose the following requirements: when `CONFIG_PERFORMANCE_LEVEL == 1`, only object1.o is put in RAM; when `CONFIG_PERFORMANCE_LEVEL == 2`, object1.o and object2.o; and when `CONFIG_PERFORMANCE_LEVEL == 3` all object files under the archive are to be put into RAM. When these three are false however, put entire library in RTC memory. This scenario is a bit contrived, but, it can be written as:

```ini
[mapping:my_component]
archive: libmy_component.a
entries:
 if PERFORMANCE_LEVEL = 1:
 my_src1 (noflash)
 elif PERFORMANCE_LEVEL = 2:
 my_src1 (noflash)
 (continues on next page)
my_src2 (noflash)
elif PERFORMANCE_LEVEL = 3:
  my_src1 (noflash)
  my_src2 (noflash)
  my_src3 (noflash)
else:
  * (rtc)

Nesting condition-checking is also possible. The following is equivalent to the snippet above:

```plaintext
(mapping:my_component)
archive: libmy_component.a
entries:
  if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
    if PERFORMANCE_LEVEL >= 1:
      object1 (noflash)
      if PERFORMANCE_LEVEL >= 2:
        object2 (noflash)
        if PERFORMANCE_LEVEL >= 3:
          object2 (noflash)
    else:
      * (rtc)
```

The ‘default’ placements

Up until this point, the term ‘default placements’ has been mentioned as fallback placements when the placement rules `rtc` and `noflash` are not specified. It is important to note that the tokens `noflash` or `rtc` are not merely keywords, but are actually entities called fragments, specifically schemes.

In the same manner as `rtc` and `noflash` are schemes, there exists a default scheme which defines what the default placement rules should be. As the name suggests, it is where code and data are usually placed, i.e. code/constants is placed in flash, variables placed in RAM, etc. More on the default scheme here.

Note: For an example of an ESP-IDF component using the linker script generation mechanism, see `freertos/CMakeLists.txt`. freertos uses this to place its object files to the instruction RAM for performance reasons.

This marks the end of the quick start guide. The following text discusses the internals of the mechanism in a little bit more detail. The following sections should be helpful in creating custom placements or modifying default behavior.

### 4.19.3 Linker Script Generation Internals

Linking is the last step in the process of turning C/C++ source files into an executable. It is performed by the toolchain’s linker, and accepts linker scripts which specify code/data placements, among other things. With the linker script generation mechanism, this process is no different, except that the linker script passed to the linker is dynamically generated from: (1) the collected linker fragment files and (2) linker script template.

Note: The tool that implements the linker script generation mechanism lives under `tools/ldgen`.

**Linker Fragment Files**

As mentioned in the quick start guide, fragment files are simple text files with the `.lf` extension containing the desired placements. This is a simplified description of what fragment files contain, however. What fragment files actually contain are ‘fragments’. Fragments are entities which contain pieces of information which, when put
together, form placement rules that tell where to place sections of object files in the output binary. There are three
types of fragments: sections, scheme and mapping.

Grammar  The three fragment types share a common grammar:

```
[type:name]
key: value
key:
  value
  value
  value...
```

- type: Corresponds to the fragment type, can either be sections, scheme or mapping.
- name: The name of the fragment, should be unique for the specified fragment type.
- key, value: Contents of the fragment; each fragment type may support different keys and different grammars
  for the key values.

**Note:** In cases where multiple fragments of the same type and name are encountered, an exception is thrown.

**Note:** The only valid characters for fragment names and keys are alphanumeric characters and underscore.

Condition Checking

Condition checking enable the linker script generation to be configuration-aware. Depending on whether expressions
involving configuration values are true or not, a particular set of values for a key can be used. The evaluation uses
eval_string from tools/kconfig_new/kconfiglib.py and adheres to its required syntax and limitations. Supported
operators are as follows:

- **comparison**
  - LessThan <
  - LessThanOrEqualTo <=
  - MoreThan >
  - MoreThanOrEqualTo >=
  - Equal =
  - NotEqual !=

- **logical**
  - Or ||
  - And &&
  - Negation !

- **grouping**
  - Parenthesis ()

Condition checking behaves as you would expect an if...elseif/elif...else block in other languages. Condition-checking is possible for both key values and entire fragments. The two sample fragments below are equivalent:

```
# Value for keys is dependent on config
[type:name]
key_1:
  if CONDITION = y:
    value_1
  else:
    value_2
key_2:
  if CONDITION = y:
    value_a
```

(continues on next page)
else:
    value_b

# Entire fragment definition is dependent on config
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_b
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b

Comments

Comment in linker fragment files begin with #. Like in other languages, comment are used to provide helpful descriptions and documentation and are ignored during processing.

Compatibility with ESP-IDF v3.x Linker Script Fragment Files

ESP-IDF v4.0 brings some changes to the linker script fragment file grammar:

• indentation is enforced and improperly indented fragment files generate a parse exception; this was not enforced in the old version but previous documentation and examples demonstrates properly indented grammar
• move to if...elif...else structure for conditionals, with the ability to nest checks and place entire fragments themselves inside conditionals
• mapping fragments now requires a name like other fragment types

Linker script generator should be able to parse ESP-IDF v3.x linker fragment files that are indented properly (as demonstrated by the ESP-IDF v3.x version of this document). Backward compatibility with the previous mapping fragment grammar (optional name and the old grammar for conditionals) has also been retained but with a deprecation warning. Users should switch to the newer grammar discussed in this document as support for the old grammar is planned to be removed in the future.

Note that linker fragment files using the new ESP-IDF v4.0 grammar is not supported on ESP-IDF v3.x, however.

Types  Sections

Sections fragments defines a list of object file sections that the GCC compiler emits. It may be a default section (e.g. .text, .data) or it may be user defined section through the __attribute__ keyword.

The use of an optional ‘+’ indicates the inclusion of the section in the list, as well as sections that start with it. This is the preferred method over listing both explicitly.

[sections:name]
entries:
    .section+
    .section
    ...

Example:

# Non-preferred
[sections:text]
entries:
    .text
    .text.*
Scheme

Scheme fragments define what target a sections fragment is assigned to.

Example:

```plaintext
[scheme:noflash]
entries:
  text -> iram0_text  # the entries under the sections fragment named...
  rodata -> dram0_data # the entries under the sections fragment named...

The default scheme

There exists a special scheme with the name default. This scheme is special because catch-all placement rules are generated from its entries. This means that, if one of its entries is text -> flash_text, the placement rule

`*(.literal .literal.* .text .text.*)`

will be generated for the target flash_text.

These catch-all rules then effectively serve as fallback rules for those whose mappings were not specified.

The default scheme is defined in esp32/ld/esp32_fragments.lf. The noflash and rtc scheme fragments which are built-in schemes referenced in the quick start guide are also defined in this file.

Mapping

Mapping fragments define what scheme fragment to use for mappable entities, i.e. object files, function names, variable names, archives.

There are three levels of placement granularity:

- symbol: The object file name and symbol name are specified. The symbol name can be a function name or a variable name.
- object: Only the object file name is specified.
- archive: * is specified, which is a short-hand for all the object files under the archive.

To know what an entry means, let us expand a sample object-granularity placement:
object (scheme)

Then expanding the scheme fragment from its entries definitions, we have:

object (sections -> target, sections -> target, ...

Expanding the sections fragment with its entries definition:

object (.section, # given this object file .section, # put its sections listed here at this ...
... -> target, # target .section, .section, # same should be done for these sections ...
... -> target, ...

Example:

[mapping:map]
archive: libfreertos.a
entries:
* (noflash)

On Symbol-Granularity Placements Symbol granularity placements is possible due to compiler flags -ffunction-sections and -ffdata-sections. ESP-IDF compiles with these flags by default. If the user opts to remove these flags, then the symbol-granularity placements will not work. Furthermore, even with the presence of these flags, there are still other limitations to keep in mind due to the dependence on the compiler’s emitted output sections.

For example, with -ffunction-sections, separate sections are emitted for each function; with section names predictably constructed i.e. .text.{func_name} and .literal.{func_name}. This is not the case for string literals within the function, as they go to pooled or generated section names.

With -fdata-sections, for global scope data the compiler predictably emits either .data.{var_name}, .rodata.{var_name} or .bss.{var_name}; and so Type I mapping entry works for these. However, this is not the case for static data declared in function scope, as the generated section name is a result of mangling the variable name with some other information.

Linker Script Template

The linker script template is the skeleton in which the generated placement rules are put into. It is an otherwise ordinary linker script, with a specific marker syntax that indicates where the generated placement rules are placed.

To reference the placement rules collected under a target token, the following syntax is used:

mapping[target]

Example:

The example below is an excerpt from a possible linker script template. It defines an output section .iram0.text, and inside is a marker referencing the target iram0_text.

.iram0.text :
{
  /* Code marked as runnning out of IRAM */
  _iram_text_start = ABSOLUTE(.);
}

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

/* Marker referencing iram0_text */
mapping[iram0_text]

 Ramirez_end = ABSOLUTE(.);
} > iram0_0_seg

Suppose the generator collected the fragment definitions below:

[sections:text]
.text+
.l literal+

[sections:iram]
.iram1+

[scheme:default]
entries:
text -> flash_text
iram -> iram0_text

[scheme:noflash]
entries:
text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
* (noflash)

Then the corresponding excerpt from the generated linker script will be as follows:

.iram0.text :
{
  /* Code marked as runnning out of IRAM */
  _iram_text_start = ABSOLUTE(.);
  /* Placement rules generated from the processed fragments, placed where the marker was in the template */
  * (.iram1 .iram1.*)
  *libfreertos.a:(.literal .text .literal.* .text.*)
  _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

*libfreertos.a:(.literal .text .literal.* .text.*)

Rule generated from the entry * (noflash) of the freertos mapping fragment. All text sections of all object files under the archive libfreertos.a will be collected under the target iram0_text (as per the noflash scheme) and placed wherever in the template iram0_text is referenced by a marker.

* (.iram1 .iram1.*)

Rule generated from the default scheme entry iram -> iram0_text. Since the default scheme specifies an iram -> iram0_text entry, it too is placed wherever iram0_text is referenced by a marker. Since it is a rule generated from the default scheme, it comes first among all other rules collected under the same target name.

The linker script template currently used is esp32/ld/esp32.project.ld.in, specified by the esp32 component; the generated output script is put under its build directory.
4.20 lwIP

ESP-IDF uses the open source lwIP lightweight TCP/IP stack. The ESP-IDF version of lwIP (esp-lwip) has some modifications and additions compared to the upstream project.

4.20.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- **BSD Sockets API**
- **Netconn API** is enabled but not officially supported for ESP-IDF applications

Adapted APIs

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the ESP-NETIF functionality
- Simple Network Time Protocol (SNTP) is supported via the lwip/include/apps/sntp/sntp.h lwip/lwip/src/include/lwip/apps/sntp.h functions (see also SNTP Time Synchronization)
- ICMP Ping is supported using a variation on the lwIP ping API. See ICMP Echo.
- NetBIOS lookup is available using the standard lwIP API. protocols/http_server/restful_server has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see mDNS Service), but lwIP can look up mDNS hosts using standard APIs such as gethostbyname() and the convention hostname.local, provided the CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES setting is enabled.

4.20.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

References

A wide range of BSD Sockets reference material is available, including:

- Single UNIX Specification BSD Sockets page
- Berkeley Sockets Wikipedia page

Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- protocols/sockets/tcp_server
- protocols/sockets/tcp_client
- protocols/sockets/udp_server
- protocols/sockets/udp_client
- protocols/sockets/udp_multicast
- protocols/http_request (Note: this is a simplified example of using a TCP socket to send an HTTP request. The ESP HTTP Client is a much better option for sending HTTP requests.)
Supported functions

The following BSD socket API functions are supported. For full details see `lwip/lwip/src/include/lwip/sockets.h`.

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt() & setsockopt()` (see Socket Options)
- `close()` (via Virtual filesystem component)
- `read()`, `readv()`, `write()`, `writev()` (via Virtual filesystem component)
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via Virtual filesystem component)
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see fcntl)

Non-standard functions:

- `ioctl()` (see ioctls)

Note: Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see Socket API Errors.
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see select() Errors.

Socket API Errors

The error detection

- We can know that the socket API fails according to its return value.

Get the error reason code

- When socket API fails, the return value doesn’t contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see <Socket Error Reason Code>.

Example:

```c
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
}
```
select() Errors

The error detection

- Socket error when `select()` has exception descriptor

Get the error reason code

- If the `select` indicates that the socket fails, we can’t get the error reason code by accessing `errno`, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to `errno`.

Note: `getsockopt` function prototype `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in `optval`. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

Example:

```c
int err;
if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

Socket Error Reason Code Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see `newlib errno.h` [https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h] and the platform-specific extensions `newlib/platform/include/errno.h`

<table>
<thead>
<tr>
<th>Error code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECONNREFUSED</td>
<td>Connection refused</td>
</tr>
<tr>
<td>EADDRINUSE</td>
<td>Address already in use</td>
</tr>
<tr>
<td>ECONNABORTED</td>
<td>Software caused connection abort</td>
</tr>
<tr>
<td>ENETUNREACH</td>
<td>Network is unreachable</td>
</tr>
<tr>
<td>ENETDOWN</td>
<td>Network interface is not configured</td>

</tr>
<tr>
<td>EPROTONOSUPPORT</td>
<td>Unknown protocol</td>
</tr>
</tbody>
</table>
Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

**Common options**  Used with level argument `SOL_SOCKET`.
- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF` (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- `SO_SNDTIMEO` / `SO_RCVTIMEO`
- `SO_ERROR` (this option is only used with `select()`, see Socket Error Handling)
- `SO_TYPE`
- `SO_NO_CHECK` (for UDP sockets only)

**IP options**  Used with level argument `IPPROTO_IP`.
- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO` (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:
- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

**TCP options**  TCP sockets only. Used with level argument `IPPROTO_TCP`.
- `TCP_NODELAY`

Options relating to TCP keepalive probes:
- `TCP_KEEPALIVE` (int value, TCP keepalive period in milliseconds)
- `TCP_KEEPIDLE` (same as `TCP_KEEPALIVE`, but the value is in seconds)
- `TCP_KEEPINTVL` (int value, interval between keepalive probes in seconds)
- `TCP_KEEPCNT` (int value, number of keepalive probes before timing out)

**IPv6 options**  IPv6 sockets only. Used with level argument `IPPROTO_IPV6`
- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

For multicast IPv6 UDP sockets:
- `IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`
The `fcntl()` function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the Virtual filesystem component layer is used to implement this function.

When the file descriptor is a socket, only the following `fcntl()` values are supported:

- `O_NONBLOCK` to set/clear non-blocking I/O mode. Also supports `O_NDELAY`, which is identical to `O_NONBLOCK`.
- `O_RDONLY`, `O_WRONLY`, `O_RDWR` flags for different read/write modes. These can read via `F_GETFL` only, they cannot be set using `F_SETFL`. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return `O_RDWR`.

`ioctl()`

The `ioctl()` function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the Virtual filesystem component layer is used to implement this function.

When the file descriptor is a socket, only the following `ioctl()` values are supported:

- `FIONREAD` returns the number of bytes of pending data already received in the socket’s network buffer.
- `FIONBIO` is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to `fcntl(fd, F_SETFL, O_NONBLOCK, ...)`. 

4.20.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF. The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

**Important:** Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is enabled but not supported. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult `lwip/lwip/src/include/lwip/api.h` and this wiki page which is part of the unofficial lwIP Application Developers Manual.

4.20.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues ("mailboxes") used to send data to/from the TCP/IP task:

- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`

4.20.5 esp-lwip custom modifications

Additions

The following code is added which is not present in the upstream lwIP release:
Thread-safe sockets  It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

On demand timers  lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times. The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. `esp-lwip` default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable `CONFIG_LWIP_TIMERS_ONDEMAND`.

Abort TCP connections when IP changes  `CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES` is disabled by default. This disables the default lwIP behaviour of keeping TCP connections open if an interface IP changes, in case the interface IP changes back (for example, if an interface connection goes down and comes back up). Enable this option to keep TCP connections open in this case, until they time out normally. This may increase the number of sockets in use if a network interface goes down temporarily.

Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

Limitations

- Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don’t wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

4.20.6 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the `wifi/ipperf` example in an RF sealed enclosure. The `wifi/ipperf/sdkconfig.defaults` file for the ipperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project `sdkconfig`.

**Important:** Suggest applying changes a few at a time and checking the performance each time with a particular application workload.
• If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (CONFIG_LWIP_TCPIP_TASK_AFFINITY) and runs at fixed priority ESP_TASK_TCPIP_PRIO (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority.

• If using select() function with socket arguments only, setting CONFIG_LWIP_USE_ONLY_LWIP_SELECT will make select() calls faster.

If using a Wi-Fi network interface, please also refer to Wi-Fi Buffer Usage.

Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

• For TCP sockets, lwIP supports setting the standard TCP_NODELAY flag to disable Nagle’s algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

• Reducing CONFIG_LWIP_MAX_SOCKETS reduces the maximum number of sockets in the system. This will also cause TCP sockets in the WAIT_CLOSE state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.

• Reducing CONFIG_LWIP_TCPIP_RECVMBOX_SIZE, CONFIG_LWIP_TCP_RECVMBOX_SIZE and CONFIG_LWIP_UDP_RECVMBOX_SIZE reduce memory usage at the expense of throughput, depending on usage.

If using Wi-Fi, please also refer to Wi-Fi Buffer Usage.

Peak Buffer Usage  The peak heap memory that lwIP consumes is the theoretically-maximum memory that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

• the memory required to create a UDP connection: lwip_udp_conn
• the memory required to create a TCP connection: lwip_tcp_conn
• the number of UDP connections that the application has: lwip_udp_con_num
• the number of TCP connections that the application has: lwip_tcp_con_num
• the TCP TX window size: lwip_tcp_tx_win_size
• the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

\[
lwip\_dynamic\_peak\_memory = (lwip\_udp\_con\_num \times lwip\_udp\_conn) + (lwip\_tcp\_con\_num \times (lwip\_tcp\_tx\_win\_size + lwip\_tcp\_rx\_win\_size + lwip\_tcp\_conn))
\]

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.21 Partition Tables

4.21.1 Overview

A single ESP32’s flash can contain multiple apps, as well as many different kinds of data (calibration data, filesystems, parameter storage, etc). For this reason a partition table is flashed to (default offset) 0x8000 in the flash.

Partition table length is 0xC00 bytes (maximum 95 partition table entries). An MD5 checksum, which is used for checking the integrity of the partition table, is appended after the table data.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.
The simplest way to use the partition table is to open the project configuration menu (idf.py menuconfig) and choose one of the simple predefined partition tables under `CONFIG_PARTITION_TABLE_TYPE`:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you execute `idf.py partition_table` then it will print a summary of the partition table.

### 4.21.2 Built-in Partition Tables

Here is the summary printed for the “Single factory app, no OTA” configuration:

```plaintext
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- At a 0x10000 (64KB) offset in the flash is the app labelled “factory”. The bootloader will run this app by default.
- There are also two data regions defined in the partition table for storing NVS library partition and PHY init data.

Here is the summary printed for the “Factory app, two OTA definitions” configuration:

```plaintext
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, 0, 0, 0x10000, 1M,
ota_0, 0, ota_0, 0x110000, 1M,
ota_1, 0, ota_1, 0x210000, 1M,
```

- There are now three app partition definitions. The type of the factory app (at 0x10000) and the next two “OTA” apps are all set to “app”, but their subtypes are different.
- There is also a new “otadata” slot, which holds the data for OTA updates. The bootloader consults this data in order to know which app to execute. If “ota data” is empty, it will execute the factory app.

### 4.21.3 Creating Custom Tables

If you choose “Custom partition table CSV” in menuconfig then you can also enter the name of a CSV file (in the project directory) to use for your partition table. The CSV file can describe any number of definitions for the table you need.

The CSV format is the same format as printed in the summaries shown above. However, not all fields are required in the CSV. For example, here is the “input” CSV for the OTA partition table:

```plaintext
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, , 1M,
ota_1, app, ota_1, , 1M,
nvs_key, data, nvs_keys, , 0x1000
```

- Whitespace between fields is ignored, and so is any line starting with # (comments).
- Each non-comment line in the CSV file is a partition definition.
• The “Offset” field for each partition is empty. The gen_esp32part.py tool fills in each blank offset, starting after the partition table and making sure each partition is aligned correctly.

Name field

Name field can be any meaningful name. It is not significant to the ESP32. Names longer than 16 characters will be truncated.

Type field

Partition type field can be specified as app (0x00) or data (0x01). Or it can be a number 0-254 (or as hex 0x00-0xFE). Types 0x00-0x3F are reserved for ESP-IDF core functions.

If your app needs to store data in a format not already supported by ESP-IDF, then please add a custom partition type value in the range 0x40-0xFE.

See `esp_partition_type_t` for the enum definitions for `app` and `data` partitions.

If writing in C++ then specifying a application-defined partition type requires casting an integer to `esp_partition_type_t` in order to use it with the partition API. For example:

```c
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

The ESP-IDF bootloader ignores any partition types other than app (0x00) and data (0x01).

SubType

The 8-bit subtype field is specific to a given partition type. ESP-IDF currently only specifies the meaning of the subtype field for `app` and `data` partition types.

See enum `esp_partition_subtype_t` for the full list of subtypes defined by ESP-IDF, including the following:

• When type is `app`, the subtype field can be specified as factory (0x00), ota_0 (0x10) ... ota_15 (0x1F) or test (0x20).
  - factory (0x00) is the default app partition. The bootloader will execute the factory app unless there it sees a partition of type data/ota, in which case it reads this partition to determine which OTA image to boot.
    * OTA never updates the factory partition.
    * If you want to conserve flash usage in an OTA project, you can remove the factory partition and use ota_0 instead.
  - ota_0 (0x10) ... ota_15 (0x1F) are the OTA app slots. When OTA is in use, the OTA data partition configures which app slot the bootloader should boot. When using OTA, an application should have at least two OTA application slots (ota_0 & ota_1). Refer to the OTA documentation for more details.
  - test (0x20) is a reserved subtype for factory test procedures. It will be used as the fallback boot partition if no other valid app partition is found. It is also possible to configure the bootloader to read a GPIO input during each boot, and boot this partition if the GPIO is held low, see Boot from TEST firmware.

• When type is `data`, the subtype field can be specified as ota (0x00), phy (0x01), nvs (0x02), nvs_keys (0x04), or a range of other component-specific subtypes (see subtype enum).
  - ota (0) is the OTA data partition which stores information about the currently selected OTA app slot. This partition should be 0x2000 bytes in size. Refer to the OTA documentation for more details.
  - phy (1) is for storing PHY initialisation data. This allows PHY to be configured per-device, instead of in firmware.
    * In the default configuration, the phy partition is not used and PHY initialisation data is compiled into the app itself. As such, this partition can be removed from the partition table to save space.
    * To load PHY data from this partition, open the project configuration menu (idf.py menuconfig) and enable CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION option. You will also need to flash your devices with phy init data as the esp-idf build system does not do this automatically.
  - nvs (2) is for the Non-Volatile Storage (NVS) API.
Chapter 4. API Guides

* NVS is used to store per-device PHY calibration data (different to initialisation data).
* NVS is used to store WiFi data if the `esp_wifi_set_storage(WIFI_STORAGE_FLASH)` initialisation function is used.
* The NVS API can also be used for other application data.
* It is strongly recommended that you include an NVS partition of at least 0x3000 bytes in your project.
* If using NVS API to store a lot of data, increase the NVS partition size from the default 0x6000 bytes.
  - `nvs_keys (4)` is for the NVS key partition. See *Non-Volatile Storage (NVS) API* for more details.
  * It is used to store NVS encryption keys when *NVS Encryption* feature is enabled.
  * The size of this partition should be 4096 bytes (minimum partition size).
  - There are other predefined data subtypes for data storage supported by ESP-IDF. These include *FAT filesystem* (`ESP_PARTITION_SUBTYPE_DATA_FAT`), *SPIFFS* (`ESP_PARTITION_SUBTYPE_DATA_SPIFFS`), etc.
* Other subtypes of data type are reserved for future ESP-IDF uses.
  * If the partition type is any application-defined value (range 0x40-0xFE), then subtype field can be any value chosen by the application (range 0x00-0xFE).
* Note that when writing in C++, an application-defined subtype value requires casting to type `esp_partition_subtype_t` in order to use it with the partition API.

**Offset & Size**

Partitions with blank offsets in the CSV file will start after the previous partition, or after the partition table in the case of the first partition.

Partitions of type `app` have to be placed at offsets aligned to 0x10000 (64K). If you leave the offset field blank, `gen_esp32part.py` will automatically align the partition. If you specify an unaligned offset for an app partition, the tool will return an error.

Sizes and offsets can be specified as decimal numbers, hex numbers with the prefix 0x, or size multipliers K or M (1024 and 1024*1024 bytes).

If you want the partitions in the partition table to work relative to any placement (*CONFIG_PARTITION_TABLE_OFFSET*) of the table itself, leave the offset field (in CSV file) for all partitions blank. Similarly, if changing the partition table offset then be aware that all blank partition offsets may change to match, and that any fixed offsets may now collide with the partition table (causing an error).

**Flags**

Only one flag is currently supported, `encrypted`. If this field is set to `encrypted`, this partition will be encrypted if *Flash Encryption* is enabled.

(Note that *app* type partitions will always be encrypted, regardless of whether this flag is set or not.)

**4.21.4 Generating Binary Partition Table**

The partition table which is flashed to the ESP32 is in a binary format, not CSV. The tool `partition_table/gen_esp32part.py` is used to convert between CSV and binary formats.

If you configure the partition table CSV name in the project configuration (`idf.py menuconfig`) and then build the project or run `idf.py partition_table`, this conversion is done as part of the build process.

To convert CSV to Binary manually:

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

To convert binary format back to CSV manually:

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```
To display the contents of a binary partition table on stdout (this is how the summaries displayed when running `idf.py partition_table` are generated):

```
python gen_esp32part.py binary_partitions.bin
```

**MD5 checksum**

The binary format of the partition table contains an MD5 checksum computed based on the partition table. This checksum is used for checking the integrity of the partition table during the boot.

The MD5 checksum generation can be disabled by the `--disable-md5sum` option of `gen_esp32part.py` or by the `CONFIG_PARTITION_TABLE_MD5` option. This is useful for example when one uses a legacy bootloader which cannot process MD5 checksums and the boot fails with the error message `invalid magic number 0xebeb`.

### 4.21.5 Flashing the partition table

- `idf.py partition_table-flash`: will flash the partition table with `esptool.py`.
- `idf.py flash`: Will flash everything including the partition table.

A manual flashing command is also printed as part of `idf.py partition_table` output.

Note that updating the partition table doesn’t erase data that may have been stored according to the old partition table. You can use `idf.py erase_flash` (or `esptool.py erase_flash`) to erase the entire flash contents.

### 4.21.6 Partition Tool (parttool.py)

The component `partition_table` provides a tool `parttool.py` for performing partition-related operations on a target device. The following operations can be performed using the tool:

- reading a partition and saving the contents to a file (read_partition)
- writing the contents of a file to a partition (write_partition)
- erasing a partition (erase_partition)
- retrieving info such as offset and size of a given partition (get_partition_info)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

**Python API**

Before anything else, make sure that the `parttool` module is imported.

```
import sys
import os

idf_path = os.environ("IDF_PATH") # get value of IDF_PATH from environment
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.py lives in $IDF_PATH/components/partition_table
sys.path.append(parttool_dir) # this enables Python to find parttool module
from parttool import * # import all names inside parttool module
```

The starting point for using the tool’s Python API to do is create a `ParttoolTarget` object:

```
# Create a parttool.py target device connected on serial port /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```
The created object can now be used to perform operations on the target device:

```python
# Erase partition with name 'storage'
target.erase_partition(PartitionName("storage"))

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# Write to partition 'factory' the contents of a file named 'factory.bin'
target.write_partition(PartitionName("factory"), "factory.bin")

# Print the size of default boot partition
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

The partition to operate on is specified using `PartitionName` or `PartitionType` or `PARTITION_BOOT_DEFAULT`. As the name implies, these can be used to refer to partitions of a particular name, type-subtype combination, or the default boot partition.

More information on the Python API is available in the docstrings for the tool.

### Command-line Interface

The command-line interface of `parttool.py` has the following structure:

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- **command-args** - These are arguments that are needed for executing the main command, mostly pertaining to the target device.
- **subcommand** - This is the operation to be performed.
- **subcommand-args** - These are arguments that are specific to the chosen operation.

```bash
# Erase partition with name 'storage'
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-subtype=spiffs "spiffs.bin"

# Write to partition 'factory' the contents of a file named 'factory.bin'
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory "factory.bin"

# Print the size of default boot partition
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --info size
```

More information can be obtained by specifying `--help` as argument:

```bash
# Display possible subcommands and show main command argument descriptions
parttool.py --help

# Show descriptions for specific subcommand arguments
parttool.py [subcommand] --help
```

### 4.22 RF calibration

ESP32 supports three RF calibration methods during RF initialization:
4.22.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to menuconfig and enable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`.

4.22.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to menuconfig and disable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don’t mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

4.22.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

4.22.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to menuconfig and disable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to menuconfig and enable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

4.23 ESP32 ROM console

When an ESP32 is unable to boot from flash ROM (and the fuse disabling it hasn’t been blown), it boots into a rom console. The console is based on TinyBasic, and statements entered should be in the form of BASIC statements. As is common in the BASIC language, without a preceeding line number, commands entered are executed immediately; lines with a prefixed line number are stored as part of a program.
4.23.1 Full list of supported statements and functions

System

- **BYE** - exits Basic, reboots and retries booting from flash
- **END** - stops execution from the program, also “STOP”
- **MEM** - displays memory usage statistics
- **NEW** - clears the current program
- **RUN** - executes the current program

IO, Documentation

- **PEEK address** - get a 32-bit value from a memory address
- **POKE** - write a 32-bit value to memory
- **USR addr, arg1, ..** - Execute a machine language function
- **PRINT expression** - print out the expression, also “?”
- **PHEX expression** - print expression as a hex number
- **REM stuff** - remark/comment, also “”

Expressions, Math

- **A=V**, **LET A=V** - assign value to a variable
- **+, -, *, / -** Math
- **<,<=,=,>,!=,>=,>** - Comparisons
- **ABS expression** - returns the absolute value of the expression
- **RSEED v** - sets the random seed to v
- **RND m** - returns a random number from 0 to m
- **A=1234** - Assign a decimal value
- **A=\&h1A2** - Assign a hex value
- **A=\&b1001** - Assign a binary value

Control

- **IF expression statement** - perform statement if expression is true
- **FOR variable = start TO end** - start for block
- **FOR variable = start TO end STEP value** - start for block with step
- **NEXT** - end of for block
- **GOTO linenumber** - continue execution at this line number
- **GOSUB linenumber** - call a subroutine at this line number
- **RETURN** - return from a subroutine
- **DELAY** - Delay a given number of milliseconds

Pin IO

- **IODIR** - Set a GPIO-pin as an output (1) or input (0)
- **IOSET** - Set a GPIO-pin, configured as output, to high (1) or low (0)
- **IOGET** - Get the value of a GPIO-pin

4.23.2 Example programs

Here are a few example commands and programs to get you started…
Read UART_DATE register of uart0

```plaintext
> PHEX PEEK(\&h3FF40078)
15122500
```

Set GPIO2 using memory writes to GPIO_OUT_REG

Note: you can do this easier with the IOSET command

```plaintext
> POKE \&h3FF44004, PEEK(\&h3FF44004) OR \&b100
```

Get value of GPIO0

```plaintext
> IODIR 0,0
> PRINT IOGET(0)
0
```

Blink LED

Hook up an LED between GPIO2 and ground. When running the program, the LED should blink 10 times.

```plaintext
10 IODIR 2,1
20 FOR A=1 TO 10
30 IOSET 2,1
40 DELAY 250
50 IOSET 2,0
60 DELAY 250
70 NEXT A
RUN
```

4.23.3 Credits

The ROM console is based on “TinyBasicPlus” by Mike Field and Scott Lawrence, which is based on “68000 TinyBasic” by Gordon Brandly

4.24 Secure Boot

**Important:** All references in this document are related to Secure Boot V1 (The AES based Secure Boot Scheme). ESP32 Revision 3 onwards, the preferred secure boot scheme is **Secure Boot V2**. Please refer to Secure Boot V2 document for ESP32 Revision 3 or ESP32S2.

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each reset.

Secure Boot is separate from the **Flash Encryption** feature, and you can use secure boot without encrypting the flash contents. However, for a secure environment both should be used simultaneously. See **Secure Boot & Flash Encryption** for more details.

**Important:** Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document thoroughly and understand the implications of enabling secure boot.
### 4.24.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (ABS_DONE_0) is burned (written to 1) to permanently enable secure boot on the chip. For more details about efuse, see Chapter 11 “eFuse Controller” in the Technical Reference Manual.
- To understand the secure boot process, first familiarise yourself with the standard ESP-IDF boot process.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.

### 4.24.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under How To Enable Secure Boot. Further in-depth details are supplied under Technical Details:

1. The options to enable secure boot are provided in the Project Configuration Menu, under “Secure Boot Configuration”.
2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.
3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.
4. On first boot, the software bootloader follows the following process to enable secure boot:
   - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
   - The secure digest is flashed at offset 0x0 in the flash.
   - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
   - Bootloader permanently enables secure boot by burning the ABS_DONE_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)
5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see Secure Boot Hardware Support.
6. When running in secure boot mode, the software bootloader uses the secure boot signing key (the public key of which is embedded in the bootloader itself, and therefore validated as part of the bootloader) to verify the signature appended to all subsequent partition tables and app images before they are booted.

### 4.24.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see Re-Flashable Software Bootloader). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
  - By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING_SCHEME efuse has value 1) and a 192 bit key must be stored in this block.
  - The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits (details).
- “secure boot signing key” is a standard ECDSA public/private key pair (see Image Signing Algorithm) in PEM format.
  - The public key from this key pair (for signature verification but not signature creation) is compiled into the software bootloader and used to verify the second stage of booting (partition table, app image) before booting continues. The public key can be freely distributed, it does not need to be kept secret.
4.24.4 Bootloader Size

When secure boot is enabled the bootloader app binary `bootloader.bin` may exceed the default bootloader size limit. This is especially likely if flash encryption is enabled as well. The default size limit is 0x7000 (28672) bytes (partition table offset 0x8000 - bootloader offset 0x1000).

If the bootloader becomes too large, the ESP32 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

Options to work around this are:

- Reduce `bootloader log level`. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set `partition table offset` to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the `partition table` CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.)

4.24.5 How To Enable Secure Boot

1. Open the `Project Configuration Menu`, navigate to “Secure Boot Configuration” and select the option “One-time Flash”. (To understand the alternative “Reflashable” choice, see Re-Flashable Software Bootloader.)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration
4. The first time you run `make`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (/dev/urandom on OS/X/Linux and CryptGenRandom() on Windows). If this random number source is weak, then the private key will be weak.

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See Generating Secure Boot Signing Key for more details.

5. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
6. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by make) and then wait for flashing to complete. **Remember this is a one time flash, you can’t change the bootloader after this!**
7. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.
**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

**Note:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).

### 4.24.6 Re-Flashable Software Bootloader

Configuration “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode Secure Boot: Reflashable is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digests for them.

In the esp-idf build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the Generating Secure Boot Signing Key step below). This private key’s SHA-256 digest is used as the secure bootloader key in efuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.

**Note:** Although it’s possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

To enable a reflashable bootloader:

1. In the **Project Configuration Menu**, select “Bootloader Config” -> **CONFIG_SECURE_BOOT** -> **CONFIG_SECURE_BOOT_V1_ENABLED** -> **CONFIG_SECURE_BOOTLOADER_MODE** -> Reflashable.
2. If necessary, set the **CONFIG_SECURE_BOOTLOADER_KEY_ENCODING** based on the coding scheme used by the device. The coding scheme is shown in the **Features** line when esptool.py connects to the chip, or in the espefuse.py summary output.
3. Follow the steps shown above to choose a signing key file, and generate the key file.
4. Run **idf.py bootloader**. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an **espefuse.py burn_key** command which is used to write the bootloader key to efuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).
5. Resume from **Step 6 of the one-time flashing process**, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

### 4.24.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via **espsecure.py generate_signing_key**. This uses the python-ecdsa library, which in turn uses Python’s os.urandom() as a random number source.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the openssl command line:
Chapter 4. API Guides

```
openssl ecparam -name prime256v1 -genkey -noout -out my_secure_boot_signing_key.pem
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

### 4.24.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates).

To extract the public key from the private key:

```
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_KEY
```

The path to the public signature verification key needs to be specified in the menuconfig under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY --output SIGNED_BINARY_FILE
```

### 4.24.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

### 4.24.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

**Secure Boot Hardware Support**

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32’s Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see [Secure Bootloader Digest Algorithm](#). The digest can only be read back by software if Efuse ABS_DONE_0 is not burned (ie still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse ABS_DONE_0 is burned.

Secure Bootloader Digest Algorithm

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the espsecure.py tool in the components/esptool_py directory (specifically, the digest_secure_bootloader command).

Items marked with (*) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.

1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in Flash Encryption Algorithm.
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (*)
4. For each 16 byte plaintext block of the input image:
   - Reverse the byte order of the plaintext input block (*)
   - Apply AES256 in ECB mode to the plaintext block.
   - Reverse the byte order of the ciphertext output block. (*)
   - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (*)
6. Calculate SHA-512 of the ciphertext.

Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.

Image Signing Algorithm

Deterministic ECDSA as specified by RFC 6979.

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
  - In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

Manual Commands

Secure boot is integrated into the esp-idf build system, so make will automatically sign an app image if secure boot is enabled. idf.py bootloader will produce a bootloader digest if menuconfig is configured for it.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./imageSigned.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```
espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./bootloader-digest.bin build/bootloader/bootloader.bin
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the espsecure.py digest_secure_bootloader command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:
4.24.11 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.24.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See How To Enable Signed App Verification for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
- Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features -> Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you’ll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key”. In this case, private signing key should be generated by following instructions in Generating Secure Boot Signing Key; public verification key and signed image should be generated by following instructions in Remote Signing of Images.

4.24.13 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.
4.25 Secure Boot V2

**Important:** The references in this document are related to Secure Boot v2, the preferred scheme from ESP32-ECO3 onwards and in ESP32S2. (Refer to Secure Boot for ESP32)

Secure Boot V2 uses RSA based app and bootloader verification. This document can also be referred for signing apps with the RSA scheme without signing the bootloader.

### 4.25.1 Background

Secure Boot protects a device from running unsigned code (verification at time of load). A new RSA based secure boot verification scheme (Secure Boot V2) has been introduced for ESP32S2 and ESP32 ECO3 onwards.

- The software bootloader’s RSA-PSS signature is verified by the Mask ROM and it is executed post successful verification.
- The verified software bootloader verifies the RSA-PSS signature of the application image before it is executed.

### 4.25.2 Advantages

- The RSA public key is stored on the device. The corresponding RSA private key is kept secret on a server and is never accessed by the device.
- Upto three public keys can store can be generated and stored in ESP32S2 during manufacturing. (ESP32 ECO3: only one key)
- ESP32S2 also provides the facility to revoke individual public keys.
- Same image format & signature verification is applied for applications & software bootloader.
- No secrets are stored on the device. Therefore immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.25.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process, Step by step instructions are supplied under How To Enable Secure Boot V2.

1. Secure Boot V2 verifies the signature blocks appended to the bootloader and application binaries. The signature block contains the image binary signed by a RSA-3072 private key and its corresponding public key. More details on the Signature Block Format.
2. On startup, ROM code checks the secure boot v2 bit in eFuse.
3. If secure boot is enabled, ROM checks the SHA-256 of the public key in the signature block in the eFuse.
4. The ROM code validates the public key embedded in the software bootloader’s signature block by matching the SHA-256 of its public key to the SHA-256 in eFuse as per the earlier step. Boot process will be aborted if a valid hash of the public key isn’t found in the eFuse.
5. The ROM code verifies the signature of the bootloader with the pre-validated public key with the RSA-PSS Scheme. In depth information on Verifying the signature Block.
6. Software bootloader, reads the app partition and performs similar verification on the application. The application is verified on every boot up and OTA update. If selected OTA app partition fails verification, bootloader will fall back and look for another correctly signed partition.

### 4.25.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

Each signature block contains the following:
• **Offset 0 (1 byte):** Magic byte (0xe7)
• **Offset 1 (1 byte):** Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
• **Offset 2 (2 bytes):** Padding bytes, Reserved. Should be zero.
• **Offset 4 (32 bytes):** SHA-256 hash of only the image content, not including the signature block.
• **Offset 36 (384 bytes):** RSA Public Modulus used for signature verification. (value ‘\(n\)’ in RFC8017).
• **Offset 420 (4 bytes):** RSA Public Exponent used for signature verification (value ‘\(e\)’ in RFC8017).
• **Offset 424 (384 bytes):** Precalculated R, derived from ‘\(n\)’.
• **Offset 808 (4 bytes):** Precalculated M\(^*\), derived from ‘\(n\)’.
• **Offset 812 (384 bytes):** RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC).
• **Offset 1196:** CRC32 of the preceding 1095 bytes.
• **Offset 1200 (16 bytes):** Zero padding to length 1216 bytes.

**Note:** R and M\(^*\) are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

### 4.25.5 Verifying the signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Upto 3 signature blocks can be appended to the bootloader or application image in ESP32S2. (ESP32 ECO3: only one key)

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. The magic byte, signature block CRC is validated.
2. Public key digests are generated per signature block and compared with the digests from eFuse. If none of the digests match, the verification process is aborted.
3. The application image digest is generated and matched with the image digest in the signature blocks. The verification process is aborted if the digests don’t match.
4. The public key is used to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (3) for comparison.

• The application signing scheme is set to RSA for secure boot V2 and to ECDSA for secure boot V1.

**Important:** It is recommended to use secure boot V2 on the chip versions supporting them.

### 4.25.6 Bootloader Size

When secure boot is enabled the bootloader app binary `bootloader.bin` may exceed the default bootloader size limit. This is especially likely if flash encryption is enabled as well. The default size limit is 0x7000 (28672) bytes (partition table offset 0x8000 - bootloader offset 0x1000).

If the bootloader becomes too large, the ESP32 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 48KB (0xC000 bytes) (excluding the 4KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

Options to work around this are:

• Set **bootloader compiler optimization** back to “Size” if it has been changed from this default value.
• Reduce **bootloader log level**. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
• Set **partition table offset** to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the **partition table** CSV file contains explicit partition offsets,
they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.) Note that because of the absolute binary size limit, there is no benefit to moving the partition table any higher than offset 0xE000.

### 4.25.7 eFuse usage

ESP32-ECO3:

- **ABS_DONE_1** - Enables secure boot protection on boot.
- **BLK2** - Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M’ values (represented as 776 bytes - offsets 36 to 812 - as per the Signature Block Format) is written to an eFuse key block.

### 4.25.8 How To Enable Secure Boot V2

1. Open the **Project Configuration Menu**, in “Security Features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot. The revision should be changed to revision 3 (ESP32-ECO3) to view the Secure Boot V2 option.
2. To change the chip revision, set “Minimum Supported ESP32 Revision” to Rev 3 in “Component Config” -> “ESP32- Specific” , the Secure Boot V2 option can be enabled under “Enable hardware Secure Boot in bootloader” -> “Secure Boot Version” . Secure Boot V2 is available for ESP32 ECO3 onwards and in ESP32S2.
3. Specify the secure boot signing key path. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
4. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.
5. The first time you run `make` or `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

6. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
7. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
8. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

9. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.
Chapter 4. API Guides

**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

**Note:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

10. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

### 4.25.9 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in efuse.
- After Secure Boot is enabled, no further efuses can be read protected. (If Flash Encryption is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behaviour can be disabled, but this is not recommended.

### 4.25.10 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `-version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the openssl command line:

```
openssl genrsa -out my_secure_boot_signing_key.pem 3072
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

### 4.25.11 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_\n --BINARY_FILE BINARY_FILE
```

### 4.25.12 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
Chapter 4. API Guides

- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

4.25.13 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

Manual Commands

Secure boot is integrated into the esp-idf build system, so make or idf.py build will sign an app image and idf.py bootloader will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_\n\nsigned.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.25.14 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.25.15 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.26 Thread Local Storage

4.26.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- **FreeRTOS Native API**: ESP-IDF FreeRTOS native API.
- **Pthread API**: ESP-IDF’s pthread API.
- **C11 Standard**: C11 standard introduces special keyword to declare variables as thread local.
4.26.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `configNUM_THREAD_LOCAL_STORAGE_POINTERS` macro. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses. Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables. If size of the variable is more then 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

4.26.3 Pthread API

The ESP-IDF provides the following pthread API to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

4.26.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see [https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local](https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local). Storage for that kind of variables is allocated on the task’s stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using just a few Xtensa instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

4.27 Tools

4.27.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like `apt`, `yum`, `brew`, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:
Chapter 4. API Guides

- Python scripts bundled with ESP-IDF (such as idf.py)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

**Note:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the [Getting Started Guide](#).

**Tools metadata file**

The list of tools and tool versions required for each platform is located in `tools/tools.json`. The schema of this file is defined by `tools/tools_schema.json`.

This file is used by `tools/idf_tools.py` script when installing the tools or setting up the environment variables.

**Tools installation directory**

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\.espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` — where the archives of the tools are downloaded.
- `tools` — where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

**idf_tools.py script**

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- `install`: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. install command accepts the list of tools to install, in TOOL_NAME or TOOL_NAME@VERSION format. If all is given, all the tools (required and optional ones) are installed. If no argument or required is given, only the required tools are installed.
- `download`: Similar to `install` but doesn’t extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- `export`: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting PATH environment variable is sufficient, but some tools require extra environment variables.

The environment variables can be listed in either of shell or key-value formats, set by `--format` parameter:

- `shell` produces output suitable for evaluation in the shell. For example,

```bash
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```bash
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH"
```

on Windows.

**Note:** Exporting environment variables in Powershell format is not supported at the moment. key-value format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:
eval `($IDF_PATH/tools/idf_tools.py export)`

- key-value produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- **list:** Lists the known versions of the tools, and indicates which ones are installed.
- **check:** For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

### Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

### Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash

**Note:** To modify the shell environment in Bash, `export.sh` must be “sourced”:

```
./export.sh
```

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

### Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- **IDF Tools installer for Windows** can download and install the tools. Internally the installer uses `idf_tools.py`.
- **Eclipse plugin for ESP-IDF** includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- **Visual Studio Code extension for ESP-IDF** includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

### Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

4.27.2  IDF Docker Image

IDF Docker image (espressif/idf) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). IDF_PATH environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, make, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up PATH environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

Tags

Multiple tags of this image are maintained:

- latest: tracks master branch of ESP-IDF
- vX.Y: corresponds to ESP-IDF release vX.Y
- release-vX.Y: tracks release/vX.Y branch of ESP-IDF

---

Espressif Systems 1551 Release v4.2-dev-1660-g7d75213
Submit Document Feedback
Chapter 4. API Guides

Note: Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Usage

Setting up Docker  Before using the espressif/idf Docker image locally, make sure you have Docker installed. Follow the instructions at https://docs.docker.com/install/, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

Building a project with CMake  In the project directory, run:

```bash
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf`: uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as `espressif/idf:TAG`, for example:

```bash
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.0 idf.py --build
```

You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Building a project with GNU Make  Same as for CMake, except that the build command is different:

```bash
docker run --rm -v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

Note: If the `sdkconfig` file does not exist, the default behavior of GNU Make build system is to open the menuconfig UI. This may be not desired in automated build environments. To ensure that the `sdkconfig` file exists, `defconfig` target is added before `all`.

If you intend to build the same project repeatedly, you may bind the `tools/kconfig` directory of ESP-IDF to a named volume. This will prevent Kconfig tools, located in ESP-IDF directory, from being rebuilt, causing a rebuild of the rest of the project:

```bash
docker run --rm -v $PWD:/project -v kconfig:/opt/esp/idf/tools/kconfig -w /project espressif/idf make defconfig all -j4
```

If you need clean up the kconfig volume, run `docker volume rm kconfig`.

Binding the `tools/kconfig` directory to a volume is not necessary when using the CMake build system.

Using the image interactively  It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:
Chapter 4. API Guides

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

**Note:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (https://github.com/docker/for-win/issues/1018) and Docker for Mac (https://github.com/docker/for-mac/issues/900).

### 4.28 ULP Coprocessor programming

#### 4.28.1 ESP32 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP coprocessor assembler.

ULP coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing**

ESP32 ULP coprocessor’s JUMP, ST, LD instructions which take register as an argument (jump address, store/load base address) expect the argument to be expressed in 32-bit words.

Consider the following example program:

```
entry:
    NOP
    NOP
    NOP

loop:
    MOVE R1, loop
    JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However `JUMP` instruction expects the address stored in register to be expressed in 32-bit words. To account for this common use case, assembler will convert the address of label `loop` from bytes to words, when generating `MOVE` instruction, so the code generated code will be equivalent to:

```
0000  NOP
0004  NOP
0008  NOP
000c  NOP
```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

```
0010  MOVE R1, 4
0014  JUMP R1
```

The other case is when the argument of `MOVE` instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```
.set     val, 0x10
MOVE     R1, val
```

In this case, value loaded into R1 will be `0x10`.

Similar considerations apply to `LD` and `ST` instructions. Consider the following code:

```
.global array
array: .long 0
   .long 0
   .long 0
   .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0 // write value of R2 into the first array element,
              // i.e. array[0]
ST R2, R1, 4 // write value of R2 into the second array element
             // (4 byte offset), i.e. array[1]
ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
ST R2, R1, 0 // write value of R2 into the third array element,
              // i.e. array[2]
```

**Note about instruction execution time**

ULP coprocessor is clocked from `RTC_FAST_CLK`, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_-
                             _8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

**NOP - no operation**

**Syntax** `NOP`

**Operands** None

**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction
Description  No operation is performed. Only the PC is incremented.

Example:

1: NOP

ADD - Add to register

Syntax  ADD Rdst, Rsrc1, Rsrc2  
ADD Rdst, Rsrc1, imm

Operands
• Rdst - Register R[0..3]
• Rsrc1 - Register R[0..3]
• Rsrc2 - Register R[0..3]
• Imm - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction adds source register to another source register or to a 16-bit signed value and stores result to the destination register.

Examples:

1: ADD R1, R2, R3  //R1 = R2 + R3
2: Add R1, R2, 0x1234  //R1 = R2 + 0x1234
3: .set value1, 0x03  //constant value1=0x03
   Add R1, R2, value1  //R1 = R2 + value1
4: .global label  //declaration of variable label
   Add R1, R2, label  //R1 = R2 + label
   ...
   label: nop  //definition of variable label

SUB - Subtract from register

Syntax  SUB Rdst, Rsrc1, Rsrc2  
SUB Rdst, Rsrc1, imm

Operands
• Rdst - Register R[0..3]
• Rsrc1 - Register R[0..3]
• Rsrc2 - Register R[0..3]
• Imm - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction subtracts the source register from another source register or subtracts 16-bit signed value from a source register, and stores result to the destination register.

Examples:

1: SUB R1, R2, R3  //R1 = R2 - R3
2: sub R1, R2, 0x1234  //R1 = R2 - 0x1234
3: .set value1, 0x03  //constant value1=0x03
   SUB R1, R2, value1  //R1 = R2 - value1
4: .global label  //declaration of variable label
   SUB R1, R2, label  //R1 = R2 - label
   ...
   label: nop  //definition of variable label
AND - Logical AND of two operands

Syntax\n\[\text{AND } \text{Rdst, Rsrc1, Rsrc2}\]
\[\text{AND } \text{Rdst, Rsrc1, imm}\]

Operands
- \text{Rdst} - Register R[0..3]
- \text{Rsrc1} - Register R[0..3]
- \text{Rsrc2} - Register R[0..3]
- \text{Imm} - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical AND of a source register and another source register or 16-bit signed value and stores result to the destination register.

Examples:

1: \text{AND R1, R2, R3} // R1 = R2 \& R3
2: \text{AND R1, R2, 0x1234} // R1 = R2 \& 0x1234
3: \text{.set value1, 0x03} // constant value1 = 0x03
   \text{AND R1, R2, value1} // R1 = R2 \& value1
4: \text{.global label} // declaration of variable label
   \text{AND R1, R2, label} // R1 = R2 \& label
   \ldots
   \text{label: nop} // definition of variable label

OR - Logical OR of two operands

Syntax\n\[\text{OR } \text{Rdst, Rsrc1, Rsrc2}\]
\[\text{OR } \text{Rdst, Rsrc1, imm}\]

Operands
- \text{Rdst} - Register R[0..3]
- \text{Rsrc1} - Register R[0..3]
- \text{Rsrc2} - Register R[0..3]
- \text{Imm} - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical OR of a source register and another source register or 16-bit signed value and stores result to the destination register.

Examples:

1: \text{OR R1, R2, R3} // R1 = R2 \| R3
2: \text{OR R1, R2, 0x1234} // R1 = R2 \| 0x1234
3: \text{.set value1, 0x03} // constant value1 = 0x03
   \text{OR R1, R2, value1} // R1 = R2 \| value1
4: \text{.global label} // declaration of variable label
   \text{OR R1, R2, label} // R1 = R2 \| label
   \ldots
   \text{label: nop} // definition of variable label

LSH - Logical Shift Left

Syntax\n\[\text{LSH } \text{Rdst, Rsrc1, Rsrc2}\]
\[\text{LSH } \text{Rdst, Rsrc1, imm}\]

Operands

Submit Document Feedback
Chapter 4. API Guides

- \textit{Rdst} - Register R[0..3]
- \textit{Rsrc1} - Register R[0..3]
- \textit{Rsrc2} - Register R[0..3]
- \textit{Imm} - 16-bit signed value

\textbf{Cycles} 2 cycles to execute, 4 cycles to fetch next instruction

\textbf{Description} The instruction does logical shift to left of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

\textbf{Examples:}

1: \texttt{LSH R1, R2, R3} \hfill \texttt{//R1 = R2 \textless\textgreater R3}
2: \texttt{LSH R1, R2, 0x03} \hfill \texttt{//R1 = R2 \textless\textgreater 0x03}
3: \texttt{.set value1, 0x03} \hfill \texttt{//constant value1=0x03}
   \texttt{LSH R1, R2, value1} \hfill \texttt{//R1 = R2 \textless\textgreater value1}
4: \texttt{.global label} \hfill \texttt{//declaration of variable label}
   \texttt{LSH R1, R2, label} \hfill \texttt{//R1 = R2 \textless\textgreater label}
   \texttt{... label: nop} \hfill \texttt{//definition of variable label}

\textbf{RSH - Logical Shift Right}

\textbf{Syntax} RSH \textit{Rdst, Rsrc1, Rsrc2}

\textbf{RSH} \textit{Rdst, Rsrc1, imm}

\textbf{Operands} \textit{Rdst} - Register R[0..3] \textit{Rsrc1} - Register R[0..3] \textit{Rsrc2} - Register R[0..3] \textit{Imm} - 16-bit signed value

\textbf{Cycles} 2 cycles to execute, 4 cycles to fetch next instruction

\textbf{Description} The instruction does logical shift to right of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

\textbf{Examples:}

1: \texttt{RSH R1, R2, R3} \hfill \texttt{//R1 = R2 \textgreater\textless R3}
2: \texttt{RSH R1, R2, 0x03} \hfill \texttt{//R1 = R2 \textgreater\textless 0x03}
3: \texttt{.set value1, 0x03} \hfill \texttt{//constant value1=0x03}
   \texttt{RSH R1, R2, value1} \hfill \texttt{//R1 = R2 \textgreater\textless value1}
4: \texttt{.global label} \hfill \texttt{//declaration of variable label}
   \texttt{RSH R1, R2, label} \hfill \texttt{//R1 = R2 \textgreater\textless label}
   \texttt{... label: nop} \hfill \texttt{//definition of variable label}

\textbf{MOVE –Move to register}

\textbf{Syntax} MOVE \textit{Rdst, Rsrc}

\textbf{MOVE} \textit{Rdst, imm}

\textbf{Operands} \textit{Rdst} \textit{–} Register R[0..3]

\textbf{Cycles} 2 cycles to execute, 4 cycles to fetch next instruction

\textbf{Description} The instruction move to destination register value from source register or 16-bit signed value.

Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. To avoid using an extra instruction.

\textbf{Examples:}
Chapter 4. API Guides

ST –Store data to the memory

Syntax  ST Rs, Rd, offset

Operands
- Rs – Register R[0..3], holds the 16-bit value to store
- Rd – Register R[0..3], address of the destination, in 32-bit words
- Offset – 10-bit signed value, offset in bytes

Cycles  4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction stores the 16-bit value of Rs to the lower half-word of memory with address Rd+offset. The upper half-word is written with the current program counter (PC), expressed in words, shifted left by 5 bits:

\[
\text{Mem}[\text{Rd} + \text{offset} / 4][31:0] = (\text{PC}[10:0], 5'b0, \text{Rs}[15:0])
\]

The application can use higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

Examples:

1: ST R1, R2, 0x12 /*MEM[R2+0x12] - R1

LD –Load data from the memory

Syntax  LD Rd, Rs, offset

Operands Rd – Register R[0..3], destination
- Rs – Register R[0..3], holds address of destination, in 32-bit words
- Offset – 10-bit signed value, offset in bytes

Cycles  4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction loads lower 16-bit half-word from memory with address Rs+offset into the destination register Rd:

\[
\text{Rd}[15:0] = \text{Mem}[\text{Rs} + \text{offset} / 4][15:0]
\]

Examples:

1: LD R1, R2, 0x12 /*R1 = MEM[R2+0x12]*/

**JUMP** – Jump to an absolute address

**Syntax**

JUMP Rdst

JUMP ImmAddr

JUMP Rdst, Condition

JUMP ImmAddr, Condition

**Operands**

- **Rdst** – Register R[0..3] containing address to jump to (expressed in 32-bit words)
- **ImmAddr** – 13 bits address (expressed in bytes), aligned to 4 bytes
- **Condition**:
  - EQ – jump if last ALU operation result was zero
  - OV – jump if last ALU has set overflow flag

**Cycles**

2 cycles to execute, 2 cycles to fetch next instruction

**Description**

The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

**Examples**

| 1: | JUMP R1 // Jump to address in R1 (address in R1 is in... 32-bit words) |
| 2: | JUMP 0x120, EQ // Jump to address 0x120 (in bytes) if ALU... result is zero |
| 3: | JUMP label // Jump to label |
| | label: nop // Definition of label |
| 4: | .global label // Declaration of global label |
| | MOVE R1, label // R1 = label (value loaded into R1 is in words) |
| | JUMP R1 // Jump to label |
| | label: nop // Definition of label |

**JUMPR** – Jump to a relative offset (condition based on R0)

**Syntax**

JUMPR Step, Threshold, Condition

**Operands**

- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition**:
  - EQ (equal) – jump if value in R0 == threshold
  - LT (less than) – jump if value in R0 < threshold
  - LE (less or equal) – jump if value in R0 <= threshold
  - GT (greater than) – jump if value in R0 > threshold
  - GE (greater or equal) – jump if value in R0 >= threshold
Cycles  Conditions \textit{LT}, \textit{GE}, \textit{LE} and \textit{GT}: 2 cycles to execute, 2 cycles to fetch next instruction  
Conditions \textit{LE} and \textit{GT} are implemented in the assembler using one \textbf{JUMPR} instructions:

\begin{verbatim}
// JUMPR target, threshold, GT is implemented as:
    JUMPR target, threshold+1, GE
// JUMPR target, threshold, LE is implemented as:
    JUMPR target, threshold + 1, LT
\end{verbatim}

Conditions \textit{EQ} is implemented in the assembler using two \textbf{JUMPR} instructions:

\begin{verbatim}
// JUMPR target, threshold, EQ is implemented as:
    JUMPR next, threshold + 1, GE
    JUMPR target, threshold, GE
next:
\end{verbatim}

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch,  
or 4 cycles to execute + 4 cycles to fetch.

\textbf{Description}  The instruction makes a jump to a relative address if condition is true. Condition is the result of  
comparison of \textit{R0} register value and the threshold value.

\textbf{Examples}:

\begin{verbatim}
1: pos: JUMPR 16, 20, GE  // Jump to address (position + 16 bytes) if \textit{in R0} >= 20

2: // Down counting loop using \textit{R0} register
    MOVE R0, 16  // load 16 into \textit{R0}
    label: SUB R0, R0, 1  // \textit{R0}--
    NOP  // do something
    JUMPR label, 1, GE  // jump to label if \textit{R0} >= 1
\end{verbatim}

\textbf{JUMPS} – Jump to a relative address (condition based on stage count)

\textbf{Syntax}  \textbf{JUMPS} \textit{Step, Threshold, Condition}

\textbf{Operands}  
\begin{itemize}
    \item \textit{Step} – relative shift from current position, in bytes
    \item \textit{Threshold} – threshold value for branch condition
    \item \textit{Condition}:  
        \begin{itemize}
            \item \textit{EQ} (equal) – jump if value in stage\_cnt == threshold
            \item \textit{LT} (less than) – jump if value in stage\_cnt < threshold
            \item \textit{LE} (less or equal) – jump if value in stage\_cnt <= threshold
            \item \textit{GT} (greater than) – jump if value in stage\_cnt > threshold
            \item \textit{GE} (greater or equal) – jump if value in stage\_cnt >= threshold
        \end{itemize}
\end{itemize}

\textbf{Cycles}  Conditions \textit{LE}, \textit{LT}, \textit{GE}: 2 cycles to execute, 2 cycles to fetch next instruction  
Conditions \textit{EQ}, \textit{GT} are implemented in the assembler using two \textbf{JUMPS} instructions:

\begin{verbatim}
// JUMPS target, threshold, EQ is implemented as:
    JUMPS next, threshold, LT
    JUMPS target, threshold, LE
next:

// JUMPS target, threshold, GT is implemented as:
    JUMPS next, threshold, LE
    JUMPS target, threshold, GE
next:
\end{verbatim}
Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples**:

```
1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt >= 20

2: // Up counting loop using stage count register
   STAGE_RST // set stage_cnt to 0
   label: STAGE_INC 1 // stage_cnt++
   NOP // do something
   JUMPS label, 16, LT // jump to label if stage_cnt < 16
```

**STAGE_RST** – Reset stage count register

**Syntax** STAGE_RST  
**Operands** No operands  
**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples**:

```
1: STAGE_RST // Reset stage count register
```

**STAGE_INC** – Increment stage count register

**Syntax** STAGE_INC **Value**  
**Operands**  
- **Value** – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments stage count register by given value.

**Examples**:

```
1: STAGE_INC 10 // stage_cnt += 10

2: // Up counting loop example:
   STAGE_RST // set stage_cnt to 0
   label: STAGE_INC 1 // stage_cnt++
   NOP // do something
   JUMPS label, 16, LT // jump to label if stage_cnt < 16
```

**STAGE_DEC** – Decrement stage count register

**Syntax** STAGE_DEC **Value**  
**Operands**  
- **Value** – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements stage count register by given value.

**Examples**:

```
1: STAGE_DEC 10 // stage_cnt -= 10;

2: // Down counting loop example
```

(continues on next page)
STAGE_RST // set stage_cnt to 0
STAGE_INC 16 // increment stage_cnt to 16
label: STAGE_DEC 1 // stage_cnt--;
NOP // do something
JUMPS label, 0, GT // jump to label if stage_cnt > 0

HALT — End the program

Syntax HALT
Operands No operands
Cycles 2 cycles to execute
Description The instruction halts the ULP coprocessor and restarts ULP wakeup timer, if it is enabled.

Examples:
```
  1: HALT // Halt the coprocessor
```

WAKE — Wake up the chip

Syntax WAKE
Operands No operands
Cycles 2 cycles to execute, 4 cycles to fetch next instruction
Description The instruction sends an interrupt from ULP to RTC controller.
  • If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
  • If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.
Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

Examples:
```
  1: is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
      READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
      AND r0, r0, 1
      JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
      WAKE // Trigger wake up
      REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP-_SLP_TIMER_EN)
      HALT // Stop the ULP program
      // After these instructions, SoC will wake up,
      // and ULP will not run again until started by the main program.
```

SLEEP — Set ULP wakeup timer period

Syntax SLEEP sleep_reg
Operands
  • sleep_reg — 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.
Cycles 2 cycles to execute, 4 cycles to fetch next instruction
Description The instruction selects which of the SENS_ULP_CP_SLEEP_CYCx_REG (x = 0..4) register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

Examples:
Chapter 4. API Guides

1: SLEEP 1 // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG
2: set sleep_reg, 4 // Set constant
   SLEEP sleep_reg // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG

WAIT – wait some number of cycles

Syntax WAIT Cycles
Operands
  • Cycles - number of cycles for wait

Cycles 2 + Cycles cycles to execute, 4 cycles to fetch next instruction
Description The instruction delays for given number of cycles.

Examples:
1: WAIT 10 // Do nothing for 10 cycles
2: set wait_cnt, 10 // Set a constant
   WAIT wait_cnt // wait for 10 cycles

TSENS – do measurement with temperature sensor

Syntax TSENS Rdst, Wait_Delay
Operands
  • Rdst - Destination Register R[0..3], result will be stored to this register
  • Wait_Delay - number of cycles used to perform the measurement

Cycles 2 + Wait_Delay + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction
Description The instruction performs measurement using TSENS and stores the result into a general purpose register.

Examples:
1: TSENS R1, 1000 // Measure temperature sensor for 1000 cycles, and store result to R1

ADC – do measurement with ADC

Syntax ADC Rdst, Sar_sel, Mux
Operands
  • Rdst - Destination Register R[0..3], result will be stored to this register
  • Sar_sel - Select ADC: 0 = SARADC1, 1 = SARADC2
  • Mux - selected PAD, SARADC Pad[Mux+1] is enabled

Cycles 23 + max(1, SAR_AMP_WAIT1) + max(1, SAR_AMP_WAIT2) + max(1, SAR_AMP_WAIT3) + SARx_SAMPLE_CYCLE + SARx_SAMPLE_BIT cycles to execute, 4 cycles to fetch next instruction
Description The instruction makes measurements from ADC.

Examples:
1: ADC R1, 0, 1 // Measure value using ADC1 pad 2 and store...
I2C_RD - read single byte from I2C slave

Syntax

- `I2C_RD Sub_addr, High, Low, Slave_sel`

Operands

- `Sub_addr` - Address within the I2C slave to read.
- `High`, `Low` - Define range of bits to read. Bits outside of `[High, Low]` range are masked.
- `Slave_sel` - Index of I2C slave address to use.

Cycles Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description I2C_RD instruction reads one byte from I2C slave with index `Slave_sel`. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == Slave_sel`. 8 bits of read result is stored into `R0` register.

Examples:

1: `I2C_RD 0x10, 7, 0, 0` // Read byte from sub-address 0x10 of...
---slave with address set in SENS_I2C_SLAVE_ADDR0

I2C_WR - write single byte to I2C slave

Syntax

- `I2C_WR Sub_addr, Value, High, Low, Slave_sel`

Operands

- `Sub_addr` - Address within the I2C slave to write.
- `Value` - 8-bit value to be written.
- `High`, `Low` - Define range of bits to write. Bits outside of `[High, Low]` range are masked.
- `Slave_sel` - Index of I2C slave address to use.

Cycles Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description I2C_WR instruction writes one byte to I2C slave with index `Slave_sel`. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == Slave_sel`.

Examples:

1: `I2C_WR 0x20, 0x33, 7, 0, 1` // Write byte 0x33 to sub-address...
---0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.

REG_RD – read from peripheral register

Syntax `REG_RD Addr, High, Low`

Operands

- `Addr` - Register address, in 32-bit words
- `High` - Register end bit number
- `Low` - Register start bit number

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction reads up to 16 bits from a peripheral register into a general purpose register: `R0 = REG[Addr][High:Low]`. This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4
```

Examples:

1: `REG_RD 0x120, 7, 4` // load 4 bits: R0 = (12'b0, REG[0x120][7:4])
**REG_WR** – write to peripheral register

**Syntax**  
`REG_WR Addr, High, Low, Data`

**Operands**
- `Addr` – Register address, in 32-bit words.
- `High` – Register end bit number
- `Low` – Register start bit number
- `Data` – Value to write, 8 bits

**Cycles**  
8 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction writes up to 8 bits from an immediate data value into a peripheral register:  
\[ \text{REG}[\text{Addr}][\text{High:Low}] = \text{data}. \]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

\[ \text{addr}_\text{ulp} = (\text{addr}_\text{dport} - \text{DR\_REG\_RTCCNTL\_BASE}) / 4 \]

**Examples:**

```
1: REG_WR 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10
```

**Convenience macros for peripheral registers access**

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ_RTC_REG(rtc_reg, low_bit, bit_width)**  
Read up to 16 bits from `rtc_reg[low_bit + bit_width - 1:low_bit]` into R0. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**READ_RTC_FIELD(rtc_reg, field)**  
Read from a field in `rtc_reg` into R0, up to 16 bits. For example:

```
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value)**  
Write immediate value into `rtc_reg[low_bit + bit_width - 1:low_bit]`, bit_width <= 8. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**WRITE_RTC_FIELD(rtc_reg, field, value)**  
Write immediate value into a field in `rtc_reg`, up to 8 bits. For example:
4.28.2 Programming ULP coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),          // R3 <- 16
    I_LD(R0, R3, 0),         // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1),         // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),      // R2 <- R0 + R1
    I_ST(R2, R3, 2),         // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 — R3) and literal constants. See ULP coprocessor instruction defines section for descriptions of instructions and arguments they take.

**Note:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

Load and store instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM (which is address 0x50000000 as seen by the main CPUs).

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp_insn_t token which contains the label number.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),          // R0 <- 34
    M_LABEL(1),              // label_1
    I_MOVI(R1, 32),          // R1 <- 32
    I_LD(R1, R1, 0),         // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),          // R2 <- 33
    I_LD(R2, R2, 0),         // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2),      // R3 <- R1 - R2
    I_ST(R3, R0, 0),         // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 0),       // R0++
    M_BL(1, 64),             // if (R0 < 64) goto label_1
    I_HALT()
};
```

(continues on next page)
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);

Application Example

Demonstration of entering into deep sleep mode and waking up using several wake up sources: system/deep_sleep.

API Reference

Header File

- ulp/include/esp32/ulp.h

Functions

`esp_err_t ulp_process_macros_and_load(uint32_t load_addr, const ulp_insn_t *program, size_t *size)`

 Resolve all macro references in a program and load it into RTC memory.

 Return

- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or can not be loaded

 Parameters

- load_addr: address where the program should be loaded, expressed in 32-bit words
- program: ulp_insn_t array with the program
- size: size of the program, expressed in 32-bit words

`esp_err_t ulp_run(uint32_t entry_point)`

 Run the program loaded into RTC memory.

 Return ESP_OK on success

 Parameters

- entry_point: entry point, expressed in 32-bit words

Error codes

`ESP_ERR_ULP_BASE` Offset for ULP-related error codes

`ESP_ERR_ULP_SIZE_TOO_BIG` Program doesn’t fit into RTC memory reserved for the ULP

`ESP_ERR_ULP_INVALID_LOAD_ADDR` Load address is outside of RTC memory reserved for the ULP

`ESP_ERR_ULP_DUPLICATE_LABEL` More than one label with the same number was defined

`ESP_ERR_ULP_UNDEFINED_LABEL` Branch instructions references an undefined label

`ESP_ERR_ULP.Branch.OUT_OF_RANGE` Branch target is out of range of B instruction (try replacing with BX)
**ULP coprocessor registers**  ULP co-processor has 4 16-bit general purpose registers. All registers have same functionality, with one exception. R0 register is used by some of the compare-and-branch instructions as a source register.

These definitions can be used for all instructions which require a register.

R0
general purpose register 0

R1
general purpose register 1

R2
general purpose register 2

R3
general purpose register 3

**ULP coprocessor instruction defines**

I_DELAY (cycles_)
Delay (nop) for a given number of cycles

I_HALT ()
Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

I_END ()
Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

I_ST (reg_val, reg_addr, offset_)
Store value from register reg_val into RTC memory.

The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:
- bits [31:21] hold the PC of current instruction, expressed in 32-bit words
- bits [20:16] = 5’b1
- bits [15:0] are assigned the contents of reg_val

RTC_SLOW_MEM[addr + offset_] = { 5’b0, insn_PC[10:0], val[15:0] }

I_LD (reg_dest, reg_addr, offset_)
Load value from RTC memory into reg_dest register.

Loads 16 LSBs from RTC memory word given by the sum of value in reg_addr and value of offset_.

I_WR_REG (reg, low_bit, high_bit, val)
Write literal value to a peripheral register

reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_RD_REG (reg, low_bit, high_bit)
Read from peripheral register into R0

R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.
**I_BL** (pc_offset, imm_value)
Branch relative if R0 less than immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BGE** (pc_offset, imm_value)
Branch relative if R0 greater or equal than immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BXR** (reg_pc)
Unconditional branch to absolute PC, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXI** (imm_pc)
Unconditional branch to absolute PC, immediate address.

Address imm_pc is expressed in 32-bit words.

**I_BXZR** (reg_pc)
Branch to absolute PC if ALU result is zero, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXZI** (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.

Address imm_pc is expressed in 32-bit words.

**I_BXFR** (reg_pc)
Branch to absolute PC if ALU overflow, address in register

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXFI** (imm_pc)
Branch to absolute PC if ALU overflow, immediate address

Address imm_pc is expressed in 32-bit words.

**I_ADDR** (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2

**I.SUBR** (reg_dest, reg_src1, reg_src2)
Subtraction: dest = src1 - src2

**I.ANDR** (reg_dest, reg_src1, reg_src2)
Logical AND: dest = src1 & src2

**I.ORR** (reg_dest, reg_src1, reg_src2)
Logical OR: dest = src1 | src2

**I_MOVR** (reg_dest, reg_src)
Copy: dest = src

**I.LSHR** (reg_dest, reg_src, reg_shift)
Logical shift left: dest = src << shift

**I.RSHR** (reg_dest, reg_src, reg_shift)
Logical shift right: dest = src >> shift

**I.ADDI** (reg_dest, reg_src, imm_)
Add register and an immediate value: dest = src1 + imm

**I.SUBI** (reg_dest, reg_src, imm_)
Subtract register and an immediate value: dest = src - imm

**I.ANDI** (reg_dest, reg_src, imm_)
Logical AND register and an immediate value: dest = src & imm
Chapter 4. API Guides

I_ORI (reg_dest, reg_src, imm_)
Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)
Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)
Logical shift left register value by an immediate: dest = src << imm

I_RSHI (reg_dest, reg_src, imm_)
Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
Define a label with number label_num.
This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.

M_BL (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BGE (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)
Macro: unconditional branch to label
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)
Macro: branch to label if ALU result is zero
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)
Macro: branch to label if ALU overflow
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

Defines
RTC_SLOW_MEM
RTC slow memory, 8k size
The ULP (Ultra Low Power) coprocessor is a simple FSM (Finite State Machine) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers.
4.28.3 Installing the Toolchain

The ULP coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain. If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then the ULP toolchain will already be installed.

4.28.4 Compiling the ULP Code

To compile the ULP code as part of the component, the following steps must be taken:

1. The ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance ulp/.

2. Call `ulp_embed_binary` from the component CMakeLists.txt after registration. For example:

   ```
   ...
   idf_component_register()
   set(ulp_app_name ulp_${COMPONENT_NAME})
   set(ulp_s_sources ulp/ulp_assembly_source_file.S)
   set(ulp_exp_dep_srcs "ulp_c_source_file.c")
   ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")
   ```

   The first argument to `ulp_embed_binary` specifies the ULP binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g. `idf.py app`) Inside, the build system will take the following steps to build ULP program:

   1. **Run each assembly file (foo.S) through the C preprocessor.** This step generates the preprocessed assembly files (foo.ulp.S) in the component build directory. This step also generates dependency files (foo.ulp.d).

   2. **Run preprocessed assembly sources through the assembler.** This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.

   3. **Run the linker script template through the C preprocessor.** The template is located in components/ulp/ld directory.

   4. **Link the object files into an output ELF file** (ulp_app_name.elf). The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.

   5. **Dump the contents of the ELF file into a binary** (ulp_app_name.bin) which can then be embedded into the application.

   6. **Generate a list of global symbols** (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.

   7. **Create an LD export script and header file** (ulp_app_name.ld and ulp_app_name.h) containing the symbols from ulp_app_name.sym. This is done using the esp32ulp_mapgen.py utility.

   8. **Add the generated binary to the list of binary files** to be embedded into the application.

4.28.5 Accessing the ULP Program Variables

Global symbols defined in the ULP program may be used inside the main program.

For example, the ULP program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:
The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the \${ULP_APP_NAME}.h and \${ULP_APP_NAME}.ld files which define the global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with ulp_.

The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as uint32_t. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```assembler
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an include statement. This will allow the ULP program variables to be accessed as regular variables:

```c
#include "ulp_app_name.h"
```

Note that the ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word.

Likewise, the ULP store instruction writes register value into the lower 16 bits part of the 32-bit word. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP, the main application needs to mask the upper 16 bits, e.g.:

```c
printf("Last measurement value: \%d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.28.6 Starting the ULP Program

To run a ULP program, the main application needs to load the ULP program into RTC memory using the ulp_load_binary function, and then start it using the ulp_run function.

Note that “Enable Ultra Low Power (ULP) Coprocessor” option must be enabled in menuconfig to reserve memory for the ULP. “RTC slow memory reserved for coprocessor” option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to ulp_app_name):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary( (continues on next page)"
Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

Parameters

- load_addr: address where the program should be loaded, expressed in 32-bit words
- program_binary: pointer to program binary
- program_size: size of the program binary

Once the program is loaded into RTC memory, the application can start it, passing the address of the entry point to the ulp_run function:

```c
ESP_ERROR_CHECK( ulp_run(\%ulp_entry - RTC_SLOW_MEM) );
```

Run the program loaded into RTC memory.

Return ESP_OK on success

Parameters

- entry_point: entry point, expressed in 32-bit words

Declaration of the entry point symbol comes from the generated header file mentioned above, \${ULP_APP_NAME}.h. In the assembly source of the ULP application, this symbol must be marked as .global:

```assembly
.globa1 entry
entry:
    /* code starts here */
```

### 4.28.7 ULP Program Flow

The ULP coprocessor is started by a timer. The timer is started once ulp_run is called. The timer counts the number of RTC_SLOW_CLK ticks (by default, produced by an internal 150kHz RC oscillator). The number of ticks is set using SENS_ULP_CP_SLEEP_CYCx_REG registers (x = 0..4). When starting the ULP for the first
Chapter 4. API Guides

time, SENS_ULP_CP_SLEEP_CYC0_REG will be used to set the number of timer ticks. Later the ULP program can select another SENS_ULP_CP_SLEEP_CYCx_REG register using the sleep instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) using the ulp_set_wakeup_period function.

```c
esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)
```

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4. By default, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

**Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

**Parameters**
- period_index: wakeup period setting number (0 - 4)
- period_us: wakeup period, us

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCx_REG register, the ULP coprocessor will power up and start running the program from the entry point set in the call to ulp_run.

The program runs until it encounters a halt instruction or an illegal instruction. Once the program halts, the ULP coprocessor will power down, and the timer will be started again.

To disable the timer (effectively preventing the ULP program from running again), please clear the RTC_CNTL_ULP_CP_SLP_TIMER_EN bit in the RTC_CNTL_STATE0_REG register. This can be done both from the ULP code and from the main program.

4.29 The ULP Coprocessor (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

The ULP (Ultra Low Power) coprocessor is a simple FSM (Finite State Machine) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers.

4.29.1 Installing the Toolchain

The ULP coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain.

2. Extract the toolchain into a directory, and add the path to the bin/ directory of the toolchain to the PATH environment variable.

### 4.29.2 Compiling the ULP Code

To compile the ULP code as part of the component, the following steps must be taken:

1. The ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance ulp/.

2. Modify the component makefile, adding the following:

   ```makefile
   ulp_APP_NAME += ulp_$(COMPONENT_NAME)
   ulp_S_SOURCES += $(COMPONENT_PATH)/ulp/ulp_source_file.S
   ulp_EXP_DEP_OBJECTS += main.o
   include $(IDF_PATH)/components/ulp/component_ulp_common.mk
   ```

   Here is each line explained:
   - **ulp_APP_NAME**: Name of the generated ULP application, without an extension. This name is used for build products of the ULP application: ELF file, map file, binary file, generated header file, and generated linker export file.
   - **ulp_S_SOURCES**: List of assembly files to be passed to the ULP assembler. These must be absolute paths, i.e. start with $(COMPONENT_PATH). Consider using $(addprefix) function if more than one file needs to be listed. Paths are relative to component build directory, so prefixing them is not necessary.
   - **ulp_EXP_DEP_OBJECTS**: List of object files names within the component which include the generated header file. This list is needed to build the dependencies correctly and ensure that the generated header file is created before any of these files are compiled. See section below explaining the concept of generated header files for ULP applications.

3. Build the application as usual (e.g. `idf.py build` or `idf.py app`)

   Inside, the build system will take the following steps to build ULP program:

   1. **Run each assembly file (foo.S) through the C preprocessor**. This step generates the preprocessed assembly files (foo.ulp.pS) in the component build directory. This step also generates dependency files (foo.ulp.d).
   2. **Run the preprocessed assembly sources through the assembler**. This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
   3. **Run the linker script template through the C preprocessor**. The template is located in components/ulp/ld directory.
   4. **Link the object files into an output ELF file** (ulp_app_name.elf). The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.
   5. **Dump the contents of the ELF file into a binary** (ulp_app_name.bin) which can then be embedded into the application.
   6. **Generate a list of global symbols** (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.
   7. **Create an LD export script and header file** (ulp_app_name.ld and ulp_app_name.h) containing the symbols from ulp_app_name.sym. This is done using the esp32ulp_mapgen.py utility.
   8. **Add the generated binary to the list of binary files** to be embedded into the application.

### 4.29.3 Accessing the ULP Program Variables

Global symbols defined in the ULP program may be used inside the main program.

For example, the ULP program may define a variable `measurement_count` which will define the number of the ADC measurements the program needs to make before waking up the chip from deep sleep:
The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating $(ULP_APP_NAME).h$ and $(ULP_APP_NAME).ld$ files which define global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with `ulp_`. The header file contains the declaration of the symbol:

```
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines locations of symbols in RTC_SLOW_MEM:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `#include` statement. This will allow the ULP program variables to be accessed as regular variables:

```
#include "ulp_app_name.h"
```

Note that the ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word.

Likewise, the ULP store instruction writes register value into the lower 16 bits part of the 32-bit word. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP, the main application needs to mask the upper 16 bits, e.g.:

```
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.29.4 Starting the ULP Program

To run a ULP program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary` function, and then start it using the `ulp_run` function.

Note that “Enable Ultra Low Power (ULP) Coprocessor” option must be enabled in menuconfig to reserve memory for the ULP. “RTC slow memory reserved for coprocessor” option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose `ULP_APP_NAME` was defined to `ulp_app_name`):

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
...
```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

0 /* load address, set to 0 when using default linker scripts */,
  bin_start,
  (bin_end - bin_start) / sizeof(uint32_t) ) ;
}

esp_err_t ulp_load_binary (uint32_t load_addr, const uint8_t *program_binary, size_t program_size)
Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):
1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This
linker script produces binaries with load_addr == 0.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if load_addr is out of range
• ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
• ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

Parameters
• load_addr: address where the program should be loaded, expressed in 32-bit words
• program_binary: pointer to program binary
• program_size: size of the program binary

Once the program is loaded into RTC memory, the application can start it, passing the address of the entry point to
the ulp_run function:

ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );

esp_err_t ulp_run (uint32_t entry_point)
Run the program loaded into RTC memory.

Return ESP_OK on success

Parameters
• entry_point: entry point, expressed in 32-bit words

Declaration of the entry point symbol comes from the generated header file mentioned above,
$(ULP_APP_NAME).h. In the assembly source of the ULP application, this symbol must be marked as
.global:

.entry:
/* code starts here */

4.29.5 ULP Program Flow

The ULP coprocessor is started by a timer. The timer is started once ulp_run is called. The timer counts the
number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of
ticks is set using SENS_ULP_CP_SLEEP_CYCx_REG registers (x = 0..4). When starting the ULP for the first
time, SENS_ULP_CP_SLEEP_CYC0_REG will be used to set the number of timer ticks. Later the ULP program can select another SENS_ULP_CP_SLEEP_CYCx_REG register using the sleep instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYC0_REG, x = 0..4) using the ulp_set_wakeup_period function.

```c
esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)
```

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYC0_REG registers, x = 0..4. By default, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

**Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

**Parameters**
- period_index: wakeup period setting number (0 - 4)
- period_us: wakeup period, us

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCx_REG register, the ULP coprocessor will power up and start running the program from the entry point set in the call to ulp_run.

The program runs until it encounters a halt instruction or an illegal instruction. Once the program halts, ULP coprocessor will power down, and the timer will be started again.

To disable the timer (effectively preventing the ULP program from running again), please clear the RTC_CNTL_ULP_CP_SLP_TIMER_EN bit in the RTC_CNTL_STATE0_REG register. This can be done both from the ULP code and from the main program.

### 4.30 Unit Testing in ESP32

ESP-IDF comes with a unit test application that is based on the Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in the test subdirectories of each component respectively.

#### 4.30.1 Normal Test Cases

Unit tests are located in the test subdirectory of a component. Tests are written in C, and a single C source file can contain multiple test cases. Test files start with the word “test”.

Each test file should include the unity.h header and the header for the C module to be tested.

Tests are added in a function in the C file as follows:

```c
TEST_CASE("test name", "[module name]"
{
    // Add test here
}
```

The first argument is a descriptive name for the test, the second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.
Note: There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()` autonomously, and run the test cases, then call `UNITY_END()`.

The test subdirectory should contain a component `CMakeLists.txt`, since they are themselves, components. ESP-IDF uses the `unity` test framework and should be specified as a requirement for the component. Normally, components should list their sources manually; for component tests however, this requirement is relaxed and the use of the `SRC_DIRS` argument in `idf_component_register` is advised.

Overall, the minimal test subdirectory `CMakeLists.txt` file should contain the following:

```cmake
idf_component_register(SRC_DIRS "." INCLUDE_DIRS "." REQUIRES unity)
```

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.

### 4.30.2 Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). However, components that require some form of communication (e.g., GPIO, SPI) require another device to communicate with, thus cannot be tested normal test cases. Multi-device test cases involve writing multiple test functions, and running them on multiple DUTs.

The following is an example of a multi-device test case:

```c
void gpio_master_test()
{
  gpio_config_t slave_config = {
    .pin_bit_mask = 1 << MASTER_GPIO_PIN,
    .mode = GPIO_MODE_INPUT,
  };
  gpio_config(&slave_config);
  unity_wait_for_signal("output high level");
  TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
  gpio_config_t master_config = {
    .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
    .mode = GPIO_MODE_OUTPUT,
  };
  gpio_config(&master_config);
  gpio_set_level(SLAVE_GPIO_PIN, 1);
  unity_send_signal("output high level");

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", 
                          "[driver]", gpio_master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare a multi-device test case. The first argument is test case name, the second argument is test case description. From the third argument, up to 5 test functions can be defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt and user interaction is required:

DUT1 (master) console:
Waiting for signal: [output high level]!
Please press "Enter" key to once any board send this signal.

DUT2 (slave) console:

Send signal: [output high level]!

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from unity_wait_for_signal and starts to change GPIO level.

4.30.3 Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we expect to run some specific tests after certain kinds of reset. For example, we expect to test if the reset reason is correct after a wakeup from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support this, we can define multi-stage test cases, to group a set of test functions:

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    RESET_REASON reason = rtc_get_reset_reason(0);
    TEST_ASSERT(reason == DEEPSLEEP_RESET);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_deepsleep, check_deepsleep_reset_reason);
```

Multi-stage test cases present a group of test functions to users. It needs user interactions (select cases and select different stages) to run the case.

4.30.4 Tests For Different Targets

Some tests (especially those related to hardware) cannot run on all targets. Below is a guide how to make your unit tests run on only specified targets.

1. Wrap your test code by !(TEMPORARY_)DISABLED_FOR_TARGETS() macros and place them either in the original test file, or separate the code into files grouped by functions, but make sure all these files will be processed by the compiler. E.g.:

```c
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

Once you need one of the tests to be compiled on a specified target, just modify the targets in the disabled list. It’s more encouraged to use some general conception that can be described in soc_caps.h to control the disabling of tests. If this is done but some of the tests are not ready yet, use both of them (and remove !(TEMPORARY_)DISABLED_FOR_TARGETS() later). E.g.:

```c
#if SOC_Sdio_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
```

(continues on next page)
2. For test code that you are 100% sure that will not be supported (e.g. no peripheral at all), use DISABLED_FOR_TARGETS; for test code that should be disabled temporarily, or due to lack of runners, etc., use TEMPORARY_DISABLED_FOR_TARGETS.

Some old ways of disabling unit tests for targets, that have obvious disadvantages, are deprecated:

- DON’T put the test code under test/target folder and use CMakeLists.txt to choose one of the target folder. This is prevented because test code is more likely to be reused than the implementations. If you put something into test/esp32 just to avoid building it on esp32s2, it’s hard to make the code tidy if you want to enable the test again on esp32s3.

- DON’T use CONFIG_IDF_TARGET_xxx macros to disable the test items any more. This makes it harder to track disabled tests and enable them again. Also, a black-list style #if !disabled is preferred to white-list style #if CONFIG_IDF_TARGET_xxx, since you will not silently disable cases when new targets are added in the future. But for test implementations, it’s allowed to use #if CONFIG_IDF_TARGET_xxx to pick one of the implementation code.
  - Test item: some items that will be performed on some targets, but skipped on other targets. E.g. There are three test items SD 1-bit, SD 4-bit and SDSPI. For ESP32S2, which doesn’t have SD host, among the tests only SDSPI is enabled on ESP32S2.
  - Test implementation: some code will always happen, but in different ways. E.g. There is no SDIO PKT_LEN register on ESP8266. If you want to get the length from the slave as a step in the test process, you can have different implementation code protected by #if CONFIG_IDF_TARGET_xxx. But please avoid using #else macro. When new target is added, the test case will fail at building stage, so that the maintainer will be aware of this, and choose one of the implementations explicitly.

### 4.30.5 Building Unit Test App

Follow the setup instructions in the top-level esp-idf README. Make sure that IDF_PATH environment variable is set to point to the path of esp-idf top-level directory.

Change into tools/unit-test-app directory to configure and build it:

- idf.py menuconfig - configure unit test app.
- idf.py -T all build - build unit test app with tests for each component having tests in the test subdirectory.
- idf.py -T "xxx yyy" build - build unit test app with tests for some space-separated specific components (For instance: idf.py -T heap build - build unit tests only for heap component directory).
- idf.py -T all -E "xxx yyy" build - build unit test app with all unit tests, except for unit tests of some components (For instance: idf.py -T all -E "ulp mbedtls" build - build all unit tests excludes ulp and mbedtls components).

When the build finishes, it will print instructions for flashing the chip. You can simply run idf.py flash to flash all build output.

You can also run idf.py -T all flash or idf.py -T xxx flash to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

### 4.30.6 Running Unit Tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:
Here's the test menu, pick your combo:
(1) "esp_ota_begin() verifies arguments" [ota]
(2) "esp_ota_get_next_update_partition logic" [ota]
(3) "Verify bootloader image in flash" [bootloader_support]
(4) "Verify unit test app image" [bootloader_support]
(5) "can use new and delete" [cxx]
(6) "can call virtual functions" [cxx]
(7) "can use static initializers for non-POD types" [cxx]
(8) "can use std::vector" [cxx]
(9) "static initialization guards work as expected" [cxx]
(10) "before scheduler has started, static initializers work correctly" [cxx]
(11) "adc2 work with wifi" [adc]
(12) "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_device]
(13) "SPI Master clockdiv calculation routines" [spi]
(14) "SPI Master DMA test: length, start, not aligned" [spi]
(15) "SPI Master, interaction of multiple devs" [ignore]
(16) "SPI Master, interaction of multiple devs" [spi][ignore]
(17) "SPI Master no response when switch from host1 (HSPI) to host2 (VSPI)"
(18) "SPI Master DMA test, TX and RX in different regions" [spi]
(19) "SPI Master DMA test, TX and RX in different regions" [spi]
(20) "reset reason check for deepsleep" [esp32][test_env=UT_T2_1][multi_stage]
(1) "trigger_deepsleep"
(2) "check_deepsleep_reset_reason"

The normal case will print the case name and description. Master-slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks to run a single test case
- Test case index to run a single test case
- Module name in square brackets to run all test cases for a specific module
- An asterisk to run all test cases

[multi_device] and [multi_stage] tags tell the test runner whether a test case is a multiple devices or multiple stages of test case. These tags are automatically added by `TEST_CASE_MULTIPLE_DEVICES` and `TEST_CASE_MULTIPLE_STAGES` macros.

After you select a multi-device test case, it will print sub-menu:

Running gpio master/slave test example...
gpio master/slave test example
(1) "gpio_master_test"
(2) "gpio_slave_test"

You need to input a number to select the test running on the DUT.

Similar to multi-device test cases, multi-stage test cases will also print sub-menu:

Running reset reason check for deepsleep...
reset reason check for deepsleep
(1) "trigger_deepsleep"
(2) "check_deepsleep_reset_reason"

First time you execute this case, input 1 to run first stage (trigger deepsleep). After DUT is rebooted and able to run test cases, select this case again and input 2 to run the second stage. The case only passes if the last stage passes and all previous stages trigger reset.
4.30.7 Timing Code with Cache Compensated Timer

Instructions and data stored in external memory (e.g. SPI Flash and SPI RAM) are accessed through the CPU’s unified instruction and data cache. When code or data is in cache, access is very fast (i.e., a cache hit).

However, if the instruction or data is not in cache, it needs to be fetched from external memory (i.e., a cache miss). Access to external memory is significantly slower, as the CPU must execute stall cycles whilst waiting for the instruction or data to be retrieved from external memory. This can cause the overall code execution speed to vary depending on the number of cache hits or misses.

Code and data placements can vary between builds, and some arrangements may be more favorable with regards to cache access (i.e., minimizing cache misses). This can technically affect execution speed, however these factors are usually irrelevant as their effect ‘average out’ over the device’s operation.

The effect of the cache on execution speed, however, can be relevant in benchmarking scenarios (especially microbenchmarks). There might be some variability in measured time between runs and between different builds. A technique for eliminating for some of the variability is to place code and data in instruction or data RAM (IRAM/DRAM), respectively. The CPU can access IRAM and DRAM directly, eliminating the cache out of the equation. However, this might not always be viable as the size of IRAM and DRAM is limited.

The cache compensated timer is an alternative to placing the code/data to be benchmarked in IRAM/DRAM. This timer uses the processor’s internal event counters in order to determine the amount of time spent on waiting for code/data in case of a cache miss, then subtract that from the recorded wall time.

```c
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

One limitation of the cache compensated timer is that the task that benchmarked functions should be pinned to a core. This is due to each core having its own event counters that are independent of each other. For example, if ccomp_timer_start gets called on one core, put to sleep by the scheduler, wakes up, and gets rescheduled on the other core, then the corresponding ccomp_timer_stop will be invalid. invalid.

4.31 Unit Testing (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

ESP-IDF comes with a unit test application that is based on the Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in the test subdirectories of each component respectively.

4.31.1 Normal Test Cases

Unit tests are located in the test subdirectory of a component. Tests are added in C files, a single C file can include multiple test cases. Test files start with the word “test”.

Each test file should include the unity.h header and the header for the C module to be tested.

Tests are added in a function in the C file as follows:
TEST_CASE("test name", "[module name]"
{
    // Add test here
}

The first argument is a descriptive name for the test, the second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

**Note:** There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()` autonomously, and run the test cases, then call `UNITY_END()`.

Each test subdirectory needs to include a `component.mk` file with the following line of code:

```
COMPONENT_ADD_LDFLAGS = -Wl,--whole-archive -l$(COMPONENT_NAME) -Wl,--no-whole-archive
```

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.

### 4.31.2 Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). However, components that require some form of communication (e.g., GPIO, SPI) require another device to communicate with, thus cannot be tested normal test cases. Multi-device test cases involve writing multiple test functions, and running them on multiple DUTs.

The following is an example of a Multi-device test case:

```c
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare a multi-device test case. The first argument is test case name, the second argument is test case description. From the third argument, up to 5 test functions can be defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt and requires user interaction:
**DUT1 (master) console:**

```plaintext
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

**DUT2 (slave) console:**

```plaintext
Send signal: [output high level]!
```

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from `unity_wait_for_signal` and starts to change GPIO level.

Signals can also be used to pass parameters between multiple devices. For example, DUT1 want to know the MAC address of DUT2, so it can connect to DUT2. In this case, `unity_wait_for_signal_param` and `unity_send_signal_param` can be used:

**DUT1 console:**

```plaintext
Waiting for signal: [dut2 mac address]!
Please input parameter value from any board send this signal and press "Enter" key.
```

**DUT2 console:**

```plaintext
Send signal: [dut2 mac address][10:20:30:40:50:60]!
```

Once the signal is sent from DUT2, you need to input `10:20:30:40:50:60` on DUT1 and press “Enter”. Then DUT1 will get the MAC address string of DUT2 and unblock from `unity_wait_for_signal_param`, then start to connect to DUT2.

### 4.31.3 Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we expect to run some specific tests after certain kinds of reset. For example, we expect to test if reset reason is correct after a wakeup from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support this, we can define multi-stage test cases, to group a set of test functions:

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    RESET_REASON reason = rtc_get_reset_reason(0);
    TEST_ASSERT(reason == DEEPSLEEP_RESET);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_deepsleep, check_deepsleep_reset_reason);
```

Multi-stage test cases present a group of test functions to users. It need user interactions (select cases and select different stages) to run the case.

### 4.31.4 Building Unit Test App

Follow the setup instructions in the top-level esp-idf README. Make sure that `IDF_PATH` environment variable is set to point to the path of esp-idf top-level directory.

Change into `tools/unit-test-app` directory to configure and build it:
Chapter 4. API Guides

- make menuconfig - configure unit test app.
- make TESTS_ALL=1 - build unit test app with tests for each component having tests in the test subdirectory.
- make TEST_COMPONENTS='xxx' - build unit test app with tests for specific components.
- make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='xxx' - build unit test app with all unit tests, except for unit tests of some components. (For instance: make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='ulp mbedtls' - build all unit tests except ulp and mbedtls components).

When the build finishes, it will print instructions for flashing the chip. You can simply run make flash to flash all build output.

You can also run make flash TESTS_ALL=1 or make TEST_COMPONENTS='xxx' to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

4.31.5 Running Unit Tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:

<table>
<thead>
<tr>
<th>Test Case Name</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_ota_begin() verifies arguments</td>
<td>[ota]</td>
</tr>
<tr>
<td>esp_ota_get_next_update_partition logic</td>
<td>[ota]</td>
</tr>
<tr>
<td>Verify bootloader image in flash</td>
<td>[bootloader_support]</td>
</tr>
<tr>
<td>Verify unit test app image</td>
<td>[bootloader_support]</td>
</tr>
<tr>
<td>can use new and delete</td>
<td>[cxx]</td>
</tr>
<tr>
<td>can call virtual functions</td>
<td>[cxx]</td>
</tr>
<tr>
<td>can use static initializers for non-POD types</td>
<td>[cxx]</td>
</tr>
<tr>
<td>can use std::vector</td>
<td>[cxx]</td>
</tr>
<tr>
<td>static initialization guards work as expected</td>
<td>[cxx]</td>
</tr>
<tr>
<td>global initializers run in the correct order</td>
<td>[cxx]</td>
</tr>
<tr>
<td>before scheduler has started, static initializers work correctly</td>
<td>[cxx]</td>
</tr>
<tr>
<td>adc2 work with wifi</td>
<td>[adc]</td>
</tr>
<tr>
<td>gpio master/slave test example</td>
<td>[ignore] [misc] [test_env=UT_T2_1] [multi_device]</td>
</tr>
<tr>
<td>SPI Master clockdiv calculation routines</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master test</td>
<td>[spi][ignore]</td>
</tr>
<tr>
<td>SPI Master test, interaction of multiple devs</td>
<td>[spi][ignore]</td>
</tr>
<tr>
<td>SPI Master no response when switch from host1 (HSPI) to host2 (VSPI)</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master DMA test, TX and RX in different regions</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master DMA test: length, start, not aligned</td>
<td>[spi]</td>
</tr>
<tr>
<td>reset reason check for deepsleep</td>
<td>[esp32][test_env=UT_T2_1][multi_stage]</td>
</tr>
</tbody>
</table>

The normal case will print the case name and description. Master-slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks (for example, "esp_ota_begin() verifies arguments") to run a single test case.
- Test case index (for example, 1) to run a single test case.
- Module name in square brackets (for example, [cxx]) to run all test cases for a specific module.
- An asterisk (*) to run all test cases.
[multi_device] and [multi_stage] tags tell the test runner whether a test case is a multi-device or multi-stage test case. These tags are automatically added by `TEST_CASE_MULTIPLE_STAGES` and `TEST_CASE_MULTIPLE_DEVICES` macros.

After you select a multi-device test case, it will print sub menu:

```
Running gpio master/slave test example...
gpio master/slave test example
    (1)  "gpio_master_test"
    (2)  "gpio_slave_test"
```

You need to input a number to select the test running on the DUT.

Similar to multi-device test cases, multi-stage test cases will also print sub-menu:

```
Running reset reason check for deepsleep...
reset reason check for deepsleep
    (1)  "trigger_deepsleep"
    (2)  "check_deepsleep_reset_reason"
```

For the first time you execute this case, please input 1 to run the first stage (trigger deep-sleep). After DUT is rebooted and test cases are available to run, select this case again and input 2 to run the second stage. The case will only pass if the last stage passes and all previous stages trigger reset.

4.32 Wi-Fi Driver

4.32.1 ESP32 Wi-Fi Feature List

- Support Station-only mode, AP-only mode, Station/AP-coexistence mode
- Support IEEE-802.11B, IEEE-802.11G, IEEE802.11N and APIs to configure the protocol mode
- Support WPA/WPA2/WPA2-Enterprise and WPS
- Support AMPDU, HT40, QoS and other key features
- Support Modem-sleep
- Support an Espressif-specific protocol which, in turn, supports up to 1 km of data traffic
- Up to 20 MBit/sec TCP throughput and 30 MBit/sec UDP throughput over the air
- Support Sniffer
- Support set fast_crypto algorithm and normal algorithm switch which used in wifi connect
- Support both fast scan and all channel scan feature
- Support multiple antennas
- Support channel state information

4.32.2 How To Write a Wi-Fi Application

Preparation

Generally, the most effective way to begin your own Wi-Fi application is to select an example which is similar to your own application, and port the useful part into your project. It is not a MUST but it is strongly recommended that you take some time to read this article first, especially if you want to program a robust Wi-Fi application. This article is supplementary to the Wi-Fi APIs/Examples. It describes the principles of using the Wi-Fi APIs, the limitations of the current Wi-Fi API implementation, and the most common pitfalls in using Wi-Fi. This article also reveals some design details of the Wi-Fi driver. We recommend that you become familiar at least with the following sections: <ESP32 Wi-Fi API Error Code>, <ESP32 Wi-Fi Programming Model>, and <ESP32 Wi-Fi Event Description>.

Setting Wi-Fi Compile-time Options

Refer to <Wi-Fi Menuconfig>
Chapter 4. API Guides

Init Wi-Fi

Refer to <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>.

Start/Connect Wi-Fi

Refer to <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>.

Event-Handling

Generally, it is easy to write code in “sunny-day” scenarios, such as <WIFI_EVENT_STA_START>, <WIFI_EVENT_STA_CONNECTED> etc. The hard part is to write routines in “rainy-day” scenarios, such as <WIFI_EVENT_STA_DISCONNECTED> etc. Good handling of “rainy-day” scenarios is fundamental to robust Wi-Fi applications. Refer to <ESP32 Wi-Fi Event Description>, <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>. See also an overview of event handling in ESP-IDF.

Write Error-Recovery Routines Correctly at All Times

Just like the handling of “rainy-day” scenarios, a good error-recovery routine is also fundamental to robust Wi-Fi applications. Refer to <ESP32 Wi-Fi API Error Code>

4.32.3 ESP32 Wi-Fi API Error Code

All of the ESP32 Wi-Fi APIs have well-defined return values, namely, the error code. The error code can be categorized into:

• No errors, e.g. ESP_OK means that the API returns successfully
• Recoverable errors, such as ESP_ERR_NO_MEM, etc.
• Non-recoverable, non-critical errors
• Non-recoverable, critical errors

Whether the error is critical or not depends on the API and the application scenario, and it is defined by the API user.

The primary principle to write a robust application with Wi-Fi API is to always check the error code and write the error-handling code. Generally, the error-handling code can be used:

• for recoverable errors, in which case you can write a recoverable-error code. For example, when esp_wifi_start returns ESP_ERR_NO_MEM, the recoverable-error code vTaskDelay can be called, in order to get a microseconds’ delay for another try.
• for non-recoverable, yet non-critical, errors, in which case printing the error code is a good method for error handling.
• for non-recoverable, critical errors, in which case “assert” may be a good method for error handling. For example, if esp_wifi_set_mode returns ESP_ERR_WIFI_NOT_INIT, it means that the Wi-Fi driver is not initialized by esp_wifi_init successfully. You can detect this kind of error very quickly in the application development phase.

In esp_err.h, ESP_ERROR_CHECK checks the return values. It is a rather commonplace error-handling code and can be used as the default error-handling code in the application development phase. However, we strongly recommend that API users write their own error-handling code.

4.32.4 ESP32 Wi-Fi API Parameter Initialization

When initializing struct parameters for the API, one of two approaches should be followed: - explicitly set all fields of the parameter or - use get API to get current configuration first, then set application specific fields

Initializing or getting the entire structure is very important because most of the time the value 0 indicates the default value is used. More fields may be added to the struct in the future and initializing these to zero ensures the application will still work correctly after IDF is updated to a new release.
4.32.5 ESP32 Wi-Fi Programming Model

The ESP32 Wi-Fi programming model is depicted as follows:

![Wi-Fi Programming Model Diagram]

The Wi-Fi driver can be considered a black box that knows nothing about high-layer code, such as the TCP/IP stack, application task, event task, etc. The application task (code) generally calls Wi-Fi driver APIs to initialize Wi-Fi and handles Wi-Fi events when necessary. Wi-Fi driver receives API calls, handles them, and post events to the application.

Wi-Fi event handling is based on the `esp_event library`. Events are sent by the Wi-Fi driver to the default event loop. Application may handle these events in callbacks registered using `esp_event_handler_register()`. Wi-Fi events are also handled by `esp_netif component` to provide a set of default behaviors. For example, when Wi-Fi station connects to an AP, esp_netif will automatically start the DHCP client (by default).

4.32.6 ESP32 Wi-Fi Event Description

**WIFI_EVENT_WIFI_READY**

The Wi-Fi driver will never generate this event, which, as a result, can be ignored by the application event callback. This event may be removed in future releases.

**WIFI_EVENT_SCAN_DONE**

The scan-done event is triggered by `esp_wifi_scan_start()` and will arise in the following scenarios:

- The scan is completed, e.g., the target AP is found successfully, or all channels have been scanned.
- The scan is stopped by `esp_wifi_scan_stop()`.
- The `esp_wifi_scan_start()` is called before the scan is completed. A new scan will override the current scan and a scan-done event will be generated.

The scan-done event will not arise in the following scenarios:

- It is a blocked scan.
- The scan is caused by `esp_wifi_connect()`.

Upon receiving this event, the event task does nothing. The application event callback needs to call `esp_wifi_scan_get_ap_num()` and `esp_wifi_scan_get_ap_records()` to fetch the scanned AP list and trigger the Wi-Fi driver to free the internal memory which is allocated during the scan (do not forget to do this)! Refer to ‘ESP32 Wi-Fi Scan’ for a more detailed description.
Chapter 4. API Guides

**WIFI_EVENT_STA_START**

If `esp_wifi_start()` returns ESP_OK and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will initialize the LwIP network interface (netif). Generally, the application event callback needs to call `esp_wifi_connect()` to connect to the configured AP.

**WIFI_EVENT_STA_STOP**

If `esp_wifi_stop()` returns ESP_OK and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will release the station’s IP address, stop the DHCP client, remove TCP/UDP-related connections and clear the LwIP station netif, etc. The application event callback generally does not need to do anything.

**WIFI_EVENT_STA_CONNECTED**

If `esp_wifi_connect()` returns ESP_OK and the station successfully connects to the target AP, the connection event will arise. Upon receiving this event, the event task starts the DHCP client and begins the DHCP process of getting the IP address. Then, the Wi-Fi driver is ready for sending and receiving data. This moment is good for beginning the application work, provided that the application does not depend on LwIP, namely the IP address. However, if the application is LwIP-based, then you need to wait until the `got ip` event comes in.

**WIFI_EVENT_STA_DISCONNECTED**

This event can be generated in the following scenarios:

- When `esp_wifi_disconnect()`, or `esp_wifi_stop()`, or `esp_wifi_deinit()`, or `esp_wifi_restart()` is called and the station is already connected to the AP.
- When `esp_wifi_connect()` is called, but the Wi-Fi driver fails to set up a connection with the AP due to certain reasons, e.g. the scan fails to find the target AP, authentication times out, etc. If there are more than one AP with the same SSID, the disconnected event is raised after the station fails to connect all of the found APs.
- When the Wi-Fi connection is disrupted because of specific reasons, e.g., the station continuously loses N beacons, the AP kicks off the station, the AP’s authentication mode is changed, etc.

Upon receiving this event, the default behavior of the event task is: - Shuts down the station’s LwIP netif. - Notifies the LwIP task to clear the UDP/TCP connections which cause the wrong status to all sockets. For socket-based applications, the application callback can choose to close all sockets and re-create them, if necessary, upon receiving this event.

The most common event handle code for this event in application is to call `esp_wifi_connect()` to reconnect the Wi-Fi. However, if the event is raised because `esp_wifi_disconnect()` is called, the application should not call `esp_wifi_connect()` to reconnect. It’s application’s responsibility to distinguish whether the event is caused by `esp_wifi_disconnect()` or other reasons. Sometimes a better reconnect strategy is required, refer to `<Wi-Fi Reconnect>` and `<Scan When Wi-Fi Is Connecting>`.

Another thing deserves our attention is that the default behavior of LwIP is to abort all TCP socket connections on receiving the disconnect. Most of time it is not a problem. However, for some special application, this may not be what they want, consider following scenarios:

- The application creates a TCP connection to maintain the application-level keep-alive data that is sent out every 60 seconds.
- Due to certain reasons, the Wi-Fi connection is cut off, and the `<WIFI_EVENT_STA_DISCONNECTED>` is raised. According to the current implementation, all TCP connections will be removed and the keep-alive socket will be in a wrong status. However, since the application designer believes that the network layer should NOT care about this error at the Wi-Fi layer, the application does not close the socket.
- Five seconds later, the Wi-Fi connection is restored because `esp_wifi_connect()` is called in the application event callback function. Moreover, the station connects to the same AP and gets the same IPV4 address as before.
Sixty seconds later, when the application sends out data with the keep-alive socket, the socket returns an error and the application closes the socket and re-creates it when necessary.

In above scenario, ideally, the application sockets and the network layer should not be affected, since the Wi-Fi connection only fails temporarily and recovers very quickly. The application can enable “Keep TCP connections when IP changed” via LwIP menuconfig.

**WIFI_EVENT_STA_AUTHMODE_CHANGE**

This event arises when the AP to which the station is connected changes its authentication mode, e.g., from no auth to WPA. Upon receiving this event, the event task will do nothing. Generally, the application event callback does not need to handle this either.

**IP_EVENT_STA_GOT_IP**

This event arises when the DHCP client successfully gets the IPV4 address from the DHCP server, or when the IPV4 address is changed. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

The IPV4 may be changed because of the following reasons:

- The DHCP client fails to renew/rebind the IPV4 address, and the station’s IPV4 is reset to 0.
- The DHCP client rebinds to a different address.
- The static-configured IPV4 address is changed.

Whether the IPV4 address is changed or NOT is indicated by field `ip_change` of `ip_event_got_ip_t`.

The socket is based on the IPV4 address, which means that, if the IPV4 changes, all sockets relating to this IPV4 will become abnormal. Upon receiving this event, the application needs to close all sockets and recreate the application when the IPV4 changes to a valid one.

**IP_EVENT_GOT_IP6**

This event arises when the IPV6 SLAAC support auto-configures an address for the ESP32, or when this address changes. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

**IP_STA_LOST_IP**

This event arises when the IPV4 address become invalid.

`IP_STA_LOST_IP` doesn’t arise immediately after the WiFi disconnects, instead it starts an IPV4 address lost timer, if the IPV4 address is got before ip lost timer expires, IP_EVENT_STA_LOST_IP doesn’t happen. Otherwise, the event arises when IPV4 address lost timer expires.

Generally the application don’t need to care about this event, it is just a debug event to let the application know that the IPV4 address is lost.

**WIFI_EVENT_AP_START**

Similar to `<WIFI_EVENT_STA_START>`.

**WIFI_EVENT_AP_STOP**

Similar to `<WIFI_EVENT_STA_STOP>`.
**WIFI_EVENT_AP_STACONNECTED**

Every time a station is connected to ESP32 AP, the `<WIFI_EVENT_AP_STACONNECTED>` will arise. Upon receiving this event, the event task will do nothing, and the application callback can also ignore it. However, you may want to do something, for example, to get the info of the connected STA, etc.

**WIFI_EVENT_AP_STADISCONNECTED**

This event can happen in the following scenarios:

- The application calls esp_wifi_disconnect(), or esp_wifi_deauth_sta(), to manually disconnect the station.
- The Wi-Fi driver kicks off the station, e.g. because the AP has not received any packets in the past five minutes, etc.
- The station kicks off the AP.

When this event happens, the event task will do nothing, but the application event callback needs to do something, e.g., close the socket which is related to this station, etc.

**WIFI_EVENT_AP_PROBEREQRECVED**

This event is disabled by default. The application can enable it via API esp_wifi_set_event_mask(). When this event is enabled, it will be raised each time the AP receives a probe request.

### 4.32.7 ESP32 Wi-Fi Station General Scenario

Below is a “big scenario” which describes some small scenarios in Station mode:

1. **Wi-Fi/LwIP Init Phase**

   - s1.1: The main task calls esp_netif_init() to create an LwIP core task and initialize LwIP-related work.
   - s1.2: The main task calls esp_event_loop_init() to create a system Event task and initialize an application event’s callback function. In the scenario above, the application event’s callback function does nothing but relaying the event to the application task.
   - s1.3: The main task calls esp_netif_create_default_wifi_ap() or esp_netif_create_default_wifi_sta() to create default network interface instance binding station or AP with TCP/IP stack.
   - s1.4: The main task calls esp_wifi_init() to create the Wi-Fi driver task and initialize the Wi-Fi driver.
   - s1.5: The main task calls OS API to create the application task.

Step 1.1~1.5 is a recommended sequence that initializes a Wi-Fi-/LwIP-based application. However, it is NOT a must-follow sequence, which means that you can create the application task in step 1.1 and put all other initializations in the application task. Moreover, you may not want to create the application task in the initialization phase if the application task depends on the sockets. Rather, you can defer the task creation until the IP is obtained.

2. **Wi-Fi Configuration Phase**

Once the Wi-Fi driver is initialized, you can start configuring the Wi-Fi driver. In this scenario, the mode is Station, so you may need to call esp_wifi_set_mode(WIFI_MODE_STA) to configure the Wi-Fi mode as Station. You can call other esp_wifi_set_xxx APIs to configure more settings, such as the protocol mode, country code, bandwidth, etc. Refer to `<ESP32 Wi-Fi Configuration>`.

Generally, we configure the Wi-Fi driver before setting up the Wi-Fi connection, but this is NOT mandatory, which means that you can configure the Wi-Fi connection anytime, provided that the Wi-Fi driver is initialized successfully. However, if the configuration does not need to change after the Wi-Fi connection is set up, you should configure the Wi-Fi driver at this stage, because the configuration APIs (such as esp_wifi_set_protocol) will cause the Wi-Fi to reconnect, which may not be desirable.
Fig. 55: Sample Wi-Fi Event Scenarios in Station Mode
If the Wi-Fi NVS flash is enabled by menuconfig, all Wi-Fi configuration in this phase, or later phases, will be stored into flash. When the board powers on/reboots, you do not need to configure the Wi-Fi driver from scratch. You only need to call esp_wifi_get_xxx APIs to fetch the configuration stored in flash previously. You can also configure the Wi-Fi driver if the previous configuration is not what you want.

3. Wi-Fi Start Phase

- **s3.1:** Call esp_wifi_start to start the Wi-Fi driver.
- **s3.2:** The Wi-Fi driver posts `<WIFI_EVENT_STA_START>` to the event task; then, the event task will do some common things and will call the application event callback function.
- **s3.3:** The application event callback function relays the `<WIFI_EVENT_STA_START>` to the application task. We recommend that you call esp_wifi_connect(). However, you can also call esp_wifi_connect() in other phrases after the `<WIFI_EVENT_STA_START>` arises.

4. Wi-Fi Connect Phase

- **s4.1:** Once esp_wifi_connect() is called, the Wi-Fi driver will start the internal scan/connection process.
- **s4.2:** If the internal scan/connection process is successful, the `<WIFI_EVENT_STA_CONNECTED>` will be generated. In the event task, it starts the DHCP client, which will finally trigger the DHCP process.
- **s4.3:** In the above-mentioned scenario, the application event callback will relay the event to the application task. Generally, the application needs to do nothing, and you can do whatever you want, e.g., print a log, etc.

In step 4.2, the Wi-Fi connection may fail because, for example, the password is wrong, the AP is not found, etc. In a case like this, `<WIFI_EVENT_STA_DISCONNECTED>` will arise and the reason for such a failure will be provided. For handling events that disrupt Wi-Fi connection, please refer to phase 6.

5. Wi-Fi ‘Got IP’ Phase

- **s5.1:** Once the DHCP client is initialized in step 4.2, the got IP phase will begin.
- **s5.2:** If the IP address is successfully received from the DHCP server, then `<IP_EVENT_STA_GOT_IP>` will arise and the event task will perform common handling.
- **s5.3:** In the application event callback, `<IP_EVENT_STA_GOT_IP>` is relayed to the application task. For LwIP-based applications, this event is very special and means that everything is ready for the application to begin its tasks, e.g., creating the TCP/UDP socket, etc. A very common mistake is to initialize the socket before `<IP_EVENT_STA_GOT_IP>` is received. **DO NOT start the socket-related work before the IP is received.**

6. Wi-Fi Disconnect Phase

- **s6.1:** When the Wi-Fi connection is disrupted, e.g., because the AP is powered off, the RSSI is poor, etc., `<WIFI_EVENT_STA_DISCONNECTED>` will arise. This event may also arise in phase 3. Here, the event task will notify the LwIP task to clear/remove all UDP/TCP connections. Then, all application sockets will be in a wrong status. In other words, no socket can work properly when this event happens.
- **s6.2:** In the scenario described above, the application event callback function relays `<WIFI_EVENT_STA_DISCONNECTED>` to the application task. We recommend that esp_wifi_connect() be called to reconnect the Wi-Fi, close all sockets and re-create them if necessary. Refer to `<WIFI_EVENT_STA_DISCONNECTED>`.

7. Wi-Fi IP Change Phase

- **s7.1:** If the IP address is changed, the `<IP_EVENT_STA_GOT_IP>` will arise with “ip_change” set to true.
- **s7.2:** This event is important to the application. When it occurs, the timing is good for closing all created sockets and recreating them.
8. Wi-Fi Deinit Phase

- s8.1: Call esp_wifi_disconnect() to disconnect the Wi-Fi connectivity.
- s8.2: Call esp_wifi_stop() to stop the Wi-Fi driver.
- s8.3: Call esp_wifi_deinit() to unload the Wi-Fi driver.

4.32.8 ESP32 Wi-Fi AP General Scenario

Below is a “big scenario” which describes some small scenarios in AP mode:

4.32.9 ESP32 Wi-Fi Scan

Currently, the esp_wifi_scan_start() API is supported only in Station or Station+AP mode.

Scan Type

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Scan</td>
<td>Scan by sending a probe request. The default scan is an active scan.</td>
</tr>
<tr>
<td>Passive Scan</td>
<td>No probe request is sent out. Just switch to the specific channel and wait for a beacon. Application can enable it via the scan_type field of wifi_scan_config_t.</td>
</tr>
<tr>
<td>Foreground Scan</td>
<td>This scan is applicable when there is no Wi-Fi connection in Station mode. Foreground or background scanning is controlled by the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>Background Scan</td>
<td>This scan is applicable when there is a Wi-Fi connection in Station mode or in Station+AP mode. Whether it is a foreground scan or background scan depends on the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>All-Channel Scan</td>
<td>It scans all of the channels. If the channel field of wifi_scan_config_t is set to 0, it is an all-channel scan.</td>
</tr>
</tbody>
</table>

**Specific Channel Scan**

- It scans specific channels only. If the channel field of wifi_scan_config_t set to 1, it is a specific-channel scan.

The scan modes in above table can be combined arbitrarily, so we totally have 8 different scans:

- All-Channel Background Active Scan
- All-Channel Background Passive Scan
- All-Channel Foreground Active Scan
- All-Channel Foreground Passive Scan
- Specific-Channel Background Active Scan
- Specific-Channel Background Passive Scan
- Specific-Channel Foreground Active Scan
- Specific-Channel Foreground Passive Scan

Scan Configuration

The scan type and other per-scan attributes are configured by esp_wifi_scan_start. The table below provides a detailed description of wifi_scan_config_t.
Chapter 4. API Guides

Fig. 56: Sample Wi-Fi Event Scenarios in AP Mode
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>If the SSID is not NULL, it is only the AP with the same SSID that can be scanned.</td>
</tr>
<tr>
<td>bssid</td>
<td>If the BSSID is not NULL, it is only the AP with the same BSSID that can be scanned.</td>
</tr>
<tr>
<td>channel</td>
<td>If “channel” is 0, there will be an all-channel scan; otherwise, there will be a specific-channel scan.</td>
</tr>
<tr>
<td>show_hidden</td>
<td>If “show_hidden” is 0, the scan ignores the AP with a hidden SSID; otherwise, the scan considers the hidden AP a normal one.</td>
</tr>
<tr>
<td>scan_type</td>
<td>If “scan_type” is WIFI_SCAN_TYPE_ACTIVE, the scan is “active”; otherwise, it is a “passive” one.</td>
</tr>
</tbody>
</table>
| scan_time | This field is used to control how long the scan dwells on each channel. For passive scans, scan_time.passive designates the dwell time for each channel. For active scans, dwell times for each channel are listed in the table below. Here, min is short for scan_time.active.min and max is short for scan_time.active.max.  
  - min=0, max=0: scan dwells on each channel for 120 ms.  
  - min>0, max=0: scan dwells on each channel for 120 ms.  
  - min=0, max>0: scan dwells on each channel for max ms.  
  - min>0, max>0: the minimum time the scan dwells on each channel is min ms. If no AP is found during this time frame, the scan switches to the next channel. Otherwise, the scan dwells on the channel for max ms. |

If you want to improve the performance of the the scan, you can try to modify these two parameters.

There also some global scan attributes which is configured by API esp_wifi_set_config, refer to [Station Basic Configuration](#).

### Scan All APs In All Channels (foreground)

**Scenario:**

The scenario above describes an all-channel, foreground scan. The foreground scan can only occur in Station mode where the station does not connect to any AP. Whether it is a foreground or background scan is totally determined by the Wi-Fi driver, and cannot be configured by the application.

Detailed scenario description:

**Scan Configuration Phase**

- s1.1: Call esp_wifi_set_country() to set the country info if the default country info is not what you want, refer to [Wi-Fi Country Code](#).
- s1.2: Call esp_wifi_scan_start() to configure the scan. To do so, you can refer to [Scan Configuration](#). Since this is an all-channel scan, just set the SSID/BSSID/channel to 0.

**Wi-Fi Driver’s Internal Scan Phase**
Fig. 57: Foreground Scan of all Wi-Fi Channels
Chapter 4. API Guides

- s2.1: The Wi-Fi driver switches to channel 1, in case the scan type is WIFI_SCAN_TYPE_ACTIVE, and broadcasts a probe request. Otherwise, the Wi-Fi will wait for a beacon from the APs. The Wi-Fi driver will stay in channel 1 for some time. The dwell time is configured in min/max time, with default value being 120 ms.
- s2.2: The Wi-Fi driver switches to channel 2 and performs the same operation as in step 2.1.
- s2.3: The Wi-Fi driver scans the last channel N, where N is determined by the country code which is configured in step 1.1.

Scan-Done Event Handling Phase

- s3.1: When all channels are scanned, <WIFI_EVENT_SCAN_DONE> will arise.
- s3.2: The application’s event callback function notifies the application task that <WIFI_EVENT_SCAN_DONE> is received. esp_wifi_scan_get_ap_num() is called to get the number of APs that have been found in this scan. Then, it allocates enough entries and calls esp_wifi_scan_get_ap_records() to get the AP records. Please note that the AP records in the Wi-Fi driver will be freed, once esp_wifi_scan_get_ap_records() is called. Do not call esp_wifi_scan_get_ap_records() twice for a single scan-done event. If esp_wifi_scan_get_ap_records() is not called when the scan-done event occurs, the AP records allocated by the Wi-Fi driver will not be freed. So, make sure you call esp_wifi_scan_get_ap_records(), yet only once.

Scan All APs on All Channels(background)

Scenario:
The scenario above is an all-channel background scan. Compared to Scan All APs In All Channels(foreground), the difference in the all-channel background scan is that the Wi-Fi driver will scan the back-to-home channel for 30 ms before it switches to the next channel to give the Wi-Fi connection a chance to transmit/receive data.

Scan for a Specific AP in All Channels

Scenario:
This scan is similar to Scan All APs In All Channels(foreground). The differences are:

- s1.1: In step 1.2, the target AP will be configured to SSID/BSSID.
- s2.1~s2.N: Each time the Wi-Fi driver scans an AP, it will check whether it is a target AP or not. If the scan is WIFI_FAST_SCAN scan and the target AP is found, then the scan-done event will arise and scanning will end; otherwise, the scan will continue. Please note that the first scanned channel may not be channel 1, because the Wi-Fi driver optimizes the scanning sequence.

If there are multiple APs which match the target AP info, for example, if we happen to scan two APs whose SSID is “ap”. If the scan is WIFI_FAST_SCAN, then only the first scanned “ap” will be found, if the scan is WIFI_ALL_CHANNEL_SCAN, both “ap” will be found and the station will connect the “ap” according to the configured strategy, refer to Station Basic Configuration.

You can scan a specific AP, or all of them, in any given channel. These two scenarios are very similar.

Scan in Wi-Fi Connect

When esp_wifi_connect() is called, then the Wi-Fi driver will try to scan the configured AP first. The scan in “Wi-Fi Connect” is the same as Scan for a Specific AP In All Channels, except that no scan-done event will be generated when the scan is completed. If the target AP is found, then the Wi-Fi driver will start the Wi-Fi connection; otherwise, <WIFI_EVENT_STA_DISCONNECTED> will be generated. Refer to Scan for a Specific AP in All Channels.
Fig. 58: Background Scan of all Wi-Fi Channels
Fig. 59: Scan of specific Wi-Fi Channels
Scan In Blocked Mode

If the block parameter of esp_wifi_scan_start() is true, then the scan is a blocked one, and the application task will be blocked until the scan is done. The blocked scan is similar to an unblocked one, except that no scan-done event will arise when the blocked scan is completed.

Parallel Scan

Two application tasks may call esp_wifi_scan_start() at the same time, or the same application task calls esp_wifi_scan_start() before it gets a scan-done event. Both scenarios can happen. However, the Wi-Fi driver does not support multiple concurrent scans adequately. As a result, concurrent scans should be avoided. Support for concurrent scan will be enhanced in future releases, as the ESP32’s Wi-Fi functionality improves continuously.

Scan When Wi-Fi Is Connecting

The esp_wifi_scan_start() fails immediately if the Wi-Fi is in connecting process because the connecting has higher priority than the scan. If scan fails because of connecting, the recommended strategy is to delay sometime and retry scan again, the scan will succeed once the connecting is completed.

However, the retry/delay strategy may not work all the time. Considering following scenario: - The station is connecting a non-existent AP or if the station connects the existed AP with a wrong password, it always raises the event <WIFI_EVENT_STA_DISCONNECTED>. - The application call esp_wifi_connect() to do reconnection on receiving the disconnect event. - Another application task, e.g. the console task, call esp_wifi_scan_start() to do scan, the scan always fails immediately because the station is keeping connecting. - When scan fails, the application simply delay sometime and retry the scan.

In above scenario the scan will never succeed because the connecting is in process. So if the application supports similar scenario, it needs to implement a better reconnect strategy. E.g. - The application can choose to define a maximum continuous reconnect counter, stop reconnect once the reconnect reaches the max counter. - The application can choose to do reconnect immediately in the first N continuous reconnect, then give a delay sometime and reconnect again.

The application can define its own reconnect strategy to avoid the scan starve to death. Refer to <Wi-Fi Reconnect>.

4.32.10 ESP32 Wi-Fi Station Connecting Scenario

This scenario only depicts the case when there is only one target AP are found in scan phase, for the scenario that more than one AP with the same SSID are found, refer to <ESP32 Wi-Fi Station Connecting When Multiple APs Are Found>.

Generally, the application does not need to care about the connecting process. Below is a brief introduction to the process for those who are really interested.

Scenario:

Scan Phase

- s1.1. The Wi-Fi driver begins scanning in “Wi-Fi Connect”. Refer to <Scan in Wi-Fi Connect> for more details.
- s1.2. If the scan fails to find the target AP, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason-code will be WIFI_REASON_NO_AP_FOUND. Refer to <Wi-Fi Reason Code>.

Auth Phase

- s2.1. The authentication request packet is sent and the auth timer is enabled.
Fig. 60: Wi-Fi Station Connecting Process

1. Scan Phase

1.1 > Scan

1.2 > WIFI_EVENT_STA_DISCONNECTED

2. Auth Phase

2.1 > Auth request

2.2 > WIFI_EVENT_STA_DISCONNECTED

2.3 > Auth response

3. Assoc Phase

3.1 > Assoc request

3.2 > WIFI_EVENT_STA_DISCONNECTED

3.3 > Assoc response

3.4 > WIFI_EVENT_STA_DISCONNECTED

4. 4-way Handshake Phase

4.1 > 1/4 EAPOL

4.2 > WIFI_EVENT_STA_DISCONNECTED

4.3 > 2/4 EAPOL

4.4 > WIFI_EVENT_STA_DISCONNECTED

4.5 > 3/4 EAPOL

4.6 > WIFI_EVENT_STA_DISCONNECTED

4.7 > 4/4 EAPOL

4.8 > WIFI_EVENT_STA_DISCONNECTED

4.9 > WIFI_EVENT_STA_CONNECTED
• s2.2, If the authentication response packet is not received before the authentication timer times out, `<WIFI_EVENT_STA_DISCONNECTED>` will arise and the reason-code will be WIFI_REASON_AUTH_EXPIRE. Refer to `<Wi-Fi Reason Code>`.
• s2.3, The auth-response packet is received and the auth-timer is stopped.
• s2.4, The AP rejects authentication in the response and `<WIFI_EVENT_STA_DISCONNECTED>` arises, while the reason-code is WIFI_REASON_AUTH_FAIL or the reasons specified by the AP. Refer to `<Wi-Fi Reason Code>`.

**Association Phase**

• s3.1, The association request is sent and the association timer is enabled.
• s3.2, If the association response is not received before the association timer times out, `<WIFI_EVENT_STA_DISCONNECTED>` will arise and the reason-code will be WIFI_REASON_ASSOC_EXPIRE. Refer to `<Wi-Fi Reason Code>`.
• s3.3, The association response is received and the association timer is stopped.
• s3.4, The AP rejects the association in the response and `<WIFI_EVENT_STA_DISCONNECTED>` arises, while the reason-code is the one specified in the association response. Refer to `<Wi-Fi Reason Code>`.

**Four-way Handshake Phase**

• s4.1, The four-way handshake is sent out and the association timer is enabled.
• s4.2, If the association response is not received before the association timer times out, `<WIFI_EVENT_STA_DISCONNECTED>` will arise and the reason-code will be WIFI_REASON_ASSOC_EXPIRE. Refer to `<Wi-Fi Reason Code>`.
• s4.3, The association response is received and the association timer is stopped.
• s4.4, The AP rejects the association in the response and `<WIFI_EVENT_STA_DISCONNECTED>` arises and the reason-code will be the one specified in the association response. Refer to `<Wi-Fi Reason Code>`.

**Wi-Fi Reason Code**

The table below shows the reason-code defined in ESP32. The first column is the macro name defined in esp_wifi_types.h. The common prefix WIFI_REASON is removed, which means that UNSPECIFIED actually stands for WIFI_REASON_UNSPECIFIED and so on. The second column is the value of the reason. The third column is the standard value to which this reason is mapped in section 8.4.1.7 of ieee802.11-2012. (For more information, refer to the standard mentioned above.) The last column is a description of the reason.
<table>
<thead>
<tr>
<th>Reason code</th>
<th>Value</th>
<th>Mapped To</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNSPECIFIED</td>
<td>1</td>
<td>1</td>
<td>Generally, it means an internal failure, e.g., the memory runs out, the internal TX fails, or the reason is received from the remote side, etc.</td>
</tr>
<tr>
<td>AUTH_EXPIRE</td>
<td>2</td>
<td>2</td>
<td>The previous authentication is no longer valid. For the ESP Station, this reason is reported when: • auth is timed out  • the reason is received from the AP. For the ESP AP, this reason is reported when: • the AP has not received any packets from the station in the past five minutes. • the AP is stopped by calling esp_wifi_stop(). • the station is de-authed by calling esp_wifi_deauth_sta()</td>
</tr>
<tr>
<td>AUTH_LEAVE</td>
<td>3</td>
<td>3</td>
<td>De-authenticated, because the sending STA is leaving (or has left). For the ESP Station, this reason is reported when: • it is received from the AP.</td>
</tr>
<tr>
<td>ASSOC_EXPIRE</td>
<td>4</td>
<td>4</td>
<td>Disassociated due to inactivity. For the ESP Station, this reason is reported when: • it is received from the AP. For the ESP AP, this reason is reported when: • the AP has not received any packets from the station in the past five minutes. • the AP is stopped by calling esp_wifi_stop(). • the station is de-authed by calling esp_wifi_deauth_sta()</td>
</tr>
<tr>
<td>ASSOC_TOOMANY</td>
<td>5</td>
<td>5</td>
<td>Disassociated, because the AP is unable to handle packets with data from a non-authenticated STA at the same time. For the ESP Station, this reason is reported when: • it is received from the AP.</td>
</tr>
</tbody>
</table>
4.32.11 ESP32 Wi-Fi Station Connecting When Multiple APs Are Found

This scenario is similar as <ESP32 Wi-Fi Station Connecting Scenario>, the difference is the station will not raise the event <WIFI_EVENT_STA_DISCONNECTED> unless it fails to connect all of the found APs.

4.32.12 Wi-Fi Reconnect

The station may disconnect due to many reasons, e.g. the connected AP is restarted etc. It’s the application’s responsibility to do the reconnect. The recommended reconnect strategy is to call esp_wifi_connect() on receiving event <WIFI_EVENT_STA_DISCONNECTED>.

Sometimes the application needs more complex reconnect strategy: - If the disconnect event is raised because the esp_wifi_disconnect() is called, the application may not want to do reconnect. - If the esp_wifi_scan_start() may be called at anytime, a better reconnect strategy is necessary, refer to <Scan When Wi-Fi Is Connecting>.

Another thing we need to consider is the reconnect may not connect the same AP if there are more than one APs with the same SSID. The reconnect always select current best APs to connect.

4.32.13 Wi-Fi Beacon Timeout

The beacon timeout mechanism is used by ESP32 station to detect whether the AP is alive or not. If the station continuously loses 60 beacons of the connected AP, the beacon timeout happens.

After the beacon timeout happens, the station sends 5 probe requests to AP, it disconnects the AP and raises the event <WIFI_EVENT_STA_DISCONNECTED> if still no probe response or beacon is received from AP.

4.32.14 ESP32 Wi-Fi Configuration

All configurations will be stored into flash when the Wi-Fi NVS is enabled; otherwise, refer to <Wi-Fi NVS Flash>.

**Wi-Fi Mode**

Call esp_wifi_set_mode() to set the Wi-Fi mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIFI_MODE_NULL</td>
<td>NULL mode: in this mode, the internal data struct is not allocated to the station and the AP, while both the station and AP interfaces are not initialized for RX/TX Wi-Fi data. Generally, this mode is used for Sniffer, or when you only want to stop both the STA and the AP without calling esp_wifi_deinit() to unload the whole Wi-Fi driver.</td>
</tr>
<tr>
<td>WIFI_MODE_STA</td>
<td>Station mode: in this mode, esp_wifi_start() will init the internal station data, while the station’s interface is ready for the RX and TX Wi-Fi data. After esp_wifi_connect() is called, the STA will connect to the target AP.</td>
</tr>
<tr>
<td>WIFI_MODE_AP</td>
<td>AP mode: in this mode, esp_wifi_start() will init the internal AP data, while the AP’s interface is ready for RX/TX Wi-Fi data. Then, the Wi-Fi driver starts broad-casting beacons, and the AP is ready to get connected to other stations.</td>
</tr>
<tr>
<td>WIFI_MODE_APSTA</td>
<td>Station-AP coexistence mode: in this mode, esp_wifi_start() will simultaneously init both the station and the AP. This is done in station mode and AP mode. Please note that the channel of the external AP, which the ESP Station is connected to, has higher priority over the ESP AP channel.</td>
</tr>
</tbody>
</table>

**Station Basic Configuration**

API esp_wifi_set_config() can be used to configure the station. The table below describes the fields in detail.
### Chapter 4. API Guides

#### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>This is the SSID of the target AP, to which the station wants to connect to.</td>
</tr>
<tr>
<td>password</td>
<td>Password of the target AP</td>
</tr>
<tr>
<td>scan_method</td>
<td>For WIFI_FAST_SCAN scan, the scan ends when the first matched AP is found, for WIFI_ALL_CHANNEL_SCAN, the scan finds all matched APs in all channels. The default scan is WIFI_FAST_SCAN.</td>
</tr>
<tr>
<td>bssid_set</td>
<td>If bssid_set is 0, the station connects to the AP whose SSID is the same as the field “ssid”, while the field “bssid” is ignored. In all other cases, the station connects to the AP whose SSID is the same as the “ssid” field, while its BSSID is the same as the “bssid” field.</td>
</tr>
<tr>
<td>bssid</td>
<td>This is valid only when bssid_set is 1; see field “bssid_set”.</td>
</tr>
<tr>
<td>channel</td>
<td>If the channel is 0, the station scans the channel 1~N to search for the target AP; otherwise, the station starts by scanning the channel whose value is the same as that of the “channel” field, and then scans others to find the target AP. If you do not know which channel the target AP is running on, set it to 0.</td>
</tr>
<tr>
<td>sort_method</td>
<td>This field is only for WIFI_ALL_CHANNEL_SCAN. If the sort_method is WIFI_CONNECT_AP_BY_SIGNAL, all matched APs are sorted by signal, for AP with best signal will be connected firstly. E.g. if the station wants to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid equals to “apxx”, the first AP’s signal is -90dBm, the second AP’s signal is -30dBm, the station connects the second AP firstly, it doesn’t connect the first one unless it fails to connect the second one. If the sort_method is WIFI_CONNECT_AP_BY_SECURITY, all matched APs are sorted by security. E.g. if the station wants to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid is “apxx”, the security of the first found AP is open while the second one is WPA2, the stations connects to the second AP firstly, it doesn’t connect the second one unless it fails to connect the first one.</td>
</tr>
<tr>
<td>threshold</td>
<td>The threshold is used to filter the found AP, if the RSSI or security mode is less than the configured threshold, the AP will be discard. If the RSSI set to 0, it means default threshold, the default RSSI threshold is -127dBm. If the authmode threshold is set to 0, it means default threshold, the default authmode threshold is open.</td>
</tr>
</tbody>
</table>

#### AP Basic Configuration

API esp_wifi_set_config() can be used to configure the AP. The table below describes the fields in detail.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>SSID of AP; if the ssid[0] is 0xFF and ssid[1] is 0xFF, the AP defaults the SSID to ESP_aabbcc, where “aabbcc” is the last three bytes of the AP MAC.</td>
</tr>
<tr>
<td>password</td>
<td>Password of AP; if the auth mode is WIFI_AUTH_OPEN, this field will be ignored.</td>
</tr>
<tr>
<td>ssid_len</td>
<td>Length of SSID; if ssid_len is 0, check the SSID until there is a termination character. If ssid_len &gt; 32, change it to 32; otherwise, set the SSID length according to ssid_len.</td>
</tr>
<tr>
<td>channel</td>
<td>Channel of AP; if the channel is out of range, the Wi-Fi driver defaults the channel to channel 1. So, please make sure the channel is within the required range. For more details, refer to &lt;Wi-Fi Country Code&gt;.</td>
</tr>
<tr>
<td>authmode</td>
<td>Auth mode of ESP AP; currently, ESP Wi-Fi does not support AUTH_WEP. If the authmode is an invalid value, AP defaults the value to WIFI_AUTH_OPEN.</td>
</tr>
<tr>
<td>ssid_hidden</td>
<td>If ssid_hidden is 1, AP does not broadcast the SSID; otherwise, it does broadcast the SSID.</td>
</tr>
<tr>
<td>max_connection</td>
<td>Currently, ESP Wi-Fi supports up to 10 Wi-Fi connections. If max_connection &gt; 10, AP defaults the value to 10.</td>
</tr>
<tr>
<td>beacon_interval</td>
<td>Beacon interval; the value is 100 ~ 600000 ms, with default value being 100 ms. If the value is out of range, AP defaults it to 100 ms.</td>
</tr>
</tbody>
</table>

#### Wi-Fi Protocol Mode

Currently, the IDF supports the following protocol modes:
### Protocol Mode Description

<table>
<thead>
<tr>
<th>Protocol Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11 B</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B) to set the station/AP to 802.11B-only mode.</td>
</tr>
<tr>
<td>802.11 BG</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGN</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGNLR</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 LR</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR) to set the station/AP only to the Espressif-specific mode. This mode is an Espressif-patented mode which can achieve a one-kilometer line of sight range. Please, make sure both the station and the AP are connected to an ESP device.</td>
</tr>
</tbody>
</table>

**Long Range (LR)**

Long Range (LR) mode is an Espressif-patented Wi-Fi mode which can achieve a one-kilometer line of sight range. It has better reception sensitivity, stronger anti-interference ability and longer transmission distance than the traditional 802.11B mode.

**LR Compatiblity** Since LR is Espressif unique Wi-Fi mode, only ESP32 devices can transmit and receive the LR data. In other words, the ESP32 device should NOT transmit the data in LR data rate if the connected device doesn’t support LR. The application can achieve this by configuring suitable Wi-Fi mode. If the negotiated mode supports LR, the ESP32 may transmit data in LR rate, otherwise, ESP32 will transmit all data in traditional Wi-Fi data rate.

Following table depicts the Wi-Fi mode negotiation:

<table>
<thead>
<tr>
<th>AP</th>
<th>STA</th>
<th>BGN</th>
<th>BG</th>
<th>B</th>
<th>BGNLR</th>
<th>BGLR</th>
<th>BLR</th>
<th>LR</th>

<td>*</td>
<td>*</td>
<td>*</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
<td></td>
</tr>
</tbody>
</table>

In above table, the row is the Wi-Fi mode of AP and the column is the Wi-Fi mode of station. The “-“ indicates Wi-Fi mode of the AP and station are not compatible.

**According to the table, we can conclude that:**

- For LR enabled in ESP32 AP, it’s incompatible with traditional 802.11 mode because the beacon is sent in LR mode.
- For LR enabled in ESP32 station and the mode is NOT LR only mode, it’s compatible with traditional 802.11 mode.
• If both station and AP are ESP32 devices and both of them enable LR mode, the negotiated mode supports LR.

If the negotiated Wi-Fi mode supports both traditional 802.11 mode and LR mode, it’s the WiFi driver’s responsibility to automatically select the best data rate in different Wi-Fi mode and the application don’t need to care about it.

**LR Impacts to Traditional Wi-Fi device**

The data transmission in LR rate has no impacts on the traditional Wi-Fi device because:
- The CCA and backoff process in LR mode are consistent with 802.11 specification.
- The traditional Wi-Fi device can detect the LR signal via CCA and do backoff.

In other words, the impact transmission in LR mode is similar as the impact in 802.11B mode.

**LR Transmission Distance** The reception sensitivity of LR has about 4 dB gain than the traditional 802.11 B mode, theoretically the transmission distance is about 2 to 2.5 times the distance of 11B.

**LR Throughput** The LR rate has very limited throughput because the raw PHY data rate LR is 1/2 Mbits and 1/4 Mbits.

**When to Use LR**

The general conditions for using LR are:
- Both the AP and station are devices.
- Long distance WiFi connection and data transmission is required.
- Data throughput requirements are very small, such as remote device control, etc.

**Wi-Fi Country Code**

Call esp_wifi_set_country() to set the country info. The table below describes the fields in detail, please consult local 2.4GHz RF operating regulations before configuring these fields.
### Field cc[3]

Country code string, this attributes identify the country or noncountry entity in which the station/AP is operating. If it’s a country, the first two octets of this string is the two character country info as described in document ISO/IEC3166-1. The third octect is one of the following:

- an ASCII space character, if the regulations under which the station/AP is operating encompass all environments for the current frequency band in the country
- an ASCII ‘O’ character if the regulations under which the station/AP is operating are for an outdoor environment only, or
- an ASCII ‘I’ character if the regulations under which the station/AP is operating are for an indoor environment only.
- an ASCII ‘X’ character if the station/AP is operating under a noncountry entity. The first two octets of the noncountry entity is two ASCII ‘XX’ characters.
- the binary representation of the Operating Class table number currently in use. Refer 802.11-2012 Annex E.

### schan

Start channel, it’s the minimum channel number of the regulations under which the station/AP can operate.

### snum

Total channel number of the regulations, e.g. if the schan=1, nchan=13, it means the station/AP can send data from channel 1 to 13.

### policy

Country policy, this field control which country info will be used if the configured country info is conflict with the connected AP’s. More description about policy is provided in following section.

The default country info is {.cc=”CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}, if the WiFi Mode is station/AP coexist mode, they share the same configured country info. Sometimes, the country info of AP, to which the station is connected, is different from the country info of configured. For example, the configured station has country info {.cc=”JP”, .schan=1, .nchan=14, policy=WIFI_COUNTRY_POLICY_AUTO}, but the connected AP has country info {.cc=”CN”, .schan=1, .nchan=13}, then country info of connected AP’s is used. Following table depicts which country info is used in different WiFi Mode and different country policy, also describe the impact to active scan.
<table>
<thead>
<tr>
<th>WiFi Mode</th>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>If the connected AP has country IE in its beacon, the country info equals to the country info in beacon, otherwise, use default country info. For scan: • before the station connects to the AP, scans channel “schan” to “min(11, schan+nchan-1)” with active scan and channel min(12, schan+nchan)” to 14 with passive scan. E.g. if the used country info is [.cc=”CN” , .schan=1, .nchan=6] then 1 to 6 is active scan and 7 to 14 is passive scan. If the used country info is [.cc=”CN” , .schan=1, .nchan=12] then 1 to 11 is active scan and 12 to 14 is passive scan. • after the station connects to the AP, scans channel “schan” to “schan+nchan-1” with active scan and channel “schan+nchan” to 14 with passive scan. Always keep in mind that if if a AP with with hidden SSID is set to a passive scan channel, the passive scan will not find it. In other words, if the application hopes to find the AP with hidden SSID in every channel, the policy of country info should be configured to WIFI_COUNTRY_POLICY_MANUAL.</td>
</tr>
<tr>
<td>AP</td>

<td>Always use the configured country info</td>
</tr>
<tr>
<td>Station/AP coexist</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>If the station doesn’t connect to any AP, the AP use the configured country info. If the station connects to an AP, the AP has the same country info as the station. Same as station mode with policy WIFI_COUNTRY_POLICY_AUTO</td>
</tr>
</tbody>
</table>

**Home Channel**  In AP mode, the home channel is defined as that of the AP channel. In Station mode, the home channel is defined as the channel of the AP to which the station is connected. In Station+AP mode, the home channel of AP and station must be the same. If the home channels of Station and AP are different, the station’s home channel is always in priority. Take the following as an example: at the beginning, the AP is on channel 6, then the
station connects to an AP whose channel is 9. Since the station’s home channel has a higher priority, the AP needs to switch its channel from 6 to 9 to make sure that both station and AP have the same home channel. While switching channel, the ESP32 in SoftAP mode will notify the connected stations about the channel migration using a Channel Switch Announcement (CSA). Stations that support channel switching will transition smoothly whereas stations who do not will disconnect and reconnect to the SoftAP.

**Wi-Fi Vendor IE Configuration**

By default, all Wi-Fi management frames are processed by the Wi-Fi driver, and the application does not need to care about them. Some applications, however, may have to handle the beacon, probe request, probe response and other management frames. For example, if you insert some vendor-specific IE into the management frames, it is only the management frames which contain this vendor-specific IE that will be processed. In ESP32, esp_wifi_set_vendor_ie() and esp_wifi_set_vendor_ie_cb() are responsible for this kind of tasks.

### 4.32.15 Wi-Fi Security

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi now supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks in traditional modes.

**Protected Management Frames (PMF)**

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

ESP32 supports the following three modes of operation with respect to PMF.

- **PMF not supported:** In this mode, ESP32 indicates to AP that it is not capable of supporting management protection during association. In effect, security in this mode will be equivalent to that in traditional mode.
- **PMF capable, but not required:** In this mode, ESP32 indicates to AP that it is capable of supporting PMF. The management protection will be used if AP mandates PMF or is at least capable of supporting PMF.
- **PMF capable and required:** In this mode, ESP32 will only connect to AP, if AP supports PMF. If not, ESP32 will refuse to connect to the AP.

`esp_wifi_set_config()` can be used to configure PMF mode by setting appropriate flags in `pmf_cfg` parameter. Currently, PMF is supported only in Station mode.

**WPA3-Personal**

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. In order to provide more robust authentication, WPA3 uses Simultaneous Authentication of
Chapter 4. API Guides

Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction. WPA3 also provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission. Please refer to Security section of Wi-Fi Alliance’s official website for further details.

In order to enable WPA3-Personal, “Enable WPA3-Personal” should be selected in menuconfig. If enabled, ESP32 uses SAE for authentication if supported by the AP. Since PMF is a mandatory requirement for WPA3, PMF capability should be at least set to “PMF capable, but not required” for ESP32 to use WPA3 mode. Application developers need not worry about the underlying security mode as highest available is chosen from security standpoint. Note that Wi-Fi stack size requirement will increase approximately by 3k when WPA3 is used. Currently, WPA3 is supported only in Station mode.

4.32.16 ESP32 Wi-Fi Power-saving Mode

Station Sleep

Currently, ESP32 Wi-Fi supports the Modem-sleep mode which refers to the legacy power-saving mode in the IEEE 802.11 protocol. Modem-sleep mode works in Station-only mode and the station must connect to the AP first. If the Modem-sleep mode is enabled, station will switch between active and sleep state periodically. In sleep state, RF, PHY and BB are turned off in order to reduce power consumption. Station can keep connection with AP in modem-sleep mode.

Modem-sleep mode includes minimum and maximum power save modes. In minimum power save mode, station wakes up every DTIM to receive beacon. Broadcast data will not be lost because it is transmitted after DTIM. However, it can not save much more power if DTIM is short for DTIM is determined by AP.

In maximum power save mode, station wakes up every listen interval to receive beacon. This listen interval can be set longer than the AP DTIM period. Broadcast data may be lost because station may be in sleep state at DTIM time. If listen interval is longer, more power is saved but broadcast data is more easy to lose. Listen interval can be configured by calling API `esp_wifi_set_config()` before connecting to AP.

Call `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` to enable Modem-sleep minimum power save mode or `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` to enable Modem-sleep maximum power save mode after calling `esp_wifi_init()`. When station connects to AP, Modem-sleep will start. When station disconnects from AP, Modem-sleep will stop.

Call `esp_wifi_set_ps(WIFI_PS_NONE)` to disable modem sleep entirely. This has much higher power consumption, but provides minimum latency for receiving Wi-Fi data in real time. When modem sleep is enabled, received Wi-Fi data can be delayed for as long as the DTIM period (minimum power save mode) or the listen interval (maximum power save mode).

The default Modem-sleep mode is WIFI_PS_MIN_MODEM.

AP Sleep

Currently ESP32 AP doesn’t support all of the power save feature defined in Wi-Fi specification. To be specific, the AP only caches unicast data for the stations connect to this AP, but doesn’t cache the multicast data for the stations. If stations connected to the ESP32 AP are power save enabled, they may experience multicast packet loss.

In future, all power save features will be supported on ESP32 AP.

4.32.17 ESP32 Wi-Fi Connect Crypto

Now ESP32 have two group crypto functions can be used when do wifi connect, one is the original functions, the other is optimized by ESP hardware: 1. Original functions which is the source code used in the folder components/wpa_supplicant/src/crypto function; 2. The optimized functions is in the folder components/wpa_supplicant/src/fast_crypto, these function used the hardware crypto to make it faster than origin one,
Chapter 4. API Guides

the type of function’s name add fast_ to distinguish with the original one. For example, the API aes_wrap() is used to encrypt frame information when do 4 way handshake, the fast_aes_wrap() has the same result but can be faster.

Two groups of crypto function can be used when register in the wpa_crypto_funcs_t, wpa2_crypto_funcs_t and wps_crypto_funcs_t structure, also we have given the recommend functions to register in the fast_crypto_ops.c, you can register the function as the way you need, however what should make action is that the crypto_hash_xxx function and crypto_cipher_xxx function need to register with the same function to operation. For example, if you register crypto_hash_init() function to initialize the esp_crypto_hash structure, you need use the crypto_hash_update() and crypto_hash_finish() function to finish the operation, rather than fast_crypto_hash_update() or fast_crypto_hash_finish().

4.32.18 ESP32 Wi-Fi Throughput

The table below shows the best throughput results we got in Espressif’s lab and in a shield box.

<table>
<thead>
<tr>
<th>Type/Throughput</th>

When the throughput is tested by iperf example, the sdkconfig is examples/wifi/iperf/sdkconfig.ci.99

4.32.19 Wi-Fi 80211 Packet Send

Important notes: The API esp_wifi_80211_tx is not available in IDF 2.1, but will be so in the upcoming release.

The esp_wifi_80211_tx API can be used to:

- Send the beacon, probe request, probe response, action frame.
- Send the non-QoS data frame.

It cannot be used for sending encrypted or QoS frames.

Preconditions of Using esp_wifi_80211_tx

- The Wi-Fi mode is Station, or AP, or Station+AP.
- Either esp_wifi_set_promiscuous(true), or esp_wifi_start(), or both of these APIs return ESP_OK. This is because we need to make sure that Wi-Fi hardware is initialized before esp_wifi_80211_tx() is called. In ESP32, both esp_wifi_set_promiscuous(true) and esp_wifi_start() can trigger the initialization of Wi-Fi hardware.
- The parameters of esp_wifi_80211_tx are hereby correctly provided.

Data rate

- If there is no WiFi connection, the data rate is 1Mbps.
- If there is WiFi connection and the packet is from station to AP or from AP to station, the data rate is same as the WiFi connection. Otherwise the data rate is 1Mbps.
Chapter 4. API Guides

Side-Effects to Avoid in Different Scenarios

Theoretically, if we do not consider the side-effects the API imposes on the Wi-Fi driver or other stations/APs, we can send a raw 802.11 packet over the air, with any destination MAC, any source MAC, any BSSID, or any other type of packet. However, robust/useful applications should avoid such side-effects. The table below provides some tips/recommendations on how to avoid the side-effects of esp_wifi_80211_tx in different scenarios.
### No WiFi connection

In this scenario, no Wi-Fi connection is set up, so there are no side-effects on the Wi-Fi driver. If `en_sys_seq==true`, the Wi-Fi driver is responsible for the sequence control. If `en_sys_seq==false`, the application needs to ensure that the buffer has the correct sequence.

Theoretically, the MAC address can be any address. However, this may impact other stations/APs with the same MAC/BSSID.

**Side-effect example#1**
The application calls `esp_wifi_80211_tx` to send a beacon with `BSSID == mac_x` in AP mode, but the `mac_x` is not the MAC of the AP interface. Moreover, there is another AP, say “other-AP”, whose bssid is `mac_x`. If this happens, an “unexpected behavior” may occur, because the stations which connect to the “other-AP” cannot figure out whether the beacon is from the “other-AP” or the `esp_wifi_80211_tx`.

To avoid the above-mentioned side-effects, we recommend that:

- If `esp_wifi_80211_tx` is called in Station mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the station interface.
- If `esp_wifi_80211_tx` is called in AP mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the AP interface.

The recommendations above are only for avoiding side-effects and can be ignored when there are good reasons for doing this.

### Have WiFi connection

When the Wi-Fi connection is already set up, and the sequence is controlled by the application, the latter may impact the sequence control of the Wi-Fi connection, as a whole. So, the `en_sys_seq` need to be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

The MAC-address recommendations in the “No WiFi connection” scenario also apply to this scenario.

If the WiFi mode is station mode and the MAC address1 is the MAC of AP to which the station is connected, the MAC address2 is the MAC of station interface, we say the packets is from the station to AP. On the other hand, if the WiFi mode is AP mode and the MAC address1 is the MAC of the station who connects to this AP, the MAC address2 is the MAC of AP interface, we say the packet is from the AP to station. To avoid conflicting with WiFi connections, the following checks are applied:

- If the packet type is data and is from the station to AP, the ToDS bit in ieee80211 frame control should be 1, the FromDS bit should be 0, otherwise the packet will be discarded by WiFi driver.
- If the packet type is data and is from the AP to station, the ToDS bit in ieee80211 frame control should be 0, the FromDS bit should be 1, otherwise the packet will be discarded by WiFi driver.
- If the packet is from station to AP or from AP to station, the Power Management, More Data, Re-Transmission, More, Data bit should be 0, otherwise the packet will be discarded by WiFi driver.

`ESP_ERR_WIFI_ARG` is returned if any check fails.
4.32.20 Wi-Fi Sniffer Mode

The Wi-Fi sniffer mode can be enabled by esp_wifi_set_promiscuous(). If the sniffer mode is enabled, the following packets can be dumped to the application:

- 802.11 Management frame
- 802.11 Data frame, including MPDU, AMPDU, AMSDU, etc.
- 802.11 MIMO frame, for MIMO frame, the sniffer only dumps the length of the frame.
- 802.11 Control frame

The following packets will NOT be dumped to the application:

- 802.11 error frame, such as the frame with a CRC error, etc.

For frames that the sniffer can dump, the application can additionally decide which specific type of packets can be filtered to the application by using esp_wifi_set_promiscuous_filter() and esp_wifi_set_promiscuous_ctrl_filter(). By default, it will filter all 802.11 data and management frames to the application.

The Wi-Fi sniffer mode can be enabled in the Wi-Fi mode of WIFI_MODE_NULL, or WIFI_MODE_STA, or WIFI_MODE_AP, or WIFI_MODE_APSTA. In other words, the sniffer mode is active when the station is connected to the AP, or when the AP has a Wi-Fi connection. Please note that the sniffer has a great impact on the throughput of the station or AP Wi-Fi connection. Generally, we should NOT enable the sniffer, when the station/AP Wi-Fi connection experiences heavy traffic unless we have special reasons.

Another noteworthy issue about the sniffer is the callback wifi_promiscuous_cb_t. The callback will be called directly in the Wi-Fi driver task, so if the application has a lot of work to do for each filtered packet, the recommendation is to post an event to the application task in the callback and defer the real work to the application task.

4.32.21 Wi-Fi Multiple Antennas

The Wi-Fi multiple antennas selecting can be depicted as following picture:

ESP32 supports up to sixteen antennas through external antenna switch. The antenna switch can be controlled by up to four address pins - antenna_select[0:3]. Different input value of antenna_select[0:3] means selecting different antenna. E.g. the value ‘0b1011’ means the antenna 11 is selected. The default value of antenna_select[3:0] is ‘0b0000’, it means the antenna 0 is selected by default.

Up to four GPIOs are connected to the four active high antenna_select pins. ESP32 can select the antenna by control the GPIO[0:3]. The API esp_wifi_set_ant_gpio() is used to configure which GPIOs are connected to antenna_selects. If GPIO[x] is connected to antenna_select[x], then gpio_config->gpio_cfg[x].gpio_select should be set to 1 and gpio_config->gpio_cfg[x].gpio_num should be provided.

Although up to sixteen antennas are supported, only one or two antennas can be simultaneously enabled for RX/TX. The API esp_wifi_set_ant() is used to configure which antennas are enabled.

The enabled antennas selecting algorithm is also configured by esp_wifi_set_ant(). The RX/TX antenna mode can be WIFI_ANT_MODE_ANT0, WIFI_ANT_MODE_ANT1 or WIFI_ANT_MODE_AUTO. If the antenna mode is WIFI_ANT_MODE_ANT0, the enabled antenna 0 is selected for RX/TX data. If the antenna mode
is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is selected for RX/TX data. Otherwise, WiFi automatically selects the antenna that has better signal from the enabled antennas.

If the RX antenna mode is WIFI_ANT_MODE_AUTO, the default antenna mode also needs to be set. Because the RX antenna switching only happens when some conditions are met, e.g. the RX antenna starts to switch if the RSSI is lower than -65dBm and if another antenna has better signal etc, RX uses the default antenna if the conditions are not met. If the default antenna mode is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is used as the default RX antenna, otherwise the enabled antenna 0 is used as the default RX antenna.

Some limitations need to be considered:
- The TX antenna can be set to WIFI_ANT_MODE_AUTO only if the RX antenna mode is WIFI_ANT_MODE_AUTO because TX antenna selecting algorithm is based on RX antenna in WIFI_ANT_MODE_AUTO type.
- Currently BT doesn’t support the multiple antennas feature, please don’t use multiple antennas related APIs.

Following is the recommended scenarios to use the multiple antennas:
- In Wi-Fi mode WIFI_MODE_STA, both RX/TX antenna modes are configured to WIFI_ANT_MODE_AUTO. The WiFi driver selects the better RX/TX antenna automatically.
- The RX antenna mode is configured to WIFI_ANT_MODE_AUTO. The TX antenna mode is configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1. The applications can choose to always select a specified antenna for TX, or implement their own TX antenna selecting algorithm, e.g. selecting the TX antenna mode based on the channel switch information etc.
- Both RX/TX antenna modes are configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1.

**Wi-Fi Multiple Antennas Configuration**

Generally, following steps can be taken to configure the multiple antennas:
- Configure which GPIOs are connected to the antenna selects, for example, if four antennas are supported and GPIO20/GPIO21 are connected to antenna_select[0]/antenna_select[1], the configurations look like:

```c
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- Configure which antennas are enabled and how RX/TX use the enabled antennas, for example, if antenna1 and antenna3 are enabled, the RX needs to select the better antenna automatically and uses antenna1 as its default antenna, the TX always selects the antenna3. The configuration looks like:

```c
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

**4.32.22 Wi-Fi Channel State Information**

Channel state information (CSI) refers to the channel information of a Wi-Fi connection. In ESP32, this information consists of channel frequency responses of sub-carriers and is estimated when packets are received from the transmitter. Each channel frequency response of sub-carrier is recorded by two bytes of signed characters. The first one is imaginary part and the second one is real part. There are up to three fields of channel frequency responses according to the type of received packet. They are legacy long training field (LLTF), high throughput LTF (HT-LTF) and space time block code HT-LTF (STBC-HT-LTF). For different types of packets which are received on channels with different state, the sub-carrier index and total bytes of signed characters of CSI is shown in the following table.
Chapter 4. API Guides

<table>
<thead>
<tr>
<th>channel</th>
<th>signal</th>

<td>0<del>31, 32</del>1</td>
<td>0~63</td>
</tr>
<tr>
<td></td>
<td>HT-LTF</td>
<td>0<del>31, 32</del>1</td>
<td>0<del>31, 32</del>1</td>
<td>0~63</td>
</tr>
<tr>
<td></td>
<td>STBC</td>
<td>0<del>31, 32</del>1</td>
<td>0<del>31, 32</del>1</td>
<td>0~63</td>
</tr>
<tr>
<td>total bytes</td>
<td>128</td>
<td>256</td>
<td>384</td>
<td>128</td>
</tr>
</tbody>
</table>

All of the information in the table can be found in the structure wifi_csi_info_t.

- Secondary channel refers to secondary_channel field of rx_ctrl field.
- Signal mode of packet refers to sig_mode field of rx_ctrl field.
- Channel bandwidth refers to cwb field of rx_ctrl field.
- STBC refers to stbc field of rx_ctrl field.
- Total bytes refers to len field.
- The CSI data corresponding to each Long Training Field(LTF) type is stored in a buffer starting from the buf field. Each item is stored as two bytes: imaginary part followed by real part. The order of each item is the same as the sub-carrier in the table. The order of LTF is: LLTF, HT-LTF, STBC-HT-LTF. However all 3 LTFs may not be present, depending on the channel and packet information (see above).
- If first_word_invalid field of wifi_csi_info_t is true, it means that the first four bytes of CSI data is invalid due to a hardware limitation in ESP32.
- More information like RSSI, noise floor of RF, receiving time and antenna is in the rx_ctrl field.

Note:

- For STBC packet, CSI is provided for every space-time stream without CSD (cyclic shift delay). As each cyclic shift on the additional chains shall be -200ns, only the CSD angle of first space-time stream is recorded in sub-carrier 0 of HT-LTF and STBC-HT-LTF for there is no channel frequency response in sub-carrier 0. CSD[10:0] is 11 bits, ranging from -pi to pi.
- If LLTF, HT-LTF or STBC-HT-LTF is not enabled by calling API esp_wifi_set_csi_config(), the total bytes of CSI data will be fewer than that in the table. For example, if LLTF and HT-LTF is not enabled and STBC-HT-LTF is enabled, when a packet is received with the condition above/HT/40MHz/STBC, the total bytes of CSI data is 244 ((61 + 60) * 2 + 2 = 244, the result is aligned to four bytes and the last two bytes is invalid).

4.32.23 Wi-Fi Channel State Information Configure

To use Wi-Fi CSI, the following steps need to be done.

- Select Wi-Fi CSI in menuconfig. It is “Menuconfig -> Components config -> Wi-Fi -> WiFi CSI(Channel State Information)”.
- Set CSI receiving callback function by calling API esp_wifi_set_csi_rx_cb().
Chapter 4. API Guides

- Configure CSI by calling API `esp_wifi_set_csi_config()`.
- Enable CSI by calling API `esp_wifi_set_csi()`.

The CSI receiving callback function runs from Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task. Because station does not receive any packet when it is disconnected and only receives packets from AP when it is connected, it is suggested to enable sniffer mode to receive more CSI data by calling `esp_wifi_set_promiscuous()`.

### 4.32.24 Wi-Fi HT20/40

ESP32 supports Wi-Fi bandwidth HT20 or HT40, it doesn’t support HT20/40 coexist. `esp_wifi_set_bandwidth` can be used to change the default bandwidth of station or AP. The default bandwidth for ESP32 station and AP is HT40.

In station mode, the actual bandwidth is firstly negotiated during the Wi-Fi connection. It is HT40 only if both the station and the connected AP support HT40, otherwise it’s HT20. If the bandwidth of connected AP is changes, the actual bandwidth is negotiated again without Wi-Fi disconnecting.

Similarly, in AP mode, the actual bandwidth is negotiated between AP and the stations that connect to the AP. It’s HT40 if the AP and one of the stations support HT40, otherwise it’s HT20.

In station/AP coexist mode, the station/AP can configure HT20/40 seperately. If both station and AP are negotiated to HT40, the HT40 channel should be the channel of station because the station always has higher priority than AP in ESP32. E.g. the configured bandwidth of AP is HT40, the configured primary channel is 6 and the configured secondary channel is 10. The station is connected to an router whose primary channel is 6 and secondary channel is 2, then the actual channel of AP is changed to primary 6 and secondary 2 automatically.

Theoretically the HT40 can gain better throughput because the maximum raw physical (PHY) data rate for HT40 is 150Mbps while it’s 72Mbps for HT20. However, if the device is used in some special environment, e.g. there are too many other Wi-Fi devices around the ESP32 device, the performance of HT40 may be degraded. So if the applications need to support same or similar scenarios, it’s recommended that the bandwidth is always configured to HT20.

### 4.32.25 Wi-Fi QoS

ESP32 supports all the mandatory features required in WFA Wi-Fi QoS Certification.

Four ACs (Access Category) are defined in Wi-Fi specification, each AC has a its own priority to access the Wi-Fi channel. Moreover a map rule is defined to map the QoS priority of other protocol, such as 802.11D or TCP/IP precedence to Wi-Fi AC.

Below is a table describes how the IP Precedences are mapped to Wi-Fi ACs in ESP32, it also indicates whether the AMPDU is supported for this AC. The table is sorted with priority descending order, namely, the AC_VO has highest priority.

<table>
<thead>
<tr>
<th>IP Precedence</th>
<th>Wi-Fi AC</th>
<th>Support AMPDU?</th>
</tr>
</thead>
<tbody>
<tr>
<td>6, 7</td>
<td>AC_VO (Voice)</td>
<td>No</td>
</tr>
<tr>
<td>4, 5</td>
<td>AC_VI (Video)</td>
<td>Yes</td>
</tr>
<tr>
<td>3, 0</td>
<td>AC_BE (Best Effort)</td>
<td>Yes</td>
</tr>
<tr>
<td>1, 2</td>
<td>AC_BK (Background)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The application can make use of the QoS feature by configuring the IP precedence via socket option IP_TOS. Here is an example to make the socket to use VI queue:

```c
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

Theoretically the higher priority AC has better performance than the low priority AC, however, it’s not always be true, here...
• For some really important application traffic, can put it into AC_VO queue. Avoid sending big traffic via AC_VO queue. On one hand, the AC_VO queue doesn’t support AMPDU and it can’t get better performance than other queue if the traffic is big, on the other hand, it may impact the the management frames that also use AC_VO queue.
• Avoid using more than two different AMPDU supported precedences, e.g. socket A uses precedence 0, socket B uses precedence 1, socket C uses precedence 2, this is a bad design because it may need much more memory. To be detailed, the Wi-Fi driver may generate a Block Ack session for each precedence and it needs more memory if the Block Ack session is setup.

4.32.26 Wi-Fi AMSDU

ESP32 supports receiving AMSDU but doesn’t support transmitting AMSDU. The transmitting AMSDU is not necessary since ESP32 has transmitting AMPDU.

4.32.27 Wi-Fi Fragment

ESP32 supports Wi-Fi receiving fragment, but doesn’t support Wi-Fi transmitting fragment. The Wi-Fi transmitting fragment will be supported in future release.

4.32.28 WPS Enrollee

ESP32 supports WPS enrollee feature in Wi-Fi mode WIFI_MODE_STA or WIFI_MODE_APSTA. Currently ESP32 supports WPS enrollee type PBC and PIN.

4.32.29 Wi-Fi Buffer Usage

This section is only about the dynamic buffer configuration.

Why Buffer Configuration Is Important

In order to get a robust, high-performance system, we need to consider the memory usage/configuration very carefully, because:

• the available memory in ESP32 is limited.
• currently, the default type of buffer in LwIP and Wi-Fi drivers is “dynamic”, which means that both the LwIP and Wi-Fi share memory with the application. Programmers should always keep this in mind; otherwise, they will face a memory issue, such as “running out of heap memory”.
• it is very dangerous to run out of heap memory, as this will cause ESP32 an “undefined behavior”. Thus, enough heap memory should be reserved for the application, so that it never runs out of it.
• the Wi-Fi throughput heavily depends on memory-related configurations, such as the TCP window size, Wi-Fi RX/TX dynamic buffer number, etc.
• the peak heap memory that the ESP32 LwIP/Wi-Fi may consume depends on a number of factors, such as the maximum TCP/UDP connections that the application may have, etc.
• the total memory that the application requires is also an important factor when considering memory configuration.

Due to these reasons, there is not a good-for-all application configuration. Rather, we have to consider memory configurations separately for every different application.

Dynamic vs. Static Buffer

The default type of buffer in Wi-Fi drivers is “dynamic”. Most of the time the dynamic buffer can significantly save memory. However, it makes the application programming a little more difficult, because in this case the application needs to consider memory usage in Wi-Fi.
lwIP also allocates buffers at the TCP/IP layer, and this buffer allocation is also dynamic. See lwIP documentation section about memory use and performance.

Peak Wi-Fi Dynamic Buffer

The Wi-Fi driver supports several types of buffer (refer to Wi-Fi Buffer Configure). However, this section is about the usage of the dynamic Wi-Fi buffer only. The peak heap memory that Wi-Fi consumes is the theoretically-maximum memory that the Wi-Fi driver consumes. Generally, the peak memory depends on:

- the number of dynamic rx buffers that are configured: wifi_rx_dynamic_buf_num
- the number of dynamic tx buffers that are configured: wifi_tx_dynamic_buf_num
- the maximum packet size that the Wi-Fi driver can receive: wifi_rx_pkt_size_max
- the maximum packet size that the Wi-Fi driver can send: wifi_tx_pkt_size_max

So, the peak memory that the Wi-Fi driver consumes can be calculated with the following formula:

\[
\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} \times \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} \times \text{wifi\_tx\_pkt\_size\_max})
\]

Generally, we do not need to care about the dynamic tx long buffers and dynamic tx long long buffers, because they are management frames which only have a small impact on the system.

4.32.30 Wi-Fi Menuconfig

Wi-Fi Buffer Configure

If you are going to modify the default number or type of buffer, it would be helpful to also have an overview of how the buffer is allocated/freed in the data path. The following diagram shows this process in the TX direction:

![TX Buffer Allocation Diagram](image)

**Fig. 61: TX Buffer Allocation**

**Description:**

- The application allocates the data which needs to be sent out.
- The application calls TCPIP-/Socket-related APIs to send the user data. These APIs will allocate a PBUF used in LwIP, and make a copy of the user data.
- When LwIP calls a Wi-Fi API to send the PBUF, the Wi-Fi API will allocate a “Dynamic Tx Buffer” or “Static Tx Buffer”, make a copy of the LwIP PBUF, and finally send the data.

The following diagram shows how buffer is allocated/freed in the RX direction:

**Description:**

- The Wi-Fi hardware receives a packet over the air and puts the packet content to the “Static Rx Buffer”, which is also called “RX DMA Buffer.”
- The Wi-Fi driver allocates a “Dynamic Rx Buffer”, makes a copy of the “Static Rx Buffer”, and returns the “Static Rx Buffer” to hardware.
- The Wi-Fi driver delivers the packet to the upper-layer (LwIP), and allocates a PBUF for holding the “Dynamic Rx Buffer.”
- The application receives data from LwIP.
The diagram shows the configuration of the Wi-Fi internal buffer.
<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Alloc Type</th>
<th>Default</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static RX Buffer (Hardware RX Buffer)</td>
<td>Static</td>
<td>10 * 1600 Bytes</td>
<td>Yes</td>
<td>This is a kind of DMA memory. It is initialized in esp_wifi_init() and freed in esp_wifi_deinit(). The ‘Static Rx Buffer’ forms the hardware receiving list. Upon receiving a frame over the air, hardware writes the frame into the buffer and raises an interrupt to the CPU. Then, the Wi-Fi driver reads the content from the buffer and returns the buffer back to the list. If the application want to reduce the the memory statically allocated by Wi-Fi, they can reduce this value from 10 to 6 to save 6400 Bytes memory. It’s not recommended to reduce the configuration to a value less than 6 unless the AMPDU feature is disabled.</td>
</tr>
<tr>
<td>Dynamic RX Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>Yes</td>
<td>The buffer length is variable and it depends on the received frames’ length. When the Wi-Fi driver receives a frame from the ‘Hardware Rx Buffer’, the ‘Dynamic Rx Buffer’ needs to be allocated from the heap. The number of the Dynamic Rx Buffer, configured in the menuconfig, is used to limit the total un-freed Dynamic Rx Buffer number.</td>
</tr>
<tr>
<td>Dynamic TX Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>Yes</td>
<td>This is a kind of DMA memory. It is allocated to the heap. When the upper-layer (LwIP) sends packets to the Wi-Fi driver, it firstly allocates Transient RX Buffer (SRAM) and makes a copy of the upper-layer buffer. The Dynamic and Static TX Buffers are mutually exclusive. Since the TX buffer must be DMA buffer, so when PSRAM is enabled, the TX buffer must be static.</td>
</tr>
<tr>
<td>Management Short Buffer</td>
<td>Dynamic</td>
<td>8</td>
<td>NO</td>
<td>Wi-Fi driver is internal buffer</td>
</tr>
<tr>
<td>Management Long Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>NO</td>
<td>Wi-Fi driver is internal buffer</td>
</tr>
<tr>
<td>Long Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>NO</td>
<td>Wi-Fi driver is internal buffer</td>
</tr>
</tbody>
</table>
Wi-Fi NVS Flash

If the Wi-Fi NVS flash is enabled, all Wi-Fi configurations set via the Wi-Fi APIs will be stored into flash, and the Wi-Fi driver will start up with these configurations next time it powers on/reboots. However, the application can choose to disable the Wi-Fi NVS flash if it does not need to store the configurations into persistent memory, or has its own persistent storage, or simply due to debugging reasons, etc.

Wi-Fi AMPDU

ESP32 supports both receiving and transmitting AMPDU, the AMPDU can greatly improve the Wi-Fi throughput. Generally, the AMPDU should be enabled. Disabling AMPDU is usually for debugging purposes.

4.32.31 Troubleshooting

Please refer to a separate document with Espressif Wireshark User Guide.

Espressif Wireshark User Guide

1. Overview

1.1 What is Wireshark? Wireshark (originally named “Ethereal”) is a network packet analyzer that captures network packets and displays the packet data as detailed as possible. It uses WinPcap as its interface to directly capture network traffic going through a network interface controller (NIC).

You could think of a network packet analyzer as a measuring device used to examine what is going on inside a network cable, just like a voltmeter is used by an electrician to examine what is going on inside an electric cable.

In the past, such tools were either very expensive, proprietary, or both. However, with the advent of Wireshark, all that has changed.

Wireshark is released under the terms of the GNU General Public License, which means you can use the software and the source code free of charge. It also allows you to modify and customize the source code.

Wireshark is, perhaps, one of the best open source packet analyzers available today.

1.2 Some Intended Purposes Here are some examples of how Wireshark is typically used:

- Network administrators use it to troubleshoot network problems.
- Network security engineers use it to examine security problems.
- Developers use it to debug protocol implementations.
- People use it to learn more about network protocol internals.

Beside these examples, Wireshark can be used for many other purposes.

1.3 Features The main features of Wireshark are as follows:

- Available for UNIX and Windows
- Captures live packet data from a network interface
- Displays packets along with detailed protocol information
- Opens/saves the captured packet data
- Imports/exports packets into a number of file formats, supported by other capture programs
- Advanced packet filtering
- Searches for packets based on multiple criteria
- Colorizes packets according to display filters
- Calculates statistics
- …and a lot more!
1.4 Wireshark Can or Can’t Do

- **Live capture from different network media.**
  Wireshark can capture traffic from different network media, including wireless LAN.
- **Import files from many other capture programs.**
  Wireshark can import data from a large number of file formats, supported by other capture programs.
- **Export files for many other capture programs.**
  Wireshark can export data into a large number of file formats, supported by other capture programs.
- **Numerous protocol dissectors.**
  Wireshark can dissect, or decode, a large number of protocols.
- **Wireshark is not an intrusion detection system.**
  It will not warn you if there are any suspicious activities on your network. However, if strange things happen, Wireshark might help you figure out what is really going on.
- **Wireshark does not manipulate processes on the network, it can only perform “measurements” within it.**
  Wireshark does not send packets on the network or influence it in any other way, except for resolving names (converting numerical address values into a human readable format), but even that can be disabled.

2. Where to Get Wireshark  
You can get Wireshark from the official website: [https://www.wireshark.org/download.html](https://www.wireshark.org/download.html)

Wireshark can run on various operating systems. Please download the correct version according to the operating system you are using.

This demonstration uses Wireshark 2.2.6 on Linux.

a) Start Wireshark

On Linux, you can run the shell script provided below. It starts Wireshark, then configures NIC and the channel for packet capture.

```bash
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

In the above script, the parameter $1 represents NIC and $2 represents channel. For example, wlan0 in ./xxx.sh wlan0 6, specifies the NIC for packet capture, and 6 identifies the channel of an AP or Soft-AP.

b) Run the Shell Script to Open Wireshark and Display Capture Interface

![Wireshark Capture Interface](image)

Fig. 63: Wireshark Capture Interface
c) Select the Interface to Start Packet Capture

As the red markup shows in the picture above, many interfaces are available. The first one is a local NIC and the second one is a wireless NIC.

Please select the NIC according to your requirements. This document will use the wireless NIC to demonstrate packet capture.

Double click wlan0 to start packet capture.

d) Set up Filters

Since all packets in the channel will be captured, and many of them are not needed, you have to set up filters to get the packets that you need.

Please find the picture below with the red markup, indicating where the filters should be set up.

![Setting up Filters in Wireshark](image)

Click Filter, the top left blue button in the picture below. The `display filter` dialogue box will appear.

![Display Filter Dialogue Box](image)

Click the Expression button to bring up the `Filter Expression` dialogue box and set the filter according to your requirements.

**The quickest way**: enter the filters directly in the toolbar.

Click on this area to enter or modify the filters. If you enter a wrong or unfinished filter, the built-in syntax check turns the background red. As soon as the correct expression is entered, the background becomes green.

The previously entered filters are automatically saved. You can access them anytime by opening the drop down list.

For example, as shown in the picture below, enter two MAC addresses as the filters and click Apply (the blue arrow). In this case, only the packet data transmitted between these two MAC addresses will be captured.
Chapter 4. API Guides

Fig. 66: Filter Expression Dialogue Box

Fig. 67: Filter Toolbar

Fig. 68: Example of MAC Addresses applied in the Filter Toolbar
e) Packet List

You can click any packet in the packet list and check the detailed information about it in the box below the list. For example, if you click the first packet, its details will appear in that box.

![Example of Packet List Details](image)

f) Stop/Start Packet Capture

As shown in the picture below, click the red button to stop capturing the current packet.

![Stopping Packet Capture](image)

Click the top left blue button to start or resume packet capture.

g) Save the Current Packet

On Linux, go to File -> Export Packet Dissections -> As Plain Text File to save the packet.

Please note that All packets, Displayed and All expanded must be selected.

By default, Wireshark saves the captured packet in a libpcap file. You can also save the file in other formats, e.g. txt, to analyze it in other tools.

Chapter 5

Libraries and Frameworks

5.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks’ agents and examples:

5.1.1 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32 based on Amazon Web Services’ aws-iot-device-sdk-embedded-C.

5.1.2 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32 based on Microsoft Azure’s azure-iot-sdk-c SDK.

5.1.3 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32 based on Google’s iot-device-sdk-embedded-c SDK.
Chapter 6

Contributions Guide

We welcome contributions to the esp-idf project!

6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
- Does any new code conform to the esp-idf Style Guide?
- Does the code documentation follow requirements in Documenting Code?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the Creating Examples guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” squashed into previous commits?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

6.4 Legal Part

Before a contribution can be accepted, you will need to sign our Contributor Agreement. You will be prompted for this automatically as part of the Pull Request process.

6.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Indentation  Use 4 spaces for each indentation level. Don’t use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space  Place one empty line between functions. Don’t begin or end a function with an empty line.

```c
void function1()
{
    do_one_thing();
    do_another_thing();  // INCORRECT, don't place empty line here
}
  // place empty line here
void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

The maximum line length is 120 characters as long as it doesn’t seriously affect the readability.

Horizontal Space  Always add single space after conditional and loop keywords:

```c
if (condition) {  // correct
    // ...
}
switch (n) {  // correct
    case 0:
        // ...
}
for(int i = 0; i < CONST; ++i) {  // INCORRECT
    // ...
}
```
Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```c
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);  // correct
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);  // also okay
int y_cur = -y;  // correct
++y_cur;
const int y = y0 + (x-x0) * (y1-y0) / (x1-x0);  // INCORRECT
```

No space is necessary around , and -> operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```c
gpio_matrix_in(PIN_CAM_D6, I2S0I_DATA_IN14_IDX, false);
gpio_matrix_in(PIN_CAM_D7, I2S0I_DATA_IN15_IDX, false);
gpio_matrix_in(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX, false);
gpio_matrix_in(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDK, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. PIN_CAM_VSYNC), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

**Braces**

- Function definition should have a brace on a separate line:

  ```c
  // This is correct:
  void function(int arg)
  {
  }

  // NOT like this:
  void function(int arg) {
  }
  ```

- Within a function, place opening brace on the same line with conditional and loop statements:

  ```c
  if {condition) {
      do_one();
  } else if {other_condition) {
      do_two();
  }
  ```

**Comments**  Use // for single line comments. For multi-line comments it is okay to use either // on each line or a /* */ block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don’t use single comments to disable some functionality:
void init_something()
{
    setup_dma();
    // load_resources(); // WHY is this thing commented, asks...
    start_timer();
}

• If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated...
    // load_resources();
    start_timer();
}

• Same goes for #if 0 ... #endif blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don’t use #if 0 ... #endif or comments to store code snippets which you may need in the future.

• Don’t add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}

Line Endings  Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the core.autocrlf setting. Github has a document about setting this option “github-line-endings”. However because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs -d 'dos2unix' && git commit -a --amend --no-edit --allow-empty' master

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it’s possible to run dos2unix FILENAME and then run git commit --amend

Formatting Your Code  You can use astyle program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don’t re-format the code you didn’t change. This will help others when they review your changes.
C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming  C++ Header files have the extension .hpp. C++ source files have the extension .cpp. The latter is important for the compiler to distinguish them from normal C source files.

Naming

• Class and struct names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake_case.
• Namespaces shall be in lower snake_case.
• Templates are specified in the line above the function declaration.
• Interfaces in terms of Object-Oriented Programming shall be named without the suffix ...Interface. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes  In order of precedence:

• First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
• First put constructors/destructors, then member functions, then member variables.

For example:

```cpp
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

• Don’t indent inside namespaces.
• Put public, protected and private labels at the same indentation level as the corresponding class label.
Simple Example

```cpp
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>
namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;
private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};
template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);
private:
    T cargo;
};
} // namespace spaceships
#endif // SPACESHIP_H_
// file spaceship.cpp
#include "spaceship.h"
namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only
// initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) {}

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
(continues on next page)
CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don’t put anything in the optional parentheses after endforeach(), endif(), etc.
- Use lowercase (with underscores) for command, function, and macro names.
- For locally scoped variables, use lowercase (with underscores).
- For globally scoped variables, use uppercase (WITH_UNDERSCORES).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Documenting Code

Please see the guide here: Documenting Code.

Naming

- Any variable or function which is only used in a single source file should be declared static.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie esp_vfs_register() or esp_console_run(). Starting the prefix with esp_ for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with s_ for easy identification. For example, static bool s_invert.
- Avoid unnecessary abbreviations (ie shortening data to dat), unless the resulting name would otherwise be very long.

Structure

To be written.

Language Features

To be written.
### 6.5.2 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in espresif/esp-idf repository and how to add new documentation.

**Introduction**

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```c
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

**Why we need it?**

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:
Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information on purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.
4. If function has void input or does not return any value, then skip @param or @return
5. When documenting a `define` as well as members of a `struct` or `enum`, place specific comment like below after each member:

```
/**
 * @brief Initialize BT controller.
 * This function should be called only once, before any other BT functions are called.
 */
void bt_controller_init(void);
```

6. To provide well formatted lists, break the line after command (like `@return` in example below).

```
* @return
  * - ESP_OK if erase operation was successful
  * - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
  * - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
  * - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
  * - other error codes from the underlying storage driver
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in the same directory in a separate README.rst file. If directory contains header files for different APIs, then the file name should be apiname-readme.rst.

**Go one extra mile**

There is couple of tips, how you can make your documentation even better and more useful to the reader.

1. Add code snippets to illustrate implementation. To do so, enclose snippet using `@code(c)` and `@endcode` commands.

```
* @endcode

```c
/* Example of using nvs_get_i32:
 * int32_t max_buffer_size = 4096; // default value
 * esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
 * assert(err == ESP_OK /* err == ESP_ERR_NVS_NOT_FOUND);*/
 * // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
 * // have its default value.
 * @endcode
```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command `@attention` or `@note`.
Chapter 6. Contributions Guide

1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /**@{*/ and /**@}*/ markup commands:

```c
/**@{*/
/**
 * @brief common description of similar functions
 */
void first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

For practical example see nvs_flash/include/nvs.h.

4. You may want to go even further and skip some code like e.g. repetitive defines or enumerations. In such case enclose the code within /** @cond */ and /** @endcond */ commands. Example of such implementation is provided in driver/include/driver/gpio.h.

5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```
```

**Note:** Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

6. Prepare one or more complete code examples together with description. Place description in a separate file README.md in specific folder of examples directory.

**Linking Examples**

When linking to examples on GitHub do not use absolute / hardcoded URLs. Instead, use docutils custom roles that will generate links for you. These auto-generated links point to the tree or blob for the git commit ID (or tag) of the repository. This is needed to ensure that links do not get broken when files in master branch are moved around or deleted. The roles will transparently handle files that are located in submodules and will link to the submodule’s repository with the correct commit ID.

The following roles are provided:

- :idf:`path` - points to directory inside ESP-IDF
- :idf_file:`path` - points to file inside ESP-IDF
- :idf_raw:`path` - points to raw view of the file inside ESP-IDF
- :component:`path` - points to directory inside ESP-IDF components dir
- :component_file:`path` - points to file inside ESP-IDF components dir
- :component_raw:`path` - points to raw view of the file inside ESP-IDF components dir
- :example:`path` - points to directory inside ESP-IDF examples dir
- :example_file:`path` - points to file inside ESP-IDF examples dir
- :example_raw:`path` - points to raw view of the file inside ESP-IDF examples dir

Example implementation:
Chapter 6. Contributions Guide

* :example:`get-started/hello_world`
* :example:`Hello World! <get-started/hello_world>`

How it renders:

- get-started/hello_world
- Hello World!

A check is added to the CI build script, which searches RST files for presence of hard-coded links (identified by tree/master, blob/master, or raw/master part of the URL). This check can be run manually: `cd docs` and then make gh-linkcheck.

### Linking Language Versions

Switching between documentation in different languages may be done using :link_to_translation: custom role. The role placed on a page of documentation provides a link to the same page in a language specified as a parameter. Examples below show how to enter links to Chinese and English versions of documentation:

```
:!link_to_translation:`zh_CN: 中文版`
!link_to_translation:`en:English`
```

The language is specified using standard abbreviations like `en` or `zh_CN`. The text after last semicolon is not standardized and may be entered depending on the context where the link is placed, e.g.:

```
!link_to_translation:`en:see description in English`
```

### Add Illustrations

Consider adding diagrams and pictures to illustrate described concepts.

Sometimes it is better to add an illustration than writing a lengthy paragraph to describe a complex idea, a data structure or an algorithm. This repository is using blockdiag suite of tools to generate diagram images from simple text files.

The following types of diagrams are supported:

- **Block diagram**
- **Sequence diagram**
- **Activity diagram**
- **Logical network diagram**

With this suite of tools it is possible to generate beautiful diagram images from simple text format (similar to graphviz’ s DOT format). The diagram elements are laid out automatically. The diagram code is then converted into “.png” graphics and integrated “behind the scenes” into Sphinx documents.

For the diagram preparation you can use an on-line interactive shell that instantly shows the rendered image.

Below are couple of diagram examples:

- **Simple block diagram** /blockdiag - Wi-Fi Buffer Configuration
- Slightly more complicated **block diagram** - Wi-Fi programming model
- **Sequence diagram** /seqdiag - Scan for a Specific AP in All Channels
- **Packet diagram** /packetdiag - NVS Page Structure

Try them out by modifying the source code and see the diagram instantly rendering below.

**Note:** There may be slight differences in rendering of font used by the interactive shell compared to the font used in the esp-idf documentation.
Add Notes

Working on a document, you might need to:

- Place some suggestions on what should be added or modified in future.
- Leave a reminder for yourself or somebody else to follow up.

In this case, add a todo note to your reST file using the directive .. todo::. For example:

```plaintext
.. todo::
    Add a package diagram.
```

If you add .. todolist:: to a reST file, the directive will be replaced by a list of all todo notes from the whole documentation.

By default, the directives .. todo:: and .. todolist:: are ignored by documentation builders. If you want the notes and the list of notes to be visible in your locally built documentation, do the following:

1. Open your local conf_common.py file.
2. Find the parameter todo_include_todos.
3. Change its value from False to True.

Before pushing your changes to origin, please set the value of todo_include_todos back to False.

For more details about the extension, see sphinx.ext.todo documentation.

Writing generic documentation for multiple chips

The documentation for all of Espressif’s chips is built from the same files. To facilitate the writing of documents that can be re-used for multiple different chips (called below “targets”), we provide you with the following functionality:

Exclusion of content based on chip-target

Occasionally there will be content that is only relevant for one of targets. When this is the case, you can exclude that content by using the .. only:: TAG directive, where you replace ‘TAG’ with one of the following names:

- Chip name:
  - esp32
  - esp32s2

Define identifiers from ‘sdkconfig.h’, generated by the default menuconfig settings for the target, e.g:

- CONFIG_FREERTOS_UNICORE

Define identifiers from the soc ‘*_caps’ headers, e.g:

- SOC_BT_SUPPORTED
- SOC_CAN_SUPPORTED

Example:

```plaintext
.. only:: esp32
    ESP32 specific content.
```

This directive also supports the boolean operators ‘and’, ‘or’ and ‘not’. Example:

```plaintext
.. only:: SOC_BT_SUPPORTED and CONFIG_FREERTOS_UNICORE
    BT specific content only relevant for single-core targets.
```
This functionality is provided by the Sphinx selective exclude extension.

A weakness in this extension is that it does not correctly handle the case were you exclude a section, and that is directly followed by a labeled new section. In these cases everything will render correctly, but the label will not correctly link to the section that follows. A temporary work-around for the cases were this can’t be avoided is the following:

```bash
.. only:: esp32

.. _section_1_label:
Section 1
^^^^^^^^^^
Section one content
.. _section_2_label:
.. only:: esp32s2
  _section_2_label:
Section 2
^^^^^^^^^^
Section 2 content
```

The :TAG: role is used for excluding content from a table of content tree. For example:

```bash
.. toctree::
  :maxdepth: 1
  :esp32: configure-wrover
  configure-other-jtag
```

When building the documents, Sphinx will use the above mentioned directive and role to include or exclude content based on the target tag it was called with.

**Note:** If excluding an entire document from the toctree based on targets, it’s necessary to also update the exclude_patterns list in docs/conf_common.py to exclude the file for other targets, or a Sphinx warning “WARNING: document isn’t included in any toctree” will be generated.

The recommended way of doing it is adding the document to one of the list that gets included in conditional_include_dict in docs/conf_common.py, e.g. a document which should only be shown for BT capable targets should be added to BT_DOCS. docs/idf_extensions/exclude_docs.py will then take care of adding it to exclude_patterns if the corresponding tag is not set.

If you need to exclude content inside a list or bullet points then this should be done by using the :TAG: role inside the .. list:: directive.

```bash
.. list::
  :esp32: - ESP32 specific content
  :SOC_BT_SUPPORTED: - BT specific content
  - Common bullet point
  - Also common bullet point
```

**Substitution macros** When you need to refer to the chip’s name, toolchain name, path or other common names that depend on the target type you can consider using the substitution macros supplied by docs/idf_extensions/format_idf_target.py.

For example, the following reStructuredText content:
Chapter 6. Contributions Guide

This is a \{IDF_TARGET_NAME\} with \{IDF_TARGET_PATH_NAME\}/soc.c, compiled with `xtensa-{IDF_TARGET_TOOLCHAIN_NAME}-elf-gcc` with `CONFIG_{IDF_TARGET_CFG_PREFIX}_MULTI_DOC`.

Would render in the documentation as:

This is a ESP32, with /esp32/soc.c, compiled with `xtensa-esp32-elf-gcc` with `CONFIG_ESP32_MULTI_DOC`.

This extension also supports markup for defining local (within a single source file) substitutions. Place a definition like the following into a single line of the RST file:

```
{\IDF_TARGET_SUFFIX:default="DEFAULT_VALUE", esp32="ESP32_VALUE", esp32s2="ESP32S2_VALUE"}
```

This will define a target-dependent substitution of the tag \{IDF_TARGET_SUFFIX\} in the current RST file. For example:

```
{\IDF_TARGET_TX_PIN:default="IO3", esp32="IO4", esp32s2="IO5"}
```

Will define a substitution for the tag \{IDF_TARGET_TX_PIN\}, which would be replaced by the text IO5 if sphinx was called with the tag esp32s2.

**Note:** These single-file definitions can be placed anywhere in the .rst file (on their own line), but the name of the directive must start with \IDF_TARGET_.

**Put it all together**

Once documentation is ready, follow instruction in *API Documentation Template* and create a single file, that will merge all individual pieces of prepared documentation. Finally add a link to this file to respective .. toctree::

in index.rst file located in /docs folder or subfolders.

**OK, but I am new to Sphinx!**

1. No worries. All the software you need is well documented. It is also open source and free. Start by checking Sphinx documentation. If you are not clear how to write using rst markup language, see reStructuredText Primer. You can also use markdown (.md) files, and find out about more about the specific markdown syntax that we use on Recommonmark parser’s documentation page.
2. Check the source files of this documentation to understand what is behind of what you see now on the screen. Sources are maintained on GitHub in espressif/esp-idf repository in docs folder. You can go directly to the source file of this page by scrolling up and clicking the link in the top right corner. When on GitHub, see what’s really inside, open source files by clicking Raw button.
3. You will likely want to see how documentation builds and looks like before posting it on the GitHub. There are two options to do so:
   - Install Sphinx, Breathe, Blockdiag and Doxygen to build it locally, see chapter below.
   - Set up an account on Read the Docs and build documentation in the cloud. Read the Docs provides document building and hosting for free and their service works really quick and great.
4. To preview documentation before building, use Sublime Text editor together with OmniMarkupPreviewer plugin.

**Setup for building documentation locally**

**Install Dependencies** You can setup environment to build documentation locally on your PC by installing:

1. Doxygen - http://doxygen.nl/
Chapter 6. Contributions Guide

The package “sphinx_idf_theme” is added to have the same “look and feel” of ESP-IDF Programming Guide. Do not worry about being confronted with several packages to install. Besides Doxygen and sphinx_idf_theme, all remaining packages are written in pure Python. Therefore installation of all of them is combined into one simple step.

**Important:** Docs building now supports Python 3 only. Python 2 installations will not work.

**Doxygen** Installation of Doxygen is OS dependent:

**Linux**

```
sudo apt-get install doxygen
```

**Windows** - install in MSYS2 console

```
pacman -S doxygen
```

**MacOS**

```
brew install doxygen
```

**Note:** If you are installing on Windows MSYS2 system (Linux and MacOS users should skip this note, Windows users who don’t use MSYS2 will need to find other alternatives), before going further, execute two extra steps below. These steps are required to install dependencies of “blockdiag” discussed under Add Illustrations.

1. Update all the system packages:

   ```
   $ pacman -Syu
   ```

   This process will likely require restarting of the MSYS2 MINGW32 console and repeating above commands, until update is complete.

2. Install pillow, that is one of dependences of the blockdiag:

   ```
   $ pacman -S mingw32/mingw-w64-i686-python-pillow
   ```

   Check the log on the screen that mingw-w64-i686-python-pillow-4.3.0-1 or newer is installed. Previous versions of pillow will not work.

A downside of Windows installation is that fonts of the blockdiag pictures <add-illustrations> do not render correctly, you will see some random characters instead. Until this issue is fixed, you can use the interactive shell to see how the complete picture looks like.

**sphinx_idf_theme** The sphinx_idf_theme needs a mixture of Python and JavaScript in order to build. So currently it’s necessary install node.js in order to build it locally.

```
cd ~/esp
git clone https://github.com/espressif/sphinx_idf_theme.git
cd sphinx_idf_theme
npm install
python setup.py build
python setup.py install
```
Chapter 6. Contributions Guide

This is a temporary inconvenience. We plan to provide a way to install `sphinx_idf_theme` as a prebuilt package, soon.

**Remaining applications** All remaining applications are Python packages and you can install them in one step as follows:

```
    cd ~/esp/esp-idf/docs
    pip install --user -r requirements.txt
```

**Note:** Installation steps assume that ESP-IDF is placed in ~/esp/esp-idf directory, that is default location of ESP-IDF used in documentation.

**Building Documentation**

```
    cd ~/esp/esp-idf/docs
```

Now you should be ready to build documentation by invoking:

```
    ./build_docs.py build
```

This will build docs for all supported ESP-IDF languages & targets. This can take some time, although jobs will run in parallel up to the number of CPU cores you have (can modify this with the `--sphinx-parallel-builds` option, see `./build_docs.py --help` for details).

To build for a single language and target combination only:

```
    ./build_docs.py -l en -t esp32 build
```

Choices for language (-l) are `en` and `zh_CN`. Choices for target (-t) are any supported ESP-IDF build system target (for example `esp32` and `esp32s2`).

Build documentation will be placed in `_build/<language>/<target>/html` folder. To see it, open the `index.html` inside this directory in a web browser.

**Building PDF** It is also possible to build latex files and a PDF of the documentation using `build_docs.py`. To do this the following Latex packages are required to be installed:

- `latexmk`
- `texlive-latex-recommended`
- `texlive-fonts-recommended`
- `texlive-xetex`

The following fonts are also required to be installed:

- Freefont Serif, Sans and Mono OpenType fonts, available as the package `fonts-freefont-otf` on Ubuntu
- `lmodern`, available as the package `fonts-lmodern` on Ubuntu
- `Fandol`, can be downloaded from [here](#)

Now you can build the PDF for a target by invoking:

```
    ./build_docs.py -bs latex -l en -t esp32 build
```

Or alternatively build both html and PDF:

```
    ./build_docs.py -bs html latex -l en -t esp32 build
```

Latex files and the PDF will be placed in `_build/<language>/<target>/latex` folder.
Chapter 6. Contributions Guide

Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

6.5.3 Documentation Add-ons and Extensions Reference

This documentation is created using Sphinx application that renders text source files in reStructuredText (.rst) format located in docs directory. For some more details on that process, please refer to section Documenting Code.

Besides Sphinx there are several other applications that help to provide nicely formatted and easy to navigate documentation. These applications are listed in section Setup for building documentation locally with the installed version numbers provided in file docs/requirements.txt.

We build ESP-IDF documentation for two languages (English, Simplified Chinese) and for multiple chips. Therefore we don’t run sphinx directly, there is a wrapper Python program build_docs.py that runs Sphinx.

On top of that we have created a couple of custom add-ons and extensions to help integrate documentation with underlining ESP-IDF repository and further improve navigation as well as maintenance of documentation.

The purpose of this section is to provide a quick reference to the add-ons and the extensions.

Documentation Folder Structure

- The ESP-IDF repository contains a dedicated documentation folder docs in the root.
- The docs folder contains localized documentation in docs/en (English) and docs/zh_CN (simplified Chinese) subfolders.
- Graphics files and fonts common to localized documentation are contained in docs/_static subfolder.
- Remaining files in the root of docs as well as docs/en and docs/zh_CN provide configuration and scripts used to automate documentation processing including the add-ons and extensions.
- Sphinx extensions are provided in two directories, extensions and idf_extensions.
- A _build directory is created in the docs folder by build_docs.py. This directory is not added to the ESP-IDF repository.

Add-ons and Extensions Reference

Config Files

docs/conf_common.py This file contains configuration common to each localized documentation (e.g. English, Chinese). The contents of this file is imported to standard Sphinx configuration file conf.py located in respective language folders (e.g. docs/en, docs/zh_CN) during build for each language.

docs/sphinx-known-warnings.txt There are couple of spurious Sphinx warnings that cannot be resolved without doing update to the Sphinx source code itself. For such specific cases respective warnings are documented in sphinx-known-warnings.txt file, that is checked during documentation build, to ignore the spurious warnings.
Chapter 6. Contributions Guide

**Scripts**  
docs/build_docs.py  
Top-level executable program which runs a Sphinx build for one or more language/target combinations. Run `build_docs.py --help` for full command line options.  
When `build_docs.py` runs Sphinx it sets the `idf_target` configuration variable, sets a Sphinx tag with the same name as the configuration variable, and uses some environment variables to communicate paths to *IDF-Specific Extensions*.  

docs/check_lang_folder_sync.sh  
To reduce potential discrepancies when maintaining concurrent language version, the structure and filenames of language folders `docs/en` and `docs/zh_CN` folders should be kept identical. The script `check_lang_folder_sync.sh` is run on each documentation build to verify if this condition is met.  

**Note:** If a new content is provided in e.g. English, and there is no any translation yet, then the corresponding file in `zh_CN` folder should contain an `.. include::` directive pointing to the source file in English. This will automatically include the English version visible to Chinese readers. For example if a file `docs/zh_CN/contribute/documenting-code.rst` does not have a Chinese translation, then it should contain `.. include:: ../../en/contribute/documenting-code.rst` instead.  

**Non-Docs Scripts**  
These scripts are used to build docs but also used for other purposes:  

**tools/gen_esp_err_to_name.py**  
This script is traversing the ESP-IDF directory structure looking for error codes and messages in source code header files to generate an `.inc` file to include in documentation under *Error Codes Reference*.  

**tools/kconfig_new/confgen.py**  
Options to configure ESP-IDF’s components are contained in `Kconfig` files located inside directories of individual components, e.g. `components/bt/Kconfig`. This script is traversing the component directories to collect configuration options and generate an `.inc` file to include in documentation under *Configuration Options Reference*.  

**Generic Extensions**  
These are Sphinx extensions developed for IDF that don’t rely on any IDF-docs-specific behaviour or configuration:  

**docs/extensions/toctree_filter.py**  
Sphinx extensions overrides the `:toctree:` directive to allow filtering entries based on whether a tag is set, as `:tagname: toctree_entry`. See the Python file for a more complete description.  

**docs/extensions/list_filter.py**  
Sphinx extensions that provides a `.. list::` directive that allows filtering of entries in lists based on whether a tag is set, as `:tagname: - list content`. See the Python file for a more complete description.  

**docs/extensions/html_redirects.py**  
During documentation lifetime some source files are moved between folders or renamed. This Sphinx extension adds a mechanism to redirect documentation pages that have changed URL by generating in the Sphinx output static HTML redirect pages. The script is used together with a redirection list `html_redirect_pages.conf_common.py` builds this list from `docs/page_redirects.txt`.  

**Third Party Extensions**  
- `sphinxcontrib` extensions for blockdiag, seqdiag, actdiag, nwdiag, rackdiag & packetdiag diagrams.  
- `Sphinx selective exclude` `eager_only` extension  

**IDF-Specific Extensions**  

**Build System Integration**  
docs/idf_extensions/build_system/  
Python package implementing a Sphinx extension to pull IDF build system information into the docs build  
- Creates a dummy CMake IDF project and runs CMake to generate metadata  
- Registers some new configuration variables and emits a new Sphinx event, both for use by other extensions.
Chapter 6. Contributions Guide

Configuration Variables

- `docs_root` - The absolute path of the $IDF_PATH/docs directory
- `idf_path` - The value of IDF_PATH variable, or the absolute path of IDF_PATH if environment unset
- `build_dir` - The build directory passed in by `build_docs.py`, default will be like _build/<lang>/<target>
- `idf_target` - The IDF_TARGET value. Expected that `build_docs.py` set this on the Sphinx command line

New Event  
`idf-info` event is emitted early in the build, after the dummy project CMake run is complete.

Arguments are `(app, project_description)` where `project_description` is a dict containing the values parsed from `project_description.json` in the CMake build directory.

Other IDF-specific extensions subscribe to this event and use it to set up some docs parameters based on build system info.

Other Extensions

docs/idf_extensions/include_build_file.py  
The `include-build-file` directive is like the built-in `include-file` directive, but file path is evaluated relative to `build_dir`.

docs/idf_extensions/kconfig_reference.py  
Subscribes to `idf-info` event and uses confgen to generate `kconfig.inc` from the components included in the default project build. This file is then included into `Project Configuration`.

docs/idf_extensions/link_roles.py  
This is an implementation of a custom Sphinx Roles to help linking from documentation to specific files and folders in ESP-IDF. For description of implemented roles please see `Linking Examples` and `Linking Language Versions`.

docs/idf_extensions/esp_err_definitions.py  
Small wrapper extension that calls `gen_esp_err_to_name.py` and updates the included .rst file if it has changed.

docs/idf_extensions/gen_toolchain_links.py  
There are couple of places in documentation that provide links to download the toolchain. To provide one source of this information and reduce effort to manually update several files, this script generates toolchain download links and toolchain unpacking code snippets based on information found in `tools/toolchain_versions.mk`.

docs/idf_extensions/gen_version_specific_includes.py  
Another extension to automatically generate reStructured-Text .inc snippets with version-based content for this ESP-IDF version.

docs/idf_extensions/util.py  
A collection of utility functions useful primarily when building documentation locally (see `Setup for building documentation locally`) to reduce the time to generate documentation on a second and subsequent builds.

docs/idf_extensions/format_idf_target.py  
An extension for replacing generic target related names with the idf_target passed to the Sphinx command line. This is a `{IDF_TARGET_NAME}`, with `/(IDF_TARGET_PATH_NAME)/soc.c`, compiled with `xtensa-{IDF_TARGET_TOOLCHAIN_NAME}-elf-gcc with CONFIG_{IDF_TARGET_CFG_PREFIX}_MULTI_DOC` will, if the backspaces are removed, render as This is an ESP32, with `esp32/soc.c`, compiled with `xtensa-esp32-elf-gcc with CONFIG_ESP32_MULTI_DOC`.

Also supports markup for defining local (single rst-file) substitutions with the following syntax: `{IDF_TARGET_TX_PIN:default=pIO3,esp32=pIO4,esp32s2=pIO5}`

This will define a replacement of the tag `{IDF_TARGET_TX_PIN}` in the current rst-file.

The extension also overrides the default `.. include::` directive in order to format any included content using the same rules.

These replacements cannot be used inside markup that rely on alignment of characters, e.g. tables.

docs/idf_extensions/latex_builder.py  
An extension for adding ESP-IDF specific functionality to the latex builder. Overrides the default Sphinx latex builder. Creates and adds the espsdf sty latex package to the output directory, which contains some macros for run-time variables such as IDF-Target.

docs/idf_extensions/gen_defines.py  
Sphinx extension to integrate defines from IDF into the Sphinx build, runs after the IDF dummy project has been built.

Parses defines and adds them as sphinx tags.

Emits the new `‘idf-defines-generated’` event which has a dictionary of raw text define values that other extensions can use to generate relevant data.
Chapter 6. Contributions Guide

**docs/idf_extensions/exclude_docs.py**  Sphinx extension that updates the excluded documents according to the conditional_include_dict [tag:documents]. If the tag is set, then the list of documents will be included. Subscribes to idf-defines-generated as it relies on the sphinx tags to determine which documents to exclude.

**docs/idf_extensions/run_doxygen.py**  Subscribes to idf-defines-generated event and runs Doxygen (docs/Doxyfile) to generate XML files describing key headers, and then runs Breathe to convert these to .inc files which can be included directly into API reference pages. Pushes a number of target-specific custom environment variables into Doxygen, including all macros defined in the project’s default sdkconfig.h file and all macros defined in all soc component xxx_caps.h headers. This means that public API headers can depend on target-specific configuration options or soc capabilities headers options as #ifdef & #if preprocessor selections in the header. This means we can generate different Doxygen files, depending on the target we are building docs for. Please refer to Documenting Code and API Documentation Template, section API Reference for additional details on this process.

**Related Documents**

- Documenting Code

**6.5.4 Creating Examples**

Each ESP-IDF example is a complete project that someone else can copy and adapt the code to solve their own problem. Examples should demonstrate ESP-IDF functionality, while keeping this purpose in mind.

**Structure**

- The main directory should contain a source file named (something)_example_main.c with the main functionality.
- If the example has additional functionality, split it logically into separate C or C++ source files under main and place a corresponding header file in the same directory.
- If the example has a lot of additional functionality, consider adding a components directory to the example project and make some example-specific components with library functionality. Only do this if the components are specific to the example, if they’re generic or common functionality then they should be added to ESP-IDF itself.
- The example should have a README.md file. Use the template example README and adapt it for your particular example.
- Examples should have an example_test.py file for running an automated example test. If submitting a GitHub Pull Request which includes an example, it’s OK not to include this file initially. The details can be discussed as part of the Pull Request.

**General Guidelines**

Example code should follow the Espressif IoT Development Framework Style Guide.

**Checklist**

Checklist before submitting a new example:

- Example project name (in Makefile and README.md) uses the word “example”. Use “example” instead of “demo”, “test” or similar words.
- Example does one distinct thing. If the example does more than one thing at a time, split it into two or more examples.
- Example has a README.md file which is similar to the template example README.
• Functions and variables in the example are named according to naming section of the style guide. (For non-static names which are only specific to the example’s source files, you can use example or something similar as a prefix.)
• All code in the example is well structured and commented.
• Any unnecessary code (old debugging logs, commented-out code, etc.) is removed from the example.
• Options in the example (like network names, addresses, etc) are not hard-coded. Use configuration items if possible, or otherwise declare macros or constants.
• Configuration items are provided in a KConfig.projbuild file with a menu named “Example Configuration” . See existing example projects to see how this is done.
• All original example code has a license header saying it is “in the public domain / CC0”, and a warranty disclaimer clause. Alternatively, the example is licensed under Apache License 2.0. See existing examples for headers to adapt from.
• Any adapted or third party example code has the original license header on it. This code must be licensed compatible with Apache License 2.0.

6.5.5 API Documentation Template

Note: INSTRUCTIONS
1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using ..include::
   • README.rst
   • example.rst
   • ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

Note: INSTRUCTIONS
1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.
3. To distinguish between sections, use the following heading levels:
   • # with overline, for parts
   • * with overline, for chapters
   • =, for sections
   • –, for subsections
   • ^\, for subsubsections
   • ", for paragraphs

Application Example

Note: INSTRUCTIONS
1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in esp-idf/examples/ folder.
3. Place example in this folder complete with README.md file.
4. Provide overview of demonstrated functionality in README.md.
5. With good overview reader should be able to understand what example does without opening the source code.
Chapter 6. Contributions Guide

6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in esp-idf/examples/.

API Reference

Note: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using code markup retrieved by Doxygen from header files.
2. Update is done on each documentation build by invoking Sphinx extension docs/idf_extensions/run_doxygen.py for all header files listed in the INPUT statement of docs/Doxyfile.
3. Each line of the INPUT statement (other than a comment that begins with ##) contains a path to header file *.h that will be used to generate corresponding *.inc files:

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

1. When the headers are expanded, any macros defined by default in sdkconfig.h as well as any macros defined in SOC-specific include/soc/*_caps.h headers will be expanded. This allows the headers to include/exclude material based on the IDF_TARGET value.
2. The *.inc files contain formatted reference of API members generated automatically on each documentation build. All *.inc files are placed in Sphinx _build directory. To see directives generated for e.g. esp_wifi.h, run python gen-dxd.py esp32/include/esp_wifi.h.
3. To show contents of *.inc file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see docs/en/api-reference/network/esp_wifi.rst

1. Optionally, rather that using *.inc files, you may want to describe API in your own way. See docs/en/api-guides/ulp.rst for example.

Below is the list of common .. doxygen...:: directives:

• Functions .. doxygenfunction:: name_of_function
• Unions .. doxygenuion:: name_of_union
• Structures .. doxygenstruct:: name_of_structure together with :members:
• Macros .. doxygendefine:: name_of_define
• Type Definitions .. doxygentypedef:: name_of_type
• Enumerations .. doxygenenum:: name_of_enumeration

See Breathe documentation for additional information.

To provide a link to header file, use the link custom role as follows:

```
* :component_file:'path_to/header_file.h'
```

1. In any case, to generate API reference, the file docs/Doxyfile should be updated with paths to *.h headers that are being documented.

1. When changes are committed and documentation is build, check how this section has been rendered. Correct annotations in respective header files, if required.
6.5.6 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement

including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) (“We” or “Us”). The purpose of this contributor agreement (“Agreement”) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at CONTRIBUTING.rst

1. DEFINITIONS

“You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“Contribution” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at angus@espressif.com.

“Copyright” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“Material” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“Submit” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“Submission Date” means the date You Submit a Contribution to Us.

“Documentation” means any non-software portion of a Contribution.

2. LICENSE GRANT

2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

• to publish the Contribution,
• to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
• to reproduce the Contribution in original or modified form,
• to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENTS

3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter
acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License
You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER
THE CONTRIBUTION IS PROVIDED “AS IS”, MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver
TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver
IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term
7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous
8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

Chapter 7

ESP-IDF Versions

The ESP-IDF GitHub repository is updated regularly, especially the master branch where new development takes place.

For production use, there are also stable releases available.

7.1 Releases

The documentation for the current stable release version can always be found at this URL:

Documentation for the latest version (master branch) can always be found at this URL:

The full history of releases can be found on the GitHub repository Releases page. There you can find release notes, links to each version of the documentation, and instructions for obtaining each version.

Another place to find documentation for all releases is the documentation page, where you can go to the bottom-left corner and click the versions dropup (a bar with a small triangle). You can also use this dropup to switch between versions of the documentation.
7.2 Which Version Should I Start With?

- For production purposes, use the current stable version. Stable versions have been manually tested, and are updated with “bugfix releases” which fix bugs without changing other functionality (see Versioning Scheme for more details).
  In order to maximize the time between updates to new ESP-IDF versions, use the latest stable Long Term Support release version. This version can be found on the Releases page.
- For prototyping, experimentation or for developing new ESP-IDF features, use the latest version (master branch in Git). The latest version in the master branch has all the latest features and has passed automated testing, but has not been completely manually tested ("bleeding edge").
- If a required feature is not yet available in a stable release, but you do not want to use the master branch, it is possible to check out a pre-release version or a release branch. It is recommended to start from a stable version and then follow the instructions for Updating to a Pre-Release Version or Updating to a Release Branch.

See Updating ESP-IDF if you already have a local copy of ESP-IDF and wish to update it.

7.3 Versioning Scheme

ESP-IDF uses Semantic Versioning. This means that:
• Major Releases, like v3.0, add new functionality and may change functionality. This includes removing deprecated functionality. If updating to a new major release (for example, from v2.1 to v3.0), some of your project’s code may need updating and functionality may need to be re-tested. The release notes on the Releases page include lists of Breaking Changes to refer to.

• Minor Releases like v3.1 add new functionality and fix bugs but will not change or remove documented functionality, or make incompatible changes to public APIs. If updating to a new minor release (for example, from v3.0 to v3.1), your project’s code does not require updating, but you should re-test your project. Pay particular attention to the items mentioned in the release notes on the Releases page.

• Bugfix Releases like v3.0.1 only fix bugs and do not add new functionality. If updating to a new bugfix release (for example, from v3.0 to v3.0.1), you do not need to change any code in your project, and you only need to re-test the functionality directly related to bugs listed in the release notes on the Releases page.

7.4 Support Periods

Each ESP-IDF major and minor release version has an associated support period. After this period, the release is End of Life and no longer supported. Some releases are designated Long Term Support, which means the support period is longer than for other releases.

The ESP-IDF Support Period Policy explains this in detail, and describes how the support periods for each release are determined.

Each release on the Releases page includes information about the support period for that particular release.

As a general guideline:

• Using Long Term Support releases will maximize the amount of time between required ESP-IDF major or minor upgrades.

• Using standard stable releases will require more frequent upgrades to new ESP-IDF versions. However, this means that new features and major improvements will be available more frequently.

It is also possible to upgrade from a Long Term Support release to a standard release, and vice versa.

7.5 Checking the Current Version

The local ESP-IDF version can be checked by using idf.py:

```
idf.py --version
```

The ESP-IDF version is also compiled into the firmware and can be accessed (as a string) via the macro IDF_VER. The default ESP-IDF bootloader will print the version on boot (the version information is not always updated in code, it only changes if that particular source file is recompiled).

If writing code that needs to support multiple ESP-IDF versions, the version can be checked at compile time using compile-time macros.

Examples of ESP-IDF versions:
### Chapter 7. ESP-IDF Versions

<table>
<thead>
<tr>
<th>Version String</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| v3.2-dev-306-gbeb3611ca | Master branch pre-release.  
- v3.2-dev - in development for version 3.2.  
- 306 - number of commits after v3.2 development started.  
- beb3611ca - commit identifier. |
| v3.0.2 | Stable release, tagged v3.0.2. |
| v3.1-beta1-75-g346d6b0ea | Beta version in development (on a release branch).  
- v3.1-beta1 - pre-release tag.  
- 75 - number of commits after the pre-release beta tag was assigned.  
- 346d6b0ea - commit identifier. |
| v3.0.1-dirty | Stable release, tagged v3.0.1.  
- dirty means that there are modifications in the local ESP-IDF directory. |

#### 7.6 Git Workflow

The development (Git) workflow of the Espressif ESP-IDF team is as follows:

- New work is always added on the master branch (latest version) first. The ESP-IDF version on master is always tagged with -dev (for “in development”), for example v3.1-dev.
- Changes are first added to an internal Git repository for code review and testing but are pushed to GitHub after automated testing passes.
- When a new version (developed on master) becomes feature complete and “beta” quality, a new branch is made for the release, for example release/v3.1. A pre-release tag is also created, for example v3.1-beta1. You can see a full list of branches and a list of tags on GitHub. Beta pre-releases have release notes which may include a significant number of Known Issues.
- As testing of the beta version progresses, bug fixes will be added to both the master branch and the release branch. New features for the next release may start being added to master at the same time.
- Once testing is nearly complete a new release candidate is tagged on the release branch, for example v3.1-rc1. This is still a pre-release version.
- If no more significant bugs are found or reported, then the final Major or Minor Version is tagged, for example v3.1. This version appears on the Releases page.
- As bugs are reported in released versions, the fixes will continue to be committed to the same release branch.
- Regular bugfix releases are made from the same release branch. After manual testing is complete, a bugfix release is tagged (i.e. v3.1.1) and appears on the Releases page.

#### 7.7 Updating ESP-IDF

Updating ESP-IDF depends on which version(s) you wish to follow:

- **Updating to Stable Release** is recommended for production use.
- **Updating to Master Branch** is recommended for the latest features, development use, and testing.
- **Updating to a Release Branch** is a compromise between the first two.
Chapter 7. ESP-IDF Versions

Note: These guides assume that you already have a local copy of ESP-IDF cloned. To get one, check Step 2 in the Getting Started guide for any ESP-IDF version.

7.7.1 Updating to Stable Release

To update to a new ESP-IDF release (recommended for production use), this is the process to follow:

• Check the Releases page regularly for new releases.
• When a bugfix release for the version you are using is released (for example, if using v3.0.1 and v3.0.2 is released), check out the new bugfix version into the existing ESP-IDF directory:

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

• When major or minor updates are released, check the Release Notes on the releases page and decide if you want to update or to stay with your current release. Updating is via the same Git commands shown above.

Note: If you installed the stable release via zip file instead of using git, it might not be possible to update versions using the commands. In this case, update by downloading a new zip file and replacing the entire IDF_PATH directory with its contents.

7.7.2 Updating to a Pre-Release Version

It is also possible to git checkout a tag corresponding to a pre-release version or release candidate, the process is the same as Updating to Stable Release.

Pre-release tags are not always found on the Releases page. Consult the list of tags on GitHub for a full list. Caveats for using a pre-release are similar to Updating to a Release Branch.

7.7.3 Updating to Master Branch

Note: Using Master branch means living “on the bleeding edge” with the latest ESP-IDF code.

To use the latest version on the ESP-IDF master branch, this is the process to follow:

• Check out the master branch locally:

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

• Periodically, re-run git pull to pull the latest version of master. Note that you may need to change your project or report bugs after updating your master branch.
• To switch from master to a release branch or stable version, run git checkout as shown in the other sections.

Important: It is strongly recommended to regularly run git pull and then git submodule update --init --recursive so a local copy of master does not get too old. Arbitrary old master branch revisions are
effectively unsupportable “snapshots” that may have undocumented bugs. For a semi-stable version, try Updating to a Release Branch instead.

### 7.7.4 Updating to a Release Branch

In terms of stability, using a release branch is part-way between using the master branch and only using stable releases. A release branch is always beta quality or better, and receives bug fixes before they appear in each stable release.

You can find a list of branches on GitHub.

For example, to follow the branch for ESP-IDF v3.1, including any bugfixes for future releases like v3.1.1, etc:

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
```

Each time you `git pull` this branch, ESP-IDF will be updated with fixes for this release.

**Note:** There is no dedicated documentation for release branches. It is recommended to use the documentation for the closest version to the branch which is currently checked out.
Chapter 8

Resources

8.1 PlatformIO

8.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

8.1.2 Installation

- PlatformIO IDE is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- PlatformIO Core (CLI) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services
8.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

8.1.4 Tutorials

• ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

8.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation

8.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

• Learn more about integrations with other IDEs/Text Editors
• Get help from PlatformIO community

8.2 Useful Links

• The esp32.com forum is a place to ask questions and find community resources.
• Check the Issues section on GitHub if you find a bug or have a feature request. Please check existing Issues before opening a new one.
• A comprehensive collection of solutions, practical applications, components and drivers based on ESP-IDF is available in ESP32 IoT Solution repository. In most of cases descriptions are provided both in English and in Chinese.
• To develop applications using Arduino platform, refer to Arduino core for ESP32 WiFi chip.
• Several books have been written about ESP32 and they are listed on Espressif web site.
• If you’re interested in contributing to ESP-IDF, please check the Contributions Guide.
• For additional ESP32 product related information, please refer to documentation section of Espressif site.
• Download latest and previous versions of this documentation in PDF and HTML format.
Chapter 9

Copyrights and Licenses

9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2019 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- Newlib is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- Xtensa header files are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of FreeRTOS (components/freertos) are Copyright (C) 2015 Real Time Engineers Ltd and is licensed under the GNU General Public License V2 with the FreeRTOS Linking Exception, as described in license.txt.
- Original parts of LWIP (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.
- wpa_supplicant Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- FreeBSD net80211 Copyright (c) 2004-2008 Sam Leffler, Erno Consulting and licensed under the BSD license.
- JSMN JSON Parser (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- linenoise line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- libcoap COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in LICENSE file and COPYING file.
- libexpat XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in COPYING file.
- FatFS library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license.
- cJSON library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file.
- libsodium library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in LICENSE file.
• micro-ecc library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
• nghttp2 library, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in COPYING file.
• Mbed TLS library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in LICENSE file.
• SPIFFS library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in LICENSE file.
• TinyCBOR library, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in LICENSE file.
• SD/MMC driver is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
• Asio, Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in COPYING file.
• ESP-MQTT MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuannpm at live dot com> is licensed under Apache License 2.0 as described in LICENSE file.
• BLE Mesh is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0.
• mynewt-nimble Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in LICENSE file.
• cryptoauthlib Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in LICENSE file.

9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

• esptool.py is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in LICENSE file.
• KConfig is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.
• Kconfiglib is Copyright (C) 2011-2019, Ulf Magnusson, and is licensed under the ISC License.
• Menuconfig of Kconfiglib is Copyright (C) 2018-2019, Nordic Semiconductor ASA and Ulf Magnusson, and is licensed under the ISC License.

9.1.3 Documentation

• HTML version of the ESP-IDF Programming Guide uses the Sphinx theme sphinx_idf_theme, which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on sphinx_rtd_theme. Both are licensed under MIT license.

9.2 ROM Source Code Copyrights

ESP32 mask ROM hardware includes binaries compiled from portions of the following third party software:

• Newlib , licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
• Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
• TinyBasic Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
• miniz, by Rich Geldreich - placed into the public domain.
• wpa_supplicant Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
• TJpgDec Copyright (C) 2011, ChaN, all right reserved. See below for license.
9.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.
Chapter 10

About

The ESP-IDF, Espressif IoT Development Framework, provides toolchain, API, components and workflows to develop applications for ESP32 using Windows, Linux and Mac OS operating systems.

Fig. 1: Espressif IoT Integrated Development Framework
Chapter 11

Switch Between Languages/切换语言

The ESP-IDF Programming Manual is now available in two languages. Please refer to the English version if there is any discrepancy.

《ESP-IDF 编程手册》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- English/英文
- Chinese/中文

You can easily change from one language to another by the panel on the sidebar like below. Just click on the Read the Docs title button on the left-bottom corner if it is folded.

如下图所示，你可使用边栏的面板进行语言的切换。如果该面板被折叠，点击左下角 Read the Docs 标题按钮来显示它。
