  For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional
  This phase is the turn around time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to master.
- **Data:** variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

**Data IO Modes** In some IO modes, more data wires can be use to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here’s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>command WN</th>
<th>address WN</th>
<th>dummy cycles</th>
<th>data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>

<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>
Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except from the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit from the QPI mode, master can send EXQPI command.

**Supported Commands**

Note: The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRBUF</td>

<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>

<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>
**Segment Transaction Mode**  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the `esp_serial_slave_link` component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.

- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Fhost Interrupts: The master can inform the slave about certain events.
3. TX FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line. The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See [SDIO Slave Capabilities of Espressif chips](#) and [SPI Slave Capabilities of Espressif chips](#) for more details.
Initialization of ESP Serial Slave Link

**ESP SDIO Slave**  The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver</api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**  

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the SDIO interface instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

*Tohost Interrupts (optional)*

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

*From Interrupts*

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

*TX FIFO*

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

*RX FIFO*

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

*Reset counters (Optional)*  Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.
Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

API Reference

Header File

• esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

`esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)`
Initialize the slave.

Return ESP_OK if success, or other value returned from lower layer `init`.

Parameters

• handle: Handle of an ESSL device.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)`
Wait for interrupt of an ESP slave device.

Return

• ESP_OK if success
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of an ESSL device.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`
Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Return

• ESP_OK Success
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of an ESSL device.
• out_tx_num: Output of buffer num that host can send data to an ESP slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)`
Get amount of data the ESP slave preparing to send to host.

Return

• ESP_OK Success
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of an ESSL device.
• out_rx_size: Output of data size to read from slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_reset_cnt (essl_handle_t handle)`
Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

Parameters

• handle: Handle of an ESSL device.
Chapter 2. API Reference

**esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)**

Send a packet to the ESP slave. The slave receive the packet into buffers whose size is buffer_size (configured during initialization).

**Return**

- ESP_OK Success
- ESP_ERR_TIMEOUT No buffer to use, or error f rom SDMMC host controller
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)**

Get a packet from an ESP slave.

**Return**

- ESP_OK Success, all the data are read from the slave.
- ESP_ERR_NOT_FINISHED Read success, while there’re data remaining.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- [out] out_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- [out] out_length: Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)**

Write general purpose R/W registers (8-bit) of an ESP slave.

**Note**

s dio 28-31 are reserved, the lower API helps to skip.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Address not valid.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- addr: Address of register to write. Valid address: 0-59.
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_read_reg (essl_handle_t handle, uint8_t *addr, uint8_t *value_o, uint32_t wait_ms)**

Read general purpose R/W registers (8-bit) of an ESP slave.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Address not valid.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- addr: Address of register to read. Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read).
- value_o: Output value read from the register.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)**

wait for an interrupt of the slave
Return

- ESP_ERR_NOT_SUPPORTED Currently our driver does not support SDIO with SPI interface.
- ESP_OK If interrupt triggered.
- ESP_ERR_TIMEOUT No interrupts before timeout.

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Clear interrupt bits of an ESP slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to clear.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr(essl_handle_t handle, uint32_t* intr_raw, uint32_t* intr_st, uint32_t wait_ms)`

Get interrupt bits of an ESP slave.

Return

- ESP_OK Success
- ESP_INVALID_ARG if both `intr_raw` and `intr_st` are NULL.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- intr_raw: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- intr_st: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)`

Set interrupt enable bits of an ESP slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- ena_mask: Mask of the interrupt bits to enable.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)`

Get interrupt enable bits of an ESP slave.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- ena_mask_o: Output of interrupt bit enable mask.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_send_slave_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Send interrupts to slave. Each bit of the interrupt will be triggered.

Return

- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters
Chapter 2. API Reference

- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to send to slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

Type Definitions

typedef struct essl_dev_t *essl_handle_t
    Handle of an ESSL device.

Header File

- esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

Functions

esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)
    Initialize the ESSL SDIO device and get its handle.

    Return
    • ESP_OK: on success
    • ESP_ERR_NO_MEM: memory exhausted.

    Parameters
    • out_handle: Output of the handle.
    • config: Configuration for the ESSL SDIO device.

esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)
    Deinitialize and free the space used by the ESSL SDIO device.

    Return
    • ESP_OK: on success
    • ESP_ERR_INVALID_ARG: wrong handle passed

    Parameters
    • handle: Handle of the ESSL SDIO device to deinit.

Structures

struct essl_sdio_config_t
    Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t *card
    The initialized sdmnc card pointer of the slave.

int recv_buffer_size
    The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
    Read the shared buffer from the slave in ISR way.

    Note out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

    Return
    • ESP_OK: on success
or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- **spi**: SPI device handle representing the slave
- **out_data**: Buffer for read data, strongly suggested to be in the DRAM and align to 4
- **addr**: Address of the slave shared buffer
- **len**: Length to read
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rdbuf_polling(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```

Read the shared buffer from the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- **ESP_OK**: on success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- **spi**: SPI device handle representing the slave
- **out_data**: Buffer for read data, strongly suggested to be in the DRAM and align to 4
- **addr**: Address of the slave shared buffer
- **len**: Length to read
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in ISR way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- **ESP_OK**: success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- **spi**: SPI device handle representing the slave
- **data**: Buffer for data to send, strongly suggested to be in the DRAM and align to 4
- **addr**: Address of the slave shared buffer,
- **len**: Length to write
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- **ESP_OK**: success
- or other return value from `cpp:func:spi_device_polling_transmit`.

**Parameters**
- **spi**: SPI device handle representing the slave
- **data**: Buffer for data to send, strongly suggested to be in the DRAM and align to 4
- **addr**: Address of the slave shared buffer,
- **len**: Length to write
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma(spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.
Note This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

Parameters
- spi: SPI device handle representing the slave
- out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and align to 4
- len: Total length of data to receive
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_seg(spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)
```

Read one data segment from the slave through its DMA.

Note To read long buffer, call :cpp:func:`essl_spi_rddma` instead.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

Parameters
- spi: SPI device handle representing the slave
- out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and align to 4
- seg_len: Length of this segment
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

Note This is required only when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

Parameters
- spi: SPI device handle representing the slave
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma(spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)
```

Send long buffer in segments to the slave through its DMA.

Note This function combines several :cpp:func:`essl_spi_wrdma_seg` and one :cpp:func:`essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

Parameters
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM and align to 4
- len: Total length of data to send
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)
```

Send one data segment to the slave through its DMA.
### 2.14 ESP x509 Certificate Bundle

#### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

**Note:** The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Wed Jan 23 04:12:09 2019 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacert_all.pem.

#### Configuration

Most configuration is done through menuconfig. Make and CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
• **CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH**: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

**Generating the List of Root Certificates**

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found [here](https://curl.se). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, `cmn_crt_authorities.csv`, from this list provided by Mozilla.

**Updating the Certificate Bundle**

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in *Updating the Certificate Bundle*.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: `protocols/https_x509_bundle`.

HTTPS example that uses ESP-TLS and the default bundle: `protocols/https_request`.

HTTPS example that uses mbedTLS and the default bundle: `protocols/https_mbedtls`.

**API Reference**

**Header File**

- `mbedtls/esp_crt_bundle/include/esp_crt_bundle.h`

**Functions**

```c
esp_err_t esp_crt_bundle_attach (void *conf)
```

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_crt_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.
Chapter 2. API Reference

Return
• ESP_OK if adding certificates was successful.
• Other if an error occurred or an action must be taken by the calling process.

Parameters
• [in] conf: The config struct for the SSL connection.

```c
void esp_crt_bundle_detach(mbedtls_ssl_config *conf)
```

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters
• [in] conf: The config struct for the SSL connection.

```c
void esp_crt_bundle_set(const uint8_t *x509_bundle)
```

Set the default certificate bundle used for verification.

Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters
• [in] x509_bundle: A pointer to the certificate bundle.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.4.15 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.5 Provisioning API

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:
• Communication security at application level -
  – protocomm_security0 (no security)
  – protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
• Proof-of-possesion (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets). Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Transport Example (SoftAP + HTTP) with Security 1

For complete example see provisioning/legacy/softap_prov
/* Endpoint handler to be registered with protocomm. */
/* This simply echoes back the received data. */

esp_err_t echo_req_handler(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen; /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOL_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid */
    /* throughout the scope of protocomm endpoint. This need not be... */
    /* static, */
    /* i.e. could be dynamically allocated and freed at the time of... */
    /* endpoint */
    /* removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for */
    /* request handlers, setting security creates an endpoint and... */
    /* registers */
    /* the handler provided by protocomm_security1. One can similarly use */
    /* protocomm_security0. Only one type of security can be set for a */
    /* protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1, ...
    /* &pop_obj); */

    /* Private data passed to the endpoint must be valid throughout the... */
    /* scope */

    (continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
/* of protocomm endpoint. This need not be static, ie. could be */
/* dynamically allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a */
/* unique name */
/* and register a handler function along with private data to be */
/* passed at the */
/* time of handler execution. Multiple endpoints can be added as long */
/* as they */
/* are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);

return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it’s unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it’s name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

Transport Example (BLE) with Security 0

For complete example see provisioning/legacy/ble_prov

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
             * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };
```

(continues on next page)
/* Start protocomm layer on top of BLE */
protocomm_ble_start(pc, &config);

/* For protocomm_security0, Proof of Possession is not used, and can... */
protocomm_set_security(pc, "security_endpoint", &protocomm_security0,...
=NULL);
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,...
=NULL);
return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
protocomm_remove_endpoint(pc, "echo_req_endpoint");
protocomm_unset_security(pc, "security_endpoint");

/* Stop BLE protocomm service */
protocomm_ble_stop(pc);
protocomm_delete(pc);
}

API Reference

Header File

- protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new(void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Return

- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete(protocomm_t *pc)
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters

[ in ] pc: Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint(protocomm_t *pc, const char *ep_name, proto-
comm_req_handler_t h, void *priv_data)
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

Note

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- This function internally calls the registered add_endpoint() function of the selected transport which is a member of the protocomm_t instance structure.

Return
**Chapter 2. API Reference**

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in] pc</td>
<td>Pointer to the protocomm instance</td>
</tr>
<tr>
<td>[in] ep_name</td>
<td>Endpoint identifier (name) string</td>
</tr>
<tr>
<td>[in] h</td>
<td>Endpoint handler function</td>
</tr>
<tr>
<td>[in] priv_data</td>
<td>Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.</td>
</tr>
</tbody>
</table>

**esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char * ep_name)**

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**

- This function internally calls the registered remove_endpoint() function which is a member of the protocomm_t instance structure.

**Return**

- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name does not exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in] pc</td>
<td>Pointer to the protocomm instance</td>
</tr>
<tr>
<td>[in] ep_name</td>
<td>Endpoint identifier (name) string</td>
</tr>
</tbody>
</table>

**esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)**

Allocates internal resources for new transport session.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

**Return**

- ESP_OK: Request handled successfully
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in] pc</td>
<td>Pointer to the protocomm instance</td>
</tr>
<tr>
<td>[in] session_id</td>
<td>Unique ID for a communication session</td>
</tr>
</tbody>
</table>

**esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)**

Frees internal resources used by a transport session.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

**Return**

- ESP_OK: Request handled successfully
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in] pc</td>
<td>Pointer to the protocomm instance</td>
</tr>
<tr>
<td>[in] session_id</td>
<td>Unique ID for a communication session</td>
</tr>
</tbody>
</table>

**esp_err_t protocomm_req_handle (protocomm_t *pc, const char * ep_name, uint32_t session_id, const uint8_t * inbuf, ssize_t inlen, uint8_t ** outbuf, ssize_t * outlen)**

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- Resulting output buffer must be deallocated by the caller.

**Return**

- ESP_OK: Request handled successfully
- ESP_FAIL: Internal error in execution of registered handler
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] session_id: Unique ID for a communication session
- [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen: Length of the input buffer
- [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen: Buffer length of the allocated output buffer

```
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establishment to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint/Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Security endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

```
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint/Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Version endpoint already set

```
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint/Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Version endpoint already set
• ESP_ERR_NO_MEM: Error allocating endpoint resource
• ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

Parameters

• [in] pc: Pointer to the protocomm instance
• [in] ep_name: Endpoint identifier(name) string
• [in] version: Version identifier(name) string

`esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return

• ESP_OK: Success
• ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG: Null instance/name arguments

Parameters

• [in] pc: Pointer to the protocomm instance
• [in] ep_name: Endpoint identifier(name) string

Type Definitions

`typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Function prototype for protocomm endpoint handler.

`typedef struct protocomm protocomm_t`

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private

Header File

• `protocomm/include/security/protocomm_security.h`

Structures

`struct protocomm_security_pop`

Proof Of Possession for authenticating a secure session.

Public Members

`const uint8_t *data`

Pointer to buffer containing the proof of possession data

`uint16_t len`

Length (in bytes) of the proof of possession data

`struct protocomm_security`

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members

`int ver`

Unique version number of security implementation
**Chapter 2. API Reference**

### esp_err_t (*init*) (protocomm_security_handle_t *handle)

Function for initializing/allocating security infrastructure

### esp_err_t (*cleanup*) (protocomm_security_handle_t handle)

Function for deallocating security infrastructure

### esp_err_t (*new_transport_session*) (protocomm_security_handle_t handle, uint32_t session_id)

Starts a new secure transport session with specified ID

### esp_err_t (*close_transport_session*) (protocomm_security_handle_t handle, uint32_t session_id)

Closes a secure transport session with specified ID

### esp_err_t (*security_req_handler*) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

### esp_err_t (*encrypt*) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

### esp_err_t (*decrypt*) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

### Type Definitions

typedef struct protocomm_security_pop protocomm_security_pop_t

Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Header File

- protocomm/include/security/protocomm_security0.h

### Header File

- protocomm/include/security/protocomm_security1.h

### Header File

- protocomm/include/transports/protocomm_httpd.h

### Functions

**esp_err_t** protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Return**

- ESP_OK : Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_SUPPORTED: Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE: Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM: Memory allocation for server resource failed
- ESP_ERR_HTTPD_*: HTTP server error on start

**Parameters**
- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server

```c
esp_err_t protocomm_httpd_stop(protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance pointer

**Parameters**
- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

**Unions**

```c
union protocomm_httpd_config_data_t
```

# include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

**Public Members**

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active

**Structures**

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

```c
uint16_t port
```

Port on which the HTTP server will listen

```c
size_t stack_size
```

Stack size of server task, adjusted depending upon stack usage of endpoint handler

```c
unsigned task_priority
```

Priority of server task

```c
struct protocomm_httpd_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

```c
bool ext_handle_provided
```

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

```c
protocomm_httpd_config_data_t data
```

Protocomm HTTPD Configuration Data
Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

- protocomm/include/transports/protocomm_ble.h

Functions

```c
esp_err_t protocomm_ble_start(protocomm_t *pc, const protocomm_ble_config_t *config)
```

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

**Return**

- ESP_OK: Success
- ESP_FAIL: Simple BLE start error
- ESP_ERR_NO_MEM: Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE: Error in ble config
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**

- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing BLE

```c
esp_err_t protocomm_ble_stop(protocomm_t *pc)
```

Stop Bluetooth Low Energy based transport layer for provisioning.

 Stops service/task responsible for BLE based interactions for provisioning.

**Note** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

**Return**

- ESP_OK: Success
- ESP_FAIL: Simple BLE stop error
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance

**Parameters**

- [in] pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

```c
struct name_uuid
```

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

```c
const char *name
```

Name of the handler, which is passed to protocomm layer

```c
uint16_t uuid
```

UUID to be assigned to the BLE characteristic which is mapped to the handler

```c
struct protocomm_ble_config
```

Config parameters for protocomm BLE service.

**Public Members**

```c
char device_name[MAX_BLE_DEVNAME_LEN]
```

BLE device name being broadcast at the time of provisioning
uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service

uint8_t* manufacturer_data
BLE device manufacturer data pointer in advertisement

ssize_t manufacturer_data_len
BLE device manufacturer data length in advertisement

ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t* nu_lookup
Pointer to the Name-UUID lookup table

### Macros

**MAX_BLE_DEVNAME_LEN**
BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

**BLE_UUID128_VAL_LENGTH**
Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

### Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.

### 2.5.2 Unified Provisioning

#### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol:** The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. **Transport Flexibility:** The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. **Security Scheme Flexibility:** It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. **Compact Data Representation:** The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.
Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases.
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.
Fig. 26: Typical Provisioning Process

1. Transport specific discovery and connection
   - Some form of beaconing
   - Client connects

2. Session Establishment
   - Get Version Request
     - Get Version Response
   - Session Setup Request
     - Session Setup Response
   - One or multiple steps as per protocol

3. Configuration
   - App specific Set Config (optional)
     - Set Config Response (optional)
     - Wi-Fi SetConfig(SSID, Pessphrase...)
       - Wi-Fi SetConfig response
     - Wi-Fi ApplyConfig cmd
       - Wi-Fi ApplyConfig resp
     - Wi-Fi GetStatus cmd (repeated)
       - Wi-Fi GetStatus resp (repeated)

4. Close connection
   - Close Connection
It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

**Sample Code**

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.3 Wi-Fi Provisioning

#### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protcocomm) sessions. The set of wifi_prov_mgr_ APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

#### Initialization

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future re-boot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM** - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE** - Free only BLE memory. Used when main application requires classic BT.
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT** - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
- **WIFI_PROV_EVENT_HANDLER_NONE** - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

**app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`’s that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV:
                wifi_sta_config_t* wifi_sta_cfg = (wifi_sta_config_t*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials
                      ssid : %s
                      Password : %s",
                      (const char*) wifi_sta_cfg->ssid,
                      (const char*) wifi_sta_cfg->password);
                break;
            case WIFI_PROV_CRED_FAIL:
                wifi_prov_sta_fail_reason_t* reason = (wifi_prov_sta_fail_reason_t*)event_data;
                ESP_LOGE(TAG, "Provisioning failed! Reason : %s
                     Please reset to factory and retry provisioning",
                     (const char*) WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi access-point not found");
                break;
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.
Chapter 2. API Reference

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the \texttt{esp\_wifi\_APIs} to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call \texttt{esp\_wifi\_APIs} for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

\begin{verbatim}
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
\end{verbatim}

\textbf{Start Provisioning Service} \hspace{1cm} At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is \texttt{wifi\_prov\_scheme\_softap}
- BLE Device name (service key is ignored) when scheme is \texttt{wifi\_prov\_scheme\_ble}

Also, since internally the manager uses \texttt{protocomm}, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (\texttt{pop}), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the \texttt{pop} is simply ignored

See \texttt{Provisioning} for details about the security features.

\begin{verbatim}
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
\end{verbatim}

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to \texttt{wifi\_prov\_mgr\_stop\_provisioning()}.

\textbf{Note:} If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in \texttt{Check Provisioning State}.

\textbf{Waiting For Completion} \hspace{1cm} Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to \texttt{wifi\_prov\_mgr\_wait()}.

\begin{verbatim}
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
\end{verbatim}
// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT`s and call:

```cpp
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation**  When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to _esp_wifi_prov_.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related procoomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] },.....` Here label `prov` provides provisioning service version (`ver`) and
capabilities (cap). For now, only no_pop capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version/capabilities will be given by other labels (like my_app in this example). These additional fields are set using wifi_prov_mgr_set_app_info().

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under protocomm/proto, which define the Protobuf message structures supported by prov-session endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of wifi_config commands, serialized as Protobuf messages (the corresponding .proto files can be found under wifi_provisioning/proto):  

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during set_config and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the wifi_config commands described above. The wifi_scan endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - **group_channels** (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - **period_ms** (input) - Scan parameter specifying how long to wait on each channel
- **scan_status** - Gives the status of scanning process:
  - **scan_finished** (output) - When scan has finished this returns true
  - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- **scan_result** - For fetching scan results. This can be called even if scan is still on going
  - **start_index** (input) - Starting index from where to fetch the entries from the results list
  - **count** (input) - Number of entries to fetch from the starting index
  - **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

**Additional Endpoints**  In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.
Chapter 2. API Reference

```c
wifi_prov_mgr_init(config);
wxifProv_mgr_endpoint_create("custom-endpoint");
wxifProv_mgr_start_provisioning(security, pop, service_name, service_key);
wxifProv_mgr_endpoint_register("custom-endpoint", custom_ep_handler, custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event get emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see `provisioning/wifi_prov_mgr`

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - BLE Provisioning app on App Store.
  - SoftAP Provisioning app on App Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:** `tools/esp_prov` (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.
API Reference

Header File

- wifi_provisioning/include/wifi_provisioning/manager.h

Functions

*esp_err_t* wifi_prov_mgr_init (*wifi_prov_mgr_config_t* config)

- Initialize provisioning manager instance.
- Configures the manager and allocates internal resources.
- Configuration specifies the provisioning scheme (transport) and event handlers.
- Event WIFI_PROV_INIT is emitted right after initialization is complete.

**Return**

- ESP_OK : Success
- ESP_FAIL : Fail

**Parameters**

- *[in]* config: Configuration structure

*void* wifi_prov_mgr_deinit (void)

- Stop provisioning (if running) and release resource used by the manager.
- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished.
- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization.

*esp_err_t* wifi_prov_mgr_is_provisioned (*bool* *provisioned*)

- Checks if device is provisioned.
- This checks if Wi-Fi credentials are present on the NVS.
- The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component.
- If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

**Parameters**

- *[out]* provisioned: True if provisioned, else false

*esp_err_t* wifi_prov_mgr_start_provisioning (*wifi_prov_security_t* security, *const* char *pop*, *const* char *service_name*, *const* char *service_key*)

- Start provisioning service.
- This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :
  - wifi_prov_scheme_ble: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests.
  - wifi_prov_scheme_softap: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)
- Event WIFI_PROV_START is emitted right after provisioning starts without failure.
Note This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

Return
- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

Parameters
- [in] security: Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- [in] pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- [in] service_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- [in] service_key: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

void wifi_prov_mgr_stop_provisioning (void)
Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_enable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_enable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)
Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note This must be called before executing wifi_prov_mgr_start_provisioning()
Chapter 2. API Reference

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

Parameters
- [in] cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

```c
esp_err_t wifi_prov_mgr_set_app_info(const char *label, const char *version, const char **capabilities, size_t total_capabilities)
```

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

Return
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM: Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG: Null argument

Parameters
- [in] label: String indicating the application name.
- [in] version: String indicating the application version. There is no constraint on format.
- [in] capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] total_capabilities: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)
```

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
- ESP_OK : Success
- ESP_FAIL: Failure

Parameters
- [in] ep_name: unique name of the endpoint

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, proto-comm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service
Chapter 2. API Reference

is stopped and hence all endpoints are unregistered

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

void wifi_prov_mgr_endpoint_unregister(const char* ep_name)
Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters
- [in] ep_name: Name of the endpoint

esp_err_t wifi_prov_mgr_event_handler(void* ctx, system_event_t* event)
Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events

Note: This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

Return
- ESP_OK : Event handled successfully

Parameters
- [in] ctx: Event context data
- [in] event: Event info

esp_err_t wifi_prov_mgr_get_wifi_state(wifi_prov_sta_state_t* state)
Get state of Wi-Fi Station during provisioning.

Return
- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

Parameters
- [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason(wifi_prov_sta_fail_reason_t* reason)
Get reason code in case of Wi-Fi station disconnection during provisioning.

Return
- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

Parameters
- [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

esp_err_t wifi_prov_mgr_configure_sta(wifi_config_t* wifi_cfg)
Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocommm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started.

Return
Chapter 2. API Reference

- ESP_OK: Wi-Fi configured and started successfully
- ESP_FAIL: Failed to set configuration

**Parameters**

- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

```c
esp_err_t wifi_prov_mgr_reset_provisioning (void)
```

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Return**

- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

```c
esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)
```

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Return**

- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**Structures**

```c
struct wifi_prov_event_handler_t
```

Event handler that is used by the manager while provisioning service is active.

**Public Members**

```c
typedef wifi_prov_cb_func_t event_cb
```

Callback function to be executed on provisioning events

```c
void *user_data
```

User context data to pass as parameter to callback function

```c
struct wifi_prov_scheme
```

Structure for specifying the provisioning scheme to be followed by the manager.

**Note**

Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

```c
esp_err_t (*prov_start)(protocomm_t *pc, void *config)
```

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

```c
esp_err_t (*prov_stop)(protocomm_t *pc)
```

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

```c
void *(*new_config)(void)
```

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to `prov_start()`

```c
void *(*delete_config)(void *config)
```

Function which is to be called by the manager to delete a configuration generated using `new_config()`
**esp_err_t** (*set_config_service*) *(void* config, const char* service_name, const char* service_key)*

Function which is to be called by the manager to set the service name and key values in the configuration structure

**esp_err_t** (*set_config_endpoint*) *(void* config, const char* endpoint_name, uint16_t uuid)*

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

**wifi_mode_t** wifi_mode

Sets mode of operation of Wi-Fi during provisioning. This is set to:

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

**struct wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

### Public Members

**wifi_prov_scheme_t** scheme

Provisioning scheme to use. Following schemes are already available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**wifi_prov_event_handler_t** scheme_event_handler

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**wifi_prov_event_handler_t** app_event_handler

Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

### Macros

**WIFI_PROV_EVENT_HANDLER_NONE**

Event handler can be set to none if not used.

### Type Definitions

typedef void (*wifi_prov_cb_func_t) *(void* user_data, wifi_prov_cb_event_t event, void* event_data)*

typedef struct wifi_prov_scheme wifi_prov_scheme_t

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm.
Chapter 2. API Reference

Enumerations

enum wifi_prov_cb_event_t
Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

WIFI_PROV_INIT
Emitted when the manager is initialized

WIFI_PROV_START
Indicates that provisioning has started

WIFI_PROV_CRED_RECV
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

WIFI_PROV_CRED_SUCCESS
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

WIFI_PROV_END
Signals that provisioning service has stopped

WIFI_PROV_DEINIT
Signals that manager has been de-initialized

enum wifi_prov_security
Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Values:

WIFI_PROV_SECURITY_0 = 0
No security (plain-text communication)

WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange

• proof of possession (pop) based authentication
• AES-CTR encryption

Header File

• wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions

void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000fffF-0000-1000-8000-00805F9B34FB.

This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

Note The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null argument

Parameters
- [in] uuid128: A custom 128 bit UUID

\[\text{esp_err_t \ wifi_prov_scheme_ble_set_mfg_data}(\text{uint8_t* } \text{mfg_data}, \text{ssize_t mfg_data_len})\]

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning().

Note It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. \((mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)\). If the mfg_data length exceeds this limit, the length will be truncated.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null argument

Parameters
- [in] mfg_data: Custom manufacturer data
- [in] mfg_data_len: Manufacturer data length

Macros
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File
- wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions
\[\text{void \ wifi_prov_scheme_softap_set_httpd_handle}(\text{void* } \text{handle})\]

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note This API should be called before wifi_prov_mgr_start_provisioning()

Parameters
- [in] handle: Handle to HTTPD server instance

Header File
- wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File
- wifi_provisioning/include/wifi_provisioning/wifi_config.h
Chapter 2. API Reference

Functions

```c
esp_err_t wifi_prov_config_data_handler(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `proto-comm_req_handler_t`) using `protocomm_add_endpoint()`.

Structures

```c
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.

**Public Members**

- `char ip_addr[IP4ADDR_STRLEN_MAX]`
  - IP Address received by station
- `char bssid[6]`
  - BSSID of the AP to which connection was established
- `char ssid[33]`
  - SSID of the AP to which connection was established
- `uint8_t channel`
  - Channel of the AP
- `uint8_t auth_mode`
  - Authorization mode of the AP

```c
struct wifi_prov_config_get_data_t
```

WiFi status data to be sent in response to `get_status` request from master.

**Public Members**

- `wifi_prov_sta_state_t wifi_state`
  - WiFi state of the station
- `wifi_prov_sta_fail_reason_t fail_reason`
  - Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)
- `wifi_prov_sta_conn_info_t conn_info`
  - Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

```c
struct wifi_prov_config_set_data_t
```

WiFi config data received by slave during `set_config` request from master.

**Public Members**

- `char ssid[33]`
  - SSID of the AP to which the slave is to be connected
- `char password[64]`
  - Password of the AP
- `char bssid[6]`
  - BSSID of the AP
- `uint8_t channel`
  - Channel of the AP
struct wifi_prov_config_handlers

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
Handler function called when WiFi connection configuration (e.g. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)
Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx
Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t
Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.

This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Enumerations

enum wifi_prov_sta_state_t
WiFi STA status for conveying back to the provisioning master.

Values:

WIFI_PROV_STA_CONNECTING
WIFI_PROV_STA_CONNECTED
WIFI_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t
WiFi STA connection fail reason.

Values:

WIFI_PROV_STA_AUTH_ERROR
WIFI_PROV_STA_AP_NOT_FOUND

Code examples for above API are provided in the provisioning directory of ESP-IDF examples.

Code example for above API is provided in wifi/smart_config
2.6 Storage API

2.6.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function esp_vfs_fat_unregister_path() deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with esp_vfs_fat_ functions:

1. Call esp_vfs_fat_register() to specify:
   • Path prefix where to mount the filesystem (e.g. "/sdcard", "/spiflash")
   • FatFs drive number
   • A variable which will receive the pointer to the FATFS structure
2. Call ff_diskio_register() to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function f_mount, and optionally f_fdisk, f_mkfs, to mount the filesystem using the same drive number which was passed to esp_vfs_fat_register(). For more information, see FatFs documentation <http://www.elm-chan.org/fsw/ff/doc/mount.html>.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to esp_vfs_register() (for example, "/sdcard/hello.txt").
5. Optionally, by enabling the option CONFIG_FATFS_USE_FASTSEEK, use the POSIX lseek function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").
7. Close all open files.
8. Call the FatFs function f_mount for the same drive number, with NULL FATFS* argument, to unmount the filesystem.
9. Call the FatFs function ff_diskio_register() with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.
10. Call esp_vfs_fat_unregister_path() with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions esp_vfs_fat_sdmmc_mount, esp_vfs_fat_sdspi_mount and esp_vfs_fat_sdcard_unmount wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

```
esp_err_t esp_vfs_fat_register(const char* base_path, const char* fat_drive, size_t max_files, FATFS** out_fs)

Register FatFs with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

Note This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Return
• ESP_OK on success
```
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**Parameters**
- **base_path**: path prefix where FATFS should be registered
- **fat_drive**: FATFS drive specification; if only one drive is used, can be an empty string
- **max_files**: maximum number of files which can be open at the same time
- **[out] out_fs**: pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

```c
esp_err_t esp_vfs_fat_unregister_path(const char* base_path)
```

Un-register FATFS from VFS.

**Note**
FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

**Parameters**
- **base_path**: path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()` and `esp_vfs_fat_sdcardUnmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmcUnmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config,
const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note**
Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**Parameters**
- **base_path**: path where partition should be registered (e.g. "/sdcard")
- **host_config**: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
• **slot_config**: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. (Deprecated) For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT()`.

• **mount_config**: Pointer to structure with extra parameters for mounting FATFS

• **[out] out_card**: If not NULL, pointer to the card information structure will be returned via this argument

```c
esp_err_t esp_vfs_fat_sdspi_mount(const char *base_path, const sdmmc_host_t *host_config_input, const sdspi_device_config_t *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**Parameters**

- **base_path**: path where partition should be registered (e.g. “/sdcard”)
- **host_config_input**: Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot_config**: Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- **mount_config**: Pointer to structure with extra parameters for mounting FATFS
- **[out] out_card**: If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

```c
struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.
```

**Public Members**

- **bool format_if_mount_failed**
  If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

- **int max_files**
  Max number of open files.

- **size_t allocation_unit_size**
  If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must
be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```
esp_err_t esp_vfs_fat_sdcardUnmount (const char *base_path, sdmmc_card_t *card)
```

Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_sdspi_mount().

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

### Using FatFs with VFS in read-only mode

The header file fatfs/vfs/esp_vfs_fat.h also defines the convenience functions esp_vfs_fat_rawflash_mount() and esp_vfs_fat_rawflash_unmount(). These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```
esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:
- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_rawflash_mount was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**
- `base_path`: path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount (const char *base_path, const char *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

**Parameters**
- `base_path`: path where partition should be registered (e.g. “/spiflash”)
- `partition_label`: label of partition to be unmouted
FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *discio_impl)
Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

Parameters
• pdrv: drive number
• discio_impl: pointer to ff_diskio_impl_t structure with diskio functions or NULL to unregister and free previously registered drive
```

```c
struct ff_diskio_impl_t
Structure of pointer to disk IO driver functions.
See FatFs documentation for details about these functions
```

Public Members

DSTATUS (*init)(unsigned char pdrv)
   disk initialization function

DSTATUS (*status)(unsigned char pdrv)
   disk status check function

DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
   sector read function

DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)
   sector write function

DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
   function to get info about disk and do some misc operations

void ff_diskio_register_sdmmc(unsigned char pdrv, sdmmc_card_t *card)
Register SD/MMC diskio driver

Parameters
• pdrv: drive number
• card: pointer to sdmmc_card_t structure describing a card; card should be initialized before calling f_mount.

```c
esp_err_t ff_diskio_register_wl_partition(unsigned char pdrv, wl_handle_t flash_handle)
Register spi flash partition

Parameters
• pdrv: drive number
• flash_handle: handle of the wear levelling partition.
```

```c
esp_err_t ff_diskio_register_raw_partition(unsigned char pdrv, const esp_partition_t *part_handle)
Register spi flash partition

Parameters
• pdrv: drive number
• part_handle: pointer to raw flash partition.
```
2.6.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- `esptool.py`
- Flash Download tool (available on Windows only). Just download it, unzip, and follow the instructions inside the `doc` folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on esp-idf’s NVS partition utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
- You have installed the packages from `requirement.txt`, the file in the root of the esp-idf directory.

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```plaintext
name1,namespace,  <-- First entry should be of type "namespace"
key1,key1,encoding1
key2,key2,encoding2,REPEAT
name2,namespace,
key3,key3,encoding3
key4,key4,encoding4
```

Note: The first line in this file should always be the namespace entry.
Each line should have three parameters: key, type, encoding, separated by a comma. If the REPEAT tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

**Note:**

Make sure there are no spaces:
- before and after ‘,’
- at the end of each line in a CSV file

**Master Value CSV File**

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,....
value1,value2,value3,....
```

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6fefeef,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:
To generate factory images for each device (Default):

Running the utility

Usage:

```bash
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

```bash
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>
```

Commands:

Run mfg_gen.py {command} -h for additional help

```bash
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>
```

To generate factory images for each device (Default): Usage:

```bash
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
```

Positional Arguments:

```bash
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
</tbody>
</table>
```

(continues on next page)
You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_1
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

Table: Parameters and Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes</td>
</tr>
<tr>
<td></td>
<td>(must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>Unique file identifier (any key in values file) for each filename suffix (Default: numeric value(1, 2, 3...))</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>
You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to *NVS key partition* for more details.

- Encrypt by providing the encryption keys as input binary file:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

**To generate only encryption keys:** **Usage:**

```bash
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```bash
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d-%H-%M`.

**Note:** To provide custom target filename use the `--keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.
Chapter 2. API Reference

The default numeric value: 1,2,3… of the fileid argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified outdir directory:

- **bin/** for storing the generated binary files
- **csv/** for storing the generated intermediate CSV files
- **keys/** for storing encryption keys (when generating encrypted factory images)

### 2.6.3 Non-volatile storage library

**Introduction**

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying storage**

Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase_flash` target to erase all contents of the flash chip.

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

**Keys and values**

NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- **integer** types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- if the new value is of the same type as the old one, value is updated
- if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.
Chapter 2. API Reference

Namespaces  To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS iterators  Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` returns iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair.

If none or no other key-value pair was found for given criteria, `nvs_entry_find()` and `nvs_entry_next()` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator()`.

Security, tampering, and robustness  NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as sector-number. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when Flash Encryption is enabled. This is done because WiFi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the NVS key partition. Two partition tables containing the NVS key partition are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example security/flash_encryption for how to configure and use NVS encryption feature.

NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted and its size should be the minimum partition size (4KB). Refer to Partition Tables for more details. Two additional partition tables which
contain the NVS key partition are provided under the partition table option (menuconfig->Partition Table). They can be directly used for NVS Encryption. The structure of these partitions is depicted below.

```
+----------------+----------------+----------------+----+
| XTS encryption key(32) |
|----------------+----------------+----------------+----+
| XTS tweak key (32) |
|----------------+----------------+----------------+----+
| CRC32(4)       |
+----------------+----------------+----------------+----+
```

The XTS encryption keys in the NVS key partition can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:
   When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first NVS key partition. Then the API function automatically generates and stores the nvs keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`. The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.

2. Use pre-generated key partition:
   This option will be required by the user when keys in the NVS key partition are not generated by the application. The NVS key partition containing the XTS encryption keys can be generated with the help of NVS Partition Generator Utility. Then the user can store the pre generated key partition on the flash with help of the following two commands:
   i) Build and flash the partition table
   ```
   idf.py partition_table partition_table-flash
   ```
   ii) Store the keys in the NVS key partition (on the flash) with the help of parttool.py (see Partition Tool section in partition-tables for more details)
   ```
   parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_partition_offset" write_partition --partition-name="name of nvs_key_partition" --input "nvs_key_partition"
   ```
Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write**  The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvS partition as well.

**Encrypt the default NVS partition:** To enable encryption for the default NVS partition no additional steps are necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first NVS key partition found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition:** To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.
When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to `NVS Partition Generator Utility`.

**Application Example**

You can find code examples in the `storage` directory of ESP-IDF examples:

**storage/nvs_rw_value**

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

**storage/nvs_rw_blob**

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- value - tracks the number of the ESP32 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

**storage/nvs_rw_value_cxx**

This example does exactly the same as `storage/nvs_rw_value`, except that it uses the C++ nvs handle class.

**Internals**

**Log of key-value pairs**

NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.
Pages and entries  NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/ uninitialized Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.

Active Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

Structure of a page  For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.
Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

- **Empty (2’ b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).
- **Written (2’ b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.
- **Erased (2’ b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

Individual fields in entry structure have the following meanings:

- **NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.
- **Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.
Span  Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this
depends on value length.

ChunkIndex  Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

CRC32  Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

Key  Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero
terminator.

Data  For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to
the right, with unused bytes filled with 0xff.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided
during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent
  chunks have chunkIndex incremented (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of
the first entry indicates how many entries are used.

### Namespaces

As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

| NS=0 Type=uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi"
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi"
| NS=0 Type=uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm"
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm"

### Item hash list

To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace,
key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead
for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds
29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum
amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

### API Reference

**Header File**

- `nvs_flash/include/nvs_flash.h`

**Functions**

`esp_err_t nvs_flash_init(void)`

Initialize the default NVS partition.
This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

1. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
2. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
3. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Return

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

```
esp_err_t nvs_flash_init_partition(const char *partition_label)
```

Initialize NVS flash storage for the specified partition.

Return

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] partition_label: Label of the partition. Must be no longer than 16 characters.

```
esp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)
```

Initialize NVS flash storage for the partition specified by partition pointer.

Return

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] partition: pointer to a partition obtained by the ESP partition API.

```
esp_err_t nvs_flash_deinit(void)
```

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Return

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```
esp_err_t nvs_flash_deinit_partition(const char *partition_label)
```

Deinitialize NVS storage for the given NVS partition.

Return
Chapter 2. API Reference

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

**Parameters**
- `[in] partition_label`: Label of the partition

`esp_err_t nvs_flash_erase (void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)

`esp_err_t nvs_flash_erase_partition (const char *part_name)`

Erase specified NVS partition.

Erase all content of a specified NVS partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

**Parameters**
- `[in] part_name`: Name (label) of the partition which should be erased

`esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)`

Erase custom partition.

Erase all content of specified custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**
- `[in] partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**
- `[in] cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.
Esp_err_t nvs_flash_secure_init_partition (const char *partition_label, nvs_sec_cfg_t *cfg)

Initialize NVS flash storage for the specified partition.

Return
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters
- [in] partition_label: Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- [in] cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

Esp_err_t nvs_flash_generate_keys (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)

Generate and store NVS keys in the provided esp partition.

Return
- ESP_OK, if cfg was read successfully;
- ESP_INVALID_ARG, if partition or cfg;
-or error codes from esp_partition_write/erase APIs.

Parameters
- [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

Esp_err_t nvs_flash_read_security_cfg (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)

Read NVS security configuration from a partition.

Note
Provided partition is assumed to be marked ‘encrypted’.

Return
- ESP_OK, if cfg was read successfully;
- ESP_INVALID_ARG, if partition or cfg;
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys;
- ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt;
-or error codes from esp_partition_read API.

Parameters
- [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures

struct nvs_sec_cfg_t

Key for encryption and decryption.

Public Members

uint8_t eky[NVS_KEY_SIZE]
XTS encryption and decryption key

uint8_t tky[NVS_KEY_SIZE]
XTS tweak key

Macros

Header File

- nvs_flash/include/nvs.h
Chapter 2. API Reference

Functions

`esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)`

Set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

Parameters

- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NV_\_KEY_\_NAME_\_MAX_\_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set.

`esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)`

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)`

Set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
Chapter 2. API Reference

- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters

- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

```c
esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

```

// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Return

- ESP_OK if the value was retrieved successfully
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

- [in] handle: Handle obtained from nvs_open function.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)

get uint8_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)

get int16_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)

get uint16_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)

get int32_t value for given key

```
This function is the same as `nvs_get_i8` except for the data type.

```c
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
```

get uint32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

```c
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
```

get int64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

```c
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
```

get uint64_t value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get_set_str` is used for zero-terminated C strings, and `nvs_get_set_blob` used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);
```

```c
// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn’t exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn’t satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

Parameters

- `[in] handle`: Handle obtained from `nvs_open` function.
- `[in] key`: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `[out] out_value`: Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- `[inout] length`: A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

```c
esp_err_t nvs_get_blob (nvs_handle_t handle, const char *key, void *out_value, size_t *length)
```

get blob value for given key
This function behaves the same as `nvs_get_str`, except for the data type.

```c
esp_err_t nvs_open(const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

**Return**

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

**Parameters**

- [in] name: Namespace name. Maximal length is (NV$\_KEY$\_NAME$\_MAX$\_SIZE-1) characters. Shouldn’t be empty.
- [in] open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out_handle: If successful (return code is zero), handle will be returned in this argument.

```c
esp_err_t nvs_open_from_partition(const char *part_name, const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

**Return**

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

**Parameters**

- [in] part_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is (NV$\_KEY$\_NAME$\_MAX$\_SIZE-1) characters. Shouldn’t be empty.
- [in] open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out_handle: If successful (return code is zero), handle will be returned in this argument.

```c
esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)
```

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

**Return**

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs,
provided that flash operation doesn’t fail again.

- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

**Parameters**

- `[in]` `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `[in]` `key`: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `[in]` `value`: The value to set.
- `[in]` `length`: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

```c
esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)
```

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Return**

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

**Parameters**

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- `[in]` `key`: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

```c
esp_err_t nvs_erase_all(nvs_handle_t handle)
```

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Return**

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

**Parameters**

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

```c
esp_err_t nvs_commit(nvs_handle_t handle)
```

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**Parameters**

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

```c
void nvs_close(nvs_handle_t handle)
```

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**
Chapter 2. API Reference

- [in] handle: Storage handle to close

```c
esp_err_t nvs_get_stats(const char *part_name, nvs_stats_t *nvs_stats)
```

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free_entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
```

Return

- ESP_OK if the changes have been written successfully. Return param `nvs_stats` will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "name" is not found. Return param `nvs_stats` will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- ESP_ERR_INVALID_ARG if `nvs_stats` equal to NULL. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

Parameters

- [in] part_name: Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
- [out] nvs_stats: Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

```c
esp_err_t nvs_get_used_entry_count(nvs_handle_t handle, size_t *used_entries)
```

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

Return

- ESP_OK if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param `used_entries` will be filled 0.
- ESP_ERR_INVALID_ARG if `used_entries` equal to NULL.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

Parameters

- [in] handle: Handle obtained from `nvs_open` function.
• [out] used_entries: Returns amount of used entries from a namespace.

\texttt{\textbf{nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)}}

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified --partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key \"%s\", type \"%d\" \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no...
// other
// element for specified criteria was found.
```

Return Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using nvs_release_iterator when not used any more.

Parameters

• [in] part_name: Partition name
• [in] namespace_name: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
• [in] type: One of nvs_type_t values.

\texttt{\textbf{nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)}}

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Return NULL if no entry was found, valid nvs_iterator_t otherwise.

Parameters

• [in] iterator: Iterator obtained from nvs_entry_find function. Must be non-NULL.

\texttt{\textbf{void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)}}

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.

Parameters

• [in] iterator: Iterator obtained from nvs_entry_find or nvs_entry_next function. Must be non-NULL.
• [out] out_info: Structure to which entry information is copied.

\texttt{\textbf{void nvs_release_iterator (nvs_iterator_t iterator)}}

Release iterator.

Parameters

• [in] iterator: Release iterator obtained from nvs_entry_find function. NULL argument is allowed.

Structures

\texttt{\textbf{struct nvs_entry_info_t}}

information about entry obtained from nvs_entry_info function

Public Members

\texttt{\textbf{char namespace_name[16]}}

Namespace to which key-value belong
char key[16]
  Key of stored key-value pair

*nvs_type_t* type
  Type of stored key-value pair

**struct nvs_stats_t**

  **Note**  Info about storage space NVS.

**Public Members**

  **size_t** used_entries
    Amount of used entries.

  **size_t** free_entries
    Amount of free entries.

  **size_t** total_entries
    Amount all available entries.

  **size_t** namespace_count
    Amount name space.

**Macros**

**ESP_ERR_NVS_BASE**
  Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED**
  The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND**
  Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH**
  The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY**
  Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE**
  There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME**
  Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE**
  Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED**
  The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG**
  Key name is too long

**ESP_ERR_NVS_PAGE_FULL**
  Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE**
  NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH**
  String or blob length is not sufficient to store data
Chapter 2. API Reference

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
String or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE
Maximal length of NVS key name (including null terminator)

Type Definitions
typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle
typedef nvs_open_mode_t nvs_open_mode
typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations
enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:
Chapter 2. API Reference

NVS_READONLY
Read only

NVS_READWRITE
Read and write

**enum nvs_type_t**
Types of variables.

*Values:*

- **NVS_TYPE_U8** = 0x01
  Type uint8_t
- **NVS_TYPE_I8** = 0x11
  Type int8_t
- **NVS_TYPE_U16** = 0x02
  Type uint16_t
- **NVS_TYPE_I16** = 0x12
  Type int16_t
- **NVS_TYPE_U32** = 0x04
  Type uint32_t
- **NVS_TYPE_I32** = 0x14
  Type int32_t
- **NVS_TYPE_U64** = 0x08
  Type uint64_t
- **NVS_TYPE_I64** = 0x18
  Type int64_t
- **NVS_TYPE_STR** = 0x21
  Type string
- **NVS_TYPE_BLOB** = 0x42
  Type blob
- **NVS_TYPE_ANY** = 0xff
  Must be last

2.6.4 NVS Partition Generator Utility

**Introduction**

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

**Prerequisites**

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in `requirements.txt` in the root of the esp-idf directory.
CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64 and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported. Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace is fixed and is not configurable. Any values in these cells are ignored.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value.</td>
<td></td>
</tr>
</tbody>
</table>

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value        <-- column header
namespace_name,namespace,,      <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

Note:

Make sure there are no spaces:
- before and after `;`
- at the end of each line in a CSV file

NVS Entry and Namespace association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of entry. If you intend to use an older format, the utility provides an option to disable this feature.
Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the utility

Usage:

```python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>
```

Commands:

Run `nvs_partition_gen.py {command} -h` for additional help

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>
```

To generate NVS partition (Default):

Usage:

```python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] input output size```

(continues on next page)
You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

To generate only encryption keys:

**Usage:**

```bash
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```
To generate encrypted NVS partition:

You can run the utility to generate only encryption keys using the command below:

```bash
python nvs_partition_gen.py generate-key
```

To generate encrypted NVS partition:

**Usage:**

```bash
python nvs_partition_gen.py encrypt [-h] [-version {1,2}] [--keygen]
[ --keyfile KEYFILE ] [ --inputkey INPUTKEY ]
[ --outdir OUTDIR ]
input output size
```

**Positional Arguments:**

- `input`: Path to CSV file to parse
- `output`: Path to output NVS binary file
- `size`: Size of NVS partition in bytes (must be multiple of 4096)

**Optional Arguments:**

- `--help`: show this help message and exit
- `--keyfile KEYFILE`: Path to output encryption keys file (Default: current directory)
- `--outdir OUTDIR`: Output directory to store files created.
  (Default: current directory)
You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:
  
  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin ___-0x3000 --keygen
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:
  
  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin ___-0x3000 --keygen --keyfile sample_keys.bin
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

  **Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to *[NVS key partition]* for more details.

- Encrypt by providing the encryption keys as input binary file:
To decrypt encrypted NVS partition:

Usage:

```python
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key
```

Positional Arguments:

```
-     | Parameter | Description |
---    |----------|------------|
| input | Path to encrypted NVS partition file to parse |
| key   | Path to file having keys for decryption |
| output| Path to output decrypted binary file |
```

Optional Arguments:

```
-     | Parameter | Description |
---    |----------|------------|
| -h, --help | show this help message and exit |
|--outdir OUTDIR | Output directory to store files created |
```

You can run the utility to decrypt encrypted NVS partition using the command below:

```python
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

Multipage Blob Support Disabled (Version 1): You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```python
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --inputkey sample_keys.bin
```
Chapter 2. API Reference

**Multipage Blob Support Enabled (Version 2):** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** Minimum NVS Partition Size needed is 0x3000 bytes.

**Note:** When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

**2.6.5 SD/SDIO/MMC Driver**

**Overview**

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (driver/include/driver/sdmmc_host.h and driver/include/driver/sdspi_host.h) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see **SDMMC Host API**
- SD SPI host, see **SD SPI Host API**

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

**Application Example**

An example which combines the SDMMC driver with the FATFS library is provided in the `storage/sd_card` directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (memory + IO) cards** The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread safety** Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.
Chapter 2. API Reference

Protocol layer API

The protocol layer is given the *sdmmc_host_t* structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the *sdmmc_card_t* structure. When sending commands to the SD/MMC host driver, the protocol layer uses the *sdmmc_command_t* structure to describe the command, arguments, expected return values, and data to transfer if there is any.

Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

Using API with eMMC chips

From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards

Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`. For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See ESP Serial Slave Link and example peripherals/sdio/host.
API Reference

Header File

- `sdmmc/include/sdmmc_cmd.h`

Functions

```c
esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)
```
Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `host`: pointer to structure defining host controller
- `out_card`: pointer to structure which will receive information about the card when the function completes

```c
void sdmmc_card_print_info(FILE *stream, const sdmmc_card_t *card)
```
Print information about the card to a stream.

**Parameters**
- `stream`: stream obtained using fopen or fdopen
- `card`: card information structure initialized using sdmmc_card_init

```c
esp_err_t sdmmc_write_sectors(sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```
Write given number of sectors to SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `src`: pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write

```c
esp_err_t sdmmc_read_sectors(sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```
Read given number of sectors from the SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `dst`: pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- `start_sector`: sector where to start reading
- `sector_count`: number of sectors to read

```c
esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```
Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **reg**: byte address within IO function
- **[out] out_byte**: output, receives the value read from the card

```c
esp_err_t sdmmc_io_write_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
```

Write one byte to an SDIO card using `IO_RW_DIRECT` (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **reg**: byte address within IO function
- **in_byte**: value to be written
- **[out] out_byte**: if not NULL, receives new byte value read from the card (read-after-write).

```c
esp_err_t sdmmc_io_read_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **addr**: byte address within IO function where reading starts
- **dst**: buffer which receives the data read from card
- **size**: number of bytes to read

```c
esp_err_t sdmmc_io_write_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **addr**: byte address within IO function where writing starts
- **src**: data to be written
- **size**: number of bytes to write

```c
esp_err_t sdmmc_io_read_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read blocks of data from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**Return**
- ESP_OK on success
• ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
• One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- dst: buffer which receives the data read from card
- size: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- src: data to be written
- size: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

Return
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Return
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- timeout_ticks: time to wait for the interrupt, in RTOS ticks

```c
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Return
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
and other error code return from sdmmc_io_read_bytes

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer**: Output buffer of the CIS data
- **buffer_size**: Size of the buffer.
- **inout_cis_size**: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

```c
esp_err_t sdmmc_io_print_cis_info(uint8_t* buffer, size_t buffer_size, FILE* fp)
```
Parse and print the CIS information of a SDIO card.

**Note** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

**Return**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

**Parameters**
- **buffer**: Buffer to parse
- **buffer_size**: Size of the buffer.
- **fp**: File pointer to print to, set to NULL to print to stdout.

**Header File**
- driver/include/driver/sdmmc_types.h

**Structures**

```c
struct sdmmc_csd_t
```
Decoded values from SD card Card Specific Data register

**Public Members**

- **int csd_ver**: CSD structure format
- **int mmc_ver**: MMC version (for CID format)
- **int capacity**: total number of sectors
- **int sector_size**: sector size in bytes
- **int read_block_len**: block length for reads
- **int card_command_class**: Card Command Class for SD
- **int tr_speed**: Max transfer speed

```c
struct sdmmc_cid_t
```
Decoded values from SD card Card IDentification register
Chapter 2. API Reference

Public Members

int mfg_id
manufacturer identification number

int oem_id
OEM/product identification number

char name[8]
product name (MMC v1 has the longest)

int revision
product revision

int serial
product serial number

int date
manufacturing date

struct sdmmc_scr_t
Decoded values from SD Configuration Register

Public Members

int sd_spec
SD Physical layer specification version, reported by card

int bus_width
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

struct sdmmc_ext_csd_t
Decoded values of Extended Card Specific Data

Public Members

uint8_t power_class
Power class used by the card

struct sdmmc_switch_func_rsp_t
SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
response data

struct sdmmc_command_t
SD/MMC command information

Public Members

uint32_t opcode
SD or MMC command index

uint32_t arg
SD/MMC command argument

sdmmc_response_t response
response buffer
Chapter 2. API Reference

```c
void *data
    buffer to send or read into
size_t datalen
    length of data buffer
size_t blklen
    block length
int flags
    see below
esp_err_t error
    error returned from transfer
int timeout_ms
    response timeout, in milliseconds
```

```c
struct sdmmc_host_t
    SD/MMC Host description
```

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

### Public Members

```c
uint32_t flags
    flags defining host properties
int slot
    slot number, to be passed to host functions
int max_freq_khz
    max frequency supported by the host
float io_voltage
    I/O voltage used by the controller (voltage switching is not supported)
```

```c
esp_err_t (*init) (void)
    Host function to initialize the driver
esp_err_t (*set_bus_width) (int slot, size_t width)
    host function to set bus width
size_t (*get_bus_width) (int slot)
    host function to get bus width
esp_err_t (*set_bus_ddr_mode) (int slot, bool ddr_enable)
    host function to set DDR mode
esp_err_t (*set_card_clk) (int slot, uint32_t freq_khz)
    host function to set card clock frequency
esp_err_t (*do_transaction) (int slot, sdmmc_command_t *cmdinfo)
    host function to do a transaction
esp_err_t (*deinit) (void)
    host function to deinitialize the driver
esp_err_t (*deinit_p) (int slot)
    host function to deinitialize the driver, called with the slot
esp_err_t (*io_int_enable) (int slot)
    Host function to enable SDIO interrupt line
esp_err_t (*io_int_wait) (int slot, TickType_t timeout_ticks)
    Host function to wait for SDIO interrupt line to be active
```
int command_timeout_ms
    timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
    SD/MMC card information structure

Public Members

    sdmmc_host_t host
        Host with which the card is associated
    uint32_t ocr
        OCR (Operation Conditions Register) value
    sdmmc_cid_t cid
        decoded CID (Card IDentification) register value
    sdmmc_response_t raw_cid
        raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode
    sdmmc_csd_t csd
        decoded CSD (Card-Specific Data) register value
    sdmmc_scr_t scr
        decoded SCR (SD card Configuration Register) value
    sdmmc_ext_csd_t ext_csd
        decoded EXT_CSD (Extended Card Specific Data) register value
    uint16_t rca
        RCA (Relative Card Address)
    uint16_t max_freq_khz
        Maximum frequency, in kHz, supported by the card
    uint32_t is_mem : 1
        Bit indicates if the card is a memory card
    uint32_t is_sdio : 1
        Bit indicates if the card is an IO card
    uint32_t is mmc : 1
        Bit indicates if the card is MMC
    uint32_t num_io_functions : 3
        If is_sdio is 1, contains the number of IO functions on the card
    uint32_t log_bus_width : 2
        log2(bus width supported by card)
    uint32_t is_ddr : 1
        Card supports DDR mode
    uint32_t reserved : 23
        Reserved for future expansion

Macros

    SDMMC_HOST_FLAG_1BIT
        host supports 1-line SD and MMC protocol
    SDMMC_HOST_FLAG_4BIT
        host supports 4-line SD and MMC protocol
    SDMMC_HOST_FLAG_8BIT
        host supports 8-line MMC protocol
Chapter 2. API Reference

SDMMC_HOST_FLAG_SPI
  host supports SPI protocol

SDMMC_HOST_FLAG_DDR
  host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG
  host deinit function called with the slot argument

SDMMC_FREQ_DEFAULT
  SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED
  SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING
  SD/MMC probing speed

SDMMC_FREQ_52M
  MMC 52MHz speed

SDMMC_FREQ_26M
  MMC 26MHz speed

Type Definitions
typedef uint32_t sdmmc_response_t[4]
  SD/MMC command response buffer

2.6.6 SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in
the external flash. The spi_flash component also has higher-level API functions which work with partitions defined
in the partition table.

Different from the API before IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash
chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external
flashes chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of through the cache connected to the SPI0 peripheral, most esp_flash_* APIs go through other SPI
peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.
However due to limitations of the cache, operations through the cache are limited to the main flash. The address
range limitation for these operations are also on the cache side. The cache is not able to access external flash chips
or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code
or access to variables in the flash.

Note: Flash APIs after IDF v4.0 are no longer atomic. A writing operation during another on-going read operation,
on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and
partly updated as new written.

Kconfig option CONFIG_SPI_FLASH_USE_LEGACY_IMPL can be used to switch spi_flash_* functions back
to the implementation before IDF v4.0. However, the code size may get bigger if you use the new API and the old
API the same time.

Encrypted reads and writes use the old implementation, even if CONFIG_SPI_FLASH_USE_LEGACY_IMPL is not
enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash

Submit Document Feedback
chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

**Support for features of flash chips**

Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don’t need any vendor-specific commands.

The Quad mode (QIO/QOUT) the following chip types are supported:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

The 32-bit address range of following chip type is supported:

1. W25Q256
2. GD25Q256

Users can also customize their own flash chip driver, see *Overriding Default Chip Drivers* for more details.

---

**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver’s initialization (i.e., *esp_flash_init()*) , there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

**Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List**

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
   - Any of the `spi_flash_chip_*` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly.
Chapter 2. API Reference

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***vendor_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***vendor_get_caps`. Take the example below as a reference. (If the flash support suspend and read unique id).
  3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***vendor_get_caps(esp.flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

- You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```cmake
idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
set_property(TARGET ${spi_flash_lib} APPEND PROPERTY INTERFACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
```

5. The `linker.1f` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See `Linker Script Generation` for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

Example See also `storage/custom_flash_driver`.

Initializing a flash device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp.flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.
SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

Concurrency Constraints for flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

When the caches are disabled  This means that all CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur. If you use the API functions documented here, then the caches will be disabled automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI busses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

See also `OS functions`, `SPI Bus Lock`.

IRAM-Safe Interrupt Handlers  If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See `How to place code in IRAM`.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).
**Note:** When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and `format string` are placed into `DRAM` in that case.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See [Concurrency Constraints for flash on SPI](#) for more details.

### Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp.flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

### Memory mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when `flash encryption` is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`.
Chapter 2. API Reference

- **spi_flash_mmap()** maps a region of physical flash addresses into instruction space or data space of the CPU.
- **spi_flash_munmap()** unmaps previously mapped region.
- **esp_partition_mmap()** maps part of a partition into the instruction space or data space of the CPU.

Differences between **spi_flash_mmap()** and **esp_partition_mmap()** are as follows:

- **spi_flash_mmap()** must be given a 64 KB aligned physical address.
- **esp_partition_mmap()** may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to **esp_partition_mmap**, regardless of the partition boundary.

**Note:** mmap is supported by cache, so it can only be used on main flash.

## SPI Flash Implementation

The **esp_flash_t** structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provides support of some OS functions (e.g. lock, delay) in different stages (1st/2st boot, or the app).

### Host driver

The host driver relies on an interface (**spi_flash_host_driver_t**) defined in the **spi_flash_types.h** (in the hal/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However due to the speed limitations of ESP32, the HAL layer can’t provide high-speed implementations to some reading commands (So we didn’t do it at all). The files (**memspi_host_driver.h** and **.c**) implement the high-speed version of these commands with the **common_command** function provided in the HAL, and wrap these functions as **spi_flash_host_driver_t** for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the **spi_flash_host_driver_t** are implemented, the esp_flash API can access to the flash regardless of the low-level hardware.

### Chip driver

The chip driver, defined in **spi_flash_chip_driver.h**, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called **generic chip** which stands for common chips. Other special chip drivers can be developed on the basis of the generic chip.

The chip driver relies on the host driver.

### OS functions

Currently the OS function layer provides entries of a lock and delay.

The lock (see **SPI Bus Lock**) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period. (especially when the device doesn’t have CS wire, or the wire is controlled by the software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

See also

- *Partition Table documentation*
- *Over The Air Update (OTA) API* provides high-level API for updating app firmware stored in flash.
- *Non-Volatile Storage (NVS) API* provides a structured API for storing small pieces of data in SPI flash.

Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (*CONFIG_FREERTOS_UNICORE* enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File

- `spi_flash/include/esp_flash_spi_init.h`

Functions

```c
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Return

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

Parameters

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.
**esp_err_t** spi_bus_remove_flash_device(esp_flash_t *chip)

Remove a SPI Flash device from the SPI bus.

**Return**
- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

**Parameters**
- chip: The flash device to remove.

**Structures**

struct esp_flash_spi_device_config_t

Configurations for the SPI Flash to init.

**Public Members**

- spi_host_device_t host_id
  Bus to use.
- int cs_io_num
  GPIO pin to output the CS signal.
- esp_flash_io_mode_t io_mode
  IO mode to read from the Flash.
- esp_flash_speed_t speed
  Speed of the Flash clock.
- int input_delay_ns
  Input delay of the data pins, in ns. Set to 0 if unknown.
- int cs_id
  CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

**Header File**

- spi_flash/include/esp_flash.h

**Functions**

**esp_err_t** esp_flash_init(esp_flash_t *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**Note**
Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Note**
If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

**Return**
ESP_OK on success, or a flash error code if initialisation fails.

**Parameters**
- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**bool** esp_flash_chip_driver_initialized(const esp_flash_t *chip)

Check if appropriate chip driver is set.

**Return**
true if set, otherwise false.

**Parameters**
- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
**esp_err_t esp_flash_read_id (esp_flash_t *chip, uint32_t *out_id)**

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of `id` are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- [out] out_id: Pointer to receive ID value.

**Return**
- ESP_OK on success, or a flash error code if operation failed.

**esp_err_t esp_flash_get_size (esp_flash_t *chip, uint32_t *out_size)**

Detect flash size based on flash ID.

**Note**
Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

**Return**
- ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- [out] out_size: Detected size in bytes.

**esp_err_t esp_flash_read_unique_chip_id (esp.flash_t *chip, uint64_t *out_id)**

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- [out] out_id: Pointer to receive unique ID value.

**Return**
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

**esp_err_t esp_flash_erase_chip (esp.flash_t *chip)**

Erase flash chip contents.

**Return**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

**esp_err_t esp_flash_erase_region (esp.flash_t *chip, uint32_t start, uint32_t len)**

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- start: Address to start erasing flash. Must be sector aligned.
- len: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Return**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.
\textbf{esp_err_t esp_flash_get_chip_write_protect (esp_flash_t \*chip, bool \*write_protected)}

Read if the entire chip is write protected.

\textbf{Note} A correct result for this flag depends on the SPI flash chip model and chip\_drv in use (via the ‘chip->drv’ field).

\textbf{Return} ESP_OK on success, or a flash error code if operation failed.

\textbf{Parameters}
- \textbf{chip}: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- \textbf{[out]} \textbf{write_protected}: Pointer to boolean, set to the value of the write protect flag.

\textbf{esp_err_t esp_flash_set_chip_write_protect (esp_flash_t \*chip, bool write_protect)}

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

\textbf{Note} Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the ‘chip->drv’ field).

\textbf{Parameters}
- \textbf{chip}: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- \textbf{write_protect}: Boolean value for the write protect flag

\textbf{Return} ESP_OK on success, or a flash error code if operation failed.

\textbf{esp_err_t esp_flash_get_protectable_regions (const esp_flash_t \*chip, const esp_flash_region_t **out_regions, uint32_t \*out_num_regions)}

Read the list of individually protectable regions of this SPI flash chip.

\textbf{Note} Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the ‘chip->drv’ field).

\textbf{Return} ESP_OK on success, or a flash error code if operation failed.

\textbf{Parameters}
- \textbf{chip}: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- \textbf{[out]} \textbf{out_regions}: Pointer to receive a pointer to the array of protectable regions of the chip.
- \textbf{[out]} \textbf{out_num_regions}: Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

\textbf{esp_err_t esp_flash_get_protected_region (esp_flash_t \*chip, const esp_flash_region_t \*region, bool \*out_protected)}

Detect if a region of the SPI flash chip is protected.

\textbf{Note} It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

\textbf{Note} Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the ‘chip->drv’ field).

\textbf{Return} ESP_OK on success, or a flash error code if operation failed.

\textbf{Parameters}
- \textbf{chip}: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- \textbf{region}: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- \textbf{[out]} \textbf{out_protected}: Pointer to a flag which is set based on the protected status for this region.

\textbf{esp_err_t esp_flash_set_protected_region (esp_flash_t \*chip, const esp_flash_region_t \*region, bool \*protect \text{if operation failed)}

Update the protected status for a region of the SPI flash chip.

\textbf{Note} It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

\textbf{Note} Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the ‘chip->drv’ field).

\textbf{Return} ESP_OK on success, or a flash error code if operation failed.
Chapter 2. API Reference

Parameters
- **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region**: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions()
- **protect**: Write protection flag to set.

`esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)`

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters
- **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **buffer**: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address**: Address on flash to read from. Must be less than chip->size field.
- **length**: Length (in bytes) of data to read.

Note If on-chip flash encryption is used, this function returns raw (i.e., encrypted) data. Use the flash cache to transparently decrypt data.

Return
- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

`esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)`

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters
- **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **address**: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer**: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length**: Length (in bytes) of data to write.

Return
- ESP_OK on success.
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

Note Both address & length must be 16 byte aligned, as this is the encryption block size

Return
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

Parameters
- **chip**: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address**: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer**: Pointer to a buffer with the data to write.
- **length**: Length (in bytes) of data to write. 16 byte aligned.
esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Return
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

Parameters
- chip: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- address: Address on flash to read from.
- out_buffer: Pointer to a buffer for the data to read to.
- length: Length (in bytes) of data to read.

static bool esp_flash_is_quad_mode(const esp_flash_t *chip)
Returns true if chip is configured for Quad I/O or Quad Fast Read.

Return true if flash works in quad mode, otherwise false

Parameters
- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Structures
struct esp_flash_region_t
Structure for describing a region of flash.

Public Members

uint32_t offset
Start address of this region.

uint32_t size
Size of the region.

struct esp_flash_os_functions_t
OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t(* start)(void *arg)
Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t(* end)(void *arg)
Called after completing any flash operation.

esp_err_t(* region_protected)(void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t(* delay_us)(void *arg, uint32_t us)
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void *(*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)
Called for get temp buffer when buffer from application cannot be directly read into/write from.

void *(*release_temp_buffer)(void *arg, void *temp_buf)
Called for release temp buffer.

`esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)`
Yield to other tasks. Called during erase operations.

**Return** ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

`esp_err_t (*yield)(void *arg, uint32_t *out_status)`
Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`
Called for get system time.

**struct esp_flash_t**
Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

*spi_flash_host_inst_t* `host`
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

*const spi_flash_chip_t* `chip_drv`
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

*const esp_flash_os_functions_t* `os_func`
Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

`void *os_func_data`
Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

*esp_flash_io_mode_t* `read_mode`
Configured SPI flash read mode. Set before esp_flash_init is called.

`uint32_t size`
Size of SPI flash in bytes. If 0, size will be detected during initialisation.

`uint32_t chip_id`
Detected chip id.

`uint32_t busy : 1`
This flag is used to verify chip’s status.

`uint32_t reserved_flags : 31`
reserved.

**Macros**

SPI_FLASH_YIELD_REQ_YIELD
SPI_FLASH_YIELD_REQ_SUSPEND
SPI_FLASH_YIELD_STA_RESUME

**Type Definitions**

typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t
Header File

- hal/include/hal/spi_flash_types.h

Structures

struct spi_flash_trans_t
Definition of a common transaction. Also holds the return value.

Public Members

uint8_t reserved
Reserved, must be 0.

uint8_t mosi_len
Output data length, in bytes.

uint8_t miso_len
Input data length, in bytes.

uint8_t address_bitlen
Length of address in bits, set to 0 if command does not need an address.

uint32_t address
Address to perform operation on.

const uint8_t* mosi_data
Output data to salve.

uint8_t* miso_data
[out] Input data from slave, little endian

uint8_t flags
Flags for this transaction. Set to 0 for now.

uint16_t command
Command to send.

uint8_t dummy_bitlen
Basic dummy bits to use.

struct spi_flash_sus_cmd_conf
Configuration structure for the flash chip suspend feature.

Public Members

uint32_t sus_mask
SUS/SUS1/SUS2 bit in flash register.

uint32_t cmd_rdsr : 8
Read flash status register(2) command.

uint32_t sus_cmd : 8
Flash suspend command.

uint32_t res_cmd : 8
Flash resume command.

uint32_t reserved : 8
Reserved, set to 0.

struct spi_flash_encryption_t
Structure for flash encryption operations.
Public Members

void (*flash_encryption_enable) (void)
    Enable the flash encryption.

void (*flash_encryption_disable) (void)
    Disable the flash encryption.

void (*flash_encryption_data_prepare) (uint32_t address, const uint32_t *buffer, uint32_t size)
    Prepare flash encryption before operation.
    Note address and buffer must be 8-word aligned.
    Parameters
    • address: The destination address in flash for the write operation.
    • buffer: Data for programming
    • size: Size to program.

void (*flash_encryption_done) (void)
    Flash data encryption operation is done.

void (*flash_encryption_destroy) (void)
    Destroy encrypted result.

bool (*flash_encryption_check) (uint32_t address, uint32_t length)
    Check if is qualified to encrypt the buffer
    Parameters
    • address: the address of written flash partition.
    • length: Buffer size.

struct spi_flash_host_inst_t
    SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
    Pointer to the implementation function table.

struct spi_flash_host_driver_s
    Host driver configuration and context structure.

Public Members

esp_err_t (*dev_config) (spi_flash_host_inst_t *host)
    Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously.

esp_err_t (*common_command) (spi_flash_host_inst_t *host, spi_flash_trans_t *t)
    Send an user-defined spi transaction to the device.

esp_err_t (*read_id) (spi_flash_host_inst_t *host, uint32_t *id)
    Read flash ID.

void (*erase_chip) (spi_flash_host_inst_t *host)
    Erase whole flash chip.

void (*erase_sector) (spi_flash_host_inst_t *host, uint32_t start_address)
    Erase a specific sector by its start address.

void (*erase_block) (spi_flash_host_inst_t *host, uint32_t start_address)
    Erase a specific block by its start address.
void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
Check whether given buffer can be directly used to write

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for write data. The program_page should be called iteratively with the return value of this function.

Return Length that can be actually written in one program_page call

Parameters
  • address: Beginning flash address to write
  • len: Length request to write
  • align_addr: Output of the aligned address to write to
  • page_size: Physical page size of the flash chip

esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
Check whether given buffer can be directly used to read

int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for read data. The read should be called iteratively with the return value of this function.

Return Length that can be actually read in one read call

Parameters
  • address: Beginning flash address to read
  • len: Length request to read
  • align_addr: Output of the aligned address to read
  • page_size: Physical page size of the flash chip

uint32_t (*host_status)(spi_flash_host_inst_t *host)
Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*poll_cmd_done)(spi_flash_host_inst_t *host)
Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (*check_suspend)(spi_flash_host_inst_t *host)
Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*resume)(spi_flash_host_inst_t *host)
Resume flash from suspend manually

void (*suspend)(spi_flash_host_inst_t *host)
Set flash in suspend status manually

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.
Chapter 2. API Reference

```c
esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

### Macros

- **SPI_FLASH_TRANS_FLAG_CMD16**
  
  Send command of 16 bits.

- **SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO**
  
  Not applying the basic io mode configuration for this transaction.

- **SPI_FLASH_TRANS_FLAG_BYTE_SWAP**
  
  Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

- **ESP_FLASH_SPEED_MIN**
  
  Lowest speed supported by the driver, currently 5 MHz.

- **SPI_FLASH_CONFIG_CONF_BITS**
  
  OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

- **SPI_FLASH_READ_MODE_MIN**
  
  Slowest io mode supported by ESP32, currently SlowRd.

### Type Definitions

```c
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

### Enumerations

- **enum esp_flash_speed_t**
  
  SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

  A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

  **Values:**

  - **ESP_FLASH_5MHZ** = 0
     
     The flash runs under 5MHz.

  - **ESP_FLASH_10MHZ**
     
     The flash runs under 10MHz.

  - **ESP_FLASH_20MHZ**
     
     The flash runs under 20MHz.

  - **ESP_FLASH_26MHZ**
     
     The flash runs under 26MHz.

  - **ESP_FLASH_40MHZ**
     
     The flash runs under 40MHz.

  - **ESP_FLASH_80MHZ**
     
     The flash runs under 80MHz.

  - **ESP_FLASH_SPEED_MAX**
     
     The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

- **enum esp_flash_io_mode_t**
  
  Mode used for reading from SPI flash.

  **Values:**

  - **SPI_FLASH_SLOWRD** = 0
     
     Data read using single I/O, some limits on speed.
Chapter 2. API Reference

SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

SPI_FLASH_DOUT
Data read using dual I/O.

SPI_FLASH_DIO
Both address & data transferred using dual I/O.

SPI_FLASH_QOUT
Data read using quad I/O.

SPI_FLASH_QIO
Both address & data transferred using quad I/O.

SPI_FLASH_READ_MODE_MAX
The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

API Reference - Partition Table

Header File

• spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find partition based on one or more parameters.

Return iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

Parameters

• type: Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• subtype: Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
• label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find first partition based on one or more parameters.

Return pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

Parameters

• type: Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• subtype: Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
• label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_get(esp_partition_iterator_t iterator)

Get esp_partition_t structure for given partition.

Return pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

Parameters

• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.
esp_partition_iterator_t esp_partition_next(esp_partition_iterator_t iterator)
Move partition iterator to the next partition found.
Any copies of the iterator will be invalid after this call.

Return NULL if no partition was found, valid esp_partition_iterator_t otherwise.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

void esp_partition_iterator_release(esp_partition_iterator_t iterator)
Release partition iterator.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)
Verify partition data.
Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)
This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.
Pointers returned from this function can be compared directly to the address of any pointer returned from esp_partition_get(), as a test for equality.

Return
• If partition not found, returns NULL.
• If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for the lifetime of the application.

Parameters
• partition: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
Read data from the partition.
Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

Return ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters
• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
• src_offset: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
Write data to the partition.
Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.
Partitions marked with an encryption flag will automatically be written via the spi_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the spi_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

Note Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

Return ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters
Chapter 2. API Reference

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

**esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)**

Read data from the partition without any transformation/decryption.

**Note** This function is essentially the same as **esp_partition_read()** above. It just never decrypts data but returns it as is.

**Return** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- src_offset: Address of the data to be read, relative to the beginning of the partition.
- size: Size of data to be read, in bytes.

**esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)**

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note** This function is essentially the same as **esp_partition_write()** above. It just never encrypts data but writes it as is.

**Note** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Return** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

**Parameters**
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

**esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)**

Erase part of the partition.

**Return** ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

**esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)**

Configure MMU to map partition into data memory.
Unlike \texttt{spi\_flash\_mmap} function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via \texttt{out\_ptr} argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via \texttt{out\_handle} argument to \texttt{spi\_flash\_munmap} function.

**Return** ESP\_OK, if successful

**Parameters**

- \texttt{partition}: Pointer to partition structure obtained using \texttt{esp\_partition\_find\_first} or \texttt{esp\_partition\_get}. Must be non-NULL.
- \texttt{offset}: Offset from the beginning of partition where mapping should start.
- \texttt{size}: Size of the area to be mapped.
- \texttt{memory}: Memory space where the region should be mapped
- \texttt{out\_ptr}: Output, pointer to the mapped memory region
- \texttt{out\_handle}: Output, handle which should be used for \texttt{spi\_flash\_munmap} call

\begin{verbatim}
func esp\_partition\_get\_sha256(const esp\_partition\_t *partition, uint8\_t *sha\_256)
Get SHA-256 digest for required partition.
For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP\_ERR\_IMAGE\_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

- ESP\_OK: In case of successful operation.
- ESP\_ERR\_INVALID\_ARG: The size was 0 or the sha\_256 was NULL.
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for sha256 operation.
- ESP\_ERR\_IMAGE\_INVALID: App partition doesn’t contain a valid app image.
- ESP\_FAIL: An allocation error occurred.

**Parameters**

- \[\texttt{in}\] \texttt{partition}: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- \[\texttt{out}\] \texttt{sha\_256}: Returned SHA-256 digest for a given partition.

\begin{verbatim}
func esp\_partition\_check\_identity(const esp\_partition\_t \*partition\_1, const esp\_partition\_t \*partition\_2)
Check for the identity of two partitions by SHA-256 digest.

**Return**

- True: In case of the two firmware is equal.
- False: Otherwise

**Parameters**

- \[\texttt{in}\] \texttt{partition\_1}: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- \[\texttt{in}\] \texttt{partition\_2}: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

\begin{verbatim}
func esp\_partition\_register\_external(esp\_flash\_t \*flash\_chip, size\_t offset, size\_t size, const char \*label, esp\_partition\_type\_t type, esp\_partition\_subtype\_t subtype, const esp\_partition\_t **out\_partition)
Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the \texttt{esp\_flash\_t} structure) as partitions. This allows using them with components which access SPI flash through the \texttt{esp\_partition} API.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL is enabled
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters
• flash_chip: Pointer to the structure identifying the flash chip
• offset: Address in bytes, where the partition starts
• size: Size of the partition in bytes
• label: Partition name
• type: One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
• [out] out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)
Deregister the partition previously registered using esp_partition_register_external.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Parameters
• partition: pointer to the partition structure obtained from esp_partition_register_external,

Structures
struct esp_partition_t
partition information structure
This is not the format in flash, that format is esp_partition_info_t.
However, this is the format used by this API.

Public Members

esp_flash_t *flash_chip
SPI flash chip on which the partition resides

esp_partition_type_t type
partition type (app/data)

esp_partition_subtype_t subtype
partition subtype

uint32_t address
starting address of the partition in flash

uint32_t size
size of the partition, in bytes

char label[17]
partition label, zero-terminated ASCII string

bool encrypted
flag is set to true if partition is encrypted

Macros

ESP_PARTITION_SUBTYPE_OTA(i)
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.
**Type Definitions**

```c
typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t
```
Opaque partition iterator type.

**Enumerations**

```c
enum esp_partition_type_t
```
Partition type.

*Note*  Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

*Values:*

- **ESP_PARTITION_TYPE_APP** = 0x00
  Application partition type.

- **ESP_PARTITION_TYPE_DATA** = 0x01
  Data partition type.

- **ESP_PARTITION_TYPE_ANY** = 0xff
  Used to search for partitions with any type.

```c
enum esp_partition_subtype_t
```
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

*Note*  These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

*Values:*

- **ESP_PARTITION_SUBTYPE_APP_FACTORY** = 0x00
  Factory application partition.

- **ESP_PARTITION_SUBTYPE_APP_OTA_MIN** = 0x10
  Base for OTA partition subtypes.

- **ESP_PARTITION_SUBTYPE_APP_OTA_0 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 0**
  OTA partition 0.

- **ESP_PARTITION_SUBTYPE_APP_OTA_1 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1**
  OTA partition 1.

- **ESP_PARTITION_SUBTYPE_APP_OTA_2 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2**
  OTA partition 2.

- **ESP_PARTITION_SUBTYPE_APP_OTA_3 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3**
  OTA partition 3.

- **ESP_PARTITION_SUBTYPE_APP_OTA_4 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4**
  OTA partition 4.

- **ESP_PARTITION_SUBTYPE_APP_OTA_5 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5**
  OTA partition 5.

- **ESP_PARTITION_SUBTYPE_APP_OTA_6 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6**
  OTA partition 6.

- **ESP_PARTITION_SUBTYPE_APP_OTA_7 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7**
  OTA partition 7.

- **ESP_PARTITION_SUBTYPE_APP_OTA_8 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8**
  OTA partition 8.

- **ESP_PARTITION_SUBTYPE_APP_OTA_9 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9**
  OTA partition 9.
ESP_PARTITION_SUBTYPE_APP_OTA_10 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.

ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA_OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.

ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
Partition for emulate eFuse bits.

ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
SPIFFS partition.

ESP_PARTITION_SUBTYPE_ANY = 0xff
Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

- bootloader_support/include/esp_flash_encrypt.h

Functions

static bool esp_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Return true if flash encryption is enabled.
Chapter 2. API Reference

```c
esp_err_t esp_flash_encrypt_check_and_update (void)

esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

Note This function resets RTC_WDT between operations with sectors.

Return ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails,
ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

Parameters
• src_addr: Source offset in flash. Should be multiple of 4096 bytes.
• data_length: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void esp_flash_write_protect_crypt_cnt (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This
should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Down-
load Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this func-
tion.

esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption
mode of ESP32

Return

void esp_flash_encryption_init_checks (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

Note This function is called automatically during app startup, it doesn’t need to be called from the app.
• Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
• Log warnings if the efuse config doesn’t match the project config in any way

esp_err_t esp_flash_encryption_enable_secure_features (void)

Set all secure eFuse features related to flash encryption.

Return
• ESP_OK - Successfully

void esp_flash_encryption_set_release_mode (void)

Switches Flash Encryption from “Development” to “Release”.

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:
• “disable encrypt in dl mode”
• set FLASH_CRYPT_CNT efuse to max

Enumerations
enum esp_flash_enc_mode_t

Values:

ESP_FLASH_ENC_MODE_DISABLED
ESP_FLASH_ENC_MODE_DEVELOPMENT
ESP_FLASH_ENC_MODE_RELEASE
```
2.6.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.

Tools

spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling spiffs_create_partition_image.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS...
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the image_size is required for the standalone invocation, only the partition name is required when using spiffs_create_partition_image—the image size is automatically obtained from the project’s partition table.

Due to the differences in structure between Make and CMake, it is important to note that:
Chapter 2. API Reference

• for Make spiffs_create_partition_image must be called from the project Makefile
• for CMake spiffs_create_partition_image must be called from one of the component CMake
Lists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc.
on idf.py flash or make flash by specifying FLASH_IN_PROJECT. For example,
in Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py, parttool.py, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DE-
PENDS/SPIFFS_IMAGE_DEPENDS to specify targets that should be executed before generating the image.
in Make:

```
dep:
...
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see storage/spiffs/p.

**mkspiffs**  Another tool for creating SPIFFS partition images is mkspiffs. Similar to spiffsgen.py, it can be used to create an image from a given folder and then flash that image using esptool.py

For that, you need to obtain the following parameters:

• **Block Size**: 4096 (standard for SPI Flash)
• **Page Size**: 256 (standard for SPI Flash)
• **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
• **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000 -i spi
```

**Notes on which SPIFFS tool to use**  The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use spiffsgen.py in the following cases:
1. If you want to simply generate a SPIFFS image during the build, `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

**See also**

- *Partition Table documentation*

**Application Example**

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

**High-level API Reference**

**Header File**

- `spiffs/include/esp_spiffs.h`

**Functions**

`esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)`

Register and mount SPIFFS to VFS with given path prefix.

**Return**

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

**Parameters**

- `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

`esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)`

Unregister and unmount SPIFFS from VFS

**Return**

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

**Parameters**

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

`bool esp_spiffs Mounted(const char *partition_label)`

Check if SPIFFS is mounted

**Return**

- true if mounted
- false if not mounted

**Parameters**
Chapter 2. API Reference

- **partition_label**: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

```c
esp_err_t esp_spiffs_format(const char *partition_label)
```
Format the SPIFFS partition

**Return**
- ESP_OK if successful
- ESP_FAIL on error

**Parameters**
- **partition_label**: Same label as passed to esp_vfs_spiffs_register.

```c
esp_err_t esp_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)
```
Get information for SPIFFS

**Return**
- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

**Parameters**
- **partition_label**: Same label as passed to esp_vfs_spiffs_register
- [out] **total_bytes**: Size of the file system
- [out] **used_bytes**: Current used bytes in the file system

**Structures**

```c
struct esp_vfs_spiffs_conf_t
```
Configuration structure for esp_vfs_spiffs_register.

**Public Members**

```c
const char *base_path
```
File path prefix associated with the filesystem.

```c
const char *partition_label
```
Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

```c
size_t max_files
```
Maximum files that could be open at the same time.

```c
bool format_if_mount_failed
```
If true, it will format the file system if it fails to mount.

### 2.6.8 Virtual filesystem component

**Overview**

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.
FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:  
  .flags = ESP_VFS_FLAG_DEFAULT,  
  .write = &myfs_write,  
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:  
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t * fs, int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:  
  .flags = ESP_VFS_FLAG_CONTEXT_PTR,  
  .write_p = &myfs_write,  
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t * myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t * myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

Synchronous input/output multiplexing  Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return
only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()`
to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for
checking events.
6. The `select()` call ends and returns the appropriate results.

Non-socket VFS drivers  If you want to use `select()` with a file descriptor belonging to a non-socket VFS
driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to
the following example:

```
// In definition of esp_vfs_t:
   .start_select = uart_start_select,
   .end_select = uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file
descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

Note: `end_select()` might be called without a previous `start_select()` call in some rare circumstances.
`end_select()` should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to
the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- peripherals/uart/uart_select
- system/select

Socket VFS drivers  A socket VFS driver is using its own internal implementation of `select()` and non-socket
VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:
   .socket_select = &lwip_select,
   .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
   .stop_socket_select = &lwip_stop_socket_select,
   .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file
descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-
socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned
by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used
from ISR.

Please see `lwip/port/esp32/vfs_lwip.c` for a reference socket driver implementation using LWIP.

Note: If you use `select()` for socket file descriptors only then you can enable the `CONFIG_LWIP_USE_ONLY_LWIP_SELECT`
option to reduce the code size and improve performance.
Chapter 2. API Reference

**Note:** Don’t change the socket driver during an active `select()` call or you might experience some undefined behavior.

## Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html" does not exist in FS 2, FS 1 will not be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (`/`) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (`.`) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/..//log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

### File descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in newlib’s `sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

### Standard IO streams (`stdin`, `stdout`, `stderr`)

If the menuconfig option UART for console output is not set to None, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to `stdout` or `stderr` will send characters to the UART transmit FIFO. Reading from `stdin` will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var)`, might not have desired results.
Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`. VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (\n) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

**Standard streams and FreeRTOS tasks**  FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n")`; by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `_stdin`, `_stdout`, and `_stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default `_stdin`, `_stdout`, or `_stderr` using `fclose` will close the FILE stream object, which will affect all other tasks.
- To change the default `_stdin`, `_stdout`, `_stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin` before creating the task.

**Event fds**

`eventfd()` call is a powerful tool to notify a select() based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC, EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

**API Reference**

**Header File**

- `vfs/include/esp_vfs.h`

**Functions**

`ssize_t esp_vfs_write(struct _reent *r, int fd, const void *data, size_t size)`

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek(struct _reent *r, int fd, off_t size, int mode)`

`ssize_t esp_vfs_read(struct _reent *r, int fd, void *dst, size_t size)`

`int esp_vfs_open(struct _reent *r, const char *path, int flags, int mode)`
int esp_vfs_close (struct _reent *r, int fd)
int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)
int esp_vfs_stat (struct _reent *r, int fd, struct stat *st)
int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)
int esp_vfs_unlink (struct _reent *r, const char *path)
int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)
int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

Parameters
• base_path: file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/” . For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
• vfs: Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
• ctx: If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters
• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• min_fd: The smallest file descriptor this VFS will use.
• max_fd: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters
• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• vfs_id: Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

esp_err_t esp_vfs_unregister (const char *base_path)

Unregister a virtual filesystem for given path prefix

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

Parameters
• base_path: file prefix previously used in esp_vfs_register call

esp_err_t esp_vfs_unregister_with_id (esp_vfs_id_t vfs_id)

Unregister a virtual filesystem with the given index
Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

Parameters
  • vfs_id: The VFS ID returned by esp_vfs_register_with_id

esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)
Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
  • vfs_id: VFS identifier returned by esp_vfs_register_with_id.
  • fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_register_fd_with_local_fd(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)
Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
  • vfs_id: VFS identifier returned by esp_vfs_register_with_id.
  • local_fd: The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
  • permanent: Whether the fd should be treated as permanent (not removed after close())
  • fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)
Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
  • vfs_id: VFS identifier returned by esp_vfs_register_with_id.
  • fd: File descriptor which should be unregistered.

int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Return The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

Parameters
  • nfds: Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
  • readfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
  • writefds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
  • errorfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
  • timeout: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out.

void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start select.

Parameters
  • sem: semaphore structure which was passed to the driver by the start_select call
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t *sem, BaseType_t *woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

Parameters
- sem: semaphore structure which was passed to the driver by the start_select call
- woken: is set to pdTRUE if the function wakes up a task with higher priority

ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)

Implements the VFS layer of POSIX pread()

Return A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

Parameters
- fd: File descriptor used for read
- dst: Pointer to the buffer where the output will be written
- size: Number of bytes to be read
- offset: Starting offset of the read

ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)

Implements the VFS layer of POSIX pwrite()

Return A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

Parameters
- fd: File descriptor used for write
- src: Pointer to the buffer from where the output will be read
- size: Number of bytes to write
- offset: Starting offset of the write

Structures

struct esp_vfs_select_sem_t
VFS semaphore type for select()

Public Members

bool is_sem_local
    type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

void *sem
    semaphore instance

struct esp_vfs_t
VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.
Public Members

int flags
   ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
   Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)
   Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
   Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)
   Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
   Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)
   Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
   pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
   pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
   pwrite with context pointer

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
   pwrite without context pointer

int (*open_p)(void *ctx, const char *path, int flags, int mode)
   open with context pointer

int (*open)(const char *path, int flags, int mode)
   open without context pointer

int (*close_p)(void *ctx, int fd)
   close with context pointer

int (*close)(int fd)
   close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)

    tcsendbreak with context pointer

int (*tcsendbreak)(int fd, int duration)
    tcsendbreak without context pointer
Chapter 2. API Reference

```c
esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writfds, fd_set *exceptfds,
                           esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the
given VFS
```

```c
int (*socket_select)(int nfds, fd_set *readfds, fd_set *writfds, fd_set *errorfds, struct timeval
                     *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for
the socket VFS
```

```c
void (*stop_socket_select)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
set only for the socket driver
```

```c
void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver
```

```c
void (*get_socket_select_semaphore)(void)

described in the C language
```

```c
esp_err_t (*end_select)(void *end_select_args)

described in the C language
```

Macros

- **MAX_FDS**
  Maximum number of (global) file descriptors.

- **ESP_VFS_PATH_MAX**
  Maximum length of path prefix (not including zero terminator)

- **ESP_VFS_FLAG_DEFAULT**
  Default value of flags member in esp_vfs_t structure.

- **ESP_VFS_FLAG_CONTEXT_PTR**
  Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

```c
typedef int esp_vfs_id_t
```

Header File

- `vfs/include/esp_vfs_dev.h`

Functions

```c
void esp_vfs_dev_uart_register (void)

add /dev/uart virtual filesystem driver
```

This function is called from startup code to enable serial output

```c
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)

Set the line endings expected to be received on UART.
```

This specifies the conversion between line endings received on UART and newlines (‘’ , LF) passed into
stdin:

- **ESP_LINE_ENDINGS_CRLF**: convert CRLF to LF
- **ESP_LINE_ENDINGS_CR**: convert CR to LF
- **ESP_LINE_ENDINGS_LF**: no modification

**Note** this function is not thread safe w.r.t. reading from UART

Parameters

- `mode`: line endings expected on UART

Submit Document Feedback
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)

Set the line endings to sent to UART.

This specifies the conversion between newlines (',', LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters
- mode: line endings to send to UART

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (',', LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Return 0 if successed, or -1 when an error (specified by errno) have occurred.

Parameters
- uart_num: the UART number
- mode: line endings to send to UART

int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (',', LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Return 0 if successed, or -1 when an error (specified by errno) have occurred.

Parameters
- uart_num: the UART number
- mode: line endings to send to UART

void esp_vfs_dev_uart_use_nonblocking (int uart_num)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters
- uart_num: UART peripheral number

void esp_vfs_dev_uart_use_driver (int uart_num)

set VFS to use UART driver for reading and writing

Note: application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

Parameters
- uart_num: UART peripheral number

void esp_vfs_usb_serial_jtag_use_driver (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

Note: application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.
void esp_vfs_usb_serial_jtag_use_nonblocking (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File

- vfs/include/esp_vfs_eventfd.h

Functions

esp_err_t esp_vfs_eventfd_register (const esp_vfs_eventfd_config_t *config)

Registers the event vfs.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t esp_vfs_eventfd_unregister (void)

Unregisters the event vfs.

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

int eventfd (unsigned int initial, int flags)

Structures

struct esp_vfs_eventfd_config_t

Eventfd vfs initialization settings.

Public Members

size_t max_fds

The maximum number of eventfds supported

Macros

EFD_SUPPORT_ISR

ESP_VFS_EVENTD_CONFIG_DEFAULT ()

2.6.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.
The default settings are as follows: - Sector size is 512 bytes - Performance mode
You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

**Wear Levelling access API functions**

This is the set of API functions for working with data in flash:

- **wl_mount** - initializes the wear levelling module and mounts the specified partition
- **wl_unmount** - unmounts the partition and deinitializes the wear levelling module
- **wl_erase_range** - erases a range of addresses in flash
- **wl_write** - writes data to a partition
- **wl_read** - reads data from a partition
- **wl_size** - returns the size of available memory in bytes
- **wl_sector_size** - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

**Memory Size**

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

**See also**

- [FAT Filesystem](#)
- [Partition Table documentation](#)

**Application Example**

An example which combines the wear levelling driver with the FATFS library is provided in the `storage/wear_levelling` directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the `storage/wear_levelling/README.md` file for more information.

**High level API Reference**

**Header Files**

- fatfs/vfs/esp_vfs_fat.h

**Functions**

```c
esp_err_t esp_vfs_fat_spiflash_mount(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config, wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.
Return

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

Parameters

- base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
- partition_label: label of the partition which should be used
- mount_config: pointer to structure with extra parameters for mounting FATFS
- [out] wl_handle: wear levelling driver handle

struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_spiflashUnmount(const char *base_path, wl_handle_t *wl_handle)
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount.

Return

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

Parameters

- base_path: path where partition should be registered (e.g. “/spiflash”)
- wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount

Mid level API Reference

Header File

- wear_levelling/include/wear_levelling.h

Functions

esp_err_t wlMount(const esp_partition_t *partition, wl_handle_t *out_handle)
Mount WL for defined partition.

Return

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

Parameters

- partition: that will be used for access
Chapter 2. API Reference

• out_handle: handle of the WL instance

```c
esp_err_t wl_unmount (wl_handle_t handle)
```
Unmount WL for defined partition.

**Return**
• ESP_OK, if the operation completed successfully;
• or one of error codes from lower-level flash driver.

**Parameters**
• handle: WL partition handle

```c
esp_err_t wl_erase_range (wl_handle_t handle, size_t start_addr, size_t size)
```
Erase part of the WL storage.

**Return**
• ESP_OK, if the range was erased successfully;
• ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
• ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

**Parameters**
• handle: WL handle that are related to the partition
• start_addr: Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(…).`
• size: Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(…).`

```c
esp_err_t wl_write (wl_handle_t handle, size_t dest_addr, const void * src, size_t size)
```
Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

**Note** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

**Return**
• ESP_OK, if data was written successfully;
• ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
• ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

**Parameters**
• handle: WL handle that are related to the partition
• dest_addr: Address where the data should be written, relative to the beginning of the partition.
• src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
• size: Size of data to be written, in bytes.

```c
esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void * dest, size_t size)
```
Read data from the WL storage.

**Return**
• ESP_OK, if data was read successfully;
• ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
• ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

**Parameters**
• handle: WL module instance that was initialized before
• dest: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size’ bytes long.
• src_addr: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

```c
size_t wl_size (wl_handle_t handle)
```
Get size of the WL storage.

**Return** usable size, in bytes
### Parameters

- **handle**: WL module handle that was initialized before

```c
size_t wl_sector_size(wl_handle_t handle)
```

Get sector size of the WL instance.

Return

- sector size, in bytes

### Parameters

- **handle**: WL module handle that was initialized before

### Macros

- **WL_INVALID_HANDLE**

### Type Definitions

```c
typedef int32_t wl_handle_t
```

wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.

---

## 2.7 System API

### 2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

   - Offset for 0 Segment = `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)`
   - Offset for Segment = Offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
   - Offset for 2 Segment = Offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than ESP_IMAGE_MAX_SEGMENTS.

To get the list of your image segments, please run the following command:

```bash
esptool.py --chip esp32 image_info build/app.bin
```

```bash
esptool.py v2.3.1

   27884) load
I (888) esp_image: segment 9: paddr=0x0000a9b60 vaddr=0x400c0000 size=0x00000  (0)
   104) load
I (929) esp_image: segment 10: paddr=0x0000a9b68 vaddr=0x50000000 size=0x00004  (4)
   104) load
I (971) esp_image: segment 11: paddr=0x0000a9b74 vaddr=0x50000004 size=0x00000  (0)
   104) load
I (1012) esp_image: segment 12: paddr=0x0000a9b7c vaddr=0x50000004 size=0x00000 ...
   104) load
```

For more details on the type of memory segments and their address ranges, see ESP32 Technical Reference Manual > System and Memory > Embedded Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

Application Description

The DROM segment starts with the esp_app_desc_t structure which carries specific fields describing the application:

- secure_version - see Anti-rollback.
- version - see App version. *
- project_name is filled from PROJECT_NAME. *
- time and date - compile time and date.
- idf_ver - version of ESP-IDF. *
- app_elf_sha256 - contains sha256 for the elf application file.
* - The maximum length is 32 characters, including null-termination character. For example, if the length of \texttt{PROJECT\_NAME} exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(\texttt{esp\_image\_header\_t}) + sizeof(\texttt{esp\_image\_segment\_header\_t}). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

**Adding a Custom Structure to an Application**

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(\texttt{esp\_image\_header\_t}) + sizeof(\texttt{esp\_image\_segment\_header\_t}) + sizeof(\texttt{esp\_app\_desc\_t}).

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add \texttt{COMPONENT\_ADD\_LD\_FLAGS += -u custom\_app\_desc} into \texttt{component.mk}
- For Cmake: add \texttt{target\_link\_libraries(${COMPONENT\_TARGET} "-u custom\_app\_desc")} into \texttt{CMakeLists.txt}

**API Reference**

**Header File**

- \texttt{bootloader\_support/include/esp\_app\_format.h}

**Structures**

**\texttt{struct esp\_image\_header\_t}**

Main header of binary image.

**Public Members**

\texttt{uint8\_t magic}

Magic word ESP\_IMAGE\_HEADER\_MAGIC

\texttt{uint8\_t segment\_count}

Count of memory segments

\texttt{uint8\_t spi\_mode}

flash read mode (\texttt{esp\_image\_spi\_mode\_t} as \texttt{uint8\_t})

\texttt{uint8\_t spi\_speed\_t}

flash frequency (\texttt{esp\_image\_spi\_freq\_t} as \texttt{uint8\_t})

\texttt{uint8\_t spi\_size\_t}

flash chip size (\texttt{esp\_image\_flash\_size\_t} as \texttt{uint8\_t})

\texttt{uint32\_t entry\_addr}

Entry address

\texttt{uint8\_t wp\_pin}

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

\texttt{uint8\_t spi\_pin\_drv}[3]

Drive settings for the SPI flash pins (read by ROM bootloader)
**esp_chip_id_t**

Chip identification number

uint8_t **min_chip_rev**

Minimum chip revision supported by image

uint8_t **reserved[8]**

Reserved bytes in additional header space, currently unused

uint8_t **hash_append**

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

**struct esp_image_segment_header_t**

Header of binary image segment.

**Public Members**

uint32_t **load_addr**

Address of segment

uint32_t **data_len**

Length of data

**struct esp_app_desc_t**

Description about application.

**Public Members**

uint32_t **magic_word**

Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t **secure_version**

Secure version

uint32_t **reserv1[2]**

reserv1

char **version[32]**

Application version

char **project_name[32]**

Project name

char **time[16]**

Compile time

char **date[16]**

Compile date

char **idf_ver[32]**

Version IDF

uint8_t **app_elf_sha256[32]**

sha256 of elf file

uint32_t **reserv2[20]**

reserv2
Macros

`ESP_IMAGE_HEADER_MAGIC`
The magic word for the `esp_image_header_t` structure.

`ESP_IMAGE_MAX_SEGMENTS`
Max count of segments in the image.

`ESP_APP_DESC_MAGIC_WORD`
The magic word for the `esp_app_desc` structure that is in DROM.

Enumerations

```c
enum esp_chip_id_t

ESP CHIP ID ESP32 = 0x0000
chip ID: ESP32

ESP CHIP ID ESP32S2 = 0x0002
chip ID: ESP32-S2

ESP CHIP ID ESP32C3 = 0x0005
chip ID: ESP32-C3

ESP CHIP ID ESP32S3 = 0x0009
chip ID: ESP32-S3

ESP CHIP ID ESP32H2 = 0x000A
chip ID: ESP32-H2

ESP CHIP ID INVALID = 0xFFFF
Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)
```

```c
enum esp_image_spi_mode_t

SPI flash mode, used in `esp_image_header_t`.
```

```c
Values:

ESP_IMAGE_SPI_MODE_QIO
SPI mode QIO

ESP_IMAGE_SPI_MODE_QOUT
SPI mode QOUT

ESP_IMAGE_SPI_MODE_DIO
SPI mode DIO

ESP_IMAGE_SPI_MODE_DOUT
SPI mode DOUT

ESP_IMAGE_SPI_MODE_FAST_READ
SPI mode FAST_READ

ESP_IMAGE_SPI_MODE_SLOW_READ
SPI mode SLOW_READ
```

```c
enum esp_image_spi_freq_t

SPI flash clock frequency.
```

```c
Values:

ESP_IMAGE_SPI_SPEED_40M
SPI clock frequency 40 MHz

ESP_IMAGE_SPI_SPEED_26M
SPI clock frequency 26 MHz
```

**Chapter 2. API Reference**

**ESP_IMAGE_SPI_SPEED_20M**

SPI clock frequency 20 MHz

**ESP_IMAGE_SPI_SPEED_80M = 0xF**

SPI clock frequency 80 MHz

```c
enum esp_image_flash_size_t
{  
    ESP_IMAGE_FLASH_SIZE_1MB = 0,  
    ESP_IMAGE_FLASH_SIZE_2MB,  
    ESP_IMAGE_FLASH_SIZE_4MB,  
    ESP_IMAGE_FLASH_SIZE_8MB,  
    ESP_IMAGE_FLASH_SIZE_16MB,  
    ESP_IMAGE_FLASH_SIZE_MAX  
}
```

**Supported SPI flash sizes.**

**Values:**

- **ESP_IMAGE_FLASH_SIZE_1MB = 0**
  - SPI flash size 1 MB
- **ESP_IMAGE_FLASH_SIZE_2MB**
  - SPI flash size 2 MB
- **ESP_IMAGE_FLASH_SIZE_4MB**
  - SPI flash size 4 MB
- **ESP_IMAGE_FLASH_SIZE_8MB**
  - SPI flash size 8 MB
- **ESP_IMAGE_FLASH_SIZE_16MB**
  - SPI flash size 16 MB
- **ESP_IMAGE_FLASH_SIZE_MAX**
  - SPI flash size MAX

**2.7.2 Application Level Tracing**

**Overview**

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

**API Reference**

**Header File**

- `app_trace/include/esp_app_trace.h`

**Functions**

```c
esp_err_t esp_apptrace_init (void)
```

Initializes application tracing module.

**Note** Should be called before any esp_apptrace_xxx call.

```c
void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)
```

Configures down buffer.

**Note** Needs to be called before initiating any data transfer using esp_apptrace_buffer_get and esp_apptrace_write. This function does not protect internal data by lock.

**Parameters**

- *buf*: Address of buffer to use for down channel (host to target) data.
## Chapter 2. API Reference

- **size**: Size of the buffer.

```c
uint8_t *esp_apptrace_buffer_get(esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)
```

Allocates buffer for trace data. After data in buffer are ready to be sent off esp_apptrace_buffer_put must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

**Parameters**
- **dest**: Indicates HW interface to send data.
- **size**: Size of data to write to trace buffer.
- **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
esp_err_t esp_apptrace_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be proceeded by esp_apptrace_buffer_get.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- **dest**: Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- **ptr**: Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
esp_err_t esp_apptrace_write(esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)
```

Writes data to trace buffer.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- **dest**: Indicates HW interface to send data.
- **data**: Address of data to write to trace buffer.
- **size**: Size of data to write to trace buffer.
- **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
```

vprintf-like function to sent log messages to host via specified HW interface.

**Return** Number of bytes written.

**Parameters**
- **dest**: Indicates HW interface to send data.
- **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- **fmt**: Address of format string.
- **ap**: List of arguments.

```c
int esp_apptrace_vprintf(const char *fmt, va_list ap)
```

vprintf-like function to sent log messages to host.

**Return** Number of bytes written.

**Parameters**
- **fmt**: Address of format string.
- **ap**: List of arguments.

```c
esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- **dest**: Indicates HW interface to flush data on.
- **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host without locking internal data. This is special version of esp_apptrace_flush which should be called from panic handler.
Return ESP_OK on success, otherwise see esp_err_t

Parameters
  • dest: Indicates HW interface to flush data on.
  • min_sz: Threshold for flushing data. If current filling level is above this value, data will be flushed.
  • TRAX destinations only.
  • tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_read (esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)
Reads host data from trace buffer.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
  • dest: Indicates HW interface to read the data on.
  • data: Address of buffer to put data from trace buffer.
  • size: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
  • tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

uint8_t *esp_apptrace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)
Retrieves incoming data buffer if any. After data in buffer are processed esp_apptrace_down_buffer_put must be called to indicate it.

Return non-NULL on success, otherwise NULL.

Parameters
  • dest: Indicates HW interface to receive data.
  • size: Address to store size of available data in down buffer. Must be initialized with requested value.
  • tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
  • dest: Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
  • ptr: Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
  • tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

bool esp_apptrace_host_is_connected (esp_apptrace_dest_t dest)
Checks whether host is connected.

Return true if host is connected, otherwise false

Parameters
  • dest: Indicates HW interface to use.

void *esp_apptrace_fopen (esp_apptrace_dest_t dest, const char *path, const char *mode)
Opens file on host. This function has the same semantic as `fopen` except for the first argument.

Return non zero file handle on success, otherwise 0

Parameters
  • dest: Indicates HW interface to use.
  • path: Path to file.
  • mode: Mode string. See fopen for details.

int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as `fclose` except for the first argument.

Return Zero on success, otherwise non-zero. See fclose for details.

Parameters
  • dest: Indicates HW interface to use.
  • stream: File handle returned by esp_apptrace_fopen.
size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writestofileonhost. Thisfunctionhasthesamesemanticas fwrite exceptforthefirstargument.

Return Number of written items. See fwrite for details.

Parameters
• dest: Indicates HW interface to use.
• ptr: Address of data to write.
• size: Size of an item.
• nmemb: Number of items to write.
• stream: File handle returned by esp_apptrace_fopen.

size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)

Readfileonhost. Thisfunctionhasthesamesemanticas ‘fread’exceptforthefirstargument.

Return Number of read items. See fread for details.

Parameters
• dest: Indicates HW interface to use.
• ptr: Address to store read data.
• size: Size of an item.
• nmemb: Number of items to read.
• stream: File handle returned by esp_apptrace_fopen.

int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as ‘fseek’except for the first argument.

Return Zero on success, otherwise non-zero. See fseek for details.

Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.
• offset: Offset. See fseek for details.
• whence: Position in file. See fseek for details.

int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)

Getcurrentpositionindicatorforfileonhost. Thisfunctionhasthesamesemanticas ‘ftell’except for the first argument.

Return Current position in file. See ftell for details.

Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Return ESP_OK on success, otherwise see esp_err_t

Parameters
• dest: Indicates HW interface to use.

void esp_gcov_dump (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t

Application trace data destinations bits.

Values:

ESP_APPTRACE_DEST_JTAG = 1

JTAG destination.
ESP_APPTRACE_DEST_TRAX = ESP_APPTRACE_DEST_JTAG
xxx_TRAX name is obsolete, use more common xxx_JTAG

ESP_APPTRACE_DEST_UART0
UART0 destination.

ESP_APPTRACE_DEST_MAX = ESP_APPTRACE_DEST_UART0

ESP_APPTRACE_DEST_NUM

Header File

- app_trace/include/esp_sysview_trace.h

Functions

static esp_err_t esp_sysview_flush(uint32_t tmo)
Flushes remaining data in SystemView trace buffer to host.

Return ESP_OK.

Parameters

- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

int esp_sysview_vprintf(const char *format, va_list args)
vprintf-like function to send log messages to the host.

Return Number of bytes written.

Parameters

- format: Address of format string.
- args: List of arguments.

esp_err_t esp_sysview_heap_trace_start(uint32_t tmo)
Starts SystemView heap tracing.

Return ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

Parameters

- tmo: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

esp_err_t esp_sysview_heap_trace_stop(void)
Stops SystemView heap tracing.

Return ESP_OK.

void esp_sysview_heap_trace_alloc(void *addr, uint32_t size, const void *callers)
Sends heap allocation event to the host.

Parameters

- addr: Address of allocated block.
- size: Size of allocated block.
- callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void esp_sysview_heap_trace_free(void *addr, const void *callers)
Sends heap de-allocation event to the host.

Parameters

- addr: Address of de-allocated block.
- callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.7.3 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:
Chapter 2. API Reference

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

**Note:** These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

### Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see \[6n\] or similar escape sequence when running `system/console` example instead of a command prompt (e.g. `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and `idf_monitor.py` (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

#### Configuration

Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

- `linenoiseClearScreen()` Clear terminal screen using an escape sequence and position the cursor at the top left corner.
- `linenoiseSetMultiLine()` Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.
- `linenoiseAllowEmpty()` Set whether linenoise library will return a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.
- `linenoiseSetMaxLineLen()` Set maximum length of the line for linenoise library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4kB.

#### Main loop

- `linenoise()` In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns completed line once ‘enter’ key is pressed. As such, it handles the ‘read’ part of the loop.
- `linenoiseFree()` This function must be called to release the command line buffer obtained from `linenoise()` function.

#### Hints and completions
linenoiseSetCompletionCallback() When user presses ‘tab’ key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to linenoiseAddCompletion() function. linenoiseSetCompletionCallback() function should be called to register this completion callback, if completion feature is desired. console component provides a ready made function to provide completions for registered commands, esp_console_get_completion() (see below).

linenoiseAddCompletion() Function to be called by completion callback to inform the library about possible completions of the currently typed command.

linenoiseSetHintsCallback() Whenever user input changes, linenoise invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

linenoiseSetFreeHintsCallback() If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via linenoiseSetFreeHintsCallback().

History

linenoiseHistorySetMaxLen() This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

linenoiseHistoryAdd() Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

linenoiseHistorySave() Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

linenoiseHistoryLoad() Counterpart to linenoiseHistorySave(), loads history from a file.

linenoiseHistoryFree() Releases memory used to store command history. Call this function when done working with linenoise library.

Splitting of command line into arguments

core component provides esp_console_split_argv() function to split command line string into arguments. The function returns the number of arguments found (argc) and fills an array of pointers which can be passed as argv argument to any function which accepts arguments in argc, argv format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using \ (backslash) character.
- Other escape sequences which are recognized are \\ (which produces literal backslash) and ", which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by esp_console_split_argv function.

Examples:

- abc def 1 20 .3 ⟶ [abc, def, 1, 20, .3]
- abc "123 456" def ⟶ [abc, 123 456, def]
- `a \b\c" ⟶ [a b\c]`

Argument parsing

For argument parsing, console component includes argtable3 library. Please see tutorial for an introduction to argtable3. Github repository also includes examples.
Command registration and dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses `Argtable3` for argument parsing, hint text can be generated automatically by providing a pointer to `argtable` argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

- `esp_console_run()` This function takes the command line string, splits it into argc/argv argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.
- `esp_console_register_help_command()` Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.
- `esp_console_get_completion()` Callback function to be used with `linenoiseSetCompletionCallback()` from `linenoise` library. Provides completions to `linenoise` based on the list of registered commands.
- `esp_console_get_hint()` Callback function to be used with `linenoiseSetHintsCallback()` from `linenoise` library. Provides argument hints for registered commands to `linenoise`.

Initialize console REPL environment

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

Application Example

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up `linenoise` library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/ipperf`.

API Reference

Header File

- `console/esp_console.h`
Functions

\texttt{esp_err_t esp\_console\_init(const esp\_console\_config\_t *config)}

initialize console module

\textbf{Note} Call this once before using other console module features

\textbf{Return}
- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_STATE if already initialized
- ESP\_ERR\_INVALID\_ARG if the configuration is invalid

\textbf{Parameters}
- \texttt{config}: console configuration

\texttt{esp_err_t esp\_console\_deinit(void)}

de-initialize console module

\textbf{Note} Call this once when done using console module functions

\textbf{Return}
- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized yet

\texttt{esp_err_t esp\_console\_cmd\_register(const esp\_console\_cmd\_t *cmd)}

Register console command.

\textbf{Return}
- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_ARG if command description includes invalid arguments

\textbf{Parameters}
- \texttt{cmd}: pointer to the command description; can point to a temporary value

\texttt{esp_err_t esp\_console\_run(const char *cmdline, int *cmd\_ret)}

Run command line.

\textbf{Return}
- ESP\_OK, if command was run
- ESP\_ERR\_INVALID\_ARG, if the command line is empty, or only contained whitespace
- ESP\_ERR\_NOT\_FOUND, if command with given name wasn’t registered
- ESP\_ERR\_INVALID\_STATE, if esp\_console\_init wasn’t called

\textbf{Parameters}
- \texttt{cmdline}: command line (command name followed by a number of arguments)
- \texttt{[out]} \texttt{cmd\_ret}: return code from the command (set if command was run)

\texttt{size\_t esp\_console\_split\_argv(char *line, char **argv, size\_t argv\_size)}

Split command line into arguments in place.

* - This function finds whitespace-separated arguments \textbf{in} the given \textit{input} line.
* - 'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
* - Argument which include spaces may be surrounded \textbf{with} quotes. In this case spaces are preserved \textbf{and} quotes are stripped.
* - 'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
* - Escape sequences may be used to produce backslash, double quote, \textbf{and} space:
* - 'a\ b\c"' -> [ 'a b\c"' ]

\textbf{Note} Pointers to at most argv\_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

\textbf{Return} number of arguments found (argc)

\textbf{Parameters}
Chapter 2. API Reference

- **line**: pointer to buffer to parse; it is modified in place
- **argv**: array where the pointers to arguments are written
- **argv_size**: number of elements in argv_array (max. number of arguments)

```c
void esp_console_get_completion(const char *buf, linenoiseCompletions *lc)
```

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:
```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

**Parameters**
- **buf**: the string typed by the user
- **lc**: linenoiseCompletions to be filled in

```c
const char *esp_console_get_hint(const char *buf, int *color, int *bold)
```

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:
```
linenoiseSetHintsCallback((linenoiseHintsCallback*)&esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

**Return** string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFree-HintsCallback should not be used).

**Parameters**
- **buf**: line typed by the user
- **[out] color**: ANSI color code to be used when displaying the hint
- **[out] bold**: set to 1 if hint has to be displayed in bold

```c
esp_err_t esp_console_register_help_command()
```

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

**Return**
- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE**, if esp_console_init wasn’t called

```c
esp_err_t esp_console_new_repl_uart(const esp_console_dev_uart_config_t *dev_config,
                                    const esp_console_repl_config_t *repl_config,
                                    esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over UART driver.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

**Return**
- **ESP_OK** on success
- **ESP_FAIL** Parameter error

**Parameters**
- **[in] dev_config**: UART device configuration
- **[in] repl_config**: REPL configuration
- **[out] ret_repl**: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_new_repl_usb_cdc(const esp_console_dev_usb_cdc_config_t *dev_config,
                                       const esp_console_repl_config_t *repl_config,
                                       esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over USB CDC.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

**Return**
- ESP_OK on success
- ESP_FAIL Parameter error

**Parameters**
- **[in]** dev_config: USB CDC configuration
- **[in]** repl_config: REPL configuration
- **[out]** ret_repl: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_start_repl(esp_console_repl_t *repl)
```

Start REPL environment.

**Note** Once the REPL got started, it won’t be stopped until user call repl->del(repl) to destroy the REPL environment.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

**Parameters**
- **[in]** repl: REPL handle returned from esp_console_new_repl_xxx

**Structures**

```c
struct esp_console_config_t
```
Parameters for console initialization.

**Public Members**

- `size_t max_cmdline_length`
  length of command line buffer, in bytes

- `size_t max_cmdline_args`
  maximum number of command line arguments to parse

- `int hint_color`
  ASCII color code of hint text.

- `int hint_bold`
  Set to 1 to print hint text in bold.

```c
struct esp_console_repl_config_t
```
Parameters for console REPL (Read Eval Print Loop)

**Public Members**

- `uint32_t max_history_len`
  maximum length for the history

- `const char *history_save_path`
  file path used to save history commands, set to NULL won’t save to file system

- `uint32_t task_stack_size`
  repl task stack size

- `uint32_t task_priority`
  repl task priority

- `const char *prompt`
  prompt (NULL represents default: “esp> “)
size_t max_cmdline_length
maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
Parameters for console device: UART.

Public Members

int channel
UART channel number (count from zero)

int baud_rate
Communication baud rate.

int tx_gpio_num
GPIO number for TX path, -1 means using default one.

int rx_gpio_num
GPIO number for RX path, -1 means using default one.

struct esp_console_dev_usb_cdc_config_t
Parameters for console device: USB CDC.

Note It’s an empty structure for now, reserved for future

struct esp_console_cmd_t
Console command description.

Public Members

const char* command
Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

const char* help
Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char* hint
Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t func
Pointer to a function which implements the command.

void *argtable
Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct esp_console_repl_s
Console REPL base structure.

Public Members

esp_err_t (*del)(esp_console_repl_t *repl)
Delete console REPL environment.

Return
• ESP_OK on success
• ESP_FAIL on errors

Parameters
• [in] repl: REPL handle returned from esp_console_new_repl_xxx

Macros

ESP_CONSOLE_CONFIG_DEFAULT()
Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT()
Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT()

Type Definitions

typedef struct linenoiseCompletions linenoiseCompletions
typedef int (*esp_console_cmd_func_t)(int argc, char **argv)

Console command main function.

Return console command return code, 0 indicates “success”

Parameters

• argc: number of arguments
• argv: array with argc entries, each pointing to a zero-terminated string argument

typedef struct esp_console_repl_s esp_console_repl_t

Type defined for console REPL.

2.7.4 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library
operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts
used by eFuse Manager.

Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which
can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these
eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are
available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

• EFUSE_BLK0 is used entirely for system purposes;
• EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for
another purpose;
• EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another
purpose;
• EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application.
Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the
structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields
of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:

- **common (esp_efuse_table.csv)** - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse_common_table`). Note that changes in this file can lead to incorrect operation.
- **custom** - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse_custom_table`.

**Description CSV file**

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

- **field_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The field_name supports structured format using `.`, to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).
- **efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available `EFUSE_BLK0..EFUSE_BLK3`.
- **bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.
- **bit_count** The number of bits to use in this field (1.-). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for `ESP_EFUSE_SECURE_BOOT_KEY` and `ESP_EFUSE_ENCRYPT_FLASH_KEY` fields). The value `MAX_BLK_LEN` depends on `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.
- **comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#############################
MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]
, EFUSE_BLK0, 64, 8, Factory MAC addr [1]
, EFUSE_BLK0, 56, 8, Factory MAC addr [2]
, EFUSE_BLK0, 48, 8, Factory MAC addr [3]
, EFUSE_BLK0, 40, 8, Factory MAC addr [4]
, EFUSE_BLK0, 32, 8, Factory MAC addr [5]
MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address
```

This field will available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.
Structured efuse fields

<table>

<tr>
<td>WR_DIS.FIELD_3.ALIAS</td>
<td>EFUSE_BLK0</td>
<td>5</td>
<td>1</td>
<td>Write protection for...</td>
</tr>
<tr>
<td>~FIELD_3 (just a alias for WR_DIS.FIELD_3)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>WR_DIS.FIELD_4</td>
<td>EFUSE_BLK0</td>
<td>7</td>
<td>1</td>
<td>Write protection for...</td>
</tr>
<tr>
<td>~FIELD_4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.

The IDF names for structured efuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by `_`. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command `idf.py efuse_common_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv
```

After generation in the folder $IDF_PATH/components/efuse/esp32 create:

- `esp_efuse_table.c` file.
- In `include` folder `esp_efuse_table.c` file.

To generate a custom files, use the following command `idf.py efuse_custom_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv PROJEC_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder PROJEC_PATH/main create:

- `esp_efuse_custom_table.c` file.
- In `include` folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:
### Supported coding scheme

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p PORT summary` command.
- from esptool utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is a `CONFIG_EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the `ESP_ERR_CODING` error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks `esp_efuse_read_...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `espEfuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `espEfuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.

```c
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```
Chapter 2. API Reference

- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block.
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks.
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```bash
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

eFuse coding scheme: NONE

Used bits in eFuse table:
- EFUSE_BLK0: [2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188 191] [194 194] [196 196] [198 201]
- EFUSE_BLK1: [0 255]
- EFUSE_BLK2: [0 255]
- EFUSE_BLK3: [0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif).

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv.

Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

1. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
2. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

### Debug eFuse & Unit tests

**Virtual eFuses**

The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: "efuse_em, data, efuse, , 0x2000, ". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

Header File

- efuse/include/esp_efuse.h

Functions

```c
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
```

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**
- `[in]` field: A pointer to the structure describing the fields of efuse.
- `[out]` dst: A pointer to array that will contain the result of reading.
- `[in]` dst_size_bits: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

```c
bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])
```

Read a single bit eFuse field as a boolean value.

**Note** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

**Note** If assertions are enabled and the parameter is invalid, execution will abort.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

**Parameters**
- `[in]` field: A pointer to the structure describing the fields of efuse.

```c
esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t *out_cnt)
```

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**
- `[in]` field: A pointer to the structure describing the fields of efuse.
- `[out]` out_cnt: A pointer that will contain the number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)
```

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
Chapter 2. API Reference

- [in] field: A pointer to the structure describing the fields of efuse.
- [in] src: A pointer to array that contains the data for writing.
- [in] src_size_bits: The number of bits required to write.

```
esp_err_t esp_efuse_write_field_cnt(const esp_efuse_desc_t *field[], size_t cnt)
```

Writes a required count of bits as "1" to EFUSE field.

If there are no free bits in the field to set the required number of bits to "1", ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

Parameters
- [in] field: A pointer to the structure describing the fields of efuse.
- [in] cnt: Required number of programmed as "1" bits.

```
esp_err_t esp_efuse_write_field_bit(const esp_efuse_desc_t *field[])
```

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Return
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

Parameters
- [in] field: Pointer to the structure describing the efuse field.

```
esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)
```

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
- [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

```
esp_err_t esp_efuse_set_read_protect(esp_efuse_block_t blk)
```

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
- [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

```
int esp_efuse_get_field_size(const esp_efuse_desc_t *field[])
```

Returns the number of bits used by field.

Return Returns the number of bits used by field.

Parameters
• [in] field: A pointer to the structure describing the fields of efuse.

```c
uint32_t esp_efuse_read_reg(esp_efuse_block_t blk, unsigned int num_reg)
```

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return** Value of register

**Parameters**
- [in] blk: Block number of eFuse.

```c
esp_err_t esp_efuse_write_reg(esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
```

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**
- [in] blk: Block number of eFuse.
- [in] val: Value to write.

```c
esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme(esp_efuse_block_t blk)
```

Return efuse coding scheme for blocks.

**Note**: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return** Return efuse coding scheme for blocks

**Parameters**
- [in] blk: Block number of eFuse.

```c
esp_err_t esp_efuse_read_block(esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
```

Read key to efuse block starting at the offset and the required size.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- [in] blk: Block number of eFuse.
- [in] dst_key: A pointer to array that will contain the result of reading.
- [in] size_bits: The number of bits required to read.

```c
esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to efuse block starting at the offset and the required size.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

**Parameters**
- [in] blk: Block number of eFuse.
- [in] src_key: A pointer to array that contains the key for writing.
Chapter 2. API Reference

- [in] size_bits: The number of bits required to write.

```c
uint8_t esp_efuse_get_chip_ver (void)
Returns chip version from efuse.
Return chip version
```

```c
uint32_t esp_efuse_get_pkg_ver (void)
Returns chip package from efuse.
Return chip package
```

```c
void esp_efuse_reset (void)
Reset efuse write registers.
```

```
Esp write registers are written to zero, to negate any changes that have been staged here.
```

```
Note This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialise.
```

```c
void esp_efuse_disable_basic_rom_console (void)
Disable BASIC ROM Console via efuse.
```

```
By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.
```

```
Call this function (from bootloader or app) to permanently disable the console on this chip.
```

```c
esp_err_t esp_efuse_disable_rom_download_mode (void)
Disable ROM Download Mode via eFuse.
```

```
Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
```

```
Note Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.
```

```
Note If ROM Download Mode is already disabled, this function does nothing and returns success.
```

```
Return
```

```
• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
• ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written
```

```c
esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)
Set boot ROM log scheme via eFuse.
```

```
Note By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.
```

```
Return
```

```
• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
• ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already
```

```c
Parameters
```

```
• log_scheme: Supported ROM log scheme
```

```c
uint32_t esp_efuse_read_secure_version (void)
Return secure_version from efuse field.
```

```
Return Secure version from efuse field
```

```c
bool esp_efuse_check_secure_version (uint32_t secure_version)
Check secure_version from app and secure_version and from efuse field.
```

```
Return
```

```
• True: If version of app is equal or more then secure_version from efuse.
```

```
Parameters
```

```
• secure_version: Secure version from app.
```
**esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)**

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Return**
- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

**Parameters**
- [in] secure_version: Secure version from app.

**esp_err_t esp_efuse_batch_write_begin (void)**

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

**Note:** If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

```c
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 -- 1, here we write a new
-- value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
-- because uncommitted changes are not readable, it will be available only...
-- after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be...
-- done in the last commit().
...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

**Return**
- ESP_OK: Successful.

**esp_err_t esp_efuse_batch_write_cancel (void)**

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.
### Chapter 2. API Reference

**Return**

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit (void)`

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

**Return**

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

**bool esp_efuse_block_is_empty (esp_efuse_block_t block)**

Checks that the given block is empty.

**Return**

- True: The block is empty.
- False: The block is not empty or was an error.

**bool esp_efuse_get_key_dis_read (esp_efuse_block_t block)**

Returns a read protection for the key block.

**Return**

True: The key block is read protected
False: The key block is readable.

**Parameters**

- `[in]` block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)**

Sets a read protection for the key block.

**Return**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**

- `[in]` block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**bool esp_efuse_get_key_dis_write (esp_efuse_block_t block)**

Returns a write protection for the key block.

**Return**

True: The key block is write protected
False: The key block is writeable.

**Parameters**

- `[in]` block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**esp_err_t esp_efuse_set_key_dis_write (esp_efuse_block_t block)**

Sets a write protection for the key block.

**Return**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**

- `[in]` block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**bool esp_efuse_key_block_unused (esp_efuse_block_t block)**

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

**Return**
Chapter 2. API Reference

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

**Parameters**
- `block`: key block to check.

```c
bool esp_efuse_find_purpose(esp_efuse_purpose_t purpose, esp_efuse_block_t* block)
```

Find a key block with the particular purpose set.

**Return**
- True: If found,
- False: If not found (value at block pointer is unchanged).

**Parameters**
- `[in]` `purpose`: Purpose to search for.
- `[out]` `block`: Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

```c
bool esp_efuse_get_keypurpose_dis_write(esp_efuse_block_t block)
```

Returns a write protection of the key purpose field for an efuse key block.

**Note**
For ESP32: no key purpose, it returns always True.

**Return**
True: The key purpose is write protected. False: The key purpose is writeable.

**Parameters**
- `[in]` `block`: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

```c
esp_efuse_purpose_t esp_efuse_get_key_purpose(esp_efuse_block_t block)
```

Returns the current purpose set for an efuse key block.

**Return**
- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

**Parameters**
- `[in]` `block`: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

```c
esp_err_t esp_efuse_write_key(esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void* key, size_t key_size_bytes)
```

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- `[in]` `block`: Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- `[in]` `purpose`: Purpose to set for this key. Purpose must be already unset.
- `[in]` `key`: Pointer to data to write.
- `[in]` `key_size_bytes`: Bytes length of data to write.

```c
esp_err_t esp_efuse_write_keys(const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)
```

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
• ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters
• [in] purposes: Array of purposes (purpose[number_of_keys]).
• [in] keys: Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
• [in] number_of_keys: The number of keys to write (up to 6 keys).

Structures
struct esp_efuse_desc_t
Type definition for an eFuse field.

Public Members

esp_efuse_block_t efuse_block: 8
  Block of eFuse

uint8_t bit_start
  Start bit [0..255]

uint16_t bit_count
  Length of bit field [1..-

Macros
ESP_ERR_EFUSE
  Base error code for efuse api.
ESP_OK_EFUSE_CNT
  OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL
  Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG
  Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING
  Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
  Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING
  Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to
  the efuse component and not returned by any public API.

Enumerations
enum esp_efuse_rom_log_scheme_t
Type definition for ROM log scheme.
Values:
  ESP_EFUSE_ROM_LOG_ALWAYS_ON
    Always enable ROM logging
  ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
    ROM logging is enabled when specific GPIO level is low during start up
  ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
    ROM logging is enabled when specific GPIO level is high during start up
Chapter 2. API Reference

**ESP_EFUSE_ROM_LOG_ALWAYS_OFF**
Disable ROM logging permanently

### 2.7.5 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see *Error Handling*.

For the full list of error codes defined in ESP-IDF, see *Error Code Reference*.

**API Reference**

**Header File**

- esp_common/include/esp_err.h

**Functions**

```c
const char* esp_err_to_name (esp_err_t code)
```

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script `tools/gen_esp_err_to_name.py` which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Return** string error message

**Parameters**

- `code`: esp_err_t error code

```c
const char* esp_err_to_name_r (esp_err_t code, char* buf, size_t buflen)
```

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script `tools/gen_esp_err_to_name.py` which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Return** buf containing the string error message

**Parameters**

- `code`: esp_err_t error code
- `buf`: buffer where the error message should be written
- `buflen`: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Macros**

- **ESP_OK**
  esp_err_t value indicating success (no error)

- **ESP_FAIL**
  Generic esp_err_t code indicating failure

- **ESP_ERR_NO_MEM**
  Out of memory

- **ESP_ERR_INVALID_ARG**
  Invalid argument

- **ESP_ERR_INVALID_STATE**
  Invalid state

- **ESP_ERR_INVALID_SIZE**
  Invalid size
ESP_ERR_NOT_FOUND
Requested resource not found

ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_NOT_FINISHED
There are items remained to retrieve

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERROR_CHECK (x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK.
Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECKWITHOUT_ABORT (x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions

typedef int esp_err_t

2.7.6 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example
```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char*)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIGMBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using `partial_http_download` with `max_http_request_size` of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure boot

API Reference

Header File

- esp_https_ota/include/esp_https_ota.h

Functions

```c
esp_err_t esp_https_ota(const esp_http_client_config_t *config)
```

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTPS stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
**API Reference**

- **ESP_ERR_OTA_VALIDATE_FAILED**: Invalid app image
- **ESP_ERR_NO_MEM**: Cannot allocate memory for OTA operation.
- **ESP_ERR_FLASH_OP_TIMEOUT** or **ESP_ERR_FLASH_OP_FAIL**: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**Parameters**
- `[in]` `config`: pointer to `esp_http_client_config_t` structure.

```c
esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)
```

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

**Return**
- **ESP_OK**: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- **ESP_FAIL**: For generic failure.
- **ESP_ERR_INVALID_ARG**: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `app_update` component and esp_http_client component in esp-idf.

**Parameters**
- `[in]` `ota_config`: pointer to `esp_https_ota_config_t` structure
- `[out]` `handle`: pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

```c
esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)
```

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Return**
- **ESP_ERR_HTTPS_OTA_IN_PROGRESS**: OTA update is in progress, call this API again to continue.
- **ESP_OK**: OTA update was successful
- **ESP_FAIL**: OTA update failed
- **ESP_ERR_INVALID_ARG**: Invalid argument
- **ESP_ERR_OTA_VALIDATE_FAILED**: Invalid app image
- **ESP_ERR_NO_MEM**: Cannot allocate memory for OTA operation.
- **ESP_ERR_FLASH_OP_TIMEOUT** or **ESP_ERR_FLASH_OP_FAIL**: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**Parameters**
- `[in]` `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

```c
bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)
```

Checks if complete data was received or not.

**Note** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

**Return**
- **false**
- **true**

**Parameters**
- `[in]` `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

```c
esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.
This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note** If this API returns successfully, esp_restart() must be called to boot from the new firmware image. esp_https_ota_finish should not be called after calling esp_https_ota_abort

**Return**
- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
esp_err_t esp_https_ota_abort(esp_https_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note** esp_https_ota_abort should not be called after calling esp_https_ota_finish

**Return**
- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)
```

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

**Return**
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure
- [out] new_app_info: pointer to an allocated esp_app_desc_t structure

```c
int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)
```

This function returns OTA image data read so far.

**Note** This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

**Return**
- -1 On failure
- total bytes read so far

**Parameters**
- [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

```c
int esp_https_ota_get_image_size(esp_https_ota_handle_t https_ota_handle)
```

This function returns OTA image total size.

**Note** This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

**Return**
- -1 On failure or chunked encoding
- total bytes of image

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

Structures

struct esp_https_ota_config_t
ESP HTTPS OTA configuration.

Public Members

const esp_http_client_config_t *http_config
ESP HTTP client configuration

http_client_init_cb_t http_client_init_cb
Callback after ESP HTTP client is initialised

bool bulk_flash_erase
Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool partial_http_download
Enable Firmware image to be downloaded over multiple HTTP requests

int max_http_request_size
Maximum request size for partial HTTP download

Macros

ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)

2.7.7 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard pthread.h header, which is included in the toolchain libc. An additional ESP-IDF specific header, esppthread.h, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for std::thread, std::mutex, std::condition_variable, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions sleep, vTaskDelay(), or usleep.
Note: If calling a standard libc or C++ sleep function, such as `usleep` defined in `unistd.h`, then the task will only block and yield the CPU if the sleep time is longer than one FreeRTOS tick period. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

### Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

#### Thread APIs

- `pthread_create()`: The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until `pthread_join()` is called on it.
  - `pthread_join()`
  - `pthread_detach()`
  - `pthread_exit()`
  - `sched_yield()`
  - `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
  - `pthread_equal()`

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn’t need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

- **Once**
  - `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

Note: This function can be called from tasks created using either pthread or FreeRTOS APIs

#### Mutexes

POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
Chapter 2. API Reference

- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Condition Variables**

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see `CONFIG_FREERTOS_HZ`). Timeouts may be delayed up to one tick period after the requested timeout.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Thread-Specific Data**

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Note:** There are other options for thread local storage in ESP-IDF, including options with higher performance. See Thread Local Storage.

**Not Implemented**

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns ENOSYS if called.
- `pthread_condattr_init()` returns ENOSYS if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub <https://github.com/espressif/esp-idf/issues> with the details.

**ESP-IDF Extensions**

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently the following configuration can be set:
Chapter 2. API Reference

• Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
• RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
• Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
• FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

Examples

• `system/pthread` demonstrates using the pthreads API to create threads
• `cxx/pthread` demonstrates using C++ Standard Library functions with threads

API Reference

Header File

• `pthread/include/esp_pthread.h`

Functions

`esp_pthread_cfg_t esp_pthread_get_default_config(void)`
Creates a default pthread configuration based on the values set via menuconfig.

Return A default configuration structure.

`esp_err_t esp_pthread_set_cfg(const esp_pthread_cfg_t *cfg)`
Configure parameters for creating pthread.

This API allows you to configure how the subsequent `pthread_create()` call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

Note Passing non-NULL attributes to `pthread_create()` will override the stack_size parameter set using this API.

Return

• ESP_OK if configuration was successfully set
• ESP_ERR_NO_MEM if out of memory
• ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

Parameters

• `cfg`: The pthread config parameters

`esp_err_t esp_pthread_get_cfg(esp_pthread_cfg_t *p)`
Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

Return

• ESP_OK if the configuration was available
• ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

Parameters

• `p`: Pointer to the pthread config structure that will be updated with the currently configured parameters

`esp_err_t esp_pthread_init(void)`
Initialize pthread library.
Structures

\textbf{struct esp_pthread_cfg_t}

\begin{itemize}
  \item \textbf{pthread configuration structure that influences pthread creation}
  \item \textbf{Public Members}
  \begin{itemize}
    \item \textbf{size_t stack_size} \newline The stack size of the pthread.
    \item \textbf{size_t prio} \newline The thread’s priority.
    \item \textbf{bool inherit_cfg} \newline Inherit this configuration further.
    \item \textbf{const char *thread_name} \newline The thread name.
    \item \textbf{int pin_to_core} \newline The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.
  \end{itemize}
\end{itemize}

\textbf{Macros}

\textbf{PTHREAD_STACK_MIN}

### 2.7.8 Event Loop Library

\textbf{Overview}

The event loop library allows components to declare events to which other components can register handlers—code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

\textbf{Using \texttt{esp_event} APIs}

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more \textit{here}. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as \texttt{esp_event_handler_t}.
2. An event loop is created using \texttt{esp_event_loop_create()}, which outputs a handle to the loop of type \texttt{esp_event_loop_handle_t}. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed \textit{here}.
3. Components register event handlers to the loop using \texttt{esp_event_handler_register_with()}. Handlers can be registered with multiple loops, more on that \textit{here}.
4. Event sources post an event to the loop using \texttt{esp_event_post_to()}
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using \texttt{esp_event_handler_unregister_with()}
6. Event loops which are no longer needed can be deleted using \texttt{esp_event_loop_delete()}

In code, the flow above may look like as follows:
```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to specify the properties of the loop to be created. A handle of type esp_event_loop_handle_t is obtained, which is needed by the other APIs to reference the loop to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,  
        .task_name = ...,  
        .task_priority = ...,  
        .task_stack_size = ...,  
        .task_core_id = ...,  
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID specifies a hypothetical event that handler run_on_event should execute on when it gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At some point in time
    // the event loop executes the event handler registered to the posted event, in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}
```

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name
identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```c
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```c
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with `EVENT`. For example, the base for wifi events is declared and defined as `WIFI_EVENT`, the ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```c
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

**Default Event Loop**

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loop equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>esp_event_loop_create()</code></td>
<td><code>esp_event_loop_create_default()</code></td>
</tr>
<tr>
<td><code>esp_event_loop_delete()</code></td>
<td><code>esp_event_loop_delete_default()</code></td>
</tr>
<tr>
<td><code>esp_event_handler_register_with()</code></td>
<td><code>esp_event_handler_register()</code></td>
</tr>
<tr>
<td><code>esp_event_handler_unregister_with()</code></td>
<td><code>esp_event_handler_unregister()</code></td>
</tr>
<tr>
<td><code>esp_event_post_to()</code></td>
<td><code>esp_event_post()</code></td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and
special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, ...
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the esp_event library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt esp_event library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- `esp_event/include/esp_event.h`
Functions

**esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args, esp_event_loop_handle_t *event_loop)**

Create a new event loop.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**Parameters**
- [in] event_loop_args: configuration structure for the event loop to create
- [out] event_loop: handle to the created event loop

**esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)**

Delete an existing event loop.

**Return**
- ESP_OK: Success
- Others: Fail

**Parameters**
- [in] event_loop: event loop to delete, must not be NULL

**esp_err_t esp_event_loop_create_default (void)**

Create default event loop.

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete_default (void)**

Delete the default event loop.

**Return**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_run (esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)**

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Return**
- ESP_OK: Success
- Others: Fail

**Parameters**
- [in] event_loop: event loop to dispatch posted events from, must not be NULL
• [in] ticks_to_run: number of ticks to run the loop

```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id,
                                   esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use ESP_EVENT_ANY_ID as the `event_id`
- all events known by the loop: use ESP_EVENT_ANY_BASE for `event_base` and ESP_EVENT_ANY_ID as the `event_id`

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- [in] `event_base`: the base id of the event to register the handler for
- [in] `event_id`: the id of the event to register the handler for
- [in] `event_handler`: the handler function which gets called when the event is dispatched
- [in] `event_handler_arg`: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop,
                                         esp_event_base_t event_base, int32_t event_id,
                                         esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- [in] `event_loop`: the event loop to register this handler function to, must not be NULL
- [in] `event_base`: the base id of the event to register the handler for
- [in] `event_id`: the id of the event to register the handler for
- [in] `event_handler`: the handler function which gets called when the event is dispatched
- [in] `event_handler_arg`: data, aside from event data, that is passed to the handler when it is called
Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

**Parameters**
- [in] event_loop: the event loop to register this handler function to, must not be NULL
- [in] event_base: the base id of the event to register the handler for
- [in] event_id: the id of the event to register the handler for
- [in] event_handler: the handler function which gets called when the event is dispatched
- [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called
- [out] instance: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

**Parameters**
- [in] event_base: the base id of the event to register the handler for
• **[in]** `event_id`: the id of the event to register the handler for
• **[in]** `event_handler`: the handler function which gets called when the event is dispatched
• **[in]** `event_handler_arg`: data, aside from event data, that is passed to the handler when it is called
• **[out]** `instance`: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

```c
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler so it will no longer be called during dispatch. Handlers can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handlers that were registered with the same wildcard arguments.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister()` instead.

**Note** When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- **[in]** `event_base`: the base of the event with which to unregister the handler
- **[in]** `event_id`: the id of the event with which to unregister the handler
- **[in]** `event_handler`: the handler to unregister

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister_with()` instead.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- **[in]** `event_loop`: the event loop with which to unregister this handler function, must not be NULL
- **[in]** `event_base`: the base of the event with which to unregister the handler
- **[in]** `event_id`: the id of the event with which to unregister the handler
- **[in]** `event_handler`: the handler to unregister

```c
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)
```

Unregister a handler instance from a specific event loop.
Unregisters a handler instance so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_instance_register() when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

**Note** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- `[in] event_loop`: the event loop with which to unregister this handler function, must not be NULL
- `[in] event_base`: the base of the event with which to unregister the handler
- `[in] event_id`: the id of the event with which to unregister the handler
- `[in] instance`: the instance object of the registration to be unregistered

```c
esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- `[in] event_base`: the base of the event with which to unregister the handler
- `[in] event_id`: the id of the event with which to unregister the handler
- `[in] instance`: the instance object of the registration to be unregistered

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**Return**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- `[in] event_base`: the event base that identifies the event
- `[in] event_id`: the event id that identifies the event
- `[in] event_data`: the data, specific to the event occurrence, that gets passed to the handler
- `[in] event_data_size`: the size of the event data
- `[in] ticks_to_wait`: number of ticks to block on a full event queue

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the
copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Return**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- **[in]** `event_loop`: the event loop to post to, must not be NULL
- **[in]** `event_base`: the event base that identifies the event
- **[in]** `event_id`: the event id that identifies the event
- **[in]** `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** `event_data_size`: the size of the event data
- **[in]** `ticks_to_wait`: number of ticks to block on a full event queue

```c
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post for posting events from interrupt handlers.

**Note** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Note** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

**Return**
- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

**Parameters**
- **[in]** `event_base`: the event base that identifies the event
- **[in]** `event_id`: the event id that identifies the event
- **[in]** `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** `event_data_size`: the size of the event data; max is 4 bytes
- **[out]** `task_unblocked`: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.
• [in] event_data_size: the size of the event data
• [out] task_unblocked: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
event loop
 handler
 handler
 ...
 event loop
 handler
 handler
 ...
```

where:

```
event loop
 format: address,name rx:total_recieved dr:total_dropped
 where:
 address - memory address of the event loop
 name - name of the event loop, 'none' if no dedicated task
 total_recieved - number of successfully posted events
 total_dropped - number of events unsuccessfully posted due to queue
```

```
handler
 format: address ev:base, id inv:total_invoked run:total_runtime
 where:
 address - address of the handler function
 base, id - the event specified by event base and id this handler
 total_invoked - number of times this handler has been invoked
 total_runtime - total amount of time used for invoking this handler
```

Note this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Return

• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
• Others: Fail

Parameters

• [in] file: the file stream to output to

**Structures**

```c
struct esp_event_loop_args_t
```

Configuration for creating event loops.

**Public Members**

```c
int32_t queue_size
```

size of the event loop queue

```c
const char *task_name
```

name of the event loop task; if NULL, a dedicated task is not created for event loop

```c
UBaseType_t task_priority
```

priority of the event loop task, ignored if task name is NULL
uint32_t task_stack_size
    stack size of the event loop task, ignored if task name is NULL

BaseType_t task_core_id
    core to which the event loop task is pinned to, ignored if task name is NULL

Header File
- esp_event/include/esp_event_base.h

Macros
ESP_EVENT_DECLARE_BASE (id)
ESP_EVENT_DEFINE_BASE (id)

ESP_EVENT_ANY_BASE
    register handler for any event base

ESP_EVENT_ANY_ID
    register handler for any event id

Type Definitions
typedef const char * esp_event_base_t
    unique pointer to a subsystem that exposes events
typedef void * esp_event_loop_handle_t
    a number that identifies an event with respect to a base
typedef void (* esp_event_handler_t) (void *event_handler_arg, esp_event_base_t event_base,
    int32_t event_id, void *event_data)
    function called when an event is posted to the queue
typedef void * esp_event_handler_instance_t
    context identifying an instance of a registered event handler

Functions
esp_err_t esp_event_send (system_event_t *event)
    Send a event to event task.
    Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task
    
    Note  This API is part of the legacy event system. New code should use event library API in esp_event.h
    
    Return  ESP_OK : succeed
    Return  others : fail
    Parameters
        • event: Event to send
\textbf{esp_err_t} \textbf{esp_event_send_internal} (\textit{esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait})

Send a event to event task.

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

\textbf{Note} This API is used by WiFi Driver only.

\textbf{Return} ESP_OK : succeed
\textbf{Return} others : fail

\textbf{Parameters}

- \texttt{[in] event_base}: the event base that identifies the event
- \texttt{[in] event_id}: the event id that identifies the event
- \texttt{[in] event_data}: the data, specific to the event occurrence, that gets passed to the handler
- \texttt{[in] event_data_size}: the size of the event data
- \texttt{[in] ticks_to_wait}: number of ticks to block on a full event queue

\textbf{esp_err_t} \textbf{esp_event_process_default} (\textit{system_event_t *event})

Default event handler for system events.

This function performs default handling of system events. When using esp_event_loop APIs, it is called automatically before invoking the user-provided callback function.

\textbf{Note} This API is part of the legacy event system. New code should use event library API in esp_event.h

Applications which implement a custom event loop must call this function as part of event processing.

\textbf{Return} ESP_OK if an event was handled successfully

\textbf{Parameters}

- \texttt{event}: pointer to event to be handled

\textbf{void} \textbf{esp_event_set_default_eth_handlers} (void)

Install default event handlers for Ethernet interface.

\textbf{Note} This API is part of the legacy event system. New code should use event library API in esp_event.h

\textbf{void} \textbf{esp_event_set_default_wifi_handlers} (void)

Install default event handlers for Wi-Fi interfaces (station and AP)

\textbf{Note} This API is part of the legacy event system. New code should use event library API in esp_event.h

\textbf{esp_err_t} \textbf{esp_event_loop_init} (\textit{system_event_cb_t cb, void *ctx})

Initialize event loop.

Create the event handler and task

\textbf{Note} This API is part of the legacy event system. New code should use event library API in esp_event.h

\textbf{Return}

- ESP_OK: succeed
- others: fail

\textbf{Parameters}

- \texttt{cb}: application specified event callback, it can be modified by call esp_event_set_cb
- \texttt{ctx}: reserved for user

\textbf{system_event_cb_t} \textbf{esp_event_loop_set_cb} (\textit{system_event_cb_t cb, void *ctx})

Set application specified event callback function.

\textbf{Note} This API is part of the legacy event system. New code should use event library API in esp_event.h

\textbf{Attention} 1. If \texttt{cb} is NULL, means application don’t need to handle If \texttt{cb} is not NULL, it will be call when an event is received, after the default event callback is completed

\textbf{Return} old callback

\textbf{Parameters}

- \texttt{cb}: application callback function
- \texttt{ctx}: argument to be passed to callback
Unions

union system_event_info_t
    
    #include <esp_event_legacy.h> Union of all possible system_event argument structures

Public Members

system_event_sta_connected_t connected
    ESP32 station connected to AP

system_event_sta_disconnected_t disconnected
    ESP32 station disconnected to AP

system_event_sta_scan_done_t scan_done
    ESP32 station scan (APs) done

system_event_sta_authmode_change_t auth_change
    the auth mode of AP ESP32 station connected to changed

system_event_sta_got_ip_t got_ip
    ESP32 station got IP, first time got IP or when IP is changed

system_event_sta_wps_er_pin_t sta_er_pin
    ESP32 station WPS enrollee mode PIN code received

system_event_sta_wps_fail_reason_t sta_er_fail_reason
    ESP32 station WPS enrollee mode failed reason code received

system_event_sta_wps_er_success_t sta_er_success
    ESP32 station WPS enrollee success

system_event_ap_staconnected_t sta_connected
    a station connected to ESP32 soft-AP

system_event_ap_stadisconnected_t sta_disconnected
    a station disconnected to ESP32 soft-AP

system_event_ap_probe_req_rx_t ap_probereqrecv
    ESP32 soft-AP receive probe request packet

system_event_ftm_report_t ftm_report
    Report of FTM procedure

system_event_ap_staipassigned_t ap_staipassigned
    ESP32 soft-AP assign an IP to the station

system_event_got_ip6_t got_ip6
    ESP32 station or ap or ethernet ipv6 addr state change to preferred

Structures

struct system_event_t

typedef esp_err_t (*system_event_handler_t)(esp_event_base_t event_base, int32_t event_id,
void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Event handler function type

typedef esp_err_t (*system_event_cb_t)(void *ctx, system_event_t *event)
Application specified event callback function.

Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Return
• ESP_OK: succeed
• others: fail

Parameters
• ctx: reserved for user
• event: event type defined in this file

Enumerations
enum system_event_id_t
System event types enumeration

Values:

SYSTEM_EVENT_WIFI_READY = 0
ESP32 WiFi ready
SYSTEM_EVENT_SCAN_DONE
ESP32 finish scanning AP

SYSTEM_EVENT_STA_START
ESP32 station start

SYSTEM_EVENT_STA_STOP
ESP32 station stop

SYSTEM_EVENT_STA_CONNECTED
ESP32 station connected to AP

SYSTEM_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

SYSTEM_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

SYSTEM_EVENT_STA_GOT_IP
ESP32 station got IP from connected AP

SYSTEM_EVENT_STA_LOST_IP
ESP32 station lost IP and the IP is reset to 0

SYSTEM_EVENT_STA_BSS_RSSI_LOW
ESP32 station connected BSS rssi goes below threshold

SYSTEM_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wpstimeout in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wpsoverlap in enrollee mode

SYSTEM_EVENT_AP_START
ESP32 soft-AP start

SYSTEM_EVENT_AP_STOP
ESP32 soft-AP stop

SYSTEM_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

SYSTEM_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

SYSTEM_EVENT_AP_STAIPASSIGNED
ESP32 soft-AP assign an IP to a connected station

SYSTEM_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

SYSTEM_EVENT_ACTION_TX_STATUS
Receive status of Action frame transmitted

SYSTEM_EVENT_ROC_DONE
Indicates the completion of Remain-on-Channel operation status

SYSTEM_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout
Chapter 2. API Reference

**SYSTEM_EVENT_FTM_REPORT**
Receive report of FTM procedure

**SYSTEM_EVENT_GOT_IP6**
ESP32 station or ap or ethernet interface v6IP addr is preferred

**SYSTEM_EVENT_ETH_START**
ESP32 ethernet start

**SYSTEM_EVENT_ETH_STOP**
ESP32 ethernet stop

**SYSTEM_EVENT_ETH_CONNECTED**
ESP32 ethernet phy link up

**SYSTEM_EVENT_ETH_DISCONNECTED**
ESP32 ethernet phy link down

**SYSTEM_EVENT_ETH_GOT_IP**
ESP32 ethernet got IP from connected AP

**SYSTEM_EVENT_ETH_LOST_IP**
ESP32 ethernet lost IP and the IP is reset to 0

**SYSTEM_EVENT_MAX**
Number of members in this enum

2.7.9 FreeRTOS

**Overview**
This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

**Note:** ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0,

For more information about FreeRTOS features specific to ESP-IDF, see ESP-IDF FreeRTOS SMP Changes and ESP-IDF FreeRTOS Additions.

**Task API**

**Header File**
- freertos/include/freertos/task.h

**Functions**

```c
BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)
```

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

**Return**
pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**Parameters**
- *pvTaskCode*: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
Chapter 2. API Reference

- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pvCreatedTask**: Used to pass back a handle by which the created task can be referenced.
- **xCoreID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

```
static BaseType_t xTaskCreate (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter...
    ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared...
    // static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have...
    // been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    // PRIORITY, &xHandle );
    configASSERT( xHandle );
    // Use the handle to delete the task.
    if( xHandle != NULL )
```

(continues on next page)
Return  pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Note  If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- usStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task should run.

static TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Return  If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- xCoreID: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer)
Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( vTaskCode, // Function that implements the task.
                                  "NAME",    // Text name for the task.
                                  STACK_SIZE, // Stack size in bytes, not words.
                                   ( void * ) 1, // Parameter passed into the task.
                                  tskIDLE_PRIORITY, // Priority at which the task is created.
                                  xStack, // Array to use as the task's stack.
                                  &xTaskBuffer ); // Variable to hold the task's data...

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}
```

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errorCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

Note If program uses thread local variables (ones specified with __thread keyword) then storage for them
will be allocated on the task’s stack.

**Parameters**

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task will run.
- **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskAllocateMPURegions ( TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
void vTaskDelete ( TaskHandle_t xTaskToDelete)

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

**Parameters**

- **xTaskToDelete**: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

```c
void vTaskDelay (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks.

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency
of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect
the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See
vTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this
by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

Parameters

- xTicksToDelay: The amount of time, in tick periods, that the calling task should block.

void vTaskDelayUntil( TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncre-
ment)

Delay a task until a specified time. INCLUDE_vTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for
the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay
() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task
calling vTaskDelay() may not be fixed [the task may take a different path though the code between calls, or
may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, vTaskDe-
layUntil() specifies the absolute (exact) time at which it wishes to unblock.

The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution
of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here.
    }
}
```

Parameters
Chapter 2. API Reference

- **pxPreviousWakeTime**: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within vTaskDelayUntil().
- **xTimeIncrement**: The cycle time period. The task will be unblocked at time \( pxPreviousWakeTime + xTimeIncrement \). Calling vTaskDelayUntil with the same \( xTimeIncrement \) parameter value will cause the task to execute with a fixed interface period.

**BaseType_t** `xTaskAbortDelay(TaskHandle_t xTask)`

**UBaseType_t** `uxTaskPriorityGet(const TaskHandle_t xTask)`

Obtain the priority of any task.

INCLUDE `uxTaskPriorityGet` must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ... 

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ... 

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Return** The priority of \( xTask \).

**Parameters**

- **xTask**: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**UBaseType_t** `uxTaskPriorityGetFromISR(const TaskHandle_t xTask)`

A version of `uxTaskPriorityGet()` that can be used from an ISR.

**eTaskState** `eTaskGetState(TaskHandle_t xTask)`

Obtain the state of any task.

States are encoded by the `eTaskState` enumerated type.

INCLUDE `eTaskGetState` must be defined as 1 for this function to be available. See the configuration section for more information.

**Return** The state of \( xTask \) at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

**Parameters**

- **xTask**: Handle of the task to be queried.
void vTaskGetInfo ( TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState )

Populates a TaskStatus_t structure with information about a task.

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```c
void vAFunction ( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle ( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT ( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo ( xHandle,
                   &xTaskDetails,
                   pdTRUE, // Include the high water mark in xTaskDetails.
                   eInvalid ); // Include the task state in xTaskDetails.
}
```

Parameters

- xTask: Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- pxTaskStatus: A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- xGetFreeStackSpace: The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE.
- eState: The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void vTaskPrioritySet ( TaskHandle_t xTask, UBaseType_t uxNewPriority )

Set the priority of any task.

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction ( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate ( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle... --);

    // ...
    ```

(continues on next page)
Use the handle to raise the priority of the created task.

```c
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );
```

// ... 

Use a NULL handle to raise our priority to the same value.

```c
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
```

### Parameters
- `xTask`: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- `uxNewPriority`: The priority to which the task will be set.

```c
void vTaskSuspend( TaskHandle_t xTaskToSuspend )
```

Suspend a task.

`INCLUDE_vTaskSuspend` must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend()` twice on the same task still only requires one call to `vTaskResume()` to ready the suspended task.

#### Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

### Parameters
- `xTaskToSuspend`: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

```c
void vTaskResume( TaskHandle_t xTaskToResume )
```

Resumes a suspended task.
INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ()..

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).
    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

Parameters

• xTaskToResume: Handle to the task being readied.

BaseType_t xTaskResumeFromISR ( TaskHandle_t xTaskToResume )

An implementation of vTaskResume() that can be called from within an ISR.

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Return pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

Parameters

• xTaskToResume: Handle to the task being readied.

void vTaskSuspendAll (void)

Suspends the scheduler without disabling interrupts.

Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.
API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}
```

BaseType_t xTaskResumeAll (void)
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.
    }
}
```
// ... 
// The operation is complete. Restart the kernel. We want to force 
// a context switch - but there is no point if resuming the scheduler 
// caused a context switch already.
if( !xTaskResumeAll() )
{
    taskYIELD();
}
}

Return If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t xTaskGetTickCount (void)
Get tick count

Return The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)
Get tick count from ISR

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Return The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)
Get current number of tasks

Return The number of tasks that the real time kernel is currently managing. This includes all ready, blocked
and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included
in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)
Get task name

Return The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can
query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

Note This function takes a relatively long time to complete and should be used sparingly.
Return The handle of the task that has the human readable name pcNameToQuery. NULL is returned if
no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for
pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)
Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be
available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their re-
turn type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.
Return  The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

Parameters
• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)
Returns the start of the stack associated with xTask.

INCLUDE_uTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Return  The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

Parameters
• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)
Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

Return  A pointer to the start of the stack.
Parameters
• xTask: Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

void vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)
Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters
• xTask: Handle of the task to set the hook function for Passing xTask as NULL has the effect of setting the calling tasks hook function.
• pxHookFunction: Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)
Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)
Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void vTaskSetThreadLocalStoragePointer (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters
• xTaskToSet: Task to set thread local storage pointer for
• xIndex:  The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue: Pointer value to set.

void *pvTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Return Pointer value

Parameters

• xTaskToQuery: Task to get thread local storage pointer for
• xIndex: The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

void vTaskSetThreadLocalStoragePointerAndDelCallback(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

• xTaskToSet: Task to set thread local storage pointer for
• xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue: Pointer value to set.
• pvDelCallback: Function to call to dispose of the local storage pointer when the task is deleted.

BaseType_t xTaskCallApplicationTaskHook(TaskHandle_t xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters

• xTask: Handle of the task to call the hook for.
• pvParameter: Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle(void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t uxTaskGetSystemState(TaskStatus_t * const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t * const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

Example usage:
This example demonstrates how a human readable table of run time stats information is generated from raw data provided by uxTaskGetSystemState(). The human readable table is written to pcWriteBuffer.

```c
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        --ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter /
                --ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t%lu\t%lu%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                    --ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t%lu\t<1%%\r\n",
                    pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
                }
                pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
            }
        }

        // The array is no longer needed, free the memory it consumes.
        vPortFree( pxTaskStatusArray );
    }
}(continues on next page)
void vTaskList (char *pcWriteBuffer)

List all the current tasks.

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

Lists all the current tasks, along with their current state and stack usage high water mark.

Note This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

Note This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

Parameters

• pcWriteBuffer: A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void vTaskGetRunTimeStats (char *pcWriteBuffer)

Get the state of running tasks as a string

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for port-CONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.
Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**Note** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

**Note** This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**Parameters**

- pcWriteBuffer: A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
uint32_t ulTaskGetIdleRunTimeCounter(void)
configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer's current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

**Return** The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify(TaskHandle_t xTaskToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)
configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification
arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

eSetBits - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

Parameters

- **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue**: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction**: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - **eIncrement**: The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - **eSetValueWithOverwrite**: The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.
  - **eSetValueWithoutOverwrite**: If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.
  - **eNoAction**: The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

- **pulPreviousNotificationValue**: Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

BaseType_t xTaskGenericNotifyFromISR(TaskHandle_t xTaskToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)

Send task notification from an ISR.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value” , which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotify() that can be used from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.
A task can use `xTaskNotifyWait()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTake()` to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**eSetBits** - The task’s notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

**Parameters**

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- `ulValue`: Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- `eAction`: Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:
  - `eIncrement`: The task’s notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.
  - `eSetValueWithOverwrite`: The task’s notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.
  - `eSetValueWithoutOverwrite`: If the task being notified did not already have a notification pending then the task’s notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.
  - `eNoAction`: The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**Return** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

**Parameters**

- `pulPreviousNotificationValue`: Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.
- `pxHigherPriorityTaskWoken`: `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
BaseType_t xTaskNotifyWait ( uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait )
```

Wait for task notification

**configUSE_TASK_NOTIFICATIONS** must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (`uint32_t`).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWait()` or `ulTaskNotifyTake()`. If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.
A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or uTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**Return** If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

**Parameters**

- **ulBitsToClearOnEntry**: Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

- **ulBitsToClearOnExit**: If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- **pulNotificationValue**: Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.

- **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
void vTaskNotifyGiveFromISR (TaskHandle_t xTaskToNotify, BaseType_t *pxHigherPriorityTaskWoken)
```

Simplified macro for sending task notification from ISR.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotifyGive() that can be called from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTake() API function rather than the xTaskNotifyWait() API function.

**Parameters**
• **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

• **pxHigherPriorityTaskWoken**: vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskNotifyTake (BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Simplified macro for receiving task notification.

**Parameters**

- **xClearCountOnExit**: if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any CPU time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
BaseType_t xTaskNotifyStateClear (TaskHandle_t xTask)
```

If the notification state of the task referenced by the handle xTask is eNotified, then set the task’s notification state to eNotWaitingNotification. The task’s notification value is not altered. Set xTask to NULL to clear the notification state of the calling task.

**Return**  pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

**Return**  The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

**Parameters**

- **xClearCountOnExit**: if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
BaseType_t xTaskNotifyStateClear (TaskHandle_t xTask)
```

If the notification state of the task referenced by the handle xTask is eNotified, then set the task’s notification state to eNotWaitingNotification. The task’s notification value is not altered. Set xTask to NULL to clear the notification state of the calling task.

**Return**  pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.
Chapter 2. API Reference

**Macros**

- `tskKERNEL_VERSION_NUMBER`
- `tskKERNEL_VERSION_MAJOR`
- `tskKERNEL_VERSION_MINOR`
- `tskKERNEL_VERSION_BUILD`
- `tskMPU_REGION_READ_ONLY`
- `tskMPU_REGION_READ_WRITE`
- `tskMPU_REGION_EXECUTE_NEVER`
- `tskMPU_REGION_NORMAL_MEMORY`
- `tskMPU_REGION_DEVICE_MEMORY`
- `tskNO_AFFINITY`
- `tskIDLE_PRIORITY`
  
  Defines the priority used by the idle task. This must not be modified.

- `taskYIELD()`
  
  Macro for forcing a context switch.

- `taskENTER_CRITICAL(x)`
  
  Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

  **Note** This may alter the stack (depending on the portable implementation) so must be used with care!

- `taskENTER_CRITICAL_FROM_ISR()`

- `taskENTER_CRITICAL_ISR(mux)`

- `taskEXIT_CRITICAL(x)`
  
  Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

  **Note** This may alter the stack (depending on the portable implementation) so must be used with care!

- `taskEXIT_CRITICAL_FROM_ISR(x)`

- `taskEXIT_CRITICAL_ISR(mux)`

- `taskDISABLE_INTERRUPTS()`
  
  Macro to disable all maskable interrupts.

- `taskENABLE_INTERRUPTS()`
  
  Macro to enable microcontroller interrupts.

- `taskSCHEDULER_SUSPENDED`

- `taskSCHEDULER_NOT_STARTED`

- `taskSCHEDULER_RUNNING`

- `xTaskNotify(xTaskToNotify, ulValue, eAction)`

- `xTaskNotifyAndQuery(xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)`

- `xTaskNotifyFromISR(xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)`

- `xTaskNotifyAndQueryFromISR(xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)`

- `xTaskNotifyGive(xTaskToNotify)`
  
  Simplified macro for sending task notification.

  **Note** `configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.
When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGive() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGive().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTake() API function rather than the xTaskNotifyWait() API function.

Return xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

Parameters
• xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

Type Definitions
typedef void *TaskHandle_t

typedef BaseType_t(*TaskHookFunction_t)(void *)

Defines the prototype to which the application task hook function must conform.

typedef void (*TlsDeleteCallbackFunction_t)(int, void *)

Prototype of local storage pointer deletion callback.

Enumerations

enum eTaskState
Task states returned by eTaskGetState.

Values:

  eRunning = 0
  eReady
  eBlocked
  eSuspended
  eDeleted
  eInvalid

enum eNotifyAction
Values:

  eNoAction = 0
  eSetBits
  eIncrement
  eSetValueWithOverwrite
  eSetValueWithoutOverwrite

### Chapter 2. API Reference

**enum eSleepModeStatus**

Possible return values for eTaskConfirmSleepModeStatus().

**Values:**

- **eAbortSleep** = 0
- **eStandardSleep**
- **eNoTasksWaitingTimeout**

**Queue API**

**Header File**

- `freertos/include/freertos/queue.h`

**Functions**

BaseType_t `xQueueGenericSendFromISR(QueueHandle_t xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)`

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have *not* woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
    }
    while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that...
    // the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        taskYIELD_YIELD_FROM_ISR();
    }
}
```

**Return** `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

**Parameters**
• xQueue: The handle to the queue on which the item is to be posted.
• pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• [out] pxHigherPriorityTaskWoken: xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
• xCopyPosition: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

BaseType_t xQueueGiveFromISR(QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t xQueueGenericSend(QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly. Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, !queueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, !queueSEND_TO_BACK );
    }

    (continues on next page)
```
Rest of task code

Return  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition**: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

**BaseType_t xQueuePeek** (QueueHandle_t xQueue, void *<const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void * pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
    // ... Rest of task code.
```
Task to peek the data from the queue.

```c
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueuePeek( xQueue, &pxRxedMessage ), ( TickType_t ) 10 )
        {
            // pcRxedMessage now points to the struct AMessage variable posted by vATask, but the item still remains on the queue.
        }
    }
    // ... Rest of task code.
}
```

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

```c
BaseType_t xQueuePeekFromISR( QueueHandle_t xQueue, void *const pvBuffer )
```

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.

```c
BaseType_t xQueueReceive ( QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait )
```

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;
```
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ... Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueReceive( xQueue, & pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pxRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }

    // ... Rest of task code.
}

Return pdFALSE if an item was successfully received from the queue, otherwise pdTRUE.

Parameters

- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to
  receive should the queue be empty at the time of the call. xQueueReceive() will return immediately
  if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )

Return the number of messages stored in a queue.

Parameters

- xQueue: A handle to the queue being queried.

UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to
the queue before the queue becomes full if no items are removed.

**Return**  The number of spaces available in the queue.

**Parameters**
- `xQueue`: A handle to the queue being queried.

```c
void vQueueDelete (QueueHandle_t xQueue)
```
Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters**
- `xQueue`: A handle to the queue to be deleted.

```c
BaseType_t xQueueReceiveFromISR (QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)
```
Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

**Example usage:**

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction (void *pvParameters)
{
    char cValueToPost;
    const TickType_t xTicksToWait = (TickType_t)0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate(10, sizeof(char));
    if (xQueue == 0)
    {
        // Failed to create the queue.
    }

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend(xQueue, (void *)&cValueToPost, xTicksToWait);
    cValueToPost = 'b';
    xQueueSend(xQueue, (void *)&cValueToPost, xTicksToWait);

    // ... keep posting characters ... this task may block when the queue
    // becomes full.
    cValueToPost = 'c';
    xQueueSend(xQueue, (void *)&cValueToPost, xTicksToWait);
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine (void)
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while (xQueueReceiveFromISR(xQueue, (void *)&cRxedChar, &xTaskWokenByReceive))
    {
        // A character was received. Output the character now.
        vOutputCharacter(cRxedChar);

        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
    }
}
```

(continues on next page)
Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters

- **xQueue**: The handle to the queue from which the item is to be received.
- **pvBuffer**: Pointer to the buffer into which the received item will be copied.
- **[out]** pxHigherPriorityTaskWoken: A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

```c
BaseType_t xQueueIsQueueEmptyFromISR(const QueueHandle_t xQueue)
```

```c
BaseType_t xQueueIsQueueFullFromISR(const QueueHandle_t xQueue)
```

```c
UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)
```

```c
void vQueueAddToRegistry(QueueHandle_t xQueue, const char *pcQueueName)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

```c
configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.
```

```c
Parameters

- **xQueue**: The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName**: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

```c
void vQueueUnregisterQueue(QueueHandle_t xQueue)
```

```
lint lInt971 Unqualified char types are allowed for strings and single characters only. The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the registry. If you are not using a kernel aware debugger then this function can be ignored.
```

```c
Parameters

- **xQueue**: The handle of the queue being removed from the registry.

```c
const char *pcQueueGetName(QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

```
Return If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.
```

```c
Parameters

- **xQueue**: The handle of the queue the name of which will be returned.

```c
QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)
```

```
Espressif Systems
Submit Document Feedback
Release v4.4-dev-2313-gc69f0ec
```
Unqualified char types are allowed for strings and single characters only. Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueHandle_t xQueueCreateSet (const UBaseType_t uxEventQueueLength)
```

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on http://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

Parameters

- `uxEventQueueLength`: Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
  - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
  - If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 + 1), or 3.
  - If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to (5 + 3), or 8.

```c
BaseType_t xQueueAddToSet ( QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

Parameters
**Chapter 2. API Reference**

**xQueueOrSemaphore**
- The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- The handle of the queue set to which the queue or semaphore is being added.

**xQueueSet**
- The handle of the queue set to which the queue or semaphore is being added.

**BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)**
Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Return**
- If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

**Parameters**
- **xQueueOrSemaphore**: The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet**: The handle of the queue set in which the queue or semaphore is included.

**QueueSetMemberHandle_t xQueueSelectFromSet (QueueHandle_t xQueue, const TickType_t xTicksToWait)**

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Note 1**: See the documentation on http://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

**Note 2**: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

**Note 3**: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Return**
- xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

**Parameters**
- **xQueueSet**: The queue set on which the task will (potentially) block.
- **xTicksToWait**: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**QueueSetMemberHandle_t xQueueSelectFromSetFromISR (QueueHandle_t xQueue)**
A version of xQueueSelectFromSet() that can be used from an ISR.

**Macros**

**xQueueCreate (uxQueueLength, uxItemSize)**
Creates a new queue instance. This allocates the storage required by the new queue and returns a handle for the queue.

**Example usage:**

```c
struct AMessage
{
  char ucMessageID;
  char ucData[20];
};
```

(continues on next page)
void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

Return If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

Parameters
    • uxQueueLength: The maximum number of items that the queue can contain.
    • uxItemSize: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

\textbf{xQueueCreateStatic}(uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using \textbf{xQueueCreate()} then both blocks of memory are automatically dynamically allocated inside the \textbf{xQueueCreate()} function. (see \texttt{http://www.freertos.org/a00111.html}). If a queue is created using \textbf{xQueueCreateStatic()} then the application writer must provide the memory that will get used by the queue. \textbf{xQueueCreateStatic()} therefore allows a queue to be created without using any dynamic memory allocation.

\texttt{http://www.FreeRTOS.org/Embedded-RTOS-Queues.html}

Example usage:

\begin{verbatim}
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

    // xQueueBuffer will hold the queue structure.
    StaticQueue_t xQueueBuffer;

    // ucQueueStorage will hold the items posted to the queue. Must be at least
    // [{queue length} * {queue item size}] bytes long.
    uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

    void vATask( void *pvParameters )
    {
    
\end{verbatim}
QueueHandle_t xQueue1;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
        ITEM_SIZE // The size of each item in the queue
        & ucQueueStorage[ 0 ], // The buffer that will...
        &xQueueBuffer ); // The buffer that will hold the...

// The queue is guaranteed to be created successfully as no dynamic memory
// allocation is used. Therefore xQueue1 is now a handle to a valid queue.

// ... Rest of task code.
}

**Return** If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL
then NULL is returned.

**Parameters**
- `uxQueueLength`: The maximum number of items that the queue can contain.
- `uxItemSize`: The number of bytes each item in the queue will require. Items are queued by copy,
  not by reference, so this is the number of bytes that will be copied for each posted item. Each item
  on the queue must be the same size.
- `pucQueueStorage`: If `uxItemSize` is not zero then `pucQueueStorageBuffer` must point to a
  uint8_t array that is at least large enough to hold the maximum number of items that can be in
  the queue at any one time - which is ( `uxQueueLength` * `uxItemsSize` ) bytes. If `uxItemSize` is zero
  then `pucQueueStorageBuffer` can be NULL.
- `pxQueueBuffer`: Must point to a variable of type StaticQueue_t, which will be used to hold the
  queue’s data structure.

**xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)
Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be
called from an interrupt service routine. See `xQueueSendFromISR` () for an alternative which may be used in
an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...
}
```
if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueueSendToBack( xQueue, pvItemToQueue, xTicksToWait)
This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
}
// ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSendToBack( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

Return  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

xQueueSend( xQueue, pvItemToQueue, xTicksToWait )

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equiva-
lent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // ...
}

return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

xQueueSend( xQueue, pvItemToQueue, xTicksToWait )

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equiva-
lent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

```
Create a queue capable of containing 10 pointers to AMessage structures. These should be passed by pointer as they contain a lot of data.

```c
xQueue2 = xQueueCreate(10, sizeof(struct AMessage*));
```

```c
if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}
```

```c
if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don’t block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
```

// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

**xQueueOverwrite** (`xQueue`, `pvItemToQueue`)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly recommended *not* to use xQueueOverwrite() on queues that can contain more than one value, and doing so will trigger an assertion // if configASSERT() is defined.
    xQueue = xQueueCreate(1, sizeof( uint32_t ));

    // ... Rest of task code.
}
```
// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
    // Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

// ...

Return  xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return
values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because
xQueueOverwrite() will write to the queue even when the queue is already full.

Parameters
• xQueue: The handle of the queue to which the data is being sent.
• pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
the queue will hold was defined when the queue was created, so this many bytes will be copied from
pvItemToQueue into the queue storage area.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPrioritTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
do
{
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
}

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
    portYIELD_FROM_ISR();
}

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the un-
  blocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR()
  sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendToBackFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    }
    while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR();
    }
}
Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended `not` to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.

    // ... 

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a...
        --context
        // switch so this interrupt returns directly to the unblocked task.
    }
}
```
portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the...

Return xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueOverwriteFromISR() will set *pxHigher-PriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR ();
    }
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
Chapter 2. API Reference

- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out]** pxHigherPriorityTaskWoken: xQueueSendFromISR() will set *pxHigherPriorityTaskWoken* to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xQueueReset** *(xQueue)*

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

### Type Definitions

**typedef struct QueueDefinition *QueueHandle_t**

**typedef struct QueueDefinition *QueueSetHandle_t**

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

**typedef struct QueueDefinition *QueueSetMemberHandle_t**

Queuesets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

### Semaphore API

**Header File**

- freertos/include/freertos/semphr.h

**Macros**

- semBINARY_SEMAPHORE_QUEUE_LENGTH
- semSEMAPHORE_QUEUE_ITEM_LENGTH
- semGIVE_BLOCK_TIME

**xSemaphoreCreateBinary()**

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
  // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
  // This is a macro so pass the variable in directly.
  xSemaphore = xSemaphoreCreateBinary();

  if( xSemaphore != NULL )
  {
    // The semaphore was created successfully.
    // The semaphore can now be used.
  }
}

Return Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

xSemaphoreCreateBinaryStatic(pxStaticSemaphore)
Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! http://www.freertos.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see http://www.freertos.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
  // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
  // xSemaphoreCreateBinaryStatic().
  // The semaphore's data structures will be placed in the xSemaphoreBuffer
  // variable, the address of which is passed into the function. The
  // function's parameter is not NULL, so the function will not attempt any
  // dynamic memory allocation, and therefore the function will not return
  // RETURN NULL.
  xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

  // Rest of task code goes here.
}

Return If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

Parameters
  • pxStaticSemaphore: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.
**xSemaphoreTake** (xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void *pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void *pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t )10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Return pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

Parameters
- **xSemaphore**: A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime**: The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

**xSemaphoreTakeRecursive** (xMutex, xBlockTime)

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task.
until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure. This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

**Return** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**Parameters**
- **xMutex**: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- **xBlockTime**: The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive()
will return immediately no matter what the value of xBlockTime.

**xSemaphoreGive** (xSemaphore)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR() for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

**Return** pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

**Parameters**
- xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

**xSemaphoreGiveRecursive** (xMutex)

semphr. h

*Macro* to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().
A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ... For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Return pdTRUE if the semaphore was given.

Parameters
- xMutex: A handle to the mutex being released, or ‘given’. This is the handle returned by xSemaphoreCreateMutex();
**xSemaphoreGiveFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to 
`xSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.
    // ...
    // Is it time for vATask () to run?
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
```
(continues on next page)
Return  pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

Parameters

- xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- pxHigherPriorityTaskWoken: xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex() must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

Return  pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

Parameters

- xSemaphore: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- [out] pxHigherPriorityTaskWoken: xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xSemaphoreCreateMutex()

Macro that implements a mutex semaphore by using the existing queue mechanism.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see http://www.freertos.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
Semaphore cannot be used before a call to xSemaphoreCreateMutex().
This is a macro so pass the variable in directly.
xSemaphore = xSemaphoreCreateMutex();

if( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}

Return If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic (pxMutexBuffer)
Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see http://www.freertos.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void *pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

Return If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

Parameters
- pxMutexBuffer: Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

xSemaphoreCreateRecursiveMutex()
Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.
Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `vSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**xSemaphoreCreateRecursiveMutexStatic**(pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.
This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void *pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Return** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Parameters**
- `pxStaticSemaphore`: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreCreateCounting** (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back
incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** Handle to the created semaphore. Null if the semaphore could not be created.

**Parameters**

- `uxMaxCount`: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount`: The count value assigned to the semaphore when it is created.

**xSemaphoreCreateCountingStatic** (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;

  // Counting semaphore cannot be used before they have been created. Create
  // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
  // value to which the semaphore can count is 10, and the initial value
  // assigned to the count will be 0. The address of xSemaphoreBuffer is
  // passed in and will be used to hold the semaphore structure, so no dynamic
  // memory allocation will be used.
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

  // No memory allocation was attempted so xSemaphore cannot be NULL, so there
  // is no need to check its value.
}

Return If the counting semaphore was successfully created then a handle to the created counting semaphore
is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

Parameters
• uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this
  value it can no longer be ‘given’.
• uxInitialCount: The count value assigned to the semaphore when it is created.
• pxSemaphoreBuffer: Must point to a variable of type StaticSemaphore_t, which will then be
  used to hold the semaphore’s data structure, removing the need for the memory to be allocated
dynamically.

vSemaphoreDelete ( xSemaphore )
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore
if the mutex is held by a task.

Parameters
• xSemaphore: A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder ( xSemaphore )
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of deter-
mining the identity of the mutex holder as the holder may change between the function exiting and the returned
value being tested.

xSemaphoreGetMutexHolderFromISR ( xSemaphore )
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount ( xSemaphore )
semphr.h
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the
semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0
if the semaphore is not available.

typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File
Chapter 2. API Reference

- freertos/include/freertos/timers.h

**Functions**

```c
TimerHandle_t xTimerCreate(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)
```

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[NUM_TIMERS];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[NUM_TIMERS] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback(TimerHandle_t pxTimer)
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT(pxTimer);

    // Which timer expired?
    lArrayIndex = (int32_t)pvTimerGetTimerID(pxTimer);

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[lArrayIndex] += 1;

    // If the timer has expired 10 times then stop it from running.
    if(lExpireCounters[lArrayIndex] >= xMaxExpiryCountBeforeStopping)
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop(pxTimer, 0);
    }
}

void main(void)
{
    int32_t x;

    // Create then start some timers. Starting the timers before the scheduler
```
// has been started means the timers will start running immediately that
// the scheduler starts.
for( x = 0; x < NUM_TIMERS; x++ )
{
    xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
    -not used by the kernel.
    ( 100 * x ), // The timer period in
    -ticks.
    pdTRUE, // The timers will auto-
    -reload themselves when they expire.
    ( void * ) x, // Assign each timer a-
    -unique id equal to its array index.
    vTimerCallback // Each timer calls the-
    -same callback when it expires.
    );

    if( xTimers[ x ] == NULL )
    {
        // The timer was not created.
    }
    else
    {
        // Start the timer. No block time is specified, and even if one-
        // was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
        {
            // The timer could not be set into the Active state.
        }
    }
}

// ...    // Create tasks here.
// ...

// Starting the scheduler will start the timers running as they have-
// already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );

**Return** If the timer is successfully created then a handle to the newly created timer is returned. If the timer
cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer
structures, or the timer period was set to 0) then NULL is returned.

**Parameters**

- **pcTimerName**: A text name that is assigned to the timer. This is done purely to assist debugging.
  The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks**: The timer period. The time is defined in tick periods so the con-
  stant portTICK_PERIOD_MS can be used to convert a time that has been specified in millisec-
  onds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be
  set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 /
  portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- **uxAutoReload**: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a
  frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the
  timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID**: An identifier that is assigned to the timer being created. Typically this would be used
in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- **pxCallbackFunction**: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “void vCallbackFunction(TimerHandle_t xTimer);”.

```c
TimerHandle_t xTimerCreateStatic(const char *pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer)
```

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```c
// The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

// A variable that will be incremented by the software timer's callback
// function.
UBaseType_t uxVariableToIncrement = 0;

// A software timer callback function that increments a variable passed to it when the software timer was created. After the 5th increment the callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t *) pvTimerGetTimerID( ~xExpiredTimer );

    // Increment the variable to show the timer callback has executed.
    ( *puxVariableToIncrement )++;

    // If this callback has executed the required number of times, stop the timer.
    if( *puxVariableToIncrement == 5 )
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }
}

void main( void )
{
    // Create the software time. xTimerCreateStatic() has an extra parameter
    // than the normal xTimerCreate() API function. The parameter is a pointer
    // to the StaticTimer_t structure that will hold the software timer

    (continues on next page)
// structure. If the parameter is passed as NULL then the structure will be allocated dynamically, just as if xTimerCreate() had been called.
xtimer = xTimerCreateStatic( "T1", // Text name for the task. 
---Helps debugging only. Not used by FreeRTOS.
xTimerPeriod, // The period of the timer
---in ticks.
pdTRUE, // This is an auto-reload
---timer.
( void * ) &uxVariableToIncrement, // A
---variable incremented by the software timer's callback function
prvTimerCallback, // The function to execute
---when the timer expires.
&xTimerBuffer ); // The buffer that will hold the software timer structure.

// The scheduler has not started yet so a block time is not used.
xReturned = xTimerStart( xTimer, 0 );

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timers running as they have already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );}

Return If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

Parameters

- **pcTimerName**: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks**: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- **uxAutoReload**: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID**: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction**: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction( TimerHandle_t xTimer );”.
- **pxTimerBuffer**: Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

void *pvTimerGetTimerID( const TimerHandle_t xTimer )
void *pvTimerGetTimerID( TimerHandle_t xTimer );

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreate() that was used to
create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

Return The ID assigned to the timer being queried.

Parameters

• xTimer: The timer being queried.

See the xTimerCreate() API function example usage scenario.

void vTimerSetTimerID(TimerHandle_t xTimer, void* pvNewID);

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

Parameters

• xTimer: The timer being updated.

• pvNewID: The ID to assign to the timer.

See the xTimerCreate() API function example usage scenario.

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
// This function assumes xTimer has already been created.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is active, do something.
    }
    else
    {
        // xTimer is not active, do something else.
    }
}
```

Return pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

Parameters

• xTimer: The timer being queried.

TaskHandle_t xTimerGetTimerDaemonTaskHandle(void)

xTimerGetTimerDaemonTaskHandle() is only available if INCLUDE_xTimerGetTimerDaemonTaskHandle is set to 1 in FreeRTOSConfig.h.
Simply returns the handle of the timer service/daemon task. It is not valid to call \texttt{xTimerGetTimerDaemonTaskHandle()} before the scheduler has been started.

\begin{verbatim}
BaseType_t \texttt{xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)}
\end{verbatim}

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in \texttt{timers.c} and is prefixed with \texttt{\textquotesingle m\textquotesingle}). Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases \texttt{xTimerPendFunctionCallFromISR()} can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

\begin{verbatim}
// The callback function that will execute in the context of the daemon task.
// Note callback functions must all use this same prototype.
void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
{
    BaseType_t xInterfaceToService;

    // The interface that requires servicing is passed in the second
    // parameter. The first parameter is not used in this case.
    xInterfaceToService = ( BaseType_t ) ulParameter2;

    // ...Perform the processing here...
}

// An ISR that receives data packets from multiple interfaces
void vAnISR( void )
{
    BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;

    // Query the hardware to determine which interface needs processing.
    xInterfaceToService = prvCheckInterfaces();

    // The actual processing is to be deferred to a task. Request the
    // vProcessInterface() callback function is executed, passing in the
    // number of the interface that needs processing. The interface to
    // service is passed in the second parameter. The first parameter is
    // not used in this case.
    xHigherPriorityTaskWoken = pdFALSE;
    xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )-"xInterfaceToService, &xHigherPriorityTaskWoken );

    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and will
    // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
    // the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
\end{verbatim}

Return \texttt{pdPASS} is returned if the message was successfully sent to the timer daemon task, otherwise \texttt{pdFALSE} is returned.

Parameters

- \texttt{xFunctionToPend}: The function to execute from the timer service/daemon task. The function must conform to the \texttt{PendedFunction_t} prototype.
- \texttt{pvParameter1}: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *.
or the void * can be used to point to a structure.

- **ulParameter2**: The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken**: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

```c
BaseType_t xTimerPendFunctionCall (PendedFunction_t xFunctionToPend, void *pvParameter1,
                                uint32_t ulParameter2, TickType_t xTicksToWait)
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

**Parameters**

- **xFunctionToPend**: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1**: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2**: The value of the callback function’s second parameter.
- **xTicksToWait**: Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

```c
const char* pcTimerGetName( TimerHandle_t xTimer)
```

Returns the name that was assigned to a timer when the timer was created.

**Return** The name assigned to the timer specified by the xTimer parameter.

**Parameters**

- **xTimer**: The handle of the timer being queried.

```c
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload)
```

Updates a timer to be either an autoreload timer, in which case the timer automatically resets itself each time it expires, or a one shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**

- **xTimer**: The handle of the timer being updated.
- **uxAutoReload**: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```c
TickType_t xTimerGetPeriod( TimerHandle_t xTimer)
```

Returns the period of a timer.

**Parameters**

- **xTimer**: The handle of the timer being queried.

```c
TickType_t xTimerGetExpiryTime( TimerHandle_t xTimer)
```

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.
Return If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

Parameters
• `xTimer`: The handle of the timer being queried.

Macros

```
tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR
  tmrCOMMAND_EXECUTE_CALLBACK
  tmrCOMMAND_START_DONT_TRACE
  tmrCOMMAND_START
  tmrCOMMAND_RESET
  tmrCOMMAND_STOP
  tmrCOMMAND_CHANGE_PERIOD
  tmrCOMMAND_DELETE
  tmrFIRST_FROM_ISR_COMMAND
  tmrCOMMAND_START_FROM_ISR
  tmrCOMMAND_RESET_FROM_ISR
  tmrCOMMAND_STOP_FROM_ISR
  tmrCOMMAND_CHANGE_PERIOD_FROM_ISR
```

`xTimerStart` *(xTimer, xTicksToWait)*

```
BaseType_t xTimerStart(TimerHandle_t xTimer, TickType_t xTicksToWait);
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStart()` starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerStart()` has equivalent functionality to the `xTimerReset()` API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called `n` ticks after `xTimerStart()` was called, where `n` is the timers defined period.

It is valid to call `xTimerStart()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerStart()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStart()` to be available.

Example usage:

Return `pdFAIL` will be returned if the start command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

Parameters
• `xTimer`: The handle of the timer being started/restarted.
• `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStart()` was called. `xTicksToWait` is ignored if `xTimerStart()` is called before the scheduler is started.
See the xTimerCreate() API function example usage scenario.

**xTimerStop** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

**Return** pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- xTimer: The handle of the timer being stopped.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

**xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
// This function assumes xTimer has already been created. If the timer
// referenced by xTimer is already active when it is called, then the timer
// is deleted. If the timer referenced by xTimer is not active when it is
// called, then the period of the timer is set to 500ms and the timer is
// started.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
    // equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    }
    else
    {
        // xTimer is not active, change its period to 500ms. This will also
        // cause the timer to start. Block for a maximum of 100 ticks if the
        // change period command cannot immediately be sent to the timer
    }
}
```

(continues on next page)
// command queue.
if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS )
{
    // The command was successfully sent.
}
else
{
    // The command could not be sent, even after waiting for 100 ticks to pass. Take appropriate action here.
}

Return pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
• xTimer: The handle of the timer that is having its period changed.
• xNewPeriod: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

xTimerDelete(xTimer, xTicksToWait)
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:
Return pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
• xTimer: The handle of the timer being deleted.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

See the xTimerChangePeriod() API function example usage scenario.

xTimerReset(xTimer, xTicksToWait)
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The
length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xBTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the
timer had already been started and was already in the active state, then xTimerReset() will cause the timer
to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the
dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the
mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerReset() was
called, where ‘n’ is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not
actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is
started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```c
// When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer.

TimerHandle_t xBacklightTimer = NULL;

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press event handler.
void vKeyPressEventHandler( char cKey )
{
    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. Wait 10 ticks for the command to be successfully sent
    // if it cannot be sent immediately.
    vSetBacklightState( BACKLIGHT_ON );
    if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate
        // action here.
    }

    // Perform the rest of the key processing here.
}

void main( void )
{
    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer",  // Just a text-
        &name, not used by the kernel.
        ( 5000 / portTICK_PERIOD_MS), // The timer-
        &period in ticks. pdFALSE, // The timer-
        &is a one-shot timer. 0, // The id is.
        not used by the callback so can take any value.
```
vBacklightTimerCallback  // The callback function that switches the LCD back-light off.
};

if ( xBacklightTimer == NULL )
{
    // The timer was not created.
}
else
{
    // Start the timer. No block time is specified, and even if one was
    // it would be ignored because the scheduler has not yet been
    // started.
    if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
    {
        // The timer could not be set into the Active state.
    }
}

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timer running as it has already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being reset/started/restarted.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

xTimerStartFromISR(xTimer, pxHigherPriorityTaskWoken)
A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

// This scenario assumes xBacklightTimer has already been created. When a // key is pressed, an LCD back-light is switched on. If 5 seconds pass // without a key being pressed, then the LCD back-light is switched off. In // this case, the timer is a one-shot timer, and unlike the example given for // the xTimerReset() function, the key press event handler is an interrupt // service routine.

// The callback function assigned to the one-shot timer. In this case the // parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
// was pressed. Switch off the LCD back-light.
void vKeyPressEventInterruptHandler( void )
{
BaseType_t xHigherPriorityTaskWoken = pdFALSE;

  // The key press interrupt service routine.
  // Ensure the LCD back-light is on, then restart the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
  vSetBacklightState( BACKLIGHT_ON );

  // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time.
  // xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
  if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
  {
    // The start command was not executed successfully. Take appropriate action here.
  }

  // Perform the rest of the key processing here.

  // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.
  if( xHigherPriorityTaskWoken != pdFALSE )
  {
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
  }
}

Return pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being started/restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)
A version of xTimerStop() that can be called from an interrupt service routine.
Example usage:

```c
// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the timer should be simply stopped.

// The interrupt service routine that stops the timer.
void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - simply stop the timer.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The stop command was not executed successfully. Take appropriate
        // action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

Return  pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being stopped.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerChangePeriodFromISR (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)
A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```c
// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the period of xTimer should be changed to 500ms.

// The interrupt service routine that changes the period of xTimer.
void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
```

(continues on next page)
The interrupt has occurred - change the period of xTimer to 500ms. 
// xHigherPriorityTaskWoken was set to pdFALSE where it was defined 
// (within this function). As this is an interrupt service routine, only 
// FreeRTOS API functions that end in "FromISR" can be used.
if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
{
    // The command to change the timers period was not executed
    // successfully. Take appropriate action here.
}

if( xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).
}

Return pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the config-TIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer that is having its period changed.
- xNewPeriod: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerResetFromISR(xTimer, pxHigherPriorityTaskWoken)
A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )

(continues on next page)
The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.

```c
vSetBacklightState( BACKLIGHT_OFF );
```

The key press interrupt service routine.

```c
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time.
    // xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
    if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate action here.
    }

    // Perform the rest of the key processing here.

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
    }
}
```

**Return**  
pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerResetFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**Parameters**
- `xTimer`: The handle of the timer that is to be started, reset, or restarted.
- `pxHigherPriorityTaskWoken`: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerResetFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerResetFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to pdTRUE internally within the `xTimerResetFromISR()` function. If `xTimerResetFromISR()` sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

typedef void (*)(PendedFunction_t)(void *, uint32_t)

Event Group API

Header File

- freertos/include/freertos/event_groups.h

Functions

EventGroupHandle_t xEventGroupCreate (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see http://www.freertos.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Return If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See http://www.freertos.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see http://www.freertos.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.
Chapter 2. API Reference

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( xEventGroupBuffer );
```

Return If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL, then NULL is returned.

Parameters

- pxEventGroupBuffer: pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

```c
EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )
```

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0  ( 1 << 0 )
#define BIT_4  ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
  EventBits_t uxBits;
  const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

  // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
  // the event group. Clear the bits before exiting.
  uxBits = xEventGroupWaitBits( xEventGroup, // The event group being tested.
                             BIT_0 | BIT_4, // The bits within the event group to wait...
                             --for.
                             pdTRUE,       // BIT_0 and BIT_4 should be cleared before...
                             --returning.
                             pdFALSE,      // Don’t wait for both bits, either bit will...
                             --do.
                             xTicksToWait ); // Wait a maximum of 100ms for either bit to...
                             --be set.

  if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
  {
    // xEventGroupWaitBits() returned because both bits were set.
  }
  else if( ( uxBits & BIT_0 ) != 0 )
```
Return The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

Parameters

- **xEventGroup**: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor**: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit**: If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- **xWaitForAllBits**: If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- **xTicksToWait**: The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

**EventBits_t xEventGroupClearBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear)**

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( xEventGroup, BIT_0 | BIT_4 ); // The event group being updated.
    BIT_0 | BIT_4 ); // The bits being cleared.
    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
(continues on next page)```
Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).

```c
else if( ( uxBits & BIT_0 ) != 0 )
{
    // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
}
else if( ( uxBits & BIT_4 ) != 0 )
{
    // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.
}
else
{
    // Neither bit 0 nor bit 4 were set in the first place.
}
```

Return The value of the event group before the specified bits were cleared.

Parameters

- `xEventGroup`: The event group in which the bits are to be cleared.
- `uxBitsToClear`: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set `uxBitsToClear` to 0x08. To clear bit 3 and bit 0 set `uxBitsToClear` to 0x09.

EventBits_t xEventGroupSetBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits( xEventGroup, // The event group being updated.
                                  BIT_0 | BIT_4 ); // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
    }
```

[c]

Return  The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

Parameters
- xEventGroup: The event group in which the bits are to be set.
- uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

EventBits_t xEventGroupSync(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```
// Bits used by the three tasks.
#define TASK_0_BIT   ( 1 << 0 )
#define TASK_1_BIT   ( 1 << 1 )
#define TASK_2_BIT   ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
```

(continues on next page)
Return The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

Parameters

- **xEventGroup**: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToSet**: The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWait parameter are set.
- **uxBitsToWaitFor**: A bitwise value that indicates the bit or bits to test inside the event group.
For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.

- **xTicksToWait**: The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by uxBitsToWaitFor to become set.

### EventBits_t xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

**Return** The event group bits at the time xEventGroupGetBitsFromISR() was called.

**Parameters**
- **xEventGroup**: The event group being queried.

### void vEventGroupDelete (EventGroupHandle_t xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

**Parameters**
- **xEventGroup**: The event group being deleted.

### Macros

**xEventGroupClearBitsFromISR (xEventGroup, uxBitsToClear)**

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

**Example usage:**

```c
#define BIT_0  ( 1 << 0 )
define BIT_4  ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(    
        xEventGroup,       // The event group being updated.
        BIT_0 | BIT_4 );   // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

**Return** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**Parameters**
- **xEventGroup**: The event group in which the bits are to be cleared.
- **uxBitsToClear**: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

### xEventGroupSetBitsFromISR (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be
performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0   ( 1 << 0 )
#define BIT_4   ( 1 << 4 )

// An event group which it is assumed has already been created by a call to xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
  BaseType_t xHigherPriorityTaskWoken, xResult;

  // xHigherPriorityTaskWoken must be initialised to pdFALSE.
  xHigherPriorityTaskWoken = pdFALSE;

  // Set bit 0 and bit 4 in xEventGroup.
  xResult = xEventGroupSetBitsFromISR(
         xEventGroup, // The event group being updated.
         BIT_0 | BIT_4 // The bits being set.
         &xHigherPriorityTaskWoken );

  // Was the message posted successfully?
  if( xResult == pdPASS )
  { // If xHigherPriorityTaskWoken is now set to pdTRUE then a context switch should be requested. The macro used is port specific and will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
  }
}
```

Return If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

Parameters
- xEventGroup: The event group in which the bits are to be set.
- uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- pxHigherPriorityTaskWoken: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Return The event group bits at the time xEventGroupGetBits() was called.

Parameters
- xEventGroup: The event group being queried.

Type Definitions
- typedef void *EventGroupHandle_t
- typedef TickType_t EventBits_t
Stream Buffer API

Header File

- freertos/include/freertos/stream_buffer.h

Functions

size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferRead()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, sizeof( ucArrayToSend ), x100ms );
    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is
    // not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, strlen( pcStringToSend ), 0 );
    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

Return The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

Parameters
• **xStreamBuffer:** The handle of the stream buffer to which a stream is being sent.
• **pvTxData:** A pointer to the buffer that holds the bytes to be copied into the stream buffer.
• **xDataLengthBytes:** The maximum number of bytes to copy from pvTxData into the stream buffer.
• **xTicksToWait:** The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

```c
size_t xStreamBufferSendFromISR(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferRead()) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
//A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                          ( void * ) pcStringToSend,
                                          strlen( pcStringToSend ),
                                          &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
```
Return  The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn’t have enough free space for all the bytes to be written.

Parameters

- xStreamBuffer: The handle of the stream buffer to which a stream is being sent.
- pvTxData: A pointer to the data that is to be copied into the stream buffer.
- xDataLengthBytes: The maximum number of bytes to copy from pvTxData into the stream buffer.
- pxHigherPriorityTaskWoken: It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[20];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS(20);

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
        (void*)ucRxData,
        sizeof( ucRxData ),
        xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains another xReceivedBytes bytes of data, which can
        // be processed here....
    }
}
Return  The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

Parameters

- xStreamBuffer: The handle of the stream buffer from which bytes are to be received.
- pvRxData: A pointer to the buffer into which the received bytes will be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- xTicksToWait: The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

size_t xStreamBufferReceiveFromISR(StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Return  The number of bytes read from the stream buffer, if any.

Parameters

- xStreamBuffer: The handle of the stream buffer from which a stream is being received.
- pvRxData: A pointer to the buffer into which the received bytes are copied.
• **xBufferLengthBytes**: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.

• **pxHigherPriorityTaskWoken**: It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

```c
void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

Parameters

• xStreamBuffer: The handle of the stream buffer to be deleted.
```

```c
 BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

Return If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters

• xStreamBuffer: The handle of the stream buffer being queried.
```

```c
 BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

Return If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters

• xStreamBuffer: The handle of the stream buffer being queried.
```

```c
 BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

Return If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

Parameters

• xStreamBuffer: The handle of the stream buffer being reset.
```

```c
 size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)

size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)

BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)

A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
```
A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Return** If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer being updated.
- xTriggerLevel: The new trigger level for the stream buffer.

```c
BaseType_t xStreamBufferSendCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)
```

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer to which data was written.
- pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

```c
BaseType_t xStreamBufferReceiveCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)
```

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer from which data was read.
- pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Macros**

- **xStreamBufferCreate** (xBufferSizeBytes, xTriggerLevelBytes)
  Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

  configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.
Example use:

```c
void vAFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

    // Create a stream buffer that can hold 100 bytes. The memory used to
    // hold // both the stream buffer structure and the data in the stream buffer
    // is // allocated dynamically.
    xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes,
                                         xTriggerLevel );

    if( xStreamBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // stream buffer.
    }
    else
    {
        // The stream buffer was created successfully and can now be used.
    }
}
```

**Return** If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**Parameters**
- `xBufferSizeBytes`: The total number of bytes the stream buffer will be able to hold at any one time.
- `xTriggerLevelBytes`: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

**xStreamBufferCreateStatic**

```c
xStreamBufferCreateStatic( xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer )
```

Creates a new stream buffer using statically allocated memory. See `xStreamBufferCreate()` for a version that uses dynamically allocated memory.

`configSUPPORT_STATIC_ALLOCATION` must be set to 1 in FreeRTOSConfig.h for `xStreamBufferCreateStatic()` to be available.

Example use:

```c
#define STORAGE_SIZE_BYTES 1000

// Used to dimension the array used to hold the streams. The available space // will actually be one less than this, so 999.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];
```

(continues on next page)
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
        xTriggerLevel,
        ucBufferStorage,
        &xStreamBufferStruct );

// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.
// Other code that uses the stream buffer can go here.
}

Return If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticStreamBuffer are NULL then NULL is returned.

Parameters

• xBufferSizeBytes: The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
• xTriggerLevelBytes: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
• pucStreamBufferStorageArea: Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
• pxStaticStreamBuffer: Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.

Type Definitions
typedef struct StreamBufferDef_t* StreamBufferHandle_t

Message Buffer API

Header File

• freertos/include/freertos/message_buffer.h

Macros

xMessageBufferCreate(xBufferSizeBytes) Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:
void vAFuntion( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}

Return If NULL is returned, then the message buffer cannot be created because there is insufficient heap
memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-
NULL value being returned indicates that the message buffer has been created successfully - the returned
value should be stored as the handle to the created message buffer.

Parameters
• xBufferSizeBytes: The total number of bytes (not messages) the message buffer will be able
to hold at any one time. When a message is written to the message buffer an additional sizeof( size_t )
bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit
architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message
buffer space.

xMessageBufferCreateStatic(xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMes-
 sageBuffer)
Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version
that uses dynamically allocated memory.

Example use:

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
        ucBufferStorage,
        &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.
}
Return If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticmessageBuffer are NULL then NULL is returned.

Parameters

- xBufferSizeBytes: The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).
- pucMessageBufferStorageArea: Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- pxStaticMessageBuffer: Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

**xMessageBufferSend** (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    + sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    + strlen( pcStringToSend ), 0 );
}
```
if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was not enough free space in the buffer.
}

Return The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

Parameters
- xMessageBuffer: The handle of the message buffer to which a message is being sent.
- pvTxData: A pointer to the message that is to be copied into the message buffer.
- xDataLengthBytes: The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- xTicksToWait: The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

xMessageBufferSendFromISR(xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)
Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer, (void *) pcStringToSend,
    // (continues on next page)
strlen( pcStringToSend ),
&xHigherPriorityTaskWoken );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );

Return The number of bytes actually written to the message buffer. If the message buffer didn’t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

Parameters
  • xMessageBuffer: The handle of the message buffer to which a message is being sent.
  • pvTxData: A pointer to the message that is to be copied into the message buffer.
  • xDataLengthBytes: The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
  • pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**xMessageBufferReceive** (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)
Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
        ( void * ) ucRxData,
        sizeof( ucRxData ),
        xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}

Return The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive()
times out before a message became available then zero is returned. If the length of the message is greater
than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

Parameters
- xMessageBuffer: The handle of the message buffer from which a message is being received.
- pvRxData: A pointer to the buffer into which the received message is to be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum length of the message that can be received. If xBufferLengthBytes is too small
to hold the next message then the message will be left in the message buffer and 0 will be returned.
- xTicksToWait: The maximum amount of time the task should remain in the Blocked state to
  wait for a message, should the message buffer be empty. xMessageBufferReceive() will return im-
  mediately if xTicksToWait is zero and the message buffer is empty. The block time is specified
  in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro
  pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in
  ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without
  timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use
  any CPU time when they are in the Blocked state.

xMessageBufferReceiveFromISR (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)
An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages
can be of variable length and are copied out of the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message
buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task
or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the
buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other
FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to
be multiple different writers then the application writer must place each call to a writing API function (such as
xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be
multiple different readers then the application writer must place each call to a reading API function (such as
xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-
FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

(continues on next page)
void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[20];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                      ( void * ) ucRxData,
                                                      sizeof( ucRxData ),
                                                      &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

Return  The length, in bytes, of the message read from the message buffer, if any.

Parameters
- xMessageBuffer: The handle of the message buffer from which a message is being received.
- pvRxData: A pointer to the buffer into which the received message is to be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum length of the message that can be received. If xBufferLengthBytes is too small
  to hold the next message then the message will be left in the message buffer and 0 will be returned.
- pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked
  on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make
  space available, and so cause a task that is waiting for space to leave the Blocked state. If calling
  xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked
  task has a priority higher than the currently executing task (the task that was interrupted), then,
  internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE.
  If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch
  should be performed before the interrupt is exited. That will ensure the interrupt returns directly
  to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE
  before it is passed into the function. See the code example below for an example.

vMessageBufferDelete(xMessageBuffer)
Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-
BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBuffer-
Create()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

Parameters
- xMessageBuffer: The handle of the message buffer to be deleted.

xMessageBufferIsFull(xMessageBuffer)
Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any
size, until space is made available by a message being removed from the message buffer.
Return If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters
• xMessageBuffer: The handle of the message buffer being queried.

xMessageBufferIsEmpty (xMessageBuffer)
Tests to see if a message buffer is empty (does not contain any messages).

Return If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters
• xMessageBuffer: The handle of the message buffer being queried.

xMessageBufferReset (xMessageBuffer)
Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

Return If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

Parameters
• xMessageBuffer: The handle of the message buffer being reset.

xMessageBufferSpacesAvailable (xMessageBuffer)
Returns the number of bytes of free space in the message buffer.

Return The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

Parameters
• xMessageBuffer: The handle of the message buffer being queried.

xMessageBufferNextLengthBytes (xMessageBuffer)
Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

Return The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

Parameters
• xMessageBuffer: The handle of the message buffer being queried.

xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)
For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Return If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Parameters
• xMessageBuffer: The handle of the stream buffer to which data was written.
• pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority...
above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**xMessageBufferReceiveCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**

- xMessageBuffer: The handle of the stream buffer from which data was read.
- pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Type Definitions**

typedef void *MessageBufferHandle_t

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns a MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc.

### 2.7.10 FreeRTOS Additions

**Overview**

ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However various features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring Buffers**: Ring buffers were added to provide a form of buffer that could accept entries of arbitrary lengths.
- **Hooks**: ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric amongst both CPUs.
- **Component Specific Properties**: Currently added only one component specific property ORIG_INCLUDE_PATH.

**Ring Buffers**

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, items are always retrieved from the ring buffer by reference. As a result, all retrieved items must also be returned to the ring buffer by using vRingbufferReturnItem() or vRingbufferReturnItemFromISR(), in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

- **No-Split** buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use no-split buffers when items must occupy contiguous memory. Only this buffer type allows you getting the data item address and writing to the item by yourself.
**Allow-Split** buffers will allow an item to be split when wrapping around if doing so will allow the item to be stored. Allow-split buffers are more memory efficient than no-split buffers but can return an item in two parts when retrieving.

**Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

**Note:** No-split/allow-split buffers will always store items at 32-bit aligned addresses. Therefore when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

**Note:** Each item stored in no-split/allow-split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of no-split/allow-split buffers will also be rounded up when created.

**Usage** The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer
\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to apply for the memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This way adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))
...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when
//copy
```

(continues on next page)
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle, &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
} item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

The following example demonstrates retrieving and returning an item from a no-split ring buffer using \texttt{xRingbufferReceive()} and \texttt{vRingbufferReturnItem()}

... 
//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));
//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from an allow-split ring buffer using \texttt{xRingbufferReceiveSplit()} and \texttt{vRingbufferReturnItem()}

... 
//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
UBaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));
//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`.

```c
    //Receive data from byte buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

    //Check received data
    if (item != NULL) {
        //Print item
        for (int i = 0; i < item_size; i++) {
            printf("%c", item[i]);
        }
        printf("\n");
        //Return Item
        vRingbufferReturnItem(buf_handle, (void *)item);
    } else {
        //Failed to receive item
        printf("Failed to receive item\n");
    }
```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`.

**Note:** Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between no-split/allow-split buffers and byte buffers with regards to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.

![Diagram of sending items to no-split/allow-split ring buffers](image_url)

Fig. 29: Sending items to no-split/allow-split ring buffers
Chapter 2. API Reference

For no-split/allow-split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

![Diagram](image)

**Fig. 30: Sending items to byte buffers**

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

**Using SendAcquire and SendComplete** Items in no-split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However the receiving of data items must occur in FIFO order, therefore not calling SendComplete the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire/SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

![Diagram](image)

**Fig. 31: SendAcquire/SendComplete items in no-split ring buffers**

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Due to the usage if 20 bytes item is not complete, it’s not available, nor the following data items.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-split/byte buffers do not allow using SendAcquire/SendComplete since acquired buffers are required to be complete (not wrapped).
Wrap around  The following diagrams illustrate the differences between no-split, allow-split, and byte buffers when a sent item requires a wrap around. The diagrams assumes a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.

Fig. 32: Wrap around in no-split buffers

No-split buffers will only store an item in continuous free space and will not split an item under any circumstances. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Fig. 33: Wrap around in allow-split buffers

Allow-split buffers will attempt to split the item into two parts when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

Note:  Allow-split buffers treats the both parts of the split item as two separate items, therefore call xRingbufferReceiveSplit() instead of xRingbufferReceive() to receive both parts of a split item in a thread safe manner.

Fig. 34: Wrap around in byte buffers

Byte buffers will store as much data as possible into the free space at the tail of buffer. The remaining data will
then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each part continuous will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrates the differences between no-split/allow-split and byte buffers in retrieving and returning data.

![Fig. 35: Retrieving/Returning items in no-split/allow-split ring buffers](image)

Items in no-split/allow-split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However the items are **not returned in the order they were retrieved** (20, 8, 16). As such, the space is not freed until the first item (16 byte) is returned.

![Fig. 36: Retrieving/Returning data in byte buffers](image)

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.
**Ring Buffers with Queue Sets**  Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item
    ...
} else {
    ...
}
```

**Ring Buffers with Static Allocation**  The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`
- The ring buffer’s storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for no-split/allow-split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.
# include "freertos/ringbuf.h"
# include "freertos/semphr.h"
# include "esp_heap_caps.h"

#define BUFFER_SIZE 400 //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t) * BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);

## Ring Buffer API Reference

**Note:** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

### Header File

- esp_ringbuf/include/freertos/ringbuf.h

### Functions

#### RingbufHandle_t xRingbufferCreate (size_t xBufferSize, RingbufferType_t xBufferType)

Create a ring buffer.

**Note** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

**Return** A handle to the created ring buffer, or NULL in case of error.

**Parameters**
Chapter 2. API Reference

- [in] `xBufferSize`: Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers.
- [in] `xBuffertype`: Type of ring buffer, see documentation.

**RingbufHandle_t **`xRingbufferCreateNoSplit(size_t xItemSize, size_t xItemNum)`

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item size.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

**Return** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

**Parameters**
- [in] `xItemSize`: Size of each item to be put into the ring buffer
- [in] `xItemNum`: Maximum number of items the buffer needs to hold simultaneously

**RingbufHandle_t **`xRingbufferCreateStatic(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)`

Create a ring buffer but manually provide the required memory.

**Note** `xBufferSize` of no-split/allow-split buffers MUST be 32-bit aligned.

**Return** A handle to the created ring buffer

**Parameters**
- [in] `xBufferSize`: Size of the buffer in bytes.
- [in] `xBuffertype`: Type of ring buffer, see documentation
- [in] `pucRingbufferStorage`: Pointer to the ring buffer’s storage area. Storage area must of the same size as specified by `xBufferSize`
- [in] `pxStaticRingbuffer`: Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**BaseType_t** `xRingbufferSend(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)`

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**
- [in] `xRingbuffer`: Ring buffer to insert the item into
- [in] `pvItem`: Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- [in] `xItemSize`: Size of data to insert.
- [in] `xTicksToWait`: Ticks to wait for room in the ring buffer.

**BaseType_t** `xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)`

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**
- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

**Parameters**
- [in] `xRingbuffer`: Ring buffer to insert the item into
- [in] `pvItem`: Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- [in] `xItemSize`: Size of data to insert.
• [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

BaseType_t xRingbufferSendAcquire (RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Return • pdTRUE if succeeded
• pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

Parameters • [in] xRingbuffer: Ring buffer to allocate the memory
• [out] ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
• [in] xItemSize: Size of item to acquire.
• [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

Note Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

Return • pdTRUE if succeeded
• pdFALSE if fail for some reason.

Parameters • [in] xRingbuffer: Ring buffer to insert the item into
• [in] pvItem: Pointer to item in allocated memory to insert.

void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

Note A call to vRingbufferReturnItem() is required after this to free the item retrieved.

Return • Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL on timeout, *pxItemSize is untouched in that case.

Parameters • [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
• [in] xTicksToWait: Ticks to wait for items in the ring buffer.

void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval.

Note A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.
Note Byte buffers do not allow multiple retrievals before returning an item
Note Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

Return
• Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.

BaseType_t xRingbufferReceiveSplit(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.
Note This function should only be called on allow-split buffers

Return
• pdTRUE if an item (split or unsplit) was retrieved
• pdFALSE when no item was retrieved

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
• [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
• [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
• [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)
• [in] xTicksToWait: Ticks to wait for items in the ring buffer.

BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

Note Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.
Note This function should only be called on allow-split buffers

Return
• pdTRUE if an item (split or unsplit) was retrieved
• pdFALSE when no item was retrieved

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
• [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
• [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
• [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)

void *xRingbufferReceiveUpTo(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note A call to vRingbufferReturnItem() is required after this to free up the data retrieved.
Note This function should only be called on byte buffers
Note Byte buffers do not allow multiple retrievals before returning an item
Note Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

Return
• Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL on timeout, *pxItemSize is untouched in that case.
Chapter 2. API Reference

Parameters
• [in] `xRingbuffer`: Ring buffer to retrieve the item from
• [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
• [in] `xTicksToWait`: Ticks to wait for items in the ring buffer.
• [in] `xMaxSize`: Maximum number of bytes to return.

```c
void* xRingbufferReceiveUpToFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)
```

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

Note This function should only be called on byte buffers

Note Byte buffers do not allow multiple retrievals before returning an item

Return
• Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
• NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

Parameters
• [in] `xRingbuffer`: Ring buffer to retrieve the item from
• [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
• [in] `xMaxSize`: Maximum number of bytes to return.

```c
void vRingbufferReturnItem(RingbufHandle_t xRingbuffer, void *pvItem)
```

Return a previously-retrieved item to the ring buffer.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• [in] `xRingbuffer`: Ring buffer the item was retrieved from
• [in] `pvItem`: Item that was received earlier

```c
void vRingbufferReturnItemFromISR(RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)
```

Return a previously-retrieved item to the ring buffer from an ISR.

Note If a split item is retrieved, both parts should be returned by calling this function twice

Parameters
• [in] `xRingbuffer`: Ring buffer the item was retrieved from
• [in] `pvItem`: Item that was received earlier
• [out] `pxHigherPriorityTaskWoken`: Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

```c
void vRingbufferDelete(RingbufHandle_t xRingbuffer)
```

Delete a ring buffer.

Note This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

Parameters
• [in] `xRingbuffer`: Ring buffer to delete

```c
size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer)
```

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note The max item size for a no-split buffer is limited to `((buffer_size/2)-header_size)`. This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Return Maximum size, in bytes, of an item that can be placed in a ring buffer.

Parameters
• [in] `xRingbuffer`: Ring buffer to query

```c
size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)
```

Get current free size available for an item/data in the buffer.
This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

**Warning** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

**Note** An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2) - header_size). See API reference for xRingbufferGetMaxItemSize().

**Return** Current free size, in bytes, available for an entry

**Parameters**
- [in] xRingbuffer: Ring buffer to query

```c
BaseType_t xRingbufferAddToQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
```

Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

**Return**
- pdTRUE on success, pdFALSE otherwise

**Parameters**
- [in] xRingbuffer: Ring buffer to add to the queue set
- [in] xQueueSet: Queue set to add the ring buffer’s read semaphore to

```c
BaseType_t xRingbufferCanRead(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)
```

Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

**Return**
- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

**Parameters**
- [in] xRingbuffer: Ring buffer which should be checked
- [in] xMember: Member returned from xQueueSelectFromSet

```c
BaseType_t xRingbufferRemoveFromQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
```

Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer.

**Return**
- pdTRUE on success
- pdFALSE otherwise

**Parameters**
- [in] xRingbuffer: Ring buffer to remove from the queue set
- [in] xQueueSet: Queue set to remove the ring buffer’s read semaphore from

```c
void vRingbufferGetInfo(RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)
```

Get information about ring buffer status.

Get information of the a ring buffer’s current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**
- [in] xRingbuffer: Ring buffer to remove from the queue set
- [out] uxFree: Pointer use to store free pointer position
- [out] uxRead: Pointer use to store read pointer position
- [out] uxWrite: Pointer use to store write pointer position
Chapter 2. API Reference

- [out] uxAcquire: Pointer use to store acquire pointer position
- [out] uxItemsWaiting: Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```
Debugging function to print the internal pointers in the ring buffer.

**Parameters**
- xRingbuffer: Ring buffer to show

**Structures**

```c
struct xSTATIC_RINGBUFFER
```
Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Type Definitions**

```c
typedef void* RingbufHandle_t
```
Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```
Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Enumerations**

```c
enum RingbufferType_t
```
Values:

- **RINGBUF_TYPE_NOSPLIT** = 0
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_ALLOWSPLIT**
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_BYTEBUF**
  Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

- **RINGBUF_TYPE_MAX**

**Hooks**

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by Vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

**Vanilla FreeRTOS Hooks**

Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions vApplicationIdleHook() and vApplicationTickHook() respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.
Vanilla FreeRTOS hooks are referred to as Legacy Hooks in ESP-IDF FreeRTOS. To enable legacy hooks, `CONFIG_FREERTOS_LEGACY_HOOKS` should be enabled in `project configuration menu`.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32 is dual core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

In a dual core system, `vApplicationTickHook()` must be located in IRAM (for example by adding the `IRAM_ATTR` attribute).

**ESP-IDF Idle and Tick Hooks** Due to the the dual core nature of the ESP32, it may be necessary for some applications to have separate hooks for each core. Furthermore, it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time. Therefore the ESP-IDF provides its own hooks API in addition to the legacy hooks provided by Vanilla FreeRTOS.

The ESP-IDF tick/idle hooks are registered at run time, and each tick/idle hook must be registered to a specific CPU. When the idle task runs/tick Interrupt occurs on a particular CPU, the CPU will run each of its registered idle/tick hooks in turn.

**Hooks API Reference**

**Header File**

- `esp_system/include/esp_freertos_hooks.h`

**Functions**

- `esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)`

  Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

  **Warning** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

  **Return**

  - ESP_OK: Callback registered to the specified core’s idle hook
  - ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
  - ESP_ERR_INVALID_ARG: cpuid is invalid

  **Parameters**

  - [in] `new_idle_cb`: Callback to be called
  - [in] `cpuid`: id of the core

- `esp_err_t esp_register_freertos_idle_hook(esp_freertos_idle_cb_t new_idle_cb)`

  Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

  **Warning** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

  **Return**

  - ESP_OK: Callback registered to the calling core’s idle hook
  - ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

  **Parameters**

  - [in] `new_idle_cb`: Callback to be called

- `esp_err_t esp_register_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)`

  Register a callback to be called from the specified core’s tick hook.

  **Return**

  - ESP_OK: Callback registered to specified core’s tick hook
### Chapter 2. API Reference

- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

**Parameters**
- [in] new_tick_cb: Callback to be called
- [in] cpuid: id of the core

```c
esp_err_t esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)
```
Register a callback to be called from the calling core’s tick hook.

**Return**
- ESP_OK: Callback registered to the calling core’s tick hook
- ESP.ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

**Parameters**
- [in] new_tick_cb: Callback to be called

```c
void esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)
```
Unregister an idle callback from the idle hook of the specified core.

**Parameters**
- [in] old_idle_cb: Callback to be unregistered
- [in] cpuid: id of the core

```c
void esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)
```
Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters**
- [in] old_idle_cb: Callback to be unregistered

```c
void esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)
```
Unregister a tick callback from the tick hook of the specified core.

**Parameters**
- [in] old_tick_cb: Callback to be unregistered
- [in] cpuid: id of the core

```c
void esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)
```
Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters**
- [in] old_tick_cb: Callback to be unregistered

**Type Definitions**

```c
typedef bool (*esp_freertos_idle_cb_t)(void)
typedef void (*esp_freertos_tick_cb_t)(void)
```

**Component Specific Properties**

Besides standart component variables that could be gotten with basic cmake build properties FreeRTOS component also provides an arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

#### 2.7.11 Heap Memory Allocation
Chapter 2. API Reference

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM** (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM** (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be 32-bit aligned.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see Memory Types.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

**Note:** Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).
IRAM    At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

D/IRAM  Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes  At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>Size</th>
<th>Address</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 KiB</td>
<td>3FFAE6E0</td>
<td>DRAM</td>
</tr>
<tr>
<td>180 KiB</td>
<td>3FFB2EC8</td>
<td>DRAM</td>
</tr>
<tr>
<td>14 KiB</td>
<td>3FFE0440</td>
<td>D/IRAM</td>
</tr>
<tr>
<td>111 KiB</td>
<td>3FFE4350</td>
<td>D/IRAM</td>
</tr>
<tr>
<td>90 KiB</td>
<td>4008944C</td>
<td>IRAM</td>
</tr>
</tbody>
</table>

Finding available heap  See Heap Information.

Special Capabilities

DMA-Capable Memory  Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory  If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with `MALLOC_CAP_32BIT` can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory  When external RAM is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on configuration. See Configuring External RAM for more details.

To use the region above the 4MiB limit, you can use the `himem API`.

API Reference - Heap Allocation

Header File

- heap/include/esp_heap_caps.h

Functions

```c
esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)
```
registers a callback function to be invoked if a memory allocation operation fails

Return  ESP_OK if callback was registered.

Parameters

- callback: caller defined callback to be invoked

```c
void *heap_caps_malloc(size_t size, uint32_t caps)
```
Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, malloc(p) is equivalent to heap_caps_malloc(p, MALLOC_CAP_8BIT).
Chapter 2. API Reference

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- **size**: Size, in bytes, of the amount of memory to allocate
- **caps**: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void **heap_caps_free**(void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, `free(p)` is equivalent to `heap_caps_free(p)`.

Parameters
- **ptr**: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void **heap_caps_realloc**(void *ptr, size_t size, uint32_t caps)

Reallocatememorypreviouslyallocatedviaheap_caps_malloc()orheap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.

‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

Return Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

Parameters
- **ptr**: Pointer to previously allocated memory, or NULL for a new allocation.
- **size**: Size of the new buffer requested, or 0 to free the buffer.
- **caps**: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory desired for the new allocation.

void **heap_caps_aligned_alloc**(size_t alignment, size_t size, uint32_t caps)

Allocate a aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- **alignment**: How the pointer received needs to be aligned must be a power of two
- **size**: Size, in bytes, of the amount of memory to allocate
- **caps**: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void **heap_caps_aligned_free**(void *ptr)

Used to deallocatememorypreviouslyallocatedwithheap_caps_aligned_alloc.

Note This function is deprecated, please consider using heap_caps_free() instead

Parameters
- **ptr**: Pointer to the memory allocated

void **heap_caps_alignedcalloc**(size_t alignment, size_t n, size_t size, uint32_t caps)

Allocate a aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- **alignment**: How the pointer received needs to be aligned must be a power of two
- **n**: Number of continuing chunks of memory to allocate
- **size**: Size, in bytes, of a chunk of memory to allocate
- **caps**: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void **heap_caps calloc**(size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.
In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

Return A pointer to the memory allocated on success, NULL on failure

Parameters

• n: Number of continuing chunks of memory to allocate
• size: Size, in bytes, of a chunk of memory to allocate
• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

size_t heap_caps_get_total_size(uint32_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

Return total size in bytes

Parameters

• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_free_size(uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

Return Amount of free bytes in the regions

Parameters

• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_minimum_free_size(uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities.

Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

Return Amount of free bytes in the regions

Parameters

• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_largest_free_block(uint32_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of s for which heap_caps_malloc(s, caps) will succeed.

Return Size of largest free block in bytes.

Parameters

• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_get_info(multi_heap_info_t *info, uint32_t caps)

Get heap info for all regions with the given capabilities.

Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for multi_heap_info_t, except that minimum_free_bytes has the same caveats described in heap_caps_get_minimum_free_size().

Parameters

• info: Pointer to a structure which will be filled with relevant heap metadata.
• caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_print_heap_info(uint32_t caps)

Print a summary of all memory with the given capabilities.
Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**

- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool **heap_caps_check_integrity_all** (bool `print_errors`)

Check integrity of all heap memory in the system.

Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

**Return**  True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**

- `print_errors`: Print specific errors if heap corruption is found.

bool **heap_caps_check_integrity** (uint32_t `caps`, bool `print_errors`)

Check integrity of all heaps with the given capabilities.

Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

**Return**  True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**

- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- `print_errors`: Print specific errors if heap corruption is found.

bool **heap_caps_check_integrity_addr** (intptr_t `addr`, bool `print_errors`)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note**  The entire heap region around the address is checked, not only the adjacent heap blocks.

**Return**  True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

**Parameters**

- `addr`: Address in memory. Check for corruption in region containing this address.
- `print_errors`: Print specific errors if heap corruption is found.

void **heap_caps_malloc_extmem_enable** (size_t `limit`)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**

- `limit`: Limit, in bytes.

void **heap_caps_malloc_prefer** (size_t `size`, size_t `num`, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention**  The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.
Return  A pointer to the memory allocated on success, NULL on failure

Parameters
  • size: Size, in bytes, of the amount of memory to allocate
  • num: Number of variable parameters

void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return  Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

Parameters
  • ptr: Pointer to previously allocated memory, or NULL for a new allocation.
  • size: Size of the new buffer requested, or 0 to free the buffer.
  • num: Number of variable parameters

void *heap_caps calloc_prefer (size_t n, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return  A pointer to the memory allocated on success, NULL on failure

Parameters
  • n: Number of continuing chunks of memory to allocate
  • size: Size, in bytes, of a chunk of memory to allocate
  • num: Number of variable parameters

void heap_caps_dump (uint32_t caps)
Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout(stderr)).
For each (variable sized) block in each matching heap, the following output is printed on a single line:
  • Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic,
or 8 bytes otherwise).
  • Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation
or because of heap debugging level).
  • Address of next block in the heap.
  • If the block is free, the address of the next free block is also printed.

Parameters
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_dump_all (void)
Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t heap_caps_get_allocated_size (void *ptr)
Return the size that a particular pointer was allocated with.

Note  The app will crash with an assertion failure if the pointer is not valid.

Return  Size of the memory allocated at this block.

Parameters
  • ptr: Pointer to currently allocated heap memory. Must be a pointer value previously returned by
heap_caps_malloc,malloc,calloc, etc. and not yet freed.

Macros
MALLOC_CAP_EXEC
  Flags to indicate the capabilities of the various memory systems.
  Memory must be able to run executable code

MALLOC_CAP_32BIT
  Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT
  Memory must allow for 8/16/...-bit data accesses.
Chapter 2. API Reference

**MALLOC_CAP_DMA**
Memory must be able to accessed by DMA.

**MALLOC_CAP_PID2**
Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC_CAP_PID3**
Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC_CAP_PID4**
Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC_CAP_PID5**
Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC_CAP_PID6**
Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC_CAP_PID7**
Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC_CAP_SPIRAM**
Memory must be in SPI RAM.

**MALLOC_CAP_INTERNAL**
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC_CAP_DEFAULT**
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC_CAP_IRAM_8BIT**
Memory must be in IRAM and allow unaligned access.

**MALLOC_CAP_RETENTION**

**MALLOC_CAP_INVALID**
Memory can’t be used / list end marker.

**Type Definitions**

```c
typedef void(*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
```

- callback called when a allocation operation fails, if registered

**Parameters**

- *size*: in bytes of failed allocation
- *caps*: capabilities requested of failed allocation
- *function_name*: function which generated the failure

**Thread Safety**

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However, this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

**Heap Tracing & Debugging**

The following features are documented on the [Heap Memory Debugging](Heap Memory Debugging) page:

- **Heap Information** (free space, etc.)
- **Heap Corruption Detection**
- **Heap Tracing** (memory leak detection, monitoring, etc.)
Chapter 2. API Reference

API Reference - Initialisation

Header File

- heap/include/esp_heap_caps_init.h

Functions

`void heap_caps_init (void)`

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

`void heap_caps_enable_nonos_stack_heaps (void)`

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

`esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)`

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions cannot be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

**Return** ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

**Parameters**

- `start`: Start address of new region.
- `end`: End address of new region.

`esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)`

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

**Parameters**

- `caps`: Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- `start`: Start address of new region.
- `end`: End address of new region.

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised,
so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile
D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap
functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation
functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired ca-
pabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() or
multi_heap_calloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling
multi_heap_free() on that particular multi_heap instance.

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need
to call this API directly.)

Header File

• heap/include/multi_heap.h

Functions

void* multi_heap_aligned_alloc (multi_heap_handle_t heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

Return pointer to the memory allocated, NULL on failure

Parameters

• heap: Handle to a registered heap.
• size: Size in bytes of memory chunk
• alignment: how the memory must be aligned

void* multi_heap_malloc (multi_heap_handle_t heap, size_t size)
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

Return Pointer to new memory, or NULL if allocation fails.

Parameters

• heap: Handle to a registered heap.
• size: Size of desired buffer.

void multi_heap_aligned_free (multi_heap_handle_t heap, void *p)
free() a buffer aligned in a given heap.

Note This function is deprecated, consider using multi_heap_free() instead

Parameters

• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void multi_heap_free (multi_heap_handle_t heap, void *p)
free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in
the specified heap.

Parameters

• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for
the same heap.
void *multi_heap_realloc (multi_heap_handle_t heap, void *p, size_t size)
reallocate a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated
in the specified heap.

Return New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

Parameters
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for
  the same heap.
• size: Desired new size for buffer.

size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)
Return the size that a particular pointer was allocated with.

Return Size of the memory allocated at this block. May be more than the original size argument, due to
padding and minimum block sizes.

Parameters
• heap: Handle to a registered heap.
• p: Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc()
  for the same heap.

multi_heap_handle_t multi_heap_register (void *start, size_t size)
Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately
start using the memory for other purposes.

Return Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

Parameters
• start: Start address of the memory to use for a new heap.
• size: Size (in bytes) of the new heap.

void multi_heap_set_lock (multi_heap_handle_t heap, void *lock)
Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, de-
defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters
• heap: Handle to a registered heap.
• lock: Optional pointer to a locking structure to associate with this heap.

void multi_heap_dump (multi_heap_handle_t heap)
Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters
• heap: Handle to a registered heap.

bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)
Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific
message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining
MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

Return true if heap is valid, false otherwise.

Parameters
• heap: Handle to a registered heap.
• print_errors: If true, errors will be printed to stderr.

size_t multi_heap_free_size (multi_heap_handle_t heap)
  Return free heap size.

  Returns the number of bytes available in the heap.

  Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

  Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To
  know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

  Return Number of free bytes.

Parameters
  • heap: Handle to a registered heap.

size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)
  Return the lifetime minimum free heap size.

  Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

  Returns the lifetime “low water mark” of possible values returned from multi_free_heap_size(), for the
  specified heap.

  Return Number of free bytes.

Parameters
  • heap: Handle to a registered heap.

void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)
  Return metadata about a given heap.

  Fills a multi_heap_info_t structure with information about the specified heap.

Parameters
  • heap: Handle to a registered heap.
  • info: Pointer to a structure to fill with heap metadata.

Structures

struct multi_heap_info_t
  Structure to access heap metadata via multi_heap_get_info.

Public Members

size_t total_free_bytes
  Total free bytes in the heap. Equivalent to multi_free_heap_size().

size_t total_allocated_bytes
  Total bytes allocated to data in the heap.

size_t largest_free_block
  Size of largest free block in the heap. This is the largest malloc-able size.

size_t minimum_free_bytes
  Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

size_t allocated_blocks
  Number of (variable size) blocks allocated in the heap.

size_t free_blocks
  Number of (variable size) free blocks in the heap.

size_t total_blocks
  Total number of (variable size) blocks in the heap.
Chapter 2. API Reference

Type Definitions

typedef struct multi_heap_info *multi_heap_handle_t
  Opaque handle to a registered heap.

2.7.12 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the Heap Memory Allocation page.

Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory.

Assertions

The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL.

If a heap integrity assertion fails, a line will be printed like CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.
**Memory Allocation Failed Hook** Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time a allocation operation fails.

Additionally, the user can enable a generation of a system abort if allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below show how to register a allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char *function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main()
{
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);

    // Use the callback function
}
```

**Finding Heap Corruption** Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. For example `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, heap tracing in HEAP_TRACE_ALL mode lets you see which callees are allocating which addresses from the heap. See Heap Tracing To Find Heap Corruption for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.
In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting CONFIG_HEAP_CORRUPTION_DETECTION can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice). Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single-byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use `calloc()` (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”.) The application should be changed to not access heap memory after it has been freed.

If a call to `malloc()` or `realloc()` causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.
Manual Heap Checks in Comprehensive Mode Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in `system/heap_task_tracking`

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see `CONFIG_HEAP_TRACING_DEST`).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in...
..."internal RAM"
```

(continues on next page)
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}

The output from the heap trace will look something like this:

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller...
    -0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
    -/blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller...
    -0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
    -/blink.c:29

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In HEAP_TRACE_LEAKS mode, for each traced memory allocation which has not already been freed a line is printed with:

- XX bytes is number of bytes allocated
- @ 0x... is the heap address returned from malloc/calloc.
- CPU x is the CPU (0 or 1) running when the allocation was made.
- ccount 0x... is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging -> Enable heap tracing -> Heap tracing stack depth. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each heap_trace_record_t record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.
**Host-Based Mode**  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> `CONFIG_HEAP_TRACING_DEST` and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> `CONFIG_APPTRACE_DESTINATION` and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

**Note:** In order to use this feature you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```bash
target remote :3333
mon reset halt
flushregs
tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdatc
end
```

(continues on next page)
Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:
   ```
   xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>
   ```

5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`.

6. Run processing script:
   ```
   $IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b
   </path/to/program/elf> /tmp/heap_log.svdat
   ```

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '/tmp/heap.svdat'...

Heap Tracing To Find Heap Corruption  Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address. If you have some idea at what time the corruption occurred, enabling heap tracing in 

HEAP_TRACE_ALL mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.
Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

**Performance Impact** Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

**False-Positive Memory Leaks** Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses `stdio` - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

**API Reference - Heap Tracing**

**Header File**

- `heap/include/esp_heap_trace.h`

**Functions**

```c
esp_err_t heap_trace_init_standalone (heap_trace_record_t *record_buffer, size_t num_records)
```

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);

**Return**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

**Parameters**

- `record_buffer`: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- `num_records`: Size of the heap trace buffer, as number of record structures.

```c
esp_err_t heap_trace_init_tohost (void)
```

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Return**
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**esp_err_t heap_trace_start (heap_trace_mode_t mode)**

Start heap tracing. All heap allocations & frees will be traced, until heap_trace_stop() is called.

**Note** heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

**Note** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

**Parameters**
- **mode**: Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

**esp_err_t heap_trace_stop (void)**

Stop heap tracing.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped.

**esp_err_t heap_trace_resume (void)**

Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

**size_t heap_trace_get_count (void)**

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

**esp_err_t heap_trace_get (size_t index, heap_trace_record_t *record)**

Return a raw record from the heap trace buffer.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

**Parameters**
- **index**: Index (zero-based) of the record to return.
- [out] record: Record where the heap trace record will be copied.

**void heap_trace_dump (void)**

Dump heap trace record data to stdout.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.
Chapter 2. API Reference

Structures

struct heap_trace_record_t
Tracerecorddata type. Stores information about an allocated region of memory.

Public Members

uint32_t ccount
CCOUNTof the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void *address
Addresswhich was allocated.

size_t size
Size of the allocation.

void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
Call stack of the caller which allocated the memory.

void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
Call stack of the caller which freed the memory (all zero if not freed.)

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Enumerations

enum heap_trace_mode_t
Values:

    HEAP_TRACE_ALL
    HEAP_TRACELeaks

2.7.13 High Resolution Timer

Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events and dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the CONFIG_ESP_TIMER_INTERRUPT_LEVEL option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

esp_timer set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, esp_timer uses a 64-bit hardware timer, where the implementation depends on CONFIG_ESP_TIMER_IMPL. Available options are:

- LAC timer
- (legacy) FRC2 timer
Note: The FRC2 is a legacy option for ESP32 until v4.2, a 32-bit hardware timer was used. Starting at v4.2, use the new LAC timer option instead, it has a simpler implementation, and has smaller run time overhead because software handling of timer overflow is not needed.

Timer callbacks can dispatched by two methods:

- **ESP_TIMER_TASK**
- **ESP_TIMER_ISR**. Available only if `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD` is enabled (by default disabled).

**ESP_TIMER_TASK**. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

**ESP_TIMER_ISR**. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

### Using esp_timer APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

### Callback functions

Timer callbacks which are processed by `ESP_TIMER_ISR` method should not call the context switch call `- portYIELD_FROM_ISR()`, instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

### esp_timer during the light sleep

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were
not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by `esp_timers`. Timers with `skip_unhandled_events` option will not wake up the system.

**Handling callbacks**

`esp_timer` is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

**Obtaining Current Time**

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

**Application Example**

The following example illustrates usage of `esp_timer` APIs: `system/esp_timer`.

**API Reference**

**Header File**

- `esp_timer/include/esp_timer.h`

**Functions**

`esp_err_t esp_timer_init (void)`

Initialize `esp_timer` library.

**Note** This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

`esp_err_t esp_timer_deinit (void)`

De-initialize `esp_timer` library.

**Note** Normally this function should not be called from applications
Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not yet initialized

```c
esp_err_t esp_timer_create(const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)
```
Create an esp_timer instance.

Note When done using the timer, delete it with esp_timer_delete function.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if some of the create_args are not valid
• ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
• ESP_ERR_NO_MEM if memory allocation fails

Parameters
• create_args: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
• [out] out_handle: Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

```c
esp_err_t esp_timer_start_once(esp_timer_handle_t timer, uint64_t timeout_us)
```
Start one-shot timer.

Timer should not be running when this function is called.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the handle is invalid
• ESP_ERR_INVALID_STATE if the timer is already running

Parameters
• timer: timer handle created using esp_timer_create
• timeout_us: timer timeout, in microseconds relative to the current moment

```c
esp_err_t esp_timer_start_periodic(esp_timer_handle_t timer, uint64_t period)
```
Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every `period’ microseconds.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the handle is invalid
• ESP_ERR_INVALID_STATE if the timer is already running

Parameters
• timer: timer handle created using esp_timer_create
• period: timer period, in microseconds

```c
esp_err_t esp_timer_stop(esp_timer_handle_t timer)
```
Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if the timer is not running

Parameters
• timer: timer handle created using esp_timer_create

```c
esp_err_t esp_timer_delete(esp_timer_handle_t timer)
```
Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if the timer is running

Parameters
• timer: timer handle allocated using esp_timer_create

int64_t esp_timer_get_time (void)
Get time in microseconds since boot.
Return number of microseconds since underlying timer has been started

int64_t esp_timer_get_next_alarm (void)
Get the timestamp when the next timeout is expected to occur.
Return Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

int64_t esp_timer_get_next_alarm_for_wake_up (void)
Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.
Return Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

esp_err_t esp_timer_dump (FILE *stream)
Dump the list of timers to a stream.
If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.
The format is:
name period alarm times_armed times_triggered total_callback_run_time
where:
name — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period — period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started
The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:
times_armed — number of times the timer was armed via esp_timer_start_X times_triggered - number of times the callback was called total_callback_run_time - total time taken by callback to execute, across all calls
Return
• ESP_OK on success
• ESP_ERR_NO_MEM if cannot allocate temporary buffer for the output
Parameters
• stream: stream (such as stdout) to dump the information to

bool esp_timer_is_active (esp_timer_handle_t timer)
Returns status of a timer, active or not.
This function is used to identify if the timer is still active or not.
Return
• 1 if timer is still active
• 0 if timer is not active.
Parameters
• timer: timer handle created using esp_timer_create

Structures
struct esp_timer_create_args_t
Timer configuration passed to esp_timer_create.
Public Members

*esp_timer_cb_t* callback
Function to call when timer expires.

void **arg
Argument to pass to the callback.

*esp_timer_dispatch_t* dispatch_method
Call the callback from task or from ISR.

*const char*** name
Timer name, used in esp_timer_dump function.

bool skip_unhandled_events
Skip unhandled events for periodic timers.

Type Definitions

typedef struct esp_timer *esp_timer_handle_t
Opaque type representing a single esp_timer.

typedef void (*esp_timer_cb_t)(void **arg)
Timer callback function type.

Parameters

• **arg**: pointer to opaque user-specific data

Enumerations

enum esp_timer_dispatch_t
Method for dispatching timer callback.

Values:

ESP_TIMER_TASK
Callback is called from timer task.

ESP_TIMER_MAX
Count of the methods for dispatching timer callback.

2.7.14 The himem allocation API

Overview

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.

In order to use the himem API, you have to enable it in the menuconfig using **CONFIG_SPIRAM_BANKSWITCH_ENABLE**, as well as set the amount of banks reserved for this in **CONFIG_SPIRAM_BANKSWITCH_RESERVE**. This decreases the amount of external memory allocated by functions like malloc(), but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.
Example

An example doing a simple memory test of the high memory range is available in esp-idf: `system/himem`

API Reference

Header File

- esp_hw_support/include/soc/esp32/himem.h

Functions

`esp_err_t esp_himem_alloc(size_t size, esp_himem_handle_t *handle_out)`

Allocate a block in high memory.

Return - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- `size`: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_alloc_map_range(size_t size, esp_himem_rangehandle_t *handle_out)`

Allocate a memory region to map blocks into.

This allocates a contiguous CPU memory region that can be used to map blocks of physical memory into.

Return - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory or address space
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- `size`: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_map(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)`

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

Note: The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

Return - ESP_OK if the memory could be mapped
- ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
- ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
- ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

Parameters
- `handle`: Handle to the block of memory, as given by esp_himem_alloc
- `range`: Range handle to map the memory in
- `ram_offset`: Offset into the block of physical memory of the block to map
- `range_offset`: Offset into the address range where the block will be mapped
- `len`: Length of region to map
- `flags`: One of ESP_HIMEM_MAPFLAG_`
- `[out] out_ptr`: Pointer to variable to store resulting memory pointer in

`esp_err_t esp_himem_free(esp_himem_handle_t handle)`

Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.
Return - ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

Parameters
- handle: Handle to the block of memory, as given by esp_himem_alloc

esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)
Free a mapping range.
This clears out the associated handle making the range available for re-allocation again. This will only succeed
if none of the range blocks currently are used for a mapping.

Return - ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

Parameters
- handle: Handle to the range block, as given by esp_himem_alloc_map_range

esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)
Unmap a region.

Return - ESP_OK if the memory is successfully unmapped,
- ESP_ERR_INVALID_ARG if ptr or len are invalid.

Parameters
- range: Range handle
- ptr: Pointer returned by esp_himem_map
- len: Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

size_t esp_himem_get_phys_size (void)
Get total amount of memory under control of himem API.

Return Amount of memory, in bytes

size_t esp_himem_get_free_size (void)
Get free amount of memory under control of himem API.

Return Amount of free memory, in bytes

size_t esp_himem_reserved_area_size (void)
Get amount of SPI memory address space needed for bankswitching.

Note This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is
used, no memory is reserved.

Return Amount of reserved area, in bytes

Macros

ESP_HIMEM_BLKSZ
ESP_HIMEM_MAPFLAG_RO
Indicates that a mapping will only be read from. Note that this is unused for now.

Type Definitions

typedef struct esp_himem_ramdata_t *esp_himem_handle_t

typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t

2.7.15 Inter-Processor Call

Overview

Due to the dual core nature of the ESP32, there are instances where a certain function must be run in the context
of a particular core (e.g. allocating ISR to an interrupt source of a particular core). The IPC (Inter-Processor Call)
feature allows for the execution of functions on a particular CPU.

A given function can be executed on a particular core by calling esp_ipc_call() or esp_ipc_call_blocking(). IPC is implemented via two high priority FreeRTOS tasks pinned to
each CPU known as the IPC Tasks. The two IPC Tasks remain inactive (blocked) until `esp_ipc_call()` or `esp_ipc_call_blocking()` is called. When an IPC Task of a particular core is unblocked, it will preempt the current running task on that core and execute a given function.

**Usage**

`esp_ipc_call()` unblocks the IPC task on a particular core to execute a given function. The task that calls `esp_ipc_call()` will be blocked until the IPC Task begins execution of the given function. `esp_ipc_call_blocking()` is similar but will block the calling task until the IPC Task has completed execution of the given function.

Functions executed by IPCs must be functions of type `void func(void *arg)`. To run more complex functions which require a larger stack, the IPC tasks’ stack size can be configured by modifying `CONFIG_ESP_IPC_TASK_STACK_SIZE` in `menuconfig`. The IPC API is protected by a mutex hence simultaneous IPC calls are not possible.

Care should taken to avoid deadlock when writing functions to be executed by IPC, especially when attempting to take a mutex within the function.

**API Reference**

**Header File**

- `esp_ipc/include/esp_ipc.h`

**Functions**

`esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the cpu_id parameter. The calling task will be blocked until the IPC task begins executing the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the “Inter-Processor Call (IPC) task stack size” setting in `menuconfig`. Increase this setting if the given function requires more stack than default.

**Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

**Return**

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

**Parameters**

- `[in]` cpu_id: CPU where the given function should be executed (0 or 1)
- `[in]` func: Pointer to a function of type void func(void* arg) to be executed
- `[in]` arg: Arbitrary argument of type void* to be passed into the function

`esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU and blocks until it completes.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the cpu_id parameter. The calling task will be blocked until the IPC task completes execution of the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the “Inter-Processor Call (IPC) task stack size” setting in `menuconfig`. Increase this setting if the given function requires more stack than default.

**Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

**Return**

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise
Parameters

- [in] cpu_id: CPU where the given function should be executed (0 or 1)
- [in] func: Pointer to a function of type void func(void* arg) to be executed
- [in] arg: Arbitrary argument of type void* to be passed into the function

2.7.16 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter.

Usage

`esp_execute_shared_stack_function()` takes four arguments, a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack, a pointer to the top of stack used to that function, the size in bytes of stack and, a pointer to a user function where the shared stack space will reside, after calling the function, the user defined function will be deferred as a callback where functions can be called using the user allocated space without taking space from current task stack.

The usage may looks like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we wanting to call printf using a separated stack space
//allowing app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                       shared_stack,
                                       8192,
                                       external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File

- esp_system/include/esp_expression_with_stack.h
Functions

void \texttt{esp\_execute\_shared\_stack\_function} (SemaphoreHandle\_t lock, void *stack, size\_t stack\_size, shared\_stack\_function function)

Calls user defined shared stack space function.

\textbf{Note} if either lock, stack or stack size is invalid, the expression will be called using the current stack.

\textbf{Parameters}

- \texttt{lock}: Mutex object to protect in case of shared stack
- \texttt{stack}: Pointer to user allocated stack
- \texttt{stack\_size}: Size of current stack in bytes
- \texttt{function}: Pointer to the shared stack function to be executed

\textbf{Macros}

\texttt{ESP\_EXECUTE\_EXPRESSION\_WITH\_STACK} (lock, stack, stack\_size, expression)

\textbf{Type Definitions}

typedef void (*shared\_stack\_function)(void)

2.7.17 Interrupt allocation

\textbf{Overview}

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The \texttt{esp\_intr\_alloc()} abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling \texttt{esp\_intr\_alloc()} (or \texttt{esp\_intr\_alloc\_intrstatus()}). It can use the flags passed to this function to set the type of interrupt allocated, specifying a specific level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code has two different types of interrupts it handles differently: Shared interrupts and non-shared interrupts. The simplest of the two are non-shared interrupts: a separate interrupt is allocated per \texttt{esp\_intr\_alloc} call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering it, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to see if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts (because of the chance of missed interrupts when edge interrupts are used.) (The logic behind this: DevA and DevB share an int. DevB signals an int. Int line goes high. ISR handler calls code for DevA -> does nothing. ISR handler calls code for DevB, but while doing that, DevA signals an int. ISR DevB is done, clears int for DevB, exits interrupt code. Now an interrupt for DevA is still pending, but because the int line never went low (DevA kept it high even when the int for DevB was cleared) the interrupt is never serviced.)

\textbf{Multicore issues}

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.
Internal peripheral interrupts  Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in esp_intr_alloc.h as ETS_INTERNAL_*_INTR_SOURCE.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have e.g. an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using esp_intr_alloc as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

External Peripheral Interrupts  The remaining interrupt sources are from external peripherals. These are defined in soc/soc.h as ETS_*_INTR_SOURCE.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing ESP_INTR_FLAG_SHARED as a flag to esp_intr_alloc().

Care should be taken when calling esp_intr_alloc() from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use xTaskCreatePinnedToCore() with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

IRAM-Safe Interrupt Handlers

The ESP_INTR_FLAG_IRAM flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses. Refer to the SPI flash API documentation for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the ESP_INTR_FLAG_SHARED flag. They’ll be all allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist 2 ways to stop a interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles the enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits should always be masked before the handler responsible for it is disabled, or the status should be handled in other enabled interrupt properly. You may leave some status bits unhandled if you just disable one of all the handlers without masking the status bits, which causes the interrupt to trigger infinitely resulting in a system crash.
API Reference

Header File

- esp_hw_support/include/esp_intr_alloc.h

Functions

**esp_err_t esp_intr_mark_shared** (int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- **intno**: The number of the interrupt (0-31)
- **cpu**: CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram**: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

**esp_err_t esp_intr_reserve** (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**

- **intno**: The number of the interrupt (0-31)
- **cpu**: CPU on which the interrupt should be marked as shared (0 or 1)

**esp_err_t esp_intr_alloc** (int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND if no free interrupt found with the specified flags ESP_OK otherwise

**Parameters**

- **source**: The interrupt source. One of the ETS_* Interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_* Intr SOURC sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt.

**esp_err_t esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatustaskmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.
This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND if no free interrupt found with the specified flags ESP_OK otherwise

Parameters

- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg**: The address of an interrupt status register
- **intrstatusmask**: A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_free(intr_handle_t handle)
```

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

Note When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. see esp_intr_disable for more details. Please do not call this function in esp_ipc_call_blocking.

Return ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

Parameters

- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_cpu(intr_handle_t handle)
```

Get CPU number an interrupt is tied to.

Return The core number where the interrupt is allocated

Parameters

- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_intno(intr_handle_t handle)
```

Get the allocated interrupt for a certain handle.

Return The interrupt number

Parameters

- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
esp_err_t esp_intr_disable(intr_handle_t handle)
```

Disable the interrupt associated with the handle.

Note

1. For local interrupts (ETS_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts
properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters

- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_enable (intr_handle_t handle)
Enable the interrupt associated with the handle.

Note For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters

- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

esp_err_t esp_intr_set_in_iram (intr_handle_t handle, bool is_in_iram)
Set the “in IRAM” status of the handler.

Note Does not work on shared interrupts.

Return ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

Parameters

- handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- is_in_iram: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

void esp_intr_noniram_disable (void)
Disable interrupts that aren’t specifically marked as running from IRAM.

void esp_intr_noniram_enable (void)
Re-enable interrupts disabled by esp_intr_noniram_disable.

void esp_intr_enable_source (int inum)
Enable the interrupt source based on its number.

Parameters

- inum: interrupt number from 0 to 31

void esp_intr_disable_source (int inum)
Disable the interrupt source based on its number.

Parameters

- inum: interrupt number from 0 to 31

static int esp_intr_flags_to_level (int flags)
Get the lowest interrupt level from the flags.

Parameters

- flags: The same flags that pass to esp_intr_alloc_intrstatus API

Macros

ESP_INTR_FLAG_LEVEL1
Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4
Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5
Accept a Level 5 interrupt vector.
Chapter 2. API Reference

ESP_INTR_FLAG_LEVEL6
Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI
Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
Low and medium priority interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE
Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE
Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)
Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)
Disable interrupt by interrupt number

Type Definitions

typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function

typedef struct intr_handle_data_t *intr_handle_data_t
Interrupt handler associated data structure

typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler

2.7.18 Logging library

Overview

The logging library provides two ways for setting log verbosity:

• **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`.
  Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more otional logs into the firmware.

• **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note**: The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char *TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%. Requested: %d baud, actual: %d baud", error_\* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. `ESP_DRAM_LOGE`. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**Note**: Inside critical sections interrupts are disabled so it’s only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.
Chapter 2. API Reference

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:
```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_ 
    _VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:
```
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling `esp_log_level("*", level)`.

**Logging to Host via JTAG** By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

**Application Example**

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- `system/ota`
- `storage/sd_card`
- `protocols/https_request`

**API Reference**

**Header File**

- `log/include/esp_log.h`

**Functions**

`void esp_log_level_set(const char *tag, esp_log_level_t level)`

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function cannot raise log level above the level set using `CONFIG_LOG_MAXIMUM_LEVEL` setting in menuconfig.

To raise log level above the default one for a given file, define `LOG_LOCAL_LEVEL` to one of the `ESP_LOG_*` values, before including `esp_log.h` in this file.

**Parameters**

- `tag`: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- `level`: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.
esp_log_level_t esp_log_level_get(const char *tag)
Get log level for given tag, can be used to avoid expensive log statements.

Return  The current log level for the given tag
Parameters
  • tag: Tag of the log to query current level. Must be a non-NULL zero terminated string.

vprintf_like_t esp_log_set_vprintf(vprintf_like_t func)
Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

Return  func old Function used for output.
Parameters
  • func: new Function used for output. Must have same signature as vprintf.

uint32_t esp_log_timestamp(void)
Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

Return  timestamp, in milliseconds

cchar* esp_log_system_timestamp(void)
Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macrostoprintthesystemtimeas “HH:MM:SS.sss” . The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will still print the RTOS tick time.

Return  timestamp, in “HH:MM:SS.sss”

uint32_t esp_log_early_timestamp(void)
Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

Return  timestamp, in milliseconds

void esp_log_write(esp_log_level_t level, const char *tag, const char *format, ...)
Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void esp_log_writev(esp_log_level_t level, const char *tag, const char *format, va_list args)
Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See  esp_log_write()

Macros
ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)
Log a buffer of hex bytes at specified level, separated into 16 bytes each line.
Parameters
- `tag`: description tag.
- `buffer`: Pointer to the buffer array.
- `buff_len`: length of buffer in bytes.
- `level`: level of the log.

**ESP_LOG_BUFFER_CHAR_LEVEL** (tag, buffer, buff_len, level)
Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

Parameters
- `tag`: description tag.
- `buffer`: Pointer to the buffer array.
- `buff_len`: length of buffer in bytes.
- `level`: level of the log.

**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)
Log a buffer of hex bytes at Info level.

See **esp_log_buffer_hex_level**

Parameters
- `tag`: description tag.
- `buffer`: Pointer to the buffer array.
- `buff_len`: length of buffer in bytes.

**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)
Log a buffer of characters at Info level. Buffer should contain only printable characters.

See **esp_log_buffer_char_level**

Parameters
- `tag`: description tag.
- `buffer`: Pointer to the buffer array.
- `buff_len`: length of buffer in bytes.

**portGET_ARGUMENT_COUNT_INNER** (zero, one, count, ...)
Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See **printf,ESP_LOGE,ESP_DRAM_LOGE**, **ESP_EARLY_LOGE** (tag, format, ...)
In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(...)`. This allows users to...
compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW** (tag, format, ...)  
Macro to output logs in startup code at ESP_LOG_WARN level.  
See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP_EARLY_LOGI** (tag, format, ...)  
Macro to output logs in startup code at ESP_LOG_INFO level.  
See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP_EARLY_LOGD** (tag, format, ...)  
Macro to output logs in startup code at ESP_LOG_DEBUG level.  
See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP_EARLY_LOGV** (tag, format, ...)  
Macro to output logs in startup code at ESP_LOG_VERBOSE level.  
See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP_LOG_EARLY_ENABLED** (log_level)  
Runtime macro to output logs at a specified level.

See `printf`  
**Parameters**

- `tag`: tag of the log, which can be used to change the log level by esp_log_level_set at runtime.  
- `level`: level of the output log.  
- `format`: format of the output log. see `printf`  
- `...`: variables to be replaced into the log. see `printf`

**ESP_LOG_LEVEL_LOCAL** (level, tag, format, ...)  
Runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.  
See `printf,ESP_LOG_LEVEL`

**ESP_DRAM_LOGE** (tag, format, ...)  
Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", ...)` or `ESP_DRAM_LOGE(TAG, "format", ...)`, where `TAG` is a char* that points to a str in the DRAM.

**Note** Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

See `ESP_EARLY_LOGE`, the log level cannot be changed per-tag, however esp_log_level_set("*", level) will set the default level which controls these log lines also.

**Note** Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

See `esp_rom_printf,ESP_LOGE`

**ESP_DRAM_LOGW** (tag, format, ...)  
Macro to output logs when the cache is disabled at ESP_LOG_WARN level.
See ESP_DRAM_LOGW,ESP_LOGW,esp_rom_printf

**ESP_DRAM_LOGI**(tag, format,...)

macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See ESP_DRAM_LOGI,ESP_LOGI,esp_rom_printf

**ESP_DRAM_LOGD**(tag, format,...)

macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See ESP_DRAM_LOGD,ESP_LOGD,esp_rom_printf

**ESP_DRAM_LOGV**(tag, format,...)

macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See ESP_DRAM_LOGV,ESP_LOGV,esp_rom_printf

**Type Definitions**

typedef int (*vprintf_like_t)(const char *, va_list)

**Enumerations**

enum esp_log_level_t

Log level.

*Values:*

ESP_LOG_NONE
No log output

ESP_LOG_ERROR
Critical errors, software module can not recover on its own

ESP_LOG_WARN
Error conditions from which recovery measures have been taken

ESP_LOG_INFO
Information messages which describe normal flow of events

ESP_LOG_DEBUG
Extra information which is not necessary for normal use (values, pointers, sizes, etc).

ESP_LOG_VERBOSE
Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

### 2.7.19 Miscellaneous System APIs

**Software reset**

To perform software reset of the chip, `esp_restart()` function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, `esp_register_shutdown_handler()` function is provided to register a routine which needs to be called prior to restart (when done by `esp_restart()`). This is similar to the functionality of `atexit` POSIX function.

**Reset reason**

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.
Heap memory

Two heap memory related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using `malloc` family of functions. For further information about heap memory see Heap Memory Allocation.

MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()` function.

In ESP-IDF these addresses are calculated from a single Base MAC address. By default, the Espressif base MAC address is used. This MAC is pre-programmed into ESP32 eFuse from the factory.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC address (4 universally administered, default)</th>
<th>MAC address (2 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td>base_mac</td>
<td>base_mac</td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td>base_mac, +1 to the last octet</td>
<td><em>Local MAC</em> derived from Wi-Fi Station MAC</td>
</tr>
<tr>
<td>Bluetooth</td>
<td>base_mac, +2 to the last octet</td>
<td>base_mac, +1 to the last octet</td>
</tr>
<tr>
<td>Ethernet</td>
<td>base_mac, +3 to the last octet</td>
<td><em>Local MAC</em> (derived from Bluetooth MAC)</td>
</tr>
</tbody>
</table>

**Note:** The default configuration is 4 universally administered MAC addresses, and this is recommended when using Espressif-provided MAC addresses.

Custom Base MAC  The default Base MAC is pre-programmed by Espressif in eFuse BLK0. To set a custom Base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Configure the option `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC, according to the table above.

**Note:** It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface, after network initialization. It’s recommended to use the Base MAC approach documented here instead, to avoid the possibility of the original MAC address briefly appearing on the network before it is changed.

Custom MAC address in eFuse  When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:
## Field Table

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others — valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

### Local vs Universal MAC addresses

ESP32 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The specific calculations to derive an interface’s MAC address from the base MAC address is shown in the table above.

When using a custom MAC address scheme, it’s possible that not all interfaces can be assigned a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network, only.

See this article for the definition of local and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (meaning: the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

### Chip version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

### SDK version

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR, ESP_IDF_VERSION_MINOR, ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```c
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
#endif
```

### App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.
To set version in your project manually you need to set PROJECT_VER variable in your project CMakeLists.txt/Makefile:

- In application CMakeLists.txt put `set(PROJECT_VER "0.1.0.1")` before including project cmake.

(For legacy GNU Make build system: in application Makefile put PROJECT_VER = "0.1.0.1" before including project.mk.)

If CONFIG_APP_PROJECT_VER_FROM_CONFIG option is set, the value of CONFIG_APP_PROJECT_VER will be used. Otherwise if PROJECT_VER variable is not set in the project then it will be retrieved from either $(PROJECT_PATH)/version.txt file (if present) else using git command `git describe`. If neither is available then PROJECT_VER will be set to “1”. Application can make use of this by calling esp_ota_get_app_description() or esp_ota_get_partition_description() functions.

API Reference

Header File

- esp_system/include/esp_system.h

Functions

```c
esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)
```

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

**Parameters**

- handle: function to execute on restart

```c
esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)
```

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

```c
void esp_restart (void)
```

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

```c
esp_reset_reason_t esp_reset_reason (void)
```

Get reason of last reset.

**Return** See description of esp_reset_reason_t for explanation of each value.

```c
uint32_t esp_get_free_heap_size (void)
```

Get the size of available heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available heap size, in bytes.

```c
uint32_t esp_get_free_internal_heap_size (void)
```

Get the size of available internal heap.
Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available internal heap size, in bytes.

```c
uint32_t esp_get_minimum_free_heap_size(void)
```

Get the minimum heap that has ever been available.

**Return** Minimum free heap ever available

```c
void esp_system_abort(const char *details)
```

Trigger a software abort.

**Parameters**
- *details*: Details that will be displayed during panic handling.

### Type Definitions

```c
typedef void (*shutdown_handler_t)(void)
```

Shutdown handler type

### Enumerations

```c
enum esp_reset_reason_t
```

Reset reasons.

**Values:**

- **ESP_RST_UNKNOWN**
  - Reset reason can not be determined.
- **ESP_RST_POWERON**
  - Reset due to power-on event.
- **ESP_RST_EXT**
  - Reset by external pin (not applicable for ESP32)
- **ESP_RST_SW**
  - Software reset via esp_restart.
- **ESP_RST_PANIC**
  - Software reset due to exception/panic.
- **ESP_RST_INT_WDT**
  - Reset (software or hardware) due to interrupt watchdog.
- **ESP_RST_TASK_WDT**
  - Reset due to task watchdog.
- **ESP_RST_WDT**
  - Reset due to other watchdogs.
- **ESP_RST_DEEPSLEEP**
  - Reset after exiting deep sleep mode.
- **ESP_RST_BROWNOUT**
  - Brownout reset (software or hardware)
- **ESP_RST_SDIO**
  - Reset over SDIO.

### Header File

- `esp_common/include/esp_idf_version.h`
Chapter 2. API Reference

Functions

**const char** `*esp_get_idf_version (void)`

Return full IDF version string, same as `git describe` output.

**Note** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

**Return** constant string from IDF_VER

Macros

**ESP_IDF_VERSION_MAJOR**

Major version number (X.x.x)

**ESP_IDF_VERSION_MINOR**

Minor version number (x.X.x)

**ESP_IDF_VERSION_PATCH**

Patch version number (x.x.X)

**ESP_IDF_VERSION_VAL (major, minor, patch)**

Macro to convert IDF version number into an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

**ESP_IDF_VERSION**

Current IDF version, as an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

2.7.20 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth).

OTA requires configuring the **Partition Table** of the device with at least two “OTA app slot” partitions (i.e. `ota_0` and `ota_1`) and an “OTA Data Partition”.

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the **Partition Table** of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually `ota_0`) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.
App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application it is written to the `otadata` partition. The partition contains a `ota_seq` counter which is a pointer to the slot (ota_0, ota_1, ...) from which the application will be selected for boot.

App OTA State

States control the process of selecting a boot app:

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_NEW</td>
<td><code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to <code>ESP_OTA_IMG_PENDING_VERIFY</code>.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING_VERIFY</td>
<td><code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected and the state will change to <code>ESP_OTA_IMG_ABORTED</code>.</td>
</tr>
</tbody>
</table>

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and `ESP_OTA_IMG_NEW` and `ESP_OTA_IMG_PENDING_VERIFY` states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

Rollback Process

The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state `ESP_OTA_IMG_NEW`. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the `ESP_OTA_IMG_PENDING_VERIFY` state if it is set, then it will be written to `ESP_OTA_IMG_ABORTED`.
- The bootloader selects a new application to boot so that the state is not set as `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED`.
- The bootloader checks the selected application for `ESP_OTA_IMG_NEW` state if it is set, then it will be written to `ESP_OTA_IMG_PENDING_VERIFY`. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to...
ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.

- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails then call `esp_ota_mark_app_invalid rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED. That will prevent re-boot of this application. There will be a rollback to the previous working application.

**Unexpected Reset**  If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

**Booting invalid/aborted apps**  Booting an application which was previously set to ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the otadata.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is ESP_OTA_IMG_PENDING_VERIFY then self-testing and subsequent confirmation of operability is required.

**Where the states are set**  A brief description of where the states are set:

- ESP_OTA_IMG_VALID state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- ESP_OTA_IMG_UNDEFINED state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- ESP_OTA_IMG_NEW state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- ESP_OTA_IMG_INVALID state is set by `esp_ota_mark_app_invalid rollback_and_reboot()` function.
- ESP_OTA_IMG_ABORTED state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- ESP_OTA_IMG_PENDING_VERIFY state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has ESP_OTA_IMG_NEW state.

**Anti-rollback**

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.
A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the `ESP_INVALID` state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen due to the device may not have any bootable apps then it will return `ESP_ERR_OTA_ROLLBACK_FAILED` error and stay in the `ESP_PENDING_VERIFY` state.
- The next update of app is possible if a running app is in the `ESP_INVALID` state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower then running app you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```c
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }
                image_header_was_checked = true;
            } else {
                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
            esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
        }
    }
    ...
```

Restrictions:

- The number of bits in the `secure_version` field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option.
- Anti-rollback only works if the encoding scheme for efuse is set to NONE.
Chapter 2. API Reference

- The partition table should not have a factory partition, only two of the app.

security_version:
- In application image it is stored in esp_app_desc structure. The number is set CONFIG_BOOTLOADER_APP_SECURE_VERSION.
- In ESP32 it is stored in efuse EFUSE_BLK3_RDATA4_REG. (when a eFuse bit is programmed to 1, it can never be reverted to 0). The number of bits set in this register is the security_version from app.

Secure OTA Updates Without Secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT and CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

For more information refer to Signed App Verification Without Hardware Secure Boot

OTA Tool (otatool.py)

The component app_update provides a tool otatool.py for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (read_otadata)
- erase otadata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

Python API

Before anything else, make sure that the otatool module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py...lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```

The starting point for using the tool’s Python API to do is create a OatoolTarget object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
```

(continues on next page)
The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

### Command-line Interface

The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]
```

- **command-args** - these are arguments that are needed for executing the main command (`parttool.py`), mostly pertaining to the target device
- **subcommand** - this is the operation to be performed
- **subcommand-args** - these are arguments that are specific to the chosen operation

```python
target.switch_ota_partition(1)
# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

# Erase otadata, resetting the device to factory app
```
otatool.py --port "/dev/ttyUSB1" erase_otadata
```

# Erase contents of OTA app slot 0
```
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0
```

# Switch boot partition to that of app slot 1
```
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1
```

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
```
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `-help` as argument:

```python
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

### Application Example

End-to-end example of OTA firmware update workflow: `system/ota`.

### API Reference

#### Header File

- `app_update/include/esp_ota_ops.h`
**Functions**

```c
const esp_app_desc_t *esp_ota_get_app_description(void)
```

Return esp_app_desc structure. This structure includes app version.

Return description for running app.

```c
int esp_ota_get_app_elf_sha256(char *dst, size_t size)
```

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Return Number of bytes written to dst (including null terminator)

**Parameters**

- `dst`: Destination buffer
- `size`: Size of the buffer

```c
esp_err_t esp_ota_begin(const esp_partition_t *partition, size_t image_size, esp_ota_handle_t *out_handle)
```

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

Return

- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR INVALID SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR FLASH_OP_TIMEOUT or ESP_ERR FLASH_OP_FAIL: Flash write failed.
- ESP_ERR OTA ROLLBACK INVALID STATE: If the running app has not confirmed state.

Before performing an update, the application must be valid.

Parameters

- `partition`: Pointer to info for partition which will receive the OTA update. Required.
- `image_size`: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- `out_handle`: On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

```c
esp_err_t esp_ota_write(esp_ota_handle_t handle, const void *data, size_t size)
```

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Return

- ESP_OK: Data was written to flash successfully.
- ESP_ERR INVALID ARG: handle is invalid.
- ESP_ERR OTA_VALIDATE FAILED: First byte of image contains invalid app image magic byte.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**
- **handle**: Handle obtained from esp_ota_begin
- **data**: Data buffer to write
- **size**: Size of data buffer in bytes.

```c
esp_err_t esp_ota_write_with_offset(esp_ota_handle_t handle, const void *data, size_t size, uint32_t offset)
```

Write OTA update data to partition.

This function can write data in non contiguous manner. If flash encryption is enabled, data should be 16 byte aligned.

**Note** While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write() is not recommended.

**Return**
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**
- **handle**: Handle obtained from esp_ota_begin
- **data**: Data buffer to write
- **size**: Size of data buffer in bytes
- **offset**: Offset in flash partition

```c
esp_err_t esp_ota_end(esp_ota_handle_t handle)
```

Finish OTA update and validate newly written app image.

**Note** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**
- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**
- **handle**: Handle obtained from esp_ota_begin().

```c
esp_err_t esp_ota_abort(esp_ota_handle_t handle)
```

Abort OTA update, free the handle and memory associated with it.

**Return**
- ESP_OK: Handle and its associated memory is freed successfully.
- ESP_ERR_NOT_FOUND: OTA handle was not found.

**Parameters**
- **handle**: obtained from esp_ota_begin().

```c
esp_err_t esp_ota_set_boot_partition(const esp_partition_t *partition)
```

Configure OTA data for a new boot partition.

**Note** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Return**
- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
Chapter 2. API Reference

- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

Parameters
- partition: Pointer to info for partition containing app image to boot.

const esp_partition_t *esp_ota_get_boot_partition (void)
Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

Return Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_running_partition (void)
Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

Return Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

Return Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

Parameters
- start_from: If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
Returns esp_app_desc structure for app partition. This structure includes app version.

Return
- ESP_OK Successful.
- ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
• or one of error codes from lower-level flash driver.

**Parameters**

- **[in] partition**: Pointer to app partition. (only app partition)
- **[out] app_desc**: Structure of info about app.

```c
esp_err_t esp_ota_mark_app_valid_cancel_rollback (void)
```

This function is called to indicate that the running app is working well.

**Return**

- ESP_OK: if successful.

```c
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot (void)
```

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

**Return**

- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

```c
const esp_partition_t *esp_ota_get_last_invalid_partition (void)
```

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

**Return**

- partition.

```c
esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t *ota_state)
```

Returns state for given partition.

**Return**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otdata or state was not found for given partition.

**Parameters**

- **[in] partition**: Pointer to partition.
- **[out] ota_state**: state of partition (if this partition has a record in otdata).

```c
esp_err_t esp_ota_erase_last_boot_app_partition (void)
```

Erases previous boot app partition and corresponding otdata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

**Return**

- ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible (void)
```

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otdata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

**Return**

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

**Macros**

**OTA_SIZE_UNKNOWN**

Used for esp_ota_begin() if new image size is unknown
OTA_WITH_SEQUENTIAL_WRITES
Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

ESP_ERR_OTA_BASE
Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT
Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID
Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED
Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER
Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED
Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions
typedef uint32_t esp_ota_handle_t
Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Debugging OTA Failure

2.7.21 Performance Monitor
The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

Application Example
An example which combines performance monitor is provided in examples/system/perfmon directory. This example initializes the performance monitor structure and execute them with printing the statistics.

Chapter 2. API Reference

Functions

`esp_err_t xtensa_perfmon_init (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)`

Initialize Performance Monitor.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

Parameters

- [in] id: performance counter number
- [in] select: select value from PMCTRLx register
- [in] mask: mask value from PMCTRLx register
- [in] kernelcnt: kernelcnt value from PMCTRLx register
- [in] tracelevel: tracelevel value from PMCTRLx register

`esp_err_t xtensa_perfmon_reset (int id)`

Reset PM counter.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

Parameters

- [in] id: performance counter number

void `xtensa_perfmon_start (void)`

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

void `xtensa_perfmon_stop (void)`

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

`uint32_t xtensa_perfmon_value (int id)`

Read PM counter.

Read value of defined PM counter.

Return

- Performance counter value

Parameters

- [in] id: performance counter number

`esp_err_t xtensa_perfmon_overflow (int id)`

Read PM overflow state.

Read overflow value of defined PM counter.

Return

- ESP_OK if there is no overflow (overflow = 0)
- ESP_FAIL if overflow occur (overflow = 1)

Parameters

- [in] id: performance counter number

void `xtensa_perfmon_dump (void)`

Dump PM values.

Dump all PM register to the console.

Header File

- perfmon/include/xtensa_perfmon_apis.h
Functions

```c
esp_err_t xtensa_perfmon_exec(const xtensa_perfmon_config_t *config)
```

Execute PM.

Execute performance counter for dedicated function with defined parameters

**Return**
- ESP_OK if no errors
- ESP_ERR_INVALID_ARG if one of the required parameters not defined
- ESP_FAIL - counter overflow

**Parameters**
- \[in\] config: pointer to the configuration structure

```c
void xtensa_perfmon_view_cb(void *params, uint32_t select, uint32_t mask, uint32_t value)
```

Dump PM results.

Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

**Parameters**
- \[in\] params: used parameters passed from configuration (callback_params). This parameter expected as FILE* hanle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- \[in\] select: select value for current counter
- \[in\] mask: mask value for current counter
- \[in\] value: counter value for current counter

Structures

```c
struct xtensa_perfmon_config
```

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

**Public Members**

```c
int repeat_count
```

how many times function will be called before the callback will be repeated

```c
float max_deviation
```

Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

```c
void *call_params
```

This pointer will be passed to the call_function as a parameter

```c
void (*call_function)(void *params)
```

pointer to the function that have to be called

```c
void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)
```

pointer to the function that will be called with result parameters

```c
void *callback_params
```

parameter that will be passed to the callback

```c
int tracelevel
```

trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

```c
uint32_t counters_size
```

amount of counter in the list

```c
const uint32_t *select_mask
```

list of the select/mask parameters
Chapter 2. API Reference

Type Definitions

```c
typedef struct xtensa_perfmon_config xtensa_perfmon_config_t
```

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

2.7.22 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks. For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (`true/false`).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

Note: Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

Note: In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the `Sleep Modes` documentation can be used to trigger wakeup from the...
light sleep state.

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

### Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_PM_CPU_FREQ_MAX</td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code>. For ESP32, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td>ESP_PM_APB_FREQ_MAX</td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32, this is 80 MHz.</td>
</tr>
<tr>
<td>ESP_PM_NO_LIGHT_SLEEP</td>
<td>Disables automatic switching to light sleep.</td>
</tr>
</tbody>
</table>

### ESP32 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ`. 
### Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the work of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK is used as a clock source. See `use_ref_tick` member of `uart_config_t`.
- **LED**: if REF_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT**: if REF_TICK or XTAL is used as a clock source. See `flags` member of `rmt_config_t` and macro `RMT_CHANNEL_FLAGS_AWARE_DFS`.

Currently, the following peripheral drivers are aware of DFS and will use the `ESP_PM_APB_FREQ_MAX` lock for the duration of the transaction:
• SPI master
• IIC
• IIC (If the AP PLL clock is used, then it will use the ESP_PM_NO_LIGHT_SLEEP lock)
• SDMMC

The following drivers will hold the ESP_PM_APB_FREQ_MAX lock while the driver is enabled:

• SPI slave: between calls to spi_slave_initialize() and spi_slave_free().
• Ethernet: between calls to esp_eth_driver_install() and esp_eth_driver_uninstall().
• WiFi: between calls to esp_wifi_start() and esp_wifi_stop(). If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
• TWAI: between calls to twai_driver_install() and twai_driver_uninstall().
• Bluetooth: between calls to esp_bt_controller_enable() and esp_bt_controller_disable(). If Bluetooth modem sleep is enabled, the ESP_PM_APB_FREQ_MAX lock will be released for the periods of time when radio is disabled. However the ESP_PM_NO_LIGHT_SLEEP lock will still be held, unless CONFIG_BTDM_CTRL_LOW_POWER_CLOCK option is set to “External 32kHz crystal”.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

• PCNT
• Sigma-delta
• Timer group
• MCPWM

API Reference

Header File

• esp_pm/include/esp_pm.h

Functions

**esp_err_t esp_pm_configure (const void *config)**
Set implementation-specific power management configuration.

**Return**

• ESP_OK on success
• ESP_ERR_INVALID_ARG if the configuration values are not correct
• ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**

• config: pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

**esp_err_t esp_pm_get_configuration (void *config)**
Get implementation-specific power management configuration.

**Return**

• ESP_OK on success
• ESP_ERR_INVALID_ARG if the pointer is null

**Parameters**

• config: pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

**esp_err_t esp_pm_lock_create (esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)**
Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

**Return**

• ESP_OK on success
### API Reference

- **ESP_ERR_NO_MEM** if the lock structure cannot be allocated
- **ESP_ERR_INVALID_ARG** if `out_handle` is NULL or type argument is not valid
- **ESP_ERR_NOT_SUPPORTED** if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

#### Parameters
- **lock_type**: Power management constraint which the lock should control
- **arg**: Argument, value depends on `lock_type`, see `esp_pm_lock_type_t`
- **name**: Arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the `esp_pm_dump_locks` function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **[out] out_handle**: Handle returned from this function. Use this handle when calling `esp_pm_lock_delete`, `esp_pm_lock_acquire`, `esp_pm_lock_release`. Must not be NULL.

```c
esp_err_t esp_pm_lock_acquire(esp_pm_lock_handle_t handle)
```

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to `esp_pm_lock_create`, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

#### Parameters
- **handle**: Handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_lock_release(esp_pm_lock_handle_t handle)
```

Release the lock taken using `esp_pm_lock_acquire`.

Call to this function removes power management restrictions placed when taking the lock.

Locks are recursive, so if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is still acquired
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

#### Parameters
- **handle**: Handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_lock_delete(esp_pm_lock_handle_t handle)
```

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

#### Parameters
- **handle**: Handle obtained from `esp_pm_lock_create` function
**esp_err_t esp_pm_dump_locks (FILE *stream)**

Dump the list of all locks to stderr

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream.

This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Parameters**

- stream: stream to print information to; use stdout or stderr to print to the console; use fmemo.pen/open_memstream to print to a string buffer.

**Type Definitions**

```c
typedef struct esp_pm_lock *esp_pm_lock_handle_t

Opaque handle to the power management lock.
```

**Enumerations**

```c
enum esp_pm_lock_type_t

Power management constraints.

Values:

- ESP_PM_CPU_FREQ_MAX
  - Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

- ESP_PM_APB_FREQ_MAX
  - Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

- ESP_PM_NO_LIGHT_SLEEP
  - Prevent the system from going into light sleep. Argument is unused and should be set to 0.
```

**Header File**

- esp_pm/include/esp32/pm.h

**Structures**

```c
struct esp_pm_config_esp32_t

Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.
```

**Public Members**

```c
int max_freq_mhz

Maximum CPU frequency, in MHz

int min_freq_mhz

Minimum CPU frequency to use when no locks are taken, in MHz

bool light_sleep_enable

Enter light sleep when no locks are taken
```
2.7.23 Random Number Generation

ESP32 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF Second stage bootloader is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the ESP32 Technical Reference Manual > Random Number Generator (RNG) [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, I2S, Wi-Fi or Bluetooth.

**Note:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

**Note:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedtls CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

API Reference

Header File

- `esp_how_support/include/esp_random.h`

Functions

```c
uint32_t esp_random(void)
```

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).
Return Random value between 0 and UINT32_MAX

```c
void esp_fill_random (void *buf, size_t len)
```

Fill a buffer with random bytes from hardware RNG.

Note This function is implemented via calls to esp_random(), so the same constraints apply.

Parameters
- `buf`: Pointer to buffer to fill with random numbers.
- `len`: Length of buffer in bytes

Header File
- `bootloader_support/include/bootloader_random.h`

Functions
- `void bootloader_random_enable (void)`
  Enable an entropy source for RNG if RF is disabled.
  
  The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

  Can also be used from app code early during operation, if true random numbers are required before RF is initialised. Consult ESP-IDF Programming Guide “Random Number Generation” section for details.

- `void bootloader_random_disable (void)`
  Disable entropy source for RNG.

  Disables internal entropy source. Must be called after bootloader_random_enable() and before RF features, ADC, or I2S (ESP32 only) are initialized.

  Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

- `void bootloader_fill_random (void *buffer, size_t length)`
  Fill buffer with ‘length’ random bytes.

  Note If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

  Parameters
  - `buffer`: Pointer to buffer
  - `length`: This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux getrandom() function is also provided for ease of porting:

```c
#include <sys/random.h>

ssize_t getrandom (void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling esp_fill_random() internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with errno set to EFAULT) if the `buf` argument is NULL, and equal to `buflen` otherwise.

### 2.7.24 Sleep Modes

Overview

ESP32 is capable of light sleep and deep sleep power saving modes.
In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from APB_CLK are powered off. The only parts of the chip which can still be powered on are:

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory
- RTC slow memory

Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see Power Management APIs). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

### WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (`esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

### Wakeup sources

#### Timer

RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW_CLK.

For details on RTC clock options, see ESP32 Technical Reference Manual > ULP Coprocessor [PDF].

This wakeup mode doesn’t require RTC peripherals or RTC memories to be powered on during sleep. `esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

#### Touch pad

RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO). `esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

#### External wakeup (ext0)

RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.
Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions, before calling `esp_sleep_start()`.

In revisions 0 and 1 of the ESP32, this wakeup source is incompatible with ULP and touch wakeup sources. `esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

**Warning:** After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using `rtc_gpio_deinit(gpio_num)` function.

### External wakeup (ext1)
RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- `wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)`
- `wake up if all the selected pins are low (ESP_EXT1_WAKEUP_ALL_LOW)`

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using `rtc_gpio_` functions, before entering sleep:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

**Warning:** After wake up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using `rtc_gpio_deinit(gpio_num)` function.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

### ULP coprocessor wakeup
ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. `ESP_PD_DOMAIN_RTC_PERIPH` should be set to `ESP_PD_OPTION_AUTO`).

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

### GPIO wakeup (light sleep only)
In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

**Warning:** Before entering light sleep mode, check if any GPIO pin to be driven is part of the VDD_SDIO power domain. If so, this power domain must be configured to remain ON during sleep.
For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SDIO power domain. If they are configured to remain high during light sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

**UART wakeup (light sleep only)**  When ESP32 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup, before sending the data. `esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

**Power-down of RTC peripherals and memories**

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

Note: in revision 0 of the ESP32, RTC fast memory will always be kept enabled in deep sleep, so that the deep sleep stub can run after reset. This can be overridden, if the application doesn’t need clean reset behaviour after deep sleep.

If some variables in the program are placed into RTC slow memory (for example, using `RTC_DATA_ATTR` attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

**Entering light sleep**

`esp_light_sleep_start()` function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

**Entering deep sleep**

`esp_deep_sleep_start()` function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

**Configuring IOs**

Some ESP32 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```
UART output handling

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs. When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

Checking sleep wakeup cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad, it is possible to identify touch pad which has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify pin which has caused wakeup using `esp_sleep_get_exti_wakeup_status()` functions.

Disable sleep wakeup source

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

Application Example

Implementation of basic functionality of deep sleep is shown in `protocols/sntp` example, where ESP module is periodically waken up to retrieve time from NTP server.

More extensive example in `system/deep_sleep` illustrates usage of various deep sleep wakeup triggers and ULP co-processor programming.

API Reference

Header File

- `esp_hw_support/include/esp_sleep.h`

Functions

```c
esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)
```

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in `esp_sleep_start` function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**Parameters**

- `source`: - number of source to disable of type `esp_sleep_source_t`

```c
esp_err_t esp_sleep_enable_ulp_wakeup(void)
```

Enable wakeup by ULP coprocessor.

**Note** In revisions 0 and 1 of the ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESPD_PD_OPTION_ON) or when ext0 wakeup source is used.
Return
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_timer_wakeup(uint64_t time_in_us)
```
Enable wakeup by timer.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

Parameters
- `time_in_us`: time before wakeup, in microseconds

```c
esp_err_t esp_sleep_enable_touchpad_wakeup(void)
```
Enable wakeup by touch sensor.

Note
In revisions 0 and 1 of the ESP32, touch wakeup source can not be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

Note
The FSM mode of the touch button should be configured as the timer trigger mode.

```c
touch_pad_t esp_sleep_get_touchpad_wakeup_status(void)
```
Get the touchpad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

Return
- `touch_pad_t` which caused wakeup

```c
bool esp_sleep_is_valid_wakeup_gpio(gpio_num_t gpio_num)
```
Returns true if a GPIO number is valid for use as wakeup source.

Note
For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

Return
- True if this GPIO number will be accepted as a sleep wakeup source.

Parameters
- `gpio_num`: Number of the GPIO to test for wakeup source capability

```c
esp_err_t esp_sleep_enable_ext0_wakeup(gpio_num_t gpio_num, int level)
```
Enable wakeup using a pin.

This function uses external wakeup feature of RTC.IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

Note
This function does not modify pin configuration. The pin is configured in esp_sleep_start, immediately before entering sleep mode.

Note
In revisions 0 and 1 of the ESP32, ext0 wakeup source can not be used together with touch or ULP wakeup sources.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

Parameters
- `gpio_num`: GPIO number used as wakeup source. Only GPIOs which are have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- `level`: input level which will trigger wakeup (0=low, 1=high)
esp_err_t esp_sleep_enable_ext1_wakeu

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pins are configured in esp_sleep_start, immediately before entering sleep mode.

**Note** internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

Parameters

- **mask**: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which are have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- **mode**: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

esp_err_t esp_sleep_enable_gpio_wakeu (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wake up from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

**Note** In revisions 0 and 1 of the ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t esp_sleep_enable_uart_wakeu (int uart_num)

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note** ESP32 does not support wakeup from UART2.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

Parameters

- **uart_num**: UART port to wake up from

esp_err_t esp_sleep_enable_wifi_wakeu (void)

Enable wakeup by WiFi MAC.

Return

- ESP_OK on success

esp_err_t esp_sleep_disable_wifi_wakeu (void)

Disable wakeup by WiFi MAC.

Return

- ESP_OK on success
uint64_t esp_sleep_get_ext1_wakeup_status (void)
Get the bit mask of GPIOs which caused wakeup (ext1)
If wakeup was caused by another source, this function will return 0.
Return bit mask, if GPIO caused wakeup, BIT(n) will be set

esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)
Set power down mode for an RTC power domain in sleep mode.
If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.
Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range
Parameters
- domain: power domain to configure
- option: power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

void esp_deep_sleep_start (void)
Enter deep sleep with the configured wakeup options.
This function does not return.

esp_err_t esp_light_sleep_start (void)
Enter light sleep with the configured wakeup options.

Return
- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped

void esp_deep_sleep (uint64_t time_in_us)
Enter deep-sleep mode.
The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep
wake stub, and then proceeds to load application.
Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to
esp_deep_sleep_start.

esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure
relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These
include:
- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop
This function does not return.

Parameters
- time_in_us: deep-sleep time, unit: microsecond

esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause (void)
Get the wakeup source which caused wakeup from sleep.

Return cause of wake up from last sleep (deep sleep or light sleep)

void esp_wake_deep_sleep (void)
Default stub to run on wake from deep sleep.
Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app
has started up.
This function is weak-linked, so you can implement your own version to run code immediately when the chip
wakes from sleep.
See docs/deep-sleep-stub.rst for details.
void esp_set_deep_sleep_wake_stub (esp_deep_sleep_wake_stub_fn_t new_stub)
    Install a new stub at runtime to run on wake from deep sleep.
    If implementing esp_wake_deep_sleep() then it is not necessary to call this function.
    However, it is possible to call this function to substitute a different deep sleep stub. Any function
    used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for
    esp_wake_deep_sleep().

esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub (void)
    Get current wake from deep sleep stub.

Return Return current wake from deep sleep stub, or NULL if no stub is installed.

void esp_default_wake_deep_sleep (void)
    The default esp-idf-provided esp_wake_deep_sleep() stub.
    See docs/deep-sleep-stub.rst for details.

void esp_deep_sleep_disable_rom_logging (void)
    Disable logging from the ROM code after deep sleep.
    Using LSB of RTC_STORE4.

void esp_sleep_config_gpio_isolate (void)
    Configure to isolate all GPIO pins in sleep state.

void esp_sleep_enable_gpio_switch (bool enable)
    Enable or disable GPIO pins status switching between slept status and waked status.

    Parameters
        • enable: decide whether to switch status or not

Type Definitions
typedef esp_sleep_source_t esp_sleep_wakeup_cause_t
typedef void (*esp_deep_sleep_wake_stub_fn_t) (void)
    Function type for stub to run on wake from sleep.

Enumerations
enum esp_sleep_ext1_wakeup_mode_t
    Logic function used for EXT1 wakeup mode.

    Values:
        ESP_EXT1_WAKEUP_ALL_LOW = 0
            Wake the chip when all selected GPIOs go low.
        ESP_EXT1_WAKEUP_ANY_HIGH = 1
            Wake the chip when any of the selected GPIOs go high.

enum esp_sleep_pd_domain_t
    Power domains which can be powered down in sleep mode.

    Values:
        ESP_PD_DOMAIN_RTC_PERIPH
            RTC IO, sensors and ULP co-processor.
        ESP_PD_DOMAIN_RTC_SLOW_MEM
            RTC slow memory.
        ESP_PD_DOMAIN_RTC_FAST_MEM
            RTC fast memory.
        ESP_PD_DOMAIN_XTAL
            XTAL oscillator.
ESP_PD_DOMAIN_CPU
  CPU core.

ESP_PD_DOMAIN_VDDSDIO
  VDD_SDIO.

ESP_PD_DOMAIN_MAX
  Number of domains.

enum esp_sleep_pd_option_t
  Power down options.

  Values:

  ESP_PD_OPTION_OFF
    Power down the power domain in sleep mode.

  ESP_PD_OPTION_ON
    Keep power domain enabled during sleep mode.

  ESP_PD_OPTION_AUTO
    Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum esp_sleep_source_t
  Sleep wakeup cause.

  Values:

  ESP_SLEEP_WAKEUP_UNDEFINED
    In case of deep sleep, reset was not caused by exit from deep sleep.

  ESP_SLEEP_WAKEUP_ALL
    Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

  ESP_SLEEP_WAKEUP_EXT0
    Wakeup caused by external signal using RTC_IO.

  ESP_SLEEP_WAKEUP_EXT1
    Wakeup caused by external signal using RTC_CNTL.

  ESP_SLEEP_WAKEUP_TIMER
    Wakeup caused by timer.

  ESP_SLEEP_WAKEUP_TOUCHPAD
    Wakeup caused by touchpad.

  ESP_SLEEP_WAKEUP_ULP
    Wakeup caused by ULP program.

  ESP_SLEEP_WAKEUP_GPIO
    Wakeup caused by GPIO (light sleep only)

  ESP_SLEEP_WAKEUP_UART
    Wakeup caused by UART (light sleep only)

  ESP_SLEEP_WAKEUP_WIFI
    Wakeup caused by WIFI (light sleep only)

  ESP_SLEEP_WAKEUP_COCPU
    Wakeup caused by COCPU int.

  ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG
    Wakeup caused by COCPU crash.

  ESP_SLEEP_WAKEUP_BT
    Wakeup caused by BT (light sleep only)
2.7.25 Watchdogs

Overview

The ESP-IDF has support for two types of watchdogs: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using the Project Configuration Menu; however, the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

Interrupt watchdog

The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn’t blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can’t get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as “Interrupt wdt timeout on CPU0” or “Interrupt wdt timeout on CPU1” (as applicable).

Configuration

The interrupt watchdog is enabled by default via the CONFIG_ESP_INT_WDT configuration flag. The timeout is configured by setting CONFIG_ESP_INT_WDT_TIMEOUT_MS. The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see CONFIG_FREERTOS_HZ).

Tuning

If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the CONFIG_ESP_INT_WDT_TIMEOUT_MS setting instead.

Task Watchdog Timer

The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task loop waiting without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. Each watched task must ‘reset’ the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function esp_task_wdt_isr_user_handler in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling esp_task_wdt_init() which will configure the hardware timer. A task can then subscribe to the TWDT using esp_task_wdt_add() in order to be watched. Each subscribed task must periodically call esp_task_wdt_reset() to reset the TWDT. Failure by any subscribed tasks to periodically call
esp_task_wdt_reset() indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using esp_task_wdt_delete(). A task that has been unsubscribed should no longer call esp_task_wdt_reset(). Once all tasks have unsubscribed form the TWDT, the TWDT can be deinitialized by calling esp_task_wdt_deinit().

The default timeout period for the TWDT is set using config item CONFIG_ESP_TASK_WDT_TIMEOUT_S. This should be set to at least as long as you expect any single task will need to monopolise the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling esp_task_wdt_init().

The following config options control TWDT configuration at startup. They are all enabled by default:

- **CONFIG_ESP_TASK_WDT** - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling esp_task_wdt_init().
- **CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0** - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling esp_task_wdt_add() at any time.
- **CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1** - CPU1 Idle task is subscribed to the TWDT during startup.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

**Interrupt Watchdog API Reference**

**Header File**

- esp_system/include/esp_int_wdt.h

**Functions**

void esp_int_wdt_init (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

**Task Watchdog API Reference**

A full example using the Task Watchdog is available in esp-idf: system/task_watchdog

**Header File**

- esp_system/include/esp_task_wdt.h

**Functions**

esp_err_t esp_task_wdt_init (uint32_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using esp_task_wdt_add().

Return
• ESP_OK: Initialization was successful
• ESP_ERR_NO_MEM: Initialization failed due to lack of memory

Note esp_task_wdt_init() must only be called after the scheduler started

Parameters

• [in] timeout: Timeout period of TWDT in seconds
• [in] panic: Flag that controls whether the panic handler will be executed when the TWDT times out

**esp_err_t esp_task_wdt_deinit (void)**

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

Return

• ESP_OK: TWDT successfully deinitialized
• ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
• ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

**esp_err_t esp_task_wdt_add (TaskHandle_t handle)**

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable esp_task_wdt_reset() to called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

Return

• ESP_OK: Successfully subscribed the task to the TWDT
• ESP_ERR_INVALID_ARG: Error, the task is already subscribed
• ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters

• [in] handle: Handle of the task. Input NULL to subscribe the current running task to the TWDT

**esp_err_t esp_task_wdt_reset (void)**

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

Return

• ESP_OK: Successfully reset the TWDT on behalf of the currently running task
• ESP_ERR_NOT_FOUND: Error, the current running task has not subscribed to the TWDT
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**esp_err_t esp_task_wdt_delete (TaskHandle_t handle)**

Unsubscribe a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset(). If the task is an IDLE task, this function will automatically disable the calling of esp_task_wdt_reset() from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

Return

• ESP_OK: Successfully unsubscribed the task from the TWDT
• ESP_ERR_INVALID_ARG: Error, the task is already unsubscribed
• ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

Parameters
• [in] handle: Handle of the task. Input NULL to unsubscribe the current running task.

```c
esp_err_t esp_task_wdt_status(TaskHandle_t handle)
```

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

Return:

- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is currently not subscribed to the TWDT
- ESP_ERR_INVALID_STATE: The TWDT is not initialized, therefore no tasks can be subscribed

Parameters:

• [in] handle: Handle of the task. Input NULL to query the current running task.

## 2.7.26 System Time

### Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an **RTC Clock Source** and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.
- **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32_TIME_SYSCALL` in project configuration.

### RTC Clock Source

The RTC timer has the following clock sources:

- **Internal 150kHz RC oscillator** (default): Features lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- **External 32kHz crystal**: Requires a 32kHz crystal to be connected to the 32K_XP and 32K_XN pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
- **External 32kHz oscillator at 32K_XN pin**: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of 0.1 < Vcm < 0.5xVamp, where Vamp is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin.
- **Internal 8.5MHz oscillator, divided by 256 (~33kHz)**: Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32_RTC_CLK_SRC` in project configuration.
More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K_XN pin sources can be found in Section Crystal Oscillator of ESP32 Hardware Design Guidelines.

Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
#include <time.h>

struct tm timeinfo;

gettimeofday(&now, NULL);
time(&now);

time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

*To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```c
#include <time.h>

struct timeval tv_now;

timeval(&tv_now, NULL);

gettimeofday(&tv_now, NULL);
time_t now = ((int64_t)tv_now.tv_usec * 1000000L + (int64_t)tv_now.tv_sec);
```

SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- **SNTP_SYNC_MODE_IMMED** (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- **SNTP_SYNC_MODE_SMOOTH** updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.
Chapter 2. API Reference

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in `protocols/sntp` directory.

**Timezones**

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the `TZ` environment variable to the correct value depending on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

**API Reference**

**Header File**

- `lwip/include/apps/esp_sntp.h`

**Functions**

```c
void sntp_sync_time (struct timeval *tv)
```

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

**Parameters**

- `tv`: Time received from SNTP server.

```c
void sntp_set_sync_mode (sntp_sync_mode_t sync_mode)
```

Set the sync mode.

Allowable two mode: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

**Parameters**

- `sync_mode`: Sync mode.

```c
sntp_sync_mode_t sntp_get_sync_mode (void)
```

Get set sync mode.
Return SNTP_SYNC_MODE_IMMED: Update time immediately. SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

`sntp_sync_status_t sntp_get_sync_status (void)`
Get status of time sync.

After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

Return SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

`void sntp_set_sync_status (sntp_sync_status_t sync_status)`
Set status of time sync.

Parameters
- `sync_status`: status of time sync (see sntp_sync_status_t)

`void sntp_set_time_sync_notification_cb (sntp_sync_time_cb_t callback)`
Set a callback function for time synchronization notification.

Parameters
- `callback`: a callback function

`void sntp_set_sync_interval (uint32_t interval_ms)`
Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the sntp_restart() function, otherwise, it will be applied after the last interval expired.

Parameters
- `interval_ms`: The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

`uint32_t sntp_get_sync_interval (void)`
Get the sync interval of SNTP operation.

Return the sync interval

`bool sntp_restart (void)`
Restart SNTP.

Return True - Restart False - SNTP was not initialized yet

Type Definitions

```c
typedef void (*sntp_sync_time_cb_t)(struct timeval *tv)
SNTP callback function for notifying about time sync event.
```

Parameters
- `tv`: Time received from SNTP server.

Enumerations

```c
enum sntp_sync_mode_t
SNTP time update mode.
```

Values:

- `SNTP_SYNC_MODE_IMMED` Update system time immediately when receiving a response from the SNTP server.
- `SNTP_SYNC_MODE_SMOOTH` Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.
Chapter 2. API Reference

```
enum sntp_sync_status_t
    SNTPSyncStatus.
    Values:
    SNTP_SYNC_STATUS_RESET
    SNTP_SYNC_STATUS_COMPLETED
    SNTP_SYNC_STATUS_IN_PROGRESS
```

2.7.27 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

### API Reference

#### Header File

- esp_rom/include/esp_rom_sys.h

#### Functions

- `int esp_rom_printf(const char *fmt, ...)`
  - Print formatted string to console device.
  - **Note** float and long long data are not supported!
  - **Return** int: Total number of characters written on success; A negative number on failure.
  - **Parameters**
    - fmt: Format string
    - ...: Additional arguments, depending on the format string

- `void esp_rom_delay_us(uint32_t us)`
  - Pauses execution for us microseconds.
  - **Parameters**
    - us: Number of microseconds to pause

- `void esp_rom_install_channel_putchar(int channel, void (*)(char))` char c
  - esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.
  - **Parameters**
    - channel: Channel number (starting from 1)
    - putc: Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

- `void esp_rom_install_uart_putchar(void)`
  - Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putchar(1, esp_rom_uart_putchar)

- `soc_reset_reason_t esp_rom_get_reset_reason(int cpu_no)`
  - Get reset reason of CPU.
  - **Return** Reset reason code (see in soc/reset_reasons.h)
  - **Parameters**
    - cpu_no: CPU number

Code examples for this API section are provided in the system directory of ESP-IDF examples.
2.8  Project Configuration

2.8.1  Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extenstions.

2.8.2  Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.

After being updated, this configuration is saved inside sdkconfig file in the project root directory. Based on sdkconfig, application build targets will generate sdkconfig.h file in the build directory, and will make sdkconfig options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with make menuconfig.)

2.8.3  Using sdkconfig.defaults

In some cases, such as when sdkconfig file is under revision control, the fact that sdkconfig file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of sdkconfig.defaults file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the sdkconfig file. Once sdkconfig.defaults is created, sdkconfig can be deleted and added to the ignore list of the revision control system (e.g. .gitignore file for git). Project build targets will automatically create sdkconfig file, populated with the settings from sdkconfig.defaults file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in sdkconfig by ones from sdkconfig.defaults. For more information, see Custom sdkconfig defaults.

2.8.4  Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backlash (because there is a bug in earlier versions of conf-idf which causes that Windows line endings are not recognized after a backlash).

Format checker

tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix .new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For
example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.8.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in sdkconfig. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. confgen.py is used by the toolchain to pre-process sdkconfig files before anything else, for example menuconfig, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. confgen.py recursively finds all sdkconfig.rename files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the sdkconfig file.
3. confgen.py post-processes sdkconfig files and generates all build outputs (sdkconfig.h, sdkconfig.cmake, auto.conf) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. Deprecated options and their replacements are automatically generated by confgen.py.

2.8.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates sdkconfig and sdkconfig.h files, option names are prefixed with CONFIG_. So if an option ENABLE_FOO is defined in a Kconfig file and selected in menuconfig, then sdkconfig and sdkconfig.h files will have CONFIG_ENABLE_FOO defined. In this reference, option names are also prefixed with CONFIG_, same as in the source code.

SDK tool configuration

Contains:

- \texttt{CONFIG\_SDK\_MAKE WARN UNDEFINED\_VARIABLES}
- \texttt{CONFIG\_SDK\_TOOLPREFIX}
- \texttt{CONFIG\_SDK\_PYTHON}
- \texttt{CONFIG\_SDK\_TOOLCHAIN SUPPORTS TIME\_WIDE\_64\_BITS}

\textbf{CONFIG\_SDK\_TOOLPREFIX}

Compiler toolchain path/prefix

\textit{Found in: SDK tool configuration}

The prefix/path that is used to call the toolchain. The default setting assumes a crosstool-ng gcc setup that is in your PATH.

\textbf{Default value:}

- \texttt{“xtensa-esp32-elf- “}

\textbf{CONFIG\_SDK\_PYTHON}

Python interpreter

\textit{Found in: SDK tool configuration}

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)
**Default value:**
- “python”

**CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES**

‘make’ warns on undefined variables  

*Found in: SDK tool configuration*

Adds -warn-undefined-variables to MAKEFLAGS. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.  
(Note: this option is used with the legacy GNU Make build system only.)

**Default value:**
- Yes (enabled)

**CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS**

Toolchain supports time_t wide 64-bits  

*Found in: SDK tool configuration*

Enable this option in case you have a custom toolchain which supports time_t wide 64-bits. This option checks time_t is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits time_t.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide time_t. This will change in a future major release, but currently 64-bit time_t requires a custom built toolchain.

**Default value:**
- No (disabled)

**Build type**

Contains:
- **CONFIG_APP_BUILD_TYPE**

**CONFIG_APP_BUILD_TYPE**

Application build type  

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```bash
Espressif Systems 1420 Release v4.4-dev-2313-gc69f0ec
Submit Document Feedback
```
# Connect to a running instance of OpenOCD target remote :3333
# Reset and halt the target
mon reset halt
# Run to a specific point in ROM code, where most of initialization is complete.
thb *0x40007d5c
# Load the application into RAM load
app_main
app_main

Execute this gdbinit file as follows:
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=y
CONFIG_ESP_ERR_TO_NAME_LOOKUP=y

Available options:
- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL)) (APP_BUILD_TYPE_ELF_RAM)

Application manager

Contains:

- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP_RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

*Default value:*

- Yes (enabled)

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*

- No (disabled)
CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

CONFIG_APP_PROJECT_VER_FROM_CONFIG

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**
- No (disabled)

CONFIG_APP_PROJECT_VER

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**Default value:**
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**
- from 8 to 64

**Default value:**
- 16

Bootloader config

Contains:

- CONFIG_BOOTLOADER_LOG_LEVEL
- CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION
- CONFIG_BOOTLOADER_SPI_WP_PIN
- CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
- CONFIG_BOOTLOADER_APP_TEST
- CONFIG_BOOTLOADER_FACTORY_RESET
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO
- CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
• `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
• `CONFIG_BOOTLOADER_WDT_ENABLE`
• `CONFIG_BOOTLOADER_VDDSdio_BOOST`

**CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION**

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

*Available options:*

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

*Available options:*

- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

**CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN**

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: Bootloader config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

*Default value:*

- No (disabled) if `ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT`
**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

*Range:*
- from 0 to 33 if \( \text{ESPToolPy_FLASHMODE_QIO} \) || \( \text{ESPToolPy_FLASHMODE_QOUT} \)

*Default value:*
- 7 if \( \text{ESPToolPy_FLASHMODE_QIO} \) || \( \text{ESPToolPy_FLASHMODE_QOUT} \)

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

*Default value:*
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

*Range:*
- from 0 to 39 if \( \text{CONFIG_BOOTLOADER_FACTORY_RESET} \)

*Default value:*
- 4 if \( \text{CONFIG_BOOTLOADER_FACTORY_RESET} \)
Chapter 2. API Reference

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL
Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE
Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET
Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, ..” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_APP_TEST
GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST
Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if CONFIG_BOOTLOADER_APP_TEST

**Default value:**
- 18 if CONFIG_BOOTLOADER_APP_TEST
**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*
After updating the app, the bootloader runs a new app with the “ESP OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIGBOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

Default value:
- No (disabled) if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:
- 0 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the efuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:
- from 1 to 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- from 1 to 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Default value:
- 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: emul_efuse, data, efuse, , 0x2000.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

Found in: Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if (CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON**

Skip image validation from power on reset (READ HELP FIRST)

Found in: Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)
**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Range:**
- from 0 to 0x10 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**Default value:**
- 0 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**Security features**

Contains:
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_MODE
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_UART_ROM_DL_MODE
• `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

**CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG_SECURE_SIGNED_APPS_SCHEME**

App Signing Scheme

*Found in: Security features*

**Available options:**

- `ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)`
  
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
  
  Refer to the documentation before enabling.

- `RSA (SECURE_SIGNED_APPS_RSA_SCHEME)`
  
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.
If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

### CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
- No (disabled)

### CONFIG_SECURE_BOOT_VERSION

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

**Available options:**
- Enable Secure Boot version 1 (`SECURE_BOOT_V1_ENABLED`)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (`SECURE_BOOT_V2_ENABLED`)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

### CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

*Found in: Security features*

**Available options:**
- One-time flash (`SECURE_BOOTLOADER_ONE_TIME_FLASH`)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (`SECURE_BOOTLOADER_REFLASHABLE`)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.
CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espfuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**

- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
• 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read Flash Encryption before enabling.

**Default value:**

- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**

- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options**

Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`
CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash. When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.
CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*
If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

**Available options:**
- **UART ROM download mode (Permanently disabled (recommended))** (`SECURE_DISABLE_ROM_DL_MODE`)
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- **UART ROM download mode (Permanently switch to Secure mode (recommended))** (`SECURE_ENABLE_SECURE_ROM_DL_MODE`)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.
  Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
  Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
  It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`
- **UART ROM download mode (Enabled (not recommended))** (`SECURE_INSECURE_ALLOW_DL_MODE`)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Serial flasher config**

Contains:
- `CONFIG_ESPTOOLPY_MONITOR_BAUD`
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_BAUD`
- `CONFIG_ESPTOOLPY_PORT`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_NO_STUB`
Chapter 2. API Reference

- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
- `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_COMPRESSED`

### `CONFIG_ESPTOOLPY_PORT`

Default serial port

*Found in: Serial flasher config*

The serial port that’s connected to the ESP chip. This can be overridden by setting the `ESPPORT` environment variable.

This value is ignored when using the CMake-based build system or `idf.py`.

**Default value:**
- “/dev/ttyUSB0”

### `CONFIG_ESPTOOLPY_BAUD`

Default baud rate

*Found in: Serial flasher config*

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the `ESPBAUD` environment variable.

This value is ignored when using the CMake-based build system or `idf.py`.

**Available options:**
- 115200 baud (ESPTOOLPY_BAUD_115200B)
- 230400 baud (ESPTOOLPY_BAUD_230400B)
- 921600 baud (ESPTOOLPY_BAUD_921600B)
- 2Mbaud (ESPTOOLPY_BAUD_2MB)
- Other baud rate (ESPTOOLPY_BAUD_OTHER)

### `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`

Other baud rate value

*Found in: Serial flasher config*

**Default value:**
- 115200

### `CONFIG_ESPTOOLPY_COMPRESSED`

Use compressed upload

*Found in: Serial flasher config*

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.

**Default value:**
- Yes (enabled)
**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

**Default value:**
- No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

**Available options:**
- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

**Available options:**
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**
- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)

**CONFIG_ESPTOOLPY_FLASHSIZE_DETECT**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

**Default value:**
• Yes (enabled)

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

• Reset to bootloader (ESPTOOLPY BEFORE RESET)
• No reset (ESPTOOLPY BEFORE NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

• Reset after flashing (ESPTOOLPY AFTER RESET)
• Stay in bootloader (ESPTOOLPY AFTER NORESET)

**CONFIG_ESPTOOLPY_MONITOR_BAUD**

`idf.py monitor` baud rate

*Found in: Serial flasher config*

Baud rate to use when running `idf.py monitor` or `make monitor` to view serial output from a running chip.

If “Same as UART Console baud rate” is chosen then the value will follow the “UART Console baud rate” config item.

Can override by setting the MONITORBAUD environment variable.

**Available options:**

• Same as UART console baud rate (ESPTOOLPY_MONITOR_BAUD_CONSOLE)
• 9600 bps (ESPTOOLPY_MONITOR_BAUD_9600B)
• 57600 bps (ESPTOOLPY_MONITOR_BAUD_57600B)
• 115200 bps (ESPTOOLPY_MONITOR_BAUD_115200B)
• 230400 bps (ESPTOOLPY_MONITOR_BAUD_230400B)
• 921600 bps (ESPTOOLPY_MONITOR_BAUD_921600B)
• 2 Mbps (ESPTOOLPY_MONITOR_BAUD_2MB)
• Custom baud rate (ESPTOOLPY_MONITOR_BAUD_OTHER)

**CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL**

Custom baud rate value

*Found in: Serial flasher config*

**Default value:**

• 115200
Partition Table

Contains:

- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.

- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled) if CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`
CONFIG_COMPILER_OPTIMIZATION

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTOADER_COMPILER_OPTIMIZATION setting.

Available options:

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros: -ESP_RETURN_ON_ERROR  -ESP_EXIT_ON_ERROR  -ESP_RETURN_ON_FALSE  -ESP_EXIT_ON_FALSE

Default value:
CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

* Found in: Compiler options

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

* Found in: Compiler options

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

* Default value:
  * No (disabled)

Contains:

  * CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

* Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

* Default value:
  * 0 if CONFIG_COMPILER_CXX_EXCEPTIONS

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

* Found in: Compiler options

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

* Default value:
  * No (disabled)
CONFIG_COMPILER_STACK_CHECK_MODE
Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected – those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

*Available options:*
- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS
Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

*Default value:*
- No (disabled)

CONFIG_COMPILER_DISABLE_GCC8_WARNINGS
Disable new warnings introduced in GCC 6 - 8

*Found in: Compiler options*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.

*Default value:*
- No (disabled)

CONFIG_COMPILER_DUMP_RTL_FILES
Dump RTL files during compilation

*Found in: Compiler options*
If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

Contains:

- ADC-Calibration
- Application Level Tracing
- Bluetooth
- CoAP Configuration
- Common ESP-related
- Core dump
- Driver configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH

Chapter 2. API Reference

- Wi-Fi
- Wi-Fi Provisioning Manager

Application Level Tracing Contains:

- `CONFIG_APPTRACE_DESTINATION`
- FreeRTOS System View Tracing
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`

**CONFIG_APPTRACE_DESTINATION**

Data Destination

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (APTPRACE_DEST_JTAG)
- None (APTPRACE_DEST_NONE)

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.
FreeRTOS SystemView Tracing  Contains:
  • CONFIG_APPTRACE_SV_ENABLE

**CONFIG_APPTRACE_SV_ENABLE**
SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_TS_SOURCE**
Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (APTRACE_SV_TS_SOURCE_CCOUNT)
- Timer 0, Group 0 (APTRACE_SV_TS_SOURCE_TIMER_00)
- Timer 1, Group 0 (APTRACE_SV_TS_SOURCE_TIMER_01)
- Timer 0, Group 1 (APTRACE_SV_TS_SOURCE_TIMER_10)
- Timer 1, Group 1 (APTRACE_SV_TS_SOURCE_TIMER_11)
- esp_timer high resolution timer (APTRACE_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE_SV_MAX_TASKS**
Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Configures maximum supported tasks in sysview debug

**CONFIG_APPTRACE_SV_BUF_WAIT_TMO**
Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE**
Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Trace Buffer Overflow” event.
CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
Task Start Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
Task Stop Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Stop Ready State” event.
CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

ESP-ASIO Contains:

- *CONFIG_ASIO_SSL_SUPPORT*
CONFIG_ASIO_SSL_SUPPORT

Enable SSL/TLS support of ASIO

Found in: Component config > ESP-ASIO

Enable support for basic SSL/TLS features, available for mbedtls/OpenSSL as well as wolfSSL TLS library.

Default value:
- No (disabled)

CONFIG_ASIO_SSL_LIBRARY_CHOICE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT

The ASIO support multiple backend TLS libraries. Currently the mbedtls with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:
- esp-openssl (ASIO_USE_ESP_OPENSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO_USE_ESP_WOLFSSL)

Bluetooth Contains:
- Bleedroid Options
- CONFIG_BT_ENABLED
- Bluetooth controller (ESP32 Dual Mode Bluetooth)
- CONFIG_BT_HOST
- NimBLE Options

CONFIG_BT_ENABLED

Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

Bluetooth controller (ESP32 Dual Mode Bluetooth) Contains:
- CONFIG_BTDM_CTRL_AUTO_LATENCY
- CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
- CONFIG_BTDM_CTRL_BLE_MAX_CONN
- CONFIG_BTDM_BLE_SCAN_DUPL
- CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
- CONFIG_BTDM_CTRL_MODE
- CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
- CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH

- CONFIG_BTDM_CTRL_HCI_MODE_CHOICE
- HCI UART (H4) Options
- CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT
- MODEM SLEEP Options
- CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG
- CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE
CONFIG_BTDM_CTRL_MODE

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

*Available options:*
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

CONFIG_BTDM_CTRL_BLE_MAX_CONN

BLE Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

*Range:*
- from 1 to 9 if BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM

*Default value:*
- 3 if BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM

CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

*Range:*
- from 1 to 7 if BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM

*Default value:*
- 2 if BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM

CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

*Range:*
- from 0 to 3 if BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM

*Default value:*
- 0 if BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM

CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”
Available options:
- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM Signal Config (Role and Polar)

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)

Default value:
- Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM

Contains:
- CONFIG_BTDM_CTRL_PCM_POLAR
- CONFIG_BTDM_CTRL_PCM_ROLE

CONFIG_BTDM_CTRL_PCM_ROLE

PCM Role

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM role can be configured as PCM master or PCM slave

Available options:
- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

CONFIG_BTDM_CTRL_PCM_POLAR

PCM Polar

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM polarity can be configured as Falling Edge or Rising Edge

Available options:
- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)

CONFIG_BTDM_CTRL_AUTO_LATENCY

Auto latency

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

Default value:
- No (disabled) if BTDM_CTRL_MODE_BTDM

CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT

Legacy Authentication Vendor Specific Event Enable

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled
Default value:
- Yes (enabled) if \( \text{BTDM_CTRL_MODE_BR_EDR_ONLY} \) || \( \text{BTDM_CTRL_MODE_BTDM} \)

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

Specify HCI mode as VHCI or UART(H4)

**Available options:**
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  - Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  - If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options**  Contains:
- **CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**
- **CONFIG_BTDM_CTRL_HCI_UART_NO**

**CONFIG_BTDM_CTRL_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**Range:**
- from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4

**Default value:**
- 1 if BTDM_CTRL_HCI_MODE_UART_H4

**CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

**Range:**
- from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4

**Default value:**
- 921600 if BTDM_CTRL_HCI_MODE_UART_H4
MODEM SLEEP Options
Contains:

- CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
- CONFIG_BTDM_CTRL_MODEM_SLEEP

CONFIG_BTDM_CTRL_MODEM_SLEEP
Bluetooth modem sleep

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode.

CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE
Bluetooth Modem sleep mode

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > MODEM SLEEP Options > CONFIG_BTDM_CTRL_MODEM_SLEEP*

To select which strategy to use for modem sleep

Available options:

- ORIG Mode (sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.

- EVED Mode (For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
  EVED mode is for BLE only and is only for internal test. Do not use it for production. this mode is not compatible with DFS nor light sleep

CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
Bluetooth low power clock

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > MODEM SLEEP Options*

Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

Available options:

- Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.

- External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g., 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

Available options:
- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

CONFIG_BTDM_BLE_SCAN_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)*

This select enables parameters setting of BLE scan duplicate.

Default value:
- Yes (enabled) if BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY

CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:
- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.
CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_SCAN_DUPL

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:
• from 10 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL

Default value:
• 200 if CONFIG_BTDM_BLE_SCAN_DUPL

CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Special duplicate scan mechanism for BLE Mesh scan

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_SCAN_DUPL

This enables the BLE scan duplicate for special BLE Mesh scan.

Default value:
• No (disabled) if CONFIG_BTDM_BLE_SCAN_DUPL

CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:
• from 10 to 1000 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Default value:
• 200 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED

BLE full scan feature supported

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

Default value:
• Yes (enabled) if BTDM_CTRL_MODE_BLEONLY || BTDM_CTRL_MODE_BTDM

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth)

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

Default value:
• Yes (enabled) if BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

The number of unprocessed advertising report that Bluedroid can save. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

Range:
• from 50 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
Default value:
• 100 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD

BLE adv lost event threshold value

Found in: Component config > Bluetooth > Bluetooth controller(ESP32 Dual Mode Bluetooth) > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

Range:
• from 1 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
Default value:
• 20 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

CONFIG_BT_HOST

Bluetooth Host

Found in: Component config > Bluetooth

This helps to choose Bluetooth host stack

Available options:
• Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
• NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
• Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

Bluedroid Options Contains:
• CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
• CONFIG_BT_BLUEDROID_MEM_DEBUG
• CONFIG_BT_BTU_TASK_STACK_SIZE
• `CONFIG_BT_BTC_TASK_STACK_SIZE`
  Bluetooth event (callback to application) task stack size

  Found in: Component config > Bluetooth > Bluedroid Options

  This select btc task stack size

  Default value:
  - 3072 if BT_BLUEDROID_ENABLED

• `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
  The cpu core which Bluedroid run

  Found in: Component config > Bluetooth > Bluedroid Options

  Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

  Available options:
  - Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
  - Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

• `CONFIG_BT_BTU_TASK_STACK_SIZE`
  Bluetooth Bluedroid Host Stack task stack size

  Found in: Component config > Bluetooth > Bluedroid Options

  This select btu task stack size

  Default value:
  - 4096 if BT_BLUEDROID_ENABLED

• `CONFIG_BT_BLUEDROID_MEM_DEBUG`
  Bluedroid memory debug

  Found in: Component config > Bluetooth > Bluedroid Options

  Bluedroid memory debug

  Default value:
  - No (disabled) if BT_BLUEDROID_ENABLED
CONFIG_BT_CLASSIC_ENABLED

Classic Bluetooth

*Found in:* Component config > Bluetooth > Bluedroid Options

For now this option needs “SMP_ENABLE” to be set to yes

CONFIG_BT_A2DP_ENABLE

A2DP

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED

CONFIG_BT_SPP_ENABLED

SPP

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

This enables the Serial Port Profile

**Default value:**

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED

**Default value:**

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED

CONFIG_BT_HFP_ROLE

Hands-free Profile Role configuration

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

**Available options:**

- Hands Free Unit (BT_HFP_CLIENT_ENABLE)
- Audio Gateway (BT_HFP_AG_ENABLE)

CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**

- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)
Chapter 2. API Reference

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**
- Yes (enabled) if BT_HFP_AUDIO_DATA_PATH_HCI

CONFIG_BT_HID_HOST_ENABLED

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED

CONFIG_BT_SSP_ENABLED

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**
- Yes (enabled) if CONFIG_BT_CLASSIC_ENABLED

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier
Default value:
• No (disabled) if `CONFIG_BT_GATTS_ENABLE`

**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

Default value:
• No (disabled) if `CONFIG_BT_GATTS_ENABLE`

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Server Profiles Count

Range:
• from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

Default value:
• 8 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATTs Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

Available options:
• GATTs manually send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)
  - Manually send service change indication through API
  - `esp_ble_gatts_send_service_change_indication()`
• GATTs automatically send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)
  - Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTC_ENABLE**

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

Default value:
• Yes (enabled) if `CONFIG_BT_BLE_ENABLED`

**CONFIG_BT_GATTC_CACHE_NVS_FLASH**

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*
This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE`

**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE`

**Default value:**
- 3 if `CONFIG_BT_GATTC_ENABLE`

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED`

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE`

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**
- No (disabled) if BT_BLUEEDROID_ENABLED

**BT DEBUG LOG LEVEL** Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
*CONFIG_BT_LOG_BTM_TRACE_LEVEL*

**BTM layer**

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)
• VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
RFCOMM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:
• NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_RFCOMM TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_RFCOMM_TRACE_LEVEL WARNING)
• API (BT_LOG_RFCOMM TRACE_LEVEL_API)
• EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL
SDP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:
• NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SDP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SDP TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL
GAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:
• NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GAP TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_GAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_GAP TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL
BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_PAN_TRACE_LEVEL**

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

**Available options:**

• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_A2D_TRACE_LEVEL**

A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer

**Available options:**

• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVDT_TRACE_LEVEL**

AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVDT layer

**Available options:**

• NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVDT_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVCT_TRACE_LEVEL**
AVCT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer

Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRC layer

Available options:
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

*Available options:*
• NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
• API (BT_LOG_APPL_TRACE_LEVEL_API)
• EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

*Available options:*
• NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
• API (BT_LOG_GATT_TRACE_LEVEL_API)
• EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

*Available options:*
• NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

*Available options:*
• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL
BTC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTC layer

Available options:
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL
OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer

Available options:
• NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
• API (BT_LOG_OSI_TRACE_LEVEL_API)
• EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL
BLUFI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BLUFI layer

Available options:
• NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
• API (BT_LOG_BLUFI_TRACE_LEVEL_API)
• EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_ACL_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count

**Range:**
- from 1 to 7 if BT_BLUEDROID_ENABLED

**Default value:**
- 4 if BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENABLE**

Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED
CONFIG_BT_BLE_ACT SCAN REP ADV SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY)

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATT OPEN EVT or ESP_GATT_OPEN_EVT is triggered.

**Range:**

- from 1 to 60 if BT_BLUEDROID_ENABLED

**Default value:**

- 30 if BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED

NimBLE Options  Contains:

- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
- CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_MESH
- CONFIG_BT_NIMBLE_ROLE_OBSERVER
- CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
- CONFIG_BT_NIMBLE_BLUFI_ENABLE
- CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
- CONFIG_BT_NIMBLE_USE_ESP_TIMER
• CONFIG_BT_NIMBLE_DEBUG
• CONFIG_BT_NIMBLE_HS_FLOW_CTRL
• CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE
• CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
• CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
• CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
• CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
• CONFIG_BT_NIMBLE_MAX_BONDS
• CONFIG_BT_NIMBLE_MAX_CCCDS
• CONFIG_BT_NIMBLE_MAX_CONNECTIONS
• CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
• CONFIG_BT_NIMBLE_MEM_ALLOC_MODE
• CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT
• CONFIG_BT_NIMBLE_LOG_LEVEL
• CONFIG_BT_NIMBLE_TASK_STACK_SIZE
• CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
• CONFIG_BT_NIMBLE_NVSS_PERSIST
• CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
• CONFIG_BT_NIMBLE_RPA_TIMEOUT
• CONFIG_BT_NIMBLE_SM_LEGACY
• CONFIG_BT_NIMBLE_SM_SC
• CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
• CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region.
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config” > Log output > Default log verbosity”.

Available options:

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Critical logs (BT_NIMBLE_LOG_LEVEL_CRIT)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
• Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
• Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS
Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure
BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-
C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

*Range:*
• from 1 to 9 if BT_NIMBLE_ENABLED

*Default value:*
• 3 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS
Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

*Default value:*
• 3 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS
Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

*Default value:*
• 8 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not
compiled in

*Range:*
• from 0 to 9 if BT_NIMBLE_ENABLED

*Default value:*
• 0 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify
no-affinity

*Available options:*
• Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
Chapter 2. API Reference

- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_TASK_STACK_SIZE**
NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**
Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**
Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_BROADCASTER**
Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_OBSERVER**
Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_NVS_PERSIST**
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options*

Enable security manager legacy pairing

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options*

Enable security manager secure connections

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

*Found in: Component config > Bluetooth > NimBLE Options*

This enables extra runtime asserts and host debugging

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

*Found in: Component config > Bluetooth > NimBLE Options*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_SM_SC

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

**Default value:**
- “nimble” if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
- 31 if BT_NIMBLE_ENABLED
Chapter 2. API Reference

**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**Default value:**

- 256 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ACL_BUF_COUNT**

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**Default value:**

- 20 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ACL_BUF_SIZE**

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE**

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 70 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT**

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*
This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

Default value:
- 30 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

Default value:
- 8 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT**

MSYS_1 Block Count

Found in: Component config > Bluetooth > NimBLE Options

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

Default value:
- 12 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

Found in: Component config > Bluetooth > NimBLE Options

Enable Host Flow control

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control interval in msecs

Default value:
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH**

Host Flow control threshold

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

Default value:
**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`

**CONFIG_BT_NIMBLE_RPA_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**

- from 1 to 41400 if BT_NIMBLE_ENABLED

**Default value:**

- 900 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

**Default value:**

- No (disabled) if BT_NIMBLE_ENABLED

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH`
CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

*Default value:*
- No (disabled) if CONFIG_BT_NIMBLE_MESH

CONFIG_BT_NIMBLE_MESH_LOW_POWER

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

*Default value:
• No (disabled) if `CONFIG_BT_NIMBLE_MESH`

**CONFIG_BT_NIMBLE_MESH_FRIEND**

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

• No (disabled) if `CONFIG_BT_NIMBLE_MESH`

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

• “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH`

**CONFIG_BT_NIMBLE_MESH_NODE_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**

• 1 if `CONFIG_BT_NIMBLE_MESH`

**CONFIG_BT_NIMBLE_MESH_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**

• 0 if `CONFIG_BT_NIMBLE_MESH`

**CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

• Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**
Chapter 2. API Reference

• 2000 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*
Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
• No (disabled)

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*
Defines maximum number of connection reattempts.

**Range:**
• from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

**Default value:**
• 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

CONFIG_BT_NIMBLE_BLUFI_ENABLE
Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*
Set this option to enable blufi functionality.

**Default value:**
• No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_USE_ESP_TIMER
Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*
Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**
• Yes (enabled)

CONFIG_BLE_MESH
ESP BLE Mesh Support

*Found in: Component config*
This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:
• BLE Mesh and BLE coexistence support
• CONFIG_BLE_MESH_GATT_PROXY_CLIENT
• CONFIG_BLE_MESH_GATT_PROXY_SERVER
• BLE Mesh NET BUF DEBUG LOG LEVEL
• CONFIG_BLE_MESH_PROV
• CONFIG_BLE_MESH_PROXY
• BLE Mesh specific test option
• BLE Mesh STACK DEBUG LOG LEVEL
• CONFIG_BLE_MESH_NO_LOG
• CONFIG_BLE_MESH_IVU_DIVIDER
• CONFIG_BLE_MESH_FAST_PROV
• CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
• CONFIG_BLE_MESH_CRP
• CONFIG_BLE_MESH_RX_SDU_MAX
• CONFIG_BLE_MESH_MODEL_KEY_COUNT
• CONFIG_BLE_MESH_APP_KEY_COUNT
• CONFIG_BLE_MESH_MODEL_GROUP_COUNT
• CONFIG_BLE_MESH_LABEL_COUNT
• CONFIG_BLE_MESH_SUBNET_COUNT
• CONFIG_BLE_MESH_TX_SEG_MAX
• CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_MEM_ALLOC_MODE
• CONFIG_BLE_MESH_MSG_CACHE_SIZE
• CONFIG_BLE_MESH_ADV_BUF_COUNT
• CONFIG_BLE_MESH_PB_GATT
• CONFIG_BLE_MESH_PB_ADV
• CONFIG_BLE_MESH_RELAY
• CONFIG_BLE_MESH_SETTINGS
• CONFIG_BLE_MESH_DEINIT
• CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
  Support for BLE Mesh Client/Server models
  Support for BLE Mesh Foundation models
• CONFIG_BLE_MESH_NODE
• CONFIG_BLE_MESH_PROVISIONER
• CONFIG_BLE_MESH_FRIEND
• CONFIG_BLE_MESH_LOW_POWER
• CONFIG_BLE_MESH_HCI_5_0
• CONFIG_BLE_MESH_IV_UPDATE_TEST
• CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

• Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**Default value:**

• Yes (enabled) if `BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH`
CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > CONFIG_BLE_MESH

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if (CONFIG_ESP32_SPIRAM_SUPPORT || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
• Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

**CONFIG_BLE_MESH_DEINIT**
Support de-initialize BLE Mesh stack

*Found in:* Component config > CONFIG_BLE_MESH
If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

**Default value:**
• Yes (enabled) if CONFIG_BLE_MESH

**BLE Mesh and BLE coexistence support**  Contains:
• CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
• CONFIG_BLE_MESH_SUPPORT_BLE_ADV

**CONFIG_BLE_MESH_SUPPORT_BLE_ADV**
Support sending normal BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support
When selected, users can send normal BLE advertising packets with specific API.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT**
Number of advertising buffers for BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Number of advertising buffers for BLE packets available.

**Range:**
• from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

**Default value:**
• 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SUPPORT_BLE_SCAN**
Support scanning normal BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support
When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER
Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM
Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_PROV_NODES
Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**
- from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
• 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

*Range:*
  • from 1 to 10 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 2 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

*Range:*
  • from 1 to 5 if CONFIG_BLE_MESH_PB_GATT && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 1 if CONFIG_BLE_MESH_PB_GATT && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

*Range:*
  • from 1 to 4096 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

*Range:*
  • from 1 to 4096 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROVISIONER_RECV_HB
Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE
Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**

- 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROV
BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_PB_ADV
Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL
Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.
Chapter 2. API Reference

CONFIG_BLE_MESH_PB_GATT
Provisioning support using GATT (PB-GATT)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY
BLE Mesh Proxy protocol support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_SERVER
BLE Mesh GATT Proxy Server

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH_NODE &amp; CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE_ID_TIMEOUT
Node Identity advertising timeout

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

Range:
- from 1 to 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER &amp; CONFIG_BLE_MESH

Default value:
- 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER &amp; CONFIG_BLE_MESH
**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in*: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

*Range:*
- from 1 to 32767 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

*Default value:*
- 4 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in*: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

*Default value:*
- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in*: Component config > CONFIG_BLE_MESH

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

*Default value:*
- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in*: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

*Range:*
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

*Default value:*
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SEQ_STORE_RATE**
How often the sequence number gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:
- No (disabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS
When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**
- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH

**Default value:**
- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG_BLE_MESH*
This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_APP_KEY_COUNT**
Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**
Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**
Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LABEL_COUNT**
Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**
- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

Range:
- from 2 to 65535 if CONFIG_BLE_MESH

Default value:
- 10 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Found in: Component config > CONFIG_BLE_MESH

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:
- from 2 to 65535 if CONFIG_BLE_MESH

Default value:
- 10 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

Found in: Component config > CONFIG_BLE_MESH

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:
- from 6 to 256 if CONFIG_BLE_MESH

Default value:
- 60 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

Found in: Component config > CONFIG_BLE_MESH

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to
happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**
- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**
- 384 if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

Range:

• from 2 to 32 if CONFIG_BLE_MESH

Default value:

• 32 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

Default value:

• Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:

• No (disabled) if CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

Range:

• from 6 to 256 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

Default value:

• 60 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_LOWPOWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOWPOWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOWPOWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOWPOWER && CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOWPOWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
Chapter 2. API Reference

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH

Default value:
- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**

RSSI Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**
- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_LPN_POLL_TIMEOUT

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

*Range:*
- from 10 to 244735 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

*Default value:*
- 300 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

*Range:*
- from 10 to if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

*Default value:*
- if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

*Range:*
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

*Default value:*
- 10 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

*Range:*
- from 0 to 16384 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

*Default value:*
- 8 if CONFIG_BLE_MESH_LOW_POWER &amp; &amp; CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND
Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

BLE Mesh STACK DEBUG LOG LEVEL

Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**

- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**

- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)

- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout (ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

*Range:*
- from 100 to 1200000 if `CONFIG_BLE_MESH`

*Default value:*
- 4000 if `CONFIG_BLE_MESH`

**Support for BLE Mesh Foundation models**  
Contains:
- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG_BLE_MESH_HEALTH_SRV**

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

*Default value:*
- Yes (enabled) if `CONFIG_BLE_MESH`

**Support for BLE Mesh Client/Server models**  
Contains:
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
Chapter 2. API Reference

- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_LEVEL_CLI**

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

**CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

**CONFIG_BLE_MESH_GENERIC_BATTERY_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.
CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
Scheduler Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model
*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light CTL Client model.
CONFIG_BLE_MESH_LIGHT_HSL_CLI
Light HSL Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
Light XYL Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI
Light LC Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER
Generic server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SENSOR_SERVER
Sensor server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TIME_SCENE_SERVER
Time and Scenes server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LIGHTING_SERVER
Lighting server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option** Contains:
- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_SELF_TEST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_USE_WHITE_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

CoAP Configuration Contains:

- `CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE`
- `CONFIG_COAP_MBEDTLS_DEBUG`

CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE

CoAP Encryption method

*Found in:* Component config > CoAP Configuration

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)

- Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
- Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

Available options:

- Pre-Shared Keys (COAP_MBEDTLS_PSK)
- PKI Certificates (COAP_MBEDTLS_PKI)
CONFIG_COAP_MBEDTLS_DEBUG

Enable CoAP debugging

*Found in: Component config > CoAP Configuration*

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call coap_set_log_level() at runtime in order to enable CoAP debug output via the ESP log mechanism.

**Default value:**
- No (disabled)

CONFIG_COAP_MBEDTLS_DEBUG_LEVEL

Set CoAP debugging level

*Found in: Component config > CoAP Configuration > CONFIG_COAP_MBEDTLS_DEBUG*

Set CoAP debugging level

**Available options:**
- Emergency (COAP_LOG_EMERG)
- Alert (COAP_LOG_ALERT)
- Critical (COAP_LOG_CRIT)
- Error (COAP_LOG_ERROR)
- Warning (COAP_LOG_WARNING)
- Notice (COAP_LOG_NOTICE)
- Info (COAP_LOG_INFO)
- Debug (COAP_LOG_DEBUG)

Driver configurations
Contains:

- ADC configuration
- GPIO Configuration
- RTCIO configuration
- SPI configuration
- TWAI configuration
- UART configuration

ADC configuration
Contains:

- CONFIG_ADC_DISABLE_DAC
- CONFIG_ADC_FORCE_XPD_FSM

CONFIG_ADC_FORCE_XPD_FSM

Use the FSM to control ADC power

*Found in: Component config > Driver configurations > ADC configuration*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**Default value:**
- No (disabled)
CONFIG_ADC_DISABLE_DAC
Disables DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

**SPI configuration**
Contains:
- CONFIG_SPI_MASTER_ISR_IN_IRAM
- CONFIG_SPI_SLAVE_ISR_IN_IRAM
- CONFIG_SPI_MASTER_IN_IRAM
- CONFIG_SPI_SLAVE_IN_IRAM

**CONFIG_SPI_MASTER_IN_IRAM**
Places transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

**CONFIG_SPI_MASTER_ISR_IN_IRAM**
Places SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_SLAVE_IN_IRAM**
Places transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI configuration**

Contains:
- **CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**
- **CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**
- **CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**
- **CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**
- **CONFIG_TWAI_ISR_IN_IRAM**

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver configurations > TWAI configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver configurations > TWAI configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**

Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver configurations > TWAI configuration*
On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**

Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**

Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**
- No (disabled)

**UART configuration**  Contains:
- **CONFIG_UART_ISR_IN_IRAM**

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled)

**RTCIO configuration**  Contains:
- **CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC**
CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC
Support array rtc_gpio_desc for ESP32

*Found in: Component config > Driver configurations > RTCIO configuration*

The array rtc_gpio_desc will not compile by default. If this option is selected, the array rtc_gpio_desc can be compile. If user use this array, please enable this configuration.

**Default value:**
- No (disabled)

GPIO Configuration  
Contains:
- CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL

CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL
Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: Component config > Driver configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

eFuse Bit Manager  
Contains:
- CONFIG_EFUSE_CODE_SCHEME_SELECTOR
- CONFIG_EFUSE_VIRTUAL
- CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_CUSTOM_TABLE
Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAMETE  
Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_VIRTUAL
Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.
During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the `efuse` partition.

partition.csv:
```
o efuse_em, data, efuse,, 0x2000,
```

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**
- None Only (EFUSE_CODE_SCHEME_COMPATNONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS**

Contains:
- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

**CONFIG_ESP_TLS_USE_SECURE_ELEMENT**
Use Secure Element (ATECC608A) with ESP-TLS

*Found in:* Component config > ESP-TLS

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESP-WROOM32SE, which can be used for TLS connection.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_SERVER**

Enable ESP-TLS Server

*Found in:* Component config > ESP-TLS

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in:* Component config > ESP-TLS

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_INSECURE**

Allow potentially insecure options

*Found in:* Component config > ESP-TLS

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in:* Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**

Enable SMALL_CERT_VERIFY

*Found in:* Component config > ESP-TLS
Chapter 2. API Reference

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust up to the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

**CONFIG_ESP_DEBUG_WOLFSSL**

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**Default value:**
- No (disabled) if ESP_TLS_USING_WOLFSSL

**ESP32-specific**

Contains:
- CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
- CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS
- CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS
- CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ
- CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL
- CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY
- CONFIG_ESP32_ULP_COPROC_ENABLED
- CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP32_BROWNOUT_DET
- CONFIG_ESP32_XTAL_FREQ_SEL
- CONFIG_ESP32_DEBUG_OCDAWARE
- CONFIG_ESP32_REV_MIN
- CONFIG_ESP32_NO_BLOBS
- CONFIG_ESP32_RTC_XTAL_CAL_RETRY
- CONFIG_ESP32_RTC_CLK_CAL_CYCLES
- CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE
- CONFIG_ESP32_RTCDATA_IN_FAST_MEM
- CONFIG_ESP32_RTC_CLK_SRC
- CONFIG_ESP32_SPIRAM_SUPPORT
- CONFIG_ESP32_TIME_SYSCALL
- CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE
- CONFIG_ESP32_TRAX

**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

*Found in: Component config > ESP32-specific*

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

**Available options:**
- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)
**CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP32-specific*

CPU frequency to be set on application startup.

**Available options:**

- 40 MHz (ESP32_DEFAULT_CPU_FREQ_40)
- 80 MHz (ESP32_DEFAULT_CPU_FREQ_80)
- 160 MHz (ESP32_DEFAULT_CPU_FREQ_160)
- 240 MHz (ESP32_DEFAULT_CPU_FREQ_240)

**CONFIG_ESP32_SPIRAM_SUPPORT**

Support for external, SPI-connected RAM

*Found in: Component config > ESP32-specific*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**

- No (disabled)

**SPI RAM config**

Contains:

- CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
- CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY
- CONFIG_SPIRAM_SPIWP_SD3_PIN
- CONFIG_SPIRAM_BANKSWITCH_ENABLE
- CONFIG_SPIRAM_2T_MODE
- CONFIG_SPIRAM_CACHE_WORKAROUND
- CONFIG_SPIRAM_BOOT_INIT
- CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL
- PSRAM clock and cs IO for ESP32-D2WD
- PSRAM clock and cs IO for ESP32-DOWD
- PSRAM clock and cs IO for ESP32-PICO
- CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
- CONFIG_SPIRAM_MEMTEST
- CONFIG_SPIRAM_SPEED
- CONFIG_SPIRAM_OCCUPY_SPI_HOST
- CONFIG_SPIRAM_USE
- SPIRAM cache workaround debugging
- SPIRAM workaround libraries placement
- CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
- CONFIG_SPIRAM_TYPE
- CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

**Available options:**

- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)
CONFIG_SPIRAM_SPEED

Set RAM clock speed

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode (80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP- TOOLPY_FLASHFREQ_80M is true)

**Available options:**
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

CONFIG_SPIRAM_BOOT_INIT

Initialize SPI RAM during startup

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**Default value:**
- Yes (enabled) if CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_IGNORE_NOTFOUND

Ignore PSRAM when not found

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT

Normally, if psmram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**Default value:**
- No (disabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_USE

SPI RAM access method

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

**Available options:**
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM) (SPIRAM_USE_CAPS_ALLOC)
• Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

*Default value:*

• Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

*Range:*

• from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

*Default value:*

• 16384 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

*Default value:*

• No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

ReservethisamountofbytesfordatathatspecificallyneedstobeinDMAorinternalmemory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

*Range:*

• from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT
Default value:
- 32768 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If enabled, variables with EXT_RAM_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_ATTR will be zero initialized.

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

Default value:
- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32_SPIRAM_SUPPORT

**SPIRAM cache workaround debugging**  Contains:

- **CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

Workaround strategy

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

Available options:
- Insert memw after vulnerable instructions (default) (SPIRAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPIRAM_CACHE_WORKAROUND_STRATEGY_NOPS)
SPIRAM workaround libraries placement  Contains:

- CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM

Put libc’s jump related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM

Put libc’s math related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: abs, div, labs, ldiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM

Put libc’s number parsing related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM

Put libc’s I/O related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: wertomb, fwrite, wbuf, wsetup, fputwc, wctomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

Put libc’s time related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: asctime, asctime_r, ctime, ctime_r, localtime, localtime_r, gmtime, gmtime_r, strftime, mktime, tzset_r, tzset, time, getzinfo, systimes, month_lengths, timelocal, tzvars, tzlock, tzcalc_limits, and strftime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM

Put libc’s characters related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: ctype_, toupper, tolower, toascii,strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM

Put libc’s memory related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: memccpy, memchr memmove, and memrchr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM

Put libc’s string related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_SPI32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcasecmp, strdsnp, strdup, strdup_r, strleat, strlcpy, strlen, strlwr, strlecasnp, strncmp, strncasecp, strncpy, strndup, strndup_r, strlchr, strsep, strspn, strsr, strsrk_r, and strupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPI32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM

Put libc’s random related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_SPI32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: srand, rand, and rand_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPI32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM

Put libc’s environment related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_SPI32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: environ, envlock, and getenv_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPI32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM

Put libc’s file related functions in IRAM

*Found in:* Component config > ESP32-specific > CONFIG_SPI32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, sbrk, stdio, syssbrk, syscall, sysopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPI32_SPIRAM_SUPPORT
Chapter 2. API Reference

**CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**

Put libc’s miscellaneous functions in IRAM, see help

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: raise and system. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_BANKSWITCH_ENABLE**

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_spiram_writeback_cache needs some kind of mapping of some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

**Default value:**
- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_BANKSWITCH_RESERVE**

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

**Range:**
- from 1 to 62 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**Default value:**
- 8 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason...
xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

**Default value:**
- No (disabled) if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPIRAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**
- HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
- VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
- Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD** Contains:

- CONFIG_D0WD_PSRAM_CLK_IO
- CONFIG_D0WD_PSRAM_CS_IO

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPIRAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**
- 17 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_D0WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPIRAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**
- 16 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT
PSRAM clock and cs IO for ESP32-D2WD Contains:

- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`

`CONFIG_D2WD_PSRAM_CLK_IO`

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*
  - from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

*Default value:*
  - 9 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

`CONFIG_D2WD_PSRAM_CS_IO`

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 17.

*Range:*
  - from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

*Default value:*
  - 10 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

PSRAM clock and cs IO for ESP32-PICO Contains:

- `CONFIG_PICO_PSRAM_CS_IO`

`CONFIG_PICO_PSRAM_CS_IO`

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

*Range:*
  - from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

*Default value:*
  - 10 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`
CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psramp only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

**Default value:**

- No (disabled) if (ESP TOOLPY_FLASHMODE_DIO || ESP TOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_SPIWP_SD3_PIN

Custom SPI PSRAM WP(SD3) Pin

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

**Range:**

- from 0 to 33 if (ESP TOOLPY_FLASHMODE_DIO || ESP TOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**

- 7 if (ESP TOOLPY_FLASHMODE_DIO || ESP TOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_2T_MODE

Enable SPI PSRAM 2T mode

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

**Default value:**

- No (disabled) if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_ESP32_TRAX

Use TRAX tracing feature

*Found in:* Component config > ESP32-specific
The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
- No (disabled)

**CONFIG_ESP32_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP32-specific > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**
- No (disabled) if `CONFIG_ESP32_TRAX && CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP32_ULP_COPROC_ENABLED**

Enable Ultra Low Power (ULP) Coprocessor

*Found in: Component config > ESP32-specific*

Set to ‘y’ if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

**Default value:**
- No (disabled)

**CONFIG_ESP32_ULP_COPROC_RESERVE_MEM**

RTC slow memory reserved for coprocessor

*Found in: Component config > ESP32-specific > CONFIG_ESP32_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP coprocessor firmware & data.

Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if `CONFIG_ESP32_ULP_COPROC_ENABLED`
- from 0 to 0 if `CONFIG_ESP32_ULP_COPROC_ENABLED`

**Default value:**
- 512 if `CONFIG_ESP32_ULP_COPROC_ENABLED`
- 0 if `CONFIG_ESP32_ULP_COPROC_ENABLED`

**CONFIG_ESP32_DEBUG_OCDAWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP32-specific*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)
CONFIG_ESP32_BROWNOUT_DET

Hardware brownout detect & reset

*Found in: Component config > ESP32-specific*

The ESP32 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
- Yes (enabled)

CONFIG_ESP32_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in: Component config > ESP32-specific > CONFIG_ESP32_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP32 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_7)

CONFIG_ESP32_TIME_SYSCALL

Timers used for gettimeofday function

*Found in: Component config > ESP32-specific*

This setting defines which hardware timers are used to implement `gettimeofday` and `time` functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

**Available options:**
- RTC and high-resolution timer (ESP32_TIME_SYSCALL_USE_RTC_FRC1)
- RTC (ESP32_TIME_SYSCALL_USE_RTC)
- High-resolution timer (ESP32_TIME_SYSCALL_USE_FRC1)
- None (ESP32_TIME_SYSCALL_USE_NONE)

CONFIG_ESP32_RTC_CLK_SRC

RTC clock source

*Found in: Component config > ESP32-specific*
Choose which clock is used as RTC clock source.

- “Internal 150kHz oscillator” option provides lowest deep sleep current consumption, and does not require extra external components. However, frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- “External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
- “External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin can not be used as a GPIO in this case.
- “Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

Available options:

- Internal 150kHz RC oscillator (ESP32_RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (ESP32_RTC_CLK_SRC_EXT_CRYST)
- External 32kHz oscillator at 32K_XN pin (ESP32_RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (ESP32_RTC_CLK_SRC_INT_8MD256)

**CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD**

Additional current for external 32kHz crystal

*Found in: Component config > ESP32-specific*

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allow all wakeup sources, and save some code size.

- “None” option will not provide additional current to external crystal
- “Method 1” option can’t ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
- “Method 2” option can solve the external 32k issue, but the touchpad can’t work in this method.

Available options:

- None (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
- Method 1 (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT)
- Method 2 (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_V2)

**CONFIG_ESP32_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > ESP32-specific*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:
150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:
- from 0 to 27000 if ESP32_RTC_CLK_SRC_EXT_Crys || ESP32_RTC_CLK_SRC_EXT_Osc || ESP32_RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

Default value:
- 3000 if ESP32_RTC_CLK_SRC_EXT_Crys || ESP32_RTC_CLK_SRC_EXT_Osc || ESP32_RTC_CLK_SRC_INT_8MD256
- 1024

CONFIG_ESP32_RTC_XTAL_CAL_RETRY

Number of attempts to repeat 32k XTAL calibration

Found in: Component config > ESP32-specific

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

Default value:
- 1 if ESP32_RTC_CLK_SRC_EXT_Crys

CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

Found in: Component config > ESP32-specific

When ESP32 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

Range:
- from 0 to 5000

Default value:
- 2000

CONFIG_ESP32_XTAL_FREQ_SEL

Main XTAL frequency

Found in: Component config > ESP32-specific

ESP32 currently supports the following XTAL frequencies:
- 26 MHz
- 40 MHz

Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.
Available options:
- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
- Autodetect (ESP32_XTAL_FREQ_AUTO)

CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE
Permanently disable BASIC ROM Console

*Found in: Component config > ESP32-specific*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an

eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**
- No (disabled)

CONFIG_ESP32_NO_BLOBS

No Binary Blobs

*Found in: Component config > ESP32-specific*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling

this Wi-Fi/Bluetooth will not work.

**Default value:**
- No (disabled) if CONFIG_BT_ENABLED

CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Component config > ESP32-specific*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

**Default value:**
- No (disabled)

CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Component config > ESP32-specific*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.
If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**
- No (disabled)

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment.

*Found in: Component config > ESP32-specific*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size.

*Found in: Component config > ESP32-specific*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

**Default value:**
- No (disabled)

**CONFIG_ESP32_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size.

*Found in: Component config > ESP32-specific > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE*

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BT_RESERVE_DRAM if Bluetooth controller is enabled.

**Range:**
- from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**Default value:**
- “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL**

Disable the interrupt level for the DPORT workarounds.

*Found in: Component config > ESP32-specific*

To prevent interrupting DPORT workarounds, need to disable interrupt with a maximum used level in the system.

**Default value:**
- 5
CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

Enable IRAM as 8 bit accessible memory

*Found in: Component config > ESP32-specific*

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

ADC-Calibration Contains:

- CONFIG_ADC_CAL_EFUSE_VREF_ENABLE
- CONFIG_ADC_CAL_LUT_ENABLE
- CONFIG_ADC_CAL_EFUSE_TP_ENABLE

CONFIG_ADC_CAL_EFUSE_TP_ENABLE

Use Two Point Values

*Found in: Component config > ADC-Calibration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CAL_EFUSE_VREF_ENABLE

Use eFuse Vref

*Found in: Component config > ADC-Calibration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CAL_LUT_ENABLE

Use Lookup Tables

*Found in: Component config > ADC-Calibration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)

Common ESP-related Contains:

- CONFIG_ESP_ERR_TO_NAME_LOOKUP
CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

Found in: Component config > Common ESP-related

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

Default value:
• Yes (enabled)

Ethernet Contains:

• CONFIG_ETH_USE_ESP32_EMAC
• CONFIG_ETH_USE_OPENETH
• CONFIG_ETH_USE_SPI_ETHERNET

CONFIG_ETH_USE_ESP32_EMAC

Support ESP32 internal EMAC controller

Found in: Component config > Ethernet

ESP32 integrates a 10/100M Ethernet MAC controller.

Default value:
• Yes (enabled)

Contains:

• CONFIG_ETH_DMA_RX_BUFFER_NUM
• CONFIG_ETH_DMA_TX_BUFFER_NUM
• CONFIG_ETH_SOFT_FLOW_CONTROL
• CONFIG_ETH_DMA_BUFFER_SIZE
• CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0
• CONFIG_ETH_PHY_INTERFACE
• CONFIG_ETH_RMII_CLK_OUTPUT_GPIO
• CONFIG_ETH_RMII_CLK_MODE

CONFIG_ETH_PHY_INTERFACE

PHY interface

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Select the communication interface between MAC and PHY chip.

Available options:
• Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

CONFIG_ETH_RMII_CLK_MODE

RMII clock mode

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Select external or internal RMII clock.

Available options:
• Input RMII clock from external (ETH_RMII_CLK_INPUT) MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
• Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external
  PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

### CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure
GPIO0 to output a 50MHz clock. In fact this clock doesn’ t have directly relationship with EMAC
peripheral. Sometimes this clock won’ t work well with your PHY chip. You might need to add some
extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental
practice. If you want the Ethernet to work with WiFi, don’ t select GPIO0 output mode for stability.

*Default value:*
  • No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

### CONFIG_ETH_RMII_CLK_OUT_GPIO

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

*Range:*
  • from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

*Default value:*
  • 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

### CONFIG_ETH_DMA_BUFFER_SIZE

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

*Range:*
  • from 256 to 1600

*Default value:*
  • 512

### CONFIG_ETH_DMA_RX_BUFFER_NUM

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’ s size is ETH_DMA_BUFFER_SIZE. Larger number
of buffers could increase throughput somehow.

*Range:*
  • from 3 to 30

*Default value:*
  • 10
**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

**CONFIG_ETH_SOFT_FLOW_CONTROL**

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**
- No (disabled) if CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_USE_SPI_ETHERNET**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

**Contains:**
- CONFIG_ETH_SPI_ETHERNET_DM9051
- CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
- CONFIG_ETH_SPI_ETHERNET_W5500

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG_ETH_SPI_ETHERNET_W5500**

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.
**CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL**

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

**CONFIG_ETH_USE_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:

- CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 4 if CONFIG_ETH_USE_OPENETH

**CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 1 if CONFIG_ETH_USE_OPENETH

**Event Loop Library**

Contains:

- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*
Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**
- No (disabled)

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

**Default value:**
- Yes (enabled)

**GDB Stub**

Contains:
- **CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

**CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using `info threads` command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**CONFIG_ESP_GDBSTUB_MAX_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**
- 32 if **CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

**ESP HTTP client**

Contains:
- **CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**
- **CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**
- **CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**
Chapter 2. API Reference

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**
- Yes (enabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**
- Yes (enabled)

**HTTP Server** Contains:

- **CONFIG_HTTPD_PURGE_BUF_LEN**
- **CONFIG_HTTPD_LOG_PURGE_DATA**
- **CONFIG_HTTPD_MAX_REQ_HDR_LEN**
- **CONFIG_HTTPD_MAX_URI_LEN**
- **CONFIG_HTTPD_ERR_RESP_NO_DELAY**
- **CONFIG_HTTPD_WS_SUPPORT**

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**
- 512

**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server
Default value:
  • 512

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

Default value:
  • Yes (enabled)

**CONFIG_HTTPD_PURGE_BUF_LEN**

Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

Default value:
  • 32

**CONFIG_HTTPD_LOG_PURGE_DATA**

Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

Default value:
  • No (disabled)

**CONFIG_HTTPD_WS_SUPPORT**

WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

Default value:
  • No (disabled)

**ESP HTTPS OTA**

Contains:

  • **CONFIG_OTA_ALLOW_HTTP**
CONFIG_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: Component config > ESP HTTPS OTA

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of:
- Non-encrypted communication channel with server
- Accepting firmware upgrade image from server with fake identity

Default value:
- No (disabled)

ESP HTTPS server Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

Found in: Component config > ESP HTTPS server

Enable ESP HTTPS server component

Hardware Settings Contains:

- MAC Config
- Sleep Config

MAC Config Contains:

- CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

Found in: Component config > Hardware Settings > MAC Config

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Available options:
- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

Sleep Config Contains:

- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
CONFIG_ESP_SLEEP_POWER_DOWN_FLASH

Power down flash in light sleep when there is no SPIRAM

*Found in:* Component config > Hardware Settings > Sleep Config

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured. This option will in fact consider VDD_SDIO auto power value (ESP_PD_OPTION_AUTO) as OFF. Also, it is possible to force a power domain to stay ON during light sleep by using esp_sleep_pd_config() function.

**Default value:**
- Yes (enabled)

LCD and Touch Panel  
Contains:

- LCD Peripheral Configuration

LCD Peripheral Configuration

ESP NETIF Adapter  
Contains:

- CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER
- CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL
- CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

*Found in:* Component config > ESP NETIF Adapter

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

TCP/IP Stack Library

*Found in:* Component config > ESP NETIF Adapter

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**
- LwIP (ESP_NETIF_TCPIP_LWIP)  
  LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)  
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only
CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER

Enable backward compatible tcpip_adapter interface

*Found in: Component config > ESP NETIF Adapter*

Backward compatible interface to tcpip_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

**Default value:**
- Yes (enabled)

PHY  
Contains:
- `CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP32_REDUCE_PHY_TX_POWER`
- `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`

CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

**Default value:**
- Yes (enabled)

CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_ESP32_PHY_DEFAULT_INIT_IF_INVALID`
- `CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN`
CONFIG_ESP32_PHY_DEFAULT_INIT_IF_INVALID

Reset default PHY init data if invalid

*Found in:* Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

**Default value:**
- No (disabled) if CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN

Support multiple PHY init data bin

*Found in:* Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

**Default value:**
- No (disabled) if CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION && CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN

CONFIG_ESP32_PHY_INIT_DATA_ERROR

Terminate operation when PHY init data error

*Found in:* Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**
- No (disabled) if CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN && CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER

Max WiFi TX power (dBm)

*Found in:* Component config > PHY

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

CONFIG_ESP32_REDUCE_PHY_TX_POWER

Reduce PHY TX power when brownout reset

*Found in:* Component config > PHY
When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled)

**Power Management**  
Contains:
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PM_RTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

**CONFIG_PM_ENABLE**  
Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled)

**CONFIG_PM_DFS_INIT_AUTO**  
Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_USE_RTC_TIMER_REF**  
Use RTC timer to prevent time drift (EXPERIMENTAL)

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

When APB clock frequency changes, high-resolution timer (esp_timer) scale and base value need to be adjusted. Each adjustment may cause small error, and over time such small errors may cause time drift. If this option is enabled, RTC timer will be used as a reference to compensate for the drift. It is recommended that this option is only used if 32k XTAL is selected as RTC clock source.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE` && ESP_TIMER_IMPL_FRC2

**CONFIG_PM_PROFILING**  
Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.
Default value:
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_TRACE
Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

Default value:
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT
Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT
Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO
Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call ‘gpio_sleep_sel_dis’ to disable this feature on those pins. You can also keep this feature on and call ‘gpio_sleep_set_direction’ and ‘gpio_sleep_set_pull_mode’ to have a different GPIO configuration at sleep. Waring: If you want to enable this option on ESP32, you should enable GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL at first, otherwise you will not be able to switch pullup/pulldown mode.

ESP System Settings Contains:
- CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES
- CONFIG_ESP_CONSOLE_UART
- CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP
- CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE
- CONFIG_ESP_TASK_WDT
- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_INT_WDT
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY
Chapter 2. API Reference

- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- Memory protection
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

`CONFIG_ESP_SYSTEM_PANIC`

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**

- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime. This feature will switch system to single core mode.

`CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

`CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.
Memory protection

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**
System event queue size

*Found in: Component config > ESP System Settings*
Config system event queue size in different application.

**Default value:**
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**
Event loop task stack size

*Found in: Component config > ESP System Settings*
Config system event task stack size in different application.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**
Main task stack size

*Found in: Component config > ESP System Settings*
Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**
Main task core affinity

*Found in: Component config > ESP System Settings*
Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**
Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*
Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**
- 2048
CONFIG_ESP_CONSOLE_UART

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**

- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- USB CDC (ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app. If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

**Available options:**

- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**

- 1 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_RX_GPIO
UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE

**Default value:**
- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in miliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
- from 10 to 10000
Default value:
- 300 if `CONFIG_ESP32_SPIRAM_SUPPORT` & `CONFIG_ESP_INT_WDT`
- 800 if `CONFIG_ESP32_SPIRAM_SUPPORT` & `CONFIG_ESP_INT_WDT`

```cpp
CONFIG_ESP_INT_WDT_CHECK_CPU1
```

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_INT_WDT` & `CONFIG_FREERTOS_UNICORE`

```cpp
CONFIG_ESP_TASK_WDT
```

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

**Default value:**
- Yes (enabled)

```cpp
CONFIG_ESP_TASK_WDT_PANIC
```

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)

```cpp
CONFIG_ESP_TASK_WDT_TIMEOUT_S
```

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

```cpp
CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0
```

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.
**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**
Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_TASK_WDT` & `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_IPC_TASK_STACK_SIZE**
Inter-Processor Call (IPC) task stack size

*Found in: Component config > ESP System Settings*

Configure the IPC tasks stack size. One IPC task runs on each core (in dual core mode), and allows for cross-core function calls.

See IPC documentation for more details.

The default stack size should be enough for most common use cases. It can be shrunk if you are sure that you do not use any custom IPC functionality.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**
IPC runs at caller’s priority

*Found in: Component config > ESP System Settings*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, and hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**
- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_PANIC_HANDLER_IRAM**
Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)
High resolution timer (esp_timer) Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_IMPL
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

*Default value:*
- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS menu.”

*Range:*
- from 2048 to 65536

*Default value:*
- 3584

**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

*Range:*
- from 1 to 3
- from 1 to 1

*Default value:*
- 1

**CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task.
ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

Default value:
- No (disabled)

CONFIG_ESP_TIMER_IMPL

Hardware timer to use for esp_timer

Found in: Component config > High resolution timer (esp_timer)

esp_timer APIs can be implemented using different hardware timers.
- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for non ESP32 chips.

Available options:
- FRC2 (legacy) timer (ESP_TIMER_IMPL_FRC2)
- LAC timer of Timer Group 0 (ESP_TIMER_IMPL_TG0_LAC)
- SYSTIMER (ESP_TIMER_IMPL_SYSTIMER)

Wi-Fi Contains:
- CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE
- CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN
- CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
- CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE
- CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE
- CONFIG_ESP32_WIFI_TX_BUFFER
- CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED
- CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED
- CONFIG_ESP32_WIFI_CSI_ENABLED
- CONFIG_ESP32_WIFI_IRAM_OPT
- CONFIG_ESP32_WIFI_MGMT_SBUF_NUM
- CONFIG_ESP32_WIFI_NVFS_ENABLED
- CONFIG_ESP32_WIFI_RX_IRAM_OPT
- CONFIG_ESP_WIFI_SLP_IRAM_OPT
- CONFIG_ESP32_WIFI_TASK_CORE_ID

CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE

Software controls WiFi/Bluetooth coexistence

Found in: Component config > Wi-Fi

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

Default value:
- Yes (enabled) if CONFIG_BT_ENABLED
**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
  - from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

*Default value:*
  - 16 if ESP32_WIFI_STATIC_TX_BUFFER

**CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

*Range:*
  - from 16 to 128 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

*Default value:*
  - 32 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
  - from 1 to 128

*Default value:*
  - 32

**CONFIG_ESP32_WIFI_CSI_ENABLED**
WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**
- No (disabled)

**CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in sheldbox, the recommended value is 9~12.

**Range:**
- from 2 to 32

**Default value:**
- 6

**CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_RX_BA_WIN**

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in sheldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
6 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED
16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED

CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED
WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

CONFIG_ESP32_WIFI_NVS_ENABLED
WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_TASK_CORE_ID
WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN
Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However, the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However, this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

*Range:*
  - from 6 to 32

*Default value:*
  - 32

**CONFIG_ESP32_WIFI_IRAM_OPT**

WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

*Default value:*
  - No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_ESP32_SPIRAM_SUPPORT`
  - Yes (enabled)

**CONFIG_ESP32_WIFI_RX_IRAM_OPT**

WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

*Default value:*
  - No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_ESP32_SPIRAM_SUPPORT`
  - Yes (enabled)

**CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE**

Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_WIFI_SLP_IRAM_OPT**

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by `ESP32_WIFI_IRAM_OPT` and `ESP32_WIFI_RX_IRAM_OPT`, or this one. If already enabled `ESP32_WIFI_IRAM_OPT`,...
the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME

Minimum active time

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT

The minimum timeout for waiting to receive data, unit: milliseconds.

Range:
• from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

Default value:
• 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME

Maximum keep alive time

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT

The maximum time that wifi keep alive, unit: seconds.

Range:
• from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

Default value:
• 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE

Power Management for station at disconnected

Found in: Component config > Wi-Fi

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

Core dump Contains:
• CONFIG_ESP_COREDUMP_CHECK_BOOT
• CONFIG_ESP_COREDUMP_DATA_FORMAT
• CONFIG_ESP_COREDUMP_CHECKSUM
• CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART
• CONFIG_ESP_COREDUMP_UART_DELAY
• CONFIG_ESP_COREDUMP_DECODE
• CONFIG_ESP_COREDUMP_MAX_TASKS_NUM

CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART

Data destination

Found in: Component config > Core dump

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.
Available options:
- Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (ESP_COREDUMP_ENABLE_TO_UART)
- None (ESP_COREDUMP_ENABLE_TO_NONE)

CONFIG_ESP_COREDUMP_DATA_FORMAT
Core dump data format

Found in: Component config > Core dump
Select the data format for core dump.

Available options:
- Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)

CONFIG_ESP_COREDUMP_CHECKSUM
Core dump data integrity check

Found in: Component config > Core dump
Select the integrity check for the core dump.

Available options:
- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

CONFIG_ESP_COREDUMP_CHECK_BOOT
Check core dump data integrity on boot

Found in: Component config > Core dump
When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

Default value:
- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

CONFIG_ESP_COREDUMP_MAX_TASKS_NUM
Maximum number of tasks

Found in: Component config > Core dump
Maximum number of tasks snapshots in core dump.

CONFIG_ESP_COREDUMP_UART_DELAY
Delay before print to UART

Found in: Component config > Core dump
Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

Default value:
- 0 if ESP_COREDUMP_ENABLE_TO_UART
**CONFIG_ESP_COREDUMP_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in:* Component config > Core dump

**Available options:**
- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**

Contains:
- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_USE_FASTSEEK
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFS_ALLOC_PREFER_EXTRAM
- CONFIG_FATFS_TIMEOUT_MS
- CONFIG_FATFS_PER_FILE_CACHE

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in:* Component config > FAT Filesystem support

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**
- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support
Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

**CONFIG_FATFS_MAX_LFN**
Max long filename length

**CONFIG_FATFS_API_ENCODING**
API character encoding

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**CONFIG_FATFS_FS_LOCK**
Number of simultaneously open files protected by lock function

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**CONFIG_FATFS_TIMEOUT_MS**
Timeout for acquiring a file lock, ms
This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**
- Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
- No (disabled)

**CONFIG_FATFS_FASTSEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
• 64 if `CONFIG_FATFS_USE_FASTSEEK`

**Modbus configuration** Contains:

- `CONFIG_FMB_COMM_MODE_ASCII_EN`
- `CONFIG_FMB_COMM_MODE_RTU_EN`
- `CONFIG_FMB_COMM_MODE_TCP_EN`
- `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE`
- `CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT`
- `CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT`
- `CONFIG_FMB_CONTROLLER_STACK_SIZE`
- `CONFIG_FMB_PORT_TASK_PRIORITY`
- `CONFIG_FMB_PORT_TASK_STACK_SIZE`
- `CONFIG_FMB_QUEUE_LENGTH`
- `CONFIG_FMB_SERIAL_BUF_SIZE`
- `CONFIG_FMB_TIMER_PORT_ENABLED`
- `CONFIG_FMB_EVENT_QUEUE_TIMEOUT`
- `CONFIG_FMB_PORT_TASK_AFFINITY`
- `CONFIG_FMB_TIMER_GROUP`
- `CONFIG_FMB_TIMER_INDEX`
- `CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMBOL`
- `CONFIG_FMB_TIMER_ISR_IN_IRAM`
- `CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS`
- `CONFIG_FMB_MASTER_DELAY_MS_CONVERT`
- `CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND`

**CONFIG_FMB_COMM_MODE_TCP_EN**

Enable Modbus stack support for TCP communication mode

*Found in: Component config > Modbus configuration*

Enable Modbus TCP option for stack.

**Default value:**

- Yes (enabled)

**CONFIG_FMB_TCP_PORT_DEFAULT**

Modbus TCP port number

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Modbus default port number used by Modbus TCP stack

**Range:**

- from 0 to 65535

**Default value:**

- 502

**CONFIG_FMB_TCP_PORT_MAX_CONN**

Maximum allowed connections for TCP stack

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

**Range:**

- from 1 to 6
CONFIG_FMB_TCP_CONNECTION_TOUT_SEC
Modbus TCP connection timeout
*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*
Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

**Range:**
- from 1 to 3600

**Default value:**
- 20

CONFIG_FMB_COMM_MODE_RTU_EN
Enable Modbus stack support for RTU mode
*Found in: Component config > Modbus configuration*
Enable RTU Modbus communication mode option for Modbus serial stack.

**Default value:**
- Yes (enabled)

CONFIG_FMB_COMM_MODE_ASCII_EN
Enable Modbus stack support for ASCII mode
*Found in: Component config > Modbus configuration*
Enable ASCII Modbus communication mode option for Modbus serial stack.

**Default value:**
- Yes (enabled)

CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND
Slave respond timeout (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a frame which is not broadcast, it has to wait sometime for slave response. If slave is not respond in this time, the master will process timeout error.

**Range:**
- from 50 to 3000

**Default value:**
- 150

CONFIG_FMB_MASTER_DELAY_MS_CONVERT
Slave conversion delay (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**Range:**
- from 50 to 400

**Default value:**
• 200

**CONFIG_FMB_QUEUE_LENGTH**

Modbus serial task queue length

*Found in: Component config > Modbus configuration*

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**Range:**
- from 0 to 200

**Default value:**
- 20

**CONFIG_FMB_PORT_TASK_STACK_SIZE**

Modbus port task stack size

*Found in: Component config > Modbus configuration*

Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).

**Range:**
- from 2048 to 8192

**Default value:**
- 4096

**CONFIG_FMB_SERIAL_BUF_SIZE**

Modbus serial task RX/TX buffer size

*Found in: Component config > Modbus configuration*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**Range:**
- from 0 to 2048

**Default value:**
- 256

**CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB**

Number of data bits per ASCII character

*Found in: Component config > Modbus configuration*

This option defines the number of data bits per ASCII character.

**Range:**
- from 7 to 8

**Default value:**
- 8
CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS

Response timeout for ASCII communication mode (ms)

*Found in: Component config > Modbus configuration*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

*Range:*
  - from 300 to 2000

*Default value:*
  - 1000

CONFIG_FMB_PORT_TASK_PRIO

Modbus port task priority

*Found in: Component config > Modbus configuration*

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_PORT_TASK_PRIO - 1).

*Range:*
  - from 3 to 23

*Default value:*
  - 10

CONFIG_FMB_PORT_TASK_AFFINITY

Modbus task affinity

*Found in: Component config > Modbus configuration*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

*Available options:*
  - No affinity (FMB_PORT_TASK_AFFINITY_NO_AFFINITY)
  - CPU0 (FMB_PORT_TASK_AFFINITY_CPU0)
  - CPU1 (FMB_PORT_TASK_AFFINITY_CPU1)

CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT

Modbus controller slave ID support

*Found in: Component config > Modbus configuration*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

*Default value:*
  - Yes (enabled)

CONFIG_FMB_CONTROLLER_SLAVE_ID

Modbus controller slave ID

*Found in: Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

*Range:*
CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT

Modbus controller notification timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**Range:**
- from 0 to 200

**Default value:**
- 20

CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE

Modbus controller notification queue size

*Found in: Component config > Modbus configuration*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**Range:**
- from 0 to 200

**Default value:**
- 20

CONFIG_FMB_CONTROLLER_STACK_SIZE

Modbus controller task stack size

*Found in: Component config > Modbus configuration*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

**Range:**
- from 0 to 8192

**Default value:**
- 4096

CONFIG_FMB_EVENT_QUEUE_TIMEOUT

Modbus stack event queue timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

**Range:**
- from 0 to 500

**Default value:**
- 20
Chapter 2. API Reference

CONFIG_FMB_TIMER_PORT_ENABLED

Modbus slave stack use timer for 3.5T symbol time measurement

*Found in*: Component config > Modbus configuration

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

**Default value:**
- No (disabled)

CONFIG_FMB_TIMER_GROUP

Modbus Timer group number

*Found in*: Component config > Modbus configuration

Modbus Timer group number that is used for timeout measurement.

**Range:**
- from 0 to 1

**Default value:**
- 0

CONFIG_FMB_TIMER_INDEX

Modbus Timer index in the group

*Found in*: Component config > Modbus configuration

Modbus Timer Index in the group that is used for timeout measurement.

**Range:**
- from 0 to 1

**Default value:**
- 0

CONFIG_FMB_TIMER_ISR_IN_IRAM

Place timer interrupt handler into IRAM

*Found in*: Component config > Modbus configuration

This option places Modbus timer IRQ handler into IRAM. This allows to avoid delays related to processing of non-IRAM-safe interrupts during a flash write operation (NVS updating a value, or some other flash API which has to perform an read/write operation and disable CPU cache). This option has dependency with the UART_ISR_IN_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

**Default value:**
- No (disabled)

FreeRTOS  Contains:

- CONFIG_FREERTOS_FPU_IN_ISR
- CONFIG_FREERTOS_CHECK_STACKOVERFLOW
- CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER
- CONFIG_FREERTOS_INTERRUPT_BACKTRACE
- CONFIG_FREERTOS_OPTIMIZED_SCHEDULER
- CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS
- CONFIG_FREERTOS_USE_TRACE_FACILITY
- CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP
- CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER
Chapter 2. API Reference

- CONFIG_FREERTOS_ASSERT
- CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE
- CONFIG_FREERTOS_TIMER_QUEUE_LENGTH
- CONFIG_FREERTOS_TIMER_TASK_PRIORITY
- CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH
- CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION
- CONFIG_FREERTOS_IDLE_TASK_STACKSIZE
- CONFIG_FREERTOS_ISR_STACKSIZE

- CONFIG_FREERTOS_HZ
- CONFIG_FREERTOS_USE_TICKLESS_IDLE
- CONFIG_FREERTOS_LEGACY_HOOKS
- CONFIG_FREERTOS_CORETIMER

CONFIG_FREERTOS_UNICORE

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.

CONFIG_FREERTOS_CORETIMER

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

*Available options:*
- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1

CONFIG_FREERTOS_OPTIMIZED_SCHEDULER

Enable FreeRTOS platform optimized scheduler

*Found in: Component config > FreeRTOS*

On most platforms there are instructions that can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

*Default value:*
- Yes (enabled) if CONFIG_FREERTOS_UNICORE
**CONFIG_FREERTOS_HZ**

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplicationStackOverflowHook when this happens.

**Available options:**
- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW=0)
- Check by stack pointer value (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW=1)
- Check using canary bytes (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW=2)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Set a debug watchpoint as a stack overflow check

*Found in: Component config > FreeRTOS*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.
This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather
than overshooting further, so it is worth combining this approach with one of the other stack overflow
check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached,
esp-idf will panic on an unhandled debug exception.

Default value:
  - No (disabled)

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted
task as its return address. This helps the debugger (or the panic handler) show a backtrace from the
interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt
stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt
dispatching code.

Default value:
  - Yes (enabled)

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

Number of thread local storage pointers

*Found in: Component config > FreeRTOS*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number
of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other
indices can be used for any desired purpose.

Range:
  - from 1 to 256

Default value:
  - 1

**CONFIG_FREERTOS_ASSERT**

FreeRTOS assertions

*Found in: Component config > FreeRTOS*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

By default these behave the same as the global project assert settings.

Available options:
  - abort() on failed assertions (FREERTOS_ASSERT_FAIL_ABORT)
    If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic
    handler can be configured to handle the outcome of an abort() in different ways.
    If assertions are disabled for the entire project, they are also disabled in FreeRTOS and this
    option is unavailable.
  - Print and continue failed assertions (FREERTOS_ASSERT_FAIL_PRINT_CONTINUE)
    If a FreeRTOS assertion fails, print it out and continue.
  - Disable FreeRTOS assertions (FREERTOS_ASSERT_DISABLE)
    FreeRTOS configASSERT() will not be compiled into the binary.
**CONFIG_FREERTOS_IDLE_TASK_STACKSIZE**

Idle Task stack size

*Found in: Component config > FreeRTOS*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

**Range:**
- from 768 to 32768

**Default value:**
- 1536

**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**
- from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
- from 1536 to 32768

**Default value:**
- 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
- 1536

**CONFIG_FREERTOS_LEGACY_HOOKS**

Use FreeRTOS legacy hooks

*Found in: Component config > FreeRTOS*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp_register_freertos_xxx_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can’t be migrated to the esp_register_freertos_xxx_hook system.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

Maximum task name length

*Found in: Component config > FreeRTOS*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**Range:**
- from 1 to 256

**Default value:**
- 16
Chapter 2.  API Reference

**CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP**

Enable static task clean up hook

*Found in: Component config > FreeRTOS*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted. Bear in mind that if this option is enabled you will need to implement the following function:

```c
void vPortCleanUpTCB ( void *pxTCB ) {
    // place clean up code here
}
```

*Default value:*

• No (disabled)

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

FreeRTOS timer task priority

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary. Use this constant to define the priority that the timer task will run at.

*Range:*

• from 1 to 25

*Default value:*

• 1

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

FreeRTOS timer task stack size

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary. Use this constant to define the size (in bytes) of the stack allocated for the timer task.

*Range:*

• from 1536 to 32768

*Default value:*

• 2048

**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

FreeRTOS timer queue length

*Found in: Component config > FreeRTOS*

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the ‘timer command queue’. The ‘timer command queue’ is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

*Range:*

• from 5 to 20

*Default value:*

• 10
CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

FreeRTOS queue registry size

*Found in: Component config > FreeRTOS*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

**Range:**
- from 0 to 20

**Default value:**
- 0

CONFIG_FREERTOS_USE_TRACE_FACILITY

Enable FreeRTOS trace facility

*Found in: Component config > FreeRTOS*

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

**Default value:**
- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

Enable FreeRTOS stats formatting functions

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY*

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_TRACE_FACILITY

CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS

Enable FreeRTOS to collect run time stats

*Found in: Component config > FreeRTOS*

If enabled, configGENERATE_RUN_TIME_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note...
that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS_USE_STATS_FORMATTING_FUNCTIONS and FREERTOS_USE_TRACE.Fprintf() are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

**Default value:**
- No (disabled)

### CONFIG_FREERTOS_RUN_TIME_STATS_CLK

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**
- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### CONFIG_FREERTOS_USE_TICKLESS_IDLE

Tickless idle support

*Found in: Component config > FreeRTOS*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

### CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP

Minimum number of ticks to enter sleep mode for

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**
- from 2 to 4294967295 if CONFIG_FREERTOS_USE_TICKLESS_IDLE
Default value:
• 3 if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: Component config > FreeRTOS*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e., does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

Default value:
• Yes (enabled)

**CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

Default value:
• Yes (enabled)

**CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

*Found in: Component config > FreeRTOS*

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g., Calling port*_CRITICAL from ISR context would cause assert failure

Default value:
• No (disabled)

**CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH**

Place FreeRTOS functions into Flash

*Found in: Component config > FreeRTOS*

When enabled, the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

Default value:
• No (disabled)

**CONFIG_FREERTOS_FPU_IN_ISR**

Allow use of float inside Level 1 ISR (EXPERIMENTAL)

*Found in: Component config > FreeRTOS*

When enabled, the usage of float type is allowed inside Level 1 ISRs.

Default value:
• No (disabled)
Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`

**CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**

Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level cannot exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion cannot be enabled either. If the system assertion is enabled, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**

- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)

**Heap memory debugging** Contains:

- `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`
- `CONFIG_HEAP_TASK_TRACKING`
- `CONFIG_HEAP_CORRUPTION_DETECTION`
- `CONFIG_HEAP_TRACING_DEST`
- `CONFIG_HEAP_TRACING_STACK_DEPTH`

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**

- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**

- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)
**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames use more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

**jsmn** Contains:

- **CONFIG_JSMN_PARENT_LINKS**
- **CONFIG_JSMN STRICT**

**CONFIG_JSMN_PARENT_LINKS**

Enable parent links

*Found in: Component config > jsmn*

You can access to parent node of parsed json

**Default value:**

- No (disabled)

**CONFIG_JSMN STRICT**

Enable strict mode

*Found in: Component config > jsmn*

In strict mode primitives are: numbers and booleans

**Default value:**

- No (disabled)

**libsodium** Contains:

- **CONFIG_LIBSODIUM_USE_MBEDTLS_SHA**
**CONFIG_LIBSODIUM_USE_MBEDTLS_SHA**

Use mbedTLS SHA256 & SHA512 implementations

*Found in: Component config > libsodium*

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium’s API manages SHA state).

**Default value:**
- Yes (enabled)

**Log output** Contains:
- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`

**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set()` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**
- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling `esp_log_level_set()` . This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
Chapter 2. API Reference

- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the ESP32’s RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

- Checksums
- DHCP server
- CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID
- CONFIG_LWIP_DHCP_DOES_ARP_CHECK
- CONFIG_LWIP_DHCP_RESTORE_LAST_IP
- CONFIG_LWIP_PPP_CHAP_SUPPORT
- CONFIG_LWIP_I2_TO_L3_COPY
- CONFIG_LWIP_IP4_FRAG
- CONFIG_LWIP_IP6_FRAG
- CONFIG_LWIP_IP_FORWARD
- CONFIG_LWIP_NETBUF_RECVINFO
- CONFIG_LWIP_AUTOIP
- CONFIG_LWIP_IPV6
- CONFIG_LWIP_ENABLE_LCP_ECHO
- CONFIG_LWIP_ETHARP_TRUST_IP_MAC
- CONFIG_LWIP_ESP_LWIP_ASSERT
- CONFIG_LWIP_DEBUG
- CONFIG_LWIP_IRAM_OPTIMIZATION
- CONFIG_LWIP_STATS
- CONFIG_LWIP_TIMERS_ONDEMAND
- CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES
• `CONFIG_LWIP_PPP_MPPE_SUPPORT`
• `CONFIG_LWIP_PPP_MSCHAP_SUPPORT`
• `CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT`
• `CONFIG_LWIP_PPP_PAP_SUPPORT`
• `CONFIG_LWIP_PPP_DEBUG_ON`
• `CONFIG_LWIP_PPP_SUPPORT`
• `CONFIG_LWIP_IP4_REASSEMBLY`
• `CONFIG_LWIP_IP6_REASSEMBLY`
• `CONFIG_LWIP_SLIP_SUPPORT`
• `CONFIG_LWIP_SO_LINGER`
• `CONFIG_LWIP_SO_REUSE`
• `CONFIG_LWIP_NETIF_STATUS_CALLBACK`
• `CONFIG_LWIP_NETIF_API`

**Hooks**

• `ICMP`

**LWIP RAW API**

• `CONFIG_LWIP_LOCAL_HOSTNAME`
• `LWIP RAW API`
• `CONFIG_LWIP_IPV6 ND6 NUM_NEIGHBORS`
• `CONFIG_LWIP_IPV6 MEMP NUM ND6 QUEUE`
• `CONFIG_LWIP_MAX SOCKETS`
• `CONFIG_LWIP_ESP GRATUITOUS ARP`
• `SNTP`
• `CONFIG_LWIP_USE ONLY LWIP SELECT`
• `CONFIG_LWIP_NETIF LOOPBACK`
• `TCP`
• `CONFIG_LWIP_TCPIP TASK AFFINITY`
• `CONFIG_LWIP_TCPIP TASK STACK SIZE`
• `CONFIG_LWIP_TCPIP_RECVMBX SIZE`
• `UDP`

**CONFIG_LWIP_LOCAL_HOSTNAME**

Local netif hostname

*Found in:* Component config > LWIP

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

• “espressif”

**CONFIG_LWIP_NETIF_API**

Enable usage of standard POSIX APIs in LWIP

*Found in:* Component config > LWIP

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific `esp_netif_get_netif_impl_name()`

**Default value:**

• No (disabled)

**CONFIG_LWIP_DNS_SUPPORT_MDNS QUERIES**

Enable mDNS queries in resolving host name

*Found in:* Component config > LWIP
If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_L2_TO_L3_COPY**
Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2 (WIFI Driver) will be copied to a new buffer before sending it to layer3 (LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IRAM_OPTIMIZATION**
Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)

**CONFIG_LWIP_TIMERS_ONDEMAND**
Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MAX_SOCKETS**
Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**
- from 1 to 16

**Default value:**
- 10
CONFIG_LWIP_USE_ONLY_LWIP_SELECT
Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Use VFS_SUPPORT_SELECT instead, which is the inverse of this option.
The virtual filesystem layer of select() redirects sockets to lwip_select() and non-socket file descriptors
to their respective driver implementations. If this option is enabled then all calls of select() will be
redirected to lwip_select(), therefore, select can be used for sockets only.

*Default value:*
- No (disabled)

CONFIG_LWIP_SO_LINGER
Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1, l_linger can set the timeout.
If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP
will discard any data packets stored in the socket send buffer and send an RST to the peer.
If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been
sent or timed out.

*Default value:*
- No (disabled)

CONFIG_LWIP_SO_REUSE
Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

*Default value:*
- Yes (enabled)

CONFIG_LWIP_SO_REUSE_RXTOALL
SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the
local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)
This increases memory overhead as the packets need to be copied, however they are only copied per
matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on
more than one socket at a time.

*Default value:*
- Yes (enabled)

CONFIG_LWIP_SO_RCVBUF
Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.
**Default value:**
- No (disabled)

**CONFIG_LWIP_NETBUF_RECVINFO**
Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IP4_FRAG**
Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IP6_FRAG**
Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IP4_REASSEMBLY**
Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IP6_REASSEMBLY**
Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**
- No (disabled)
Chapter 2. API Reference

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV4_NAPT

Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if CONFIG_LWIP_IP_FORWARD

CONFIG_LWIP_STATS

Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

CONFIG_LWIP_ETHARP_TRUST_IP_MAC

Enable LWIP ARP trust

*Found in: Component config > LWIP*

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little latency. The peer "is" in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer.
- The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

**Default value:**
- No (disabled)
CONFIG_LWIP_ESP_GRATUITOUS_ARP

Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

**Default value:**
  * Yes (enabled)

CONFIG_LWIP_GARP_TMR_INTERVAL

GARP timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**
  * 60

CONFIG_LWIP_TCPIP_RECVMBOX_SIZE

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
  * from 6 to 64 if CONFIG_LWIP_WND_SCALE
  * from 6 to 1024 if CONFIG_LWIP_WND_SCALE

**Default value:**
  * 32

CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
  * Yes (enabled)

CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
  * No (disabled)
CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

DHCP server  Contains:

- CONFIG_LWIP_DHCPS

CONFIG_LWIP_DHCPS

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

CONFIG_LWIP_DHCPS_LEASE_UNIT

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from its address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.
Chapter 2. API Reference

See RFC 3927.

**Default value:**
- No (disabled)

**Contains:**
- `CONFIG_LWIP_AUTOIP_TRIES`
- `CONFIG_LWIP_AUTOIP_MAX_CONFLICTS`
- `CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL`

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

**Found in:** `Component config > LWIP > CONFIG_LWIP_AUTOIP`

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple `SYSTEM_EVENT_STA_GOT_IP` events.)

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

**Found in:** `Component config > LWIP > CONFIG_LWIP_AUTOIP`

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

**Found in:** `Component config > LWIP > CONFIG_LWIP_AUTOIP`

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_IPV6**

Enable IPv6

**Found in:** `Component config > LWIP`

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
• Yes (enabled)

**CONFIG_LWIP_IPV6_AUTOCONFIG**
Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPv6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**
• No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**
Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
• 3

**CONFIG_LWIP_IPV6_FORWARD**
Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
• No (disabled)

**CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**
Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**
• 0

**CONFIG_LWIP_NETIF_STATUS_CALLBACK**
Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
• No (disabled)
CONFIG_LWIP_NETIF_LOOPBACK

Support per-interface loopback

Found in: Component config > LWIP

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface.

Default value:
- Yes (enabled)

Contains:
- CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS

Max queued loopback packets per interface

Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

Range:
- from 0 to 16

Default value:
- 8

TCP Contains:
- CONFIG_LWIP_TCP_WND_DEFAULT
- CONFIG_LWIP_TCP_SND_BUF_DEFAULT
- CONFIG_LWIP_TCP_RECVMBBOX_SIZE
- CONFIG_LWIP_TCP_RTO_TIME
- CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES
- CONFIG_LWIP_MAX_ACTIVE_TCP
- CONFIG_LWIP_MAX_LISTENING_TCP
- CONFIG_LWIP_TCP_MAXRTX
- CONFIG_LWIP_TCP_SYNMAXRTX
- CONFIG_LWIP_TCP_MSL
- CONFIG_LWIP_TCP_MSS
- CONFIG_LWIP_TCP_Oversize
- CONFIG_LWIP_TCP_QUEUE_OOSEQ
- CONFIG_LWIP_TCP_SACK_OUT
- CONFIG_LWIP_TCP_WND_SCALE
- CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION
- CONFIG_LWIP_TCP_TMR_INTERVAL

CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

Found in: Component config > LWIP > TCP

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

Range:
Chapter 2. API Reference

• from 1 to 1024
Default value:
• 16

CONFIG_LWIP_MAX_LISTENING_TCP
Maximum listening TCP Connections

Found in: Component config > LWIP > TCP

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

Range:
• from 1 to 1024
Default value:
• 16

CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION
TCP high speed retransmissions

Found in: Component config > LWIP > TCP

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto to time to 3000.

Default value:
• Yes (enabled)

CONFIG_LWIP_TCP_MAXRTX
Maximum number of retransmissions of data segments

Found in: Component config > LWIP > TCP

Set maximum number of retransmissions of data segments.

Range:
• from 3 to 12
Default value:
• 12

CONFIG_LWIP_TCP_SYNMAXRTX
Maximum number of retransmissions of SYN segments

Found in: Component config > LWIP > TCP

Set maximum number of retransmissions of SYN segments.

Range:
• from 3 to 12
Default value:
• 6
• 12
**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission. Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval (ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds. Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
- 60000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets. Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...). This value must be at least 2x the MSS size, and the default is 4x the default MSS size. Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCPWND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.
Per-socket receive window size can be changed at runtime with \texttt{lwip\_setsockopt(s, TCP\_WINDOW, ... )}.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**
- from 2440 to 65535 if \texttt{CONFIG\_LWIP\_WND\_SCALE}
- from 2440 to 1024000 if \texttt{CONFIG\_LWIP\_WND\_SCALE}

**Default value:**
- 5744

\textbf{CONFIG\_LWIP\_TCP\_RECVMBBOX\_SIZE}

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: \texttt{LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2}, e.g. if \texttt{LWIP\_TCP\_WND\_DEFAULT=14360, TCP\_MSS=1436}, then the recommended receive mail box size is \((14360/1436 + 2) = 12\).

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum \texttt{LWIP\_TCP\_RECVMBBOX\_SIZE} packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is \texttt{LWIP\_TCP\_RECVMBBOX\_SIZE} multiples the maximum TCP socket number. In other words, the bigger \texttt{LWIP\_TCP\_RECVMBBOX\_SIZE} means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64 if \texttt{CONFIG\_LWIP\_WND\_SCALE}
- from 6 to 1024 if \texttt{CONFIG\_LWIP\_WND\_SCALE}

**Default value:**
- 6

\textbf{CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ}

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**
- Yes (enabled)

\textbf{CONFIG\_LWIP\_TCP\_SACK\_OUT}

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)
**CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES**

Keep TCP connections when IP changed

*Found in: Component config > LWIP > TCP*

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2

Disable this option to keep consistent with the original LWIP code behavior.

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

**CONFIG_LWIP_TCP_RCV_SCALE**

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if CONFIG_LWIP_WND_SCALE

**Default value:**
- 0 if CONFIG_LWIP_WND_SCALE

**CONFIG_LWIP_TCP_RTO_TIME**

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.
Default value:
- 3000
- 1500

**UDP** Contains:
- `CONFIG_LWIP_UDP_RECVMBOX_SIZE`
- `CONFIG_LWIP_MAX_UDP_PCBS`

**CONFIG_LWIP_MAX_UDP_PCBS**
Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_UDP_RECVMBOX_SIZE**
Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receiv mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

**Checksums** Contains:
- `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`
- `CONFIG_LWIP_CHECKSUM_CHECK_IP`
- `CONFIG_LWIP_CHECKSUM_CHECK_UDP`

**CONFIG_LWIP_CHECKSUM_CHECK_IP**
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)
CONFIG_LWIP_CHECKSUM_CHECK_UDP
Enable LWIP UDP checksums

Found in: Component config > LWIP > Checksums
Enable checksum checking for received UDP messages

Default value:
  • No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP
Enable LWIP ICMP checksums

Found in: Component config > LWIP > Checksums
Enable checksum checking for received ICMP messages

Default value:
  • Yes (enabled)

CONFIG_LWIP_TCP_IP_TASK_STACK_SIZE
TCP/IP Task Stack Size

Found in: Component config > LWIP
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

Range:
  • from 2048 to 65536
Default value:
  • 3072

CONFIG_LWIP_TCP_IP_TASK_AFFINITY
TCP/IP task affinity

Found in: Component config > LWIP
Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

Available options:
  • No affinity (LWIP_TCP_IP_TASK_AFFINITY_NO_AFFINITY)
  • CPU0 (LWIP_TCP_IP_TASK_AFFINITY_CPU0)
  • CPU1 (LWIP_TCP_IP_TASK_AFFINITY_CPU1)

CONFIG_LWIP_PPP_SUPPORT
Enable PPP support (new/experimental)

Found in: Component config > LWIP
Enable PPP stack. Now only PPP over serial is possible.
PPP over serial support is experimental and unsupported.

Default value:
  • No (disabled)

Contains:
  • CONFIG_LWIP_PPP_ENABLE_IPV6
CONFIG_LWIP_PPP_ENABLE_IPV6
Enable IPv6 support for PPP connections (IPV6CP)

Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

Default value:
- Yes (enabled) if CONFIG_LWIP_PPP_SUPPORT && CONFIG_LWIP_IPV6

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE
Max number of IPv6 packets to queue during MAC resolution

Found in: Component config > LWIP

Config max number of IPv6 packets to queue during MAC resolution.

Range:
- from 3 to 20

Default value:
- 3

CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS
Max number of entries in IPv6 neighbor cache

Found in: Component config > LWIP

Config max number of entries in IPv6 neighbor cache

Range:
- from 3 to 10

Default value:
- 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
Enable Notify Phase Callback

Found in: Component config > LWIP

Enable to set a callback which is called on change of the internal PPP state machine.

Default value:
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_PAP_SUPPORT
Enable PAP support

Found in: Component config > LWIP

Enable Password Authentication Protocol (PAP) support

Default value:
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT
**CONFIG_LWIP_PPP_CHAP_SUPPORT**
Enable CHAP support

*Found in: Component config > LWIP*
Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_MSCHAP_SUPPORT**
Enable MSCHAP support

*Found in: Component config > LWIP*
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_MPPE_SUPPORT**
Enable MPPE support

*Found in: Component config > LWIP*
Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_ENABLE_LCP_ECHO**
Enable LCP ECHO

*Found in: Component config > LWIP*
Enable LCP echo keepalive requests

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_LCP_ECHOINTERVAL**
Echo interval (s)

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*
Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**
- from 0 to 1000000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**CONFIG_LWIP_LCP_MAXECHOFAILS**
Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*
Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`
Default value:
• 3 if CONFIG_LWIP_ENABLE_LCP_ECHO

**CONFIG_LWIP_PPP_DEBUG_ON**
Enable PPP debug log output
*Found in: Component config > LWIP*
Enable PPP debug log output
**Default value:**
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

**CONFIG_LWIP_SLIP_SUPPORT**
Enable SLIP support (new/experimental)
*Found in: Component config > LWIP*
Enable SLIP stack. Now only SLIP over serial is possible.
SLIP over serial support is experimental and unsupported.
**Default value:**
• No (disabled)
Contains:
• CONFIG_LWIP_SLIP_DEBUG_ON

**CONFIG_LWIP_SLIP_DEBUG_ON**
Enable SLIP debug log output
*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*
Enable SLIP debug log output
**Default value:**
• No (disabled) if CONFIG_LWIP_SLIP_SUPPORT

**ICMP**
Contains:
• CONFIG_LWIP_ICMP
• CONFIG_LWIP_BROADCAST_PING
• CONFIG_LWIP_MULTICAST_PING

**CONFIG_LWIP_ICMP**
ICMP: Enable ICMP
*Found in: Component config > LWIP > ICMP*
Enable ICMP module for check network stability
**Default value:**
• Yes (enabled)
CONFIG_LWIP_MULTICAST_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

*Default value:*
  - No (disabled)

CONFIG_LWIP_BROADCAST_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

*Default value:*
  - No (disabled)

LWIP RAW API  Contains:

  - CONFIG_LWIP_MAX_RAW_PCBS

CONFIG_LWIP_MAX_RAW_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

*Range:*
  - from 1 to 1024

*Default value:*
  - 16

SNTP  Contains:

  - CONFIG_LWIP_DHCP_MAX_NTP_SERVERS
  - CONFIG_LWIP_SNTP_UPDATE_DELAY

CONFIG_LWIP_DHCP_MAX_NTP_SERVERS

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

*Range:*
  - from 1 to 16

*Default value:*
  - 1

CONFIG_LWIP_SNTP_UPDATE_DELAY

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).
CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

*Default value:*
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE

Hooks

Contains:

- CONFIG_LWIP_HOOK_ND6_GET_GW
- CONFIG_LWIP_HOOK_IP6_ROUTE
- CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
- CONFIG_LWIP_HOOK_TCP_ISN

CONFIG_LWIP_HOOK_TCP_ISN

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (tcp_next_iss) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to LWIP_HOOK_TCP_ISN_CUSTOM to provide custom implementation. Set to LWIP_HOOK_TCP_ISN_NONE to use lwIP implementation.

*Available options:*
- No hook declared (LWIP_HOOK_TCP_ISN_NONE)
- Default implementation (LWIP_HOOK_TCP_ISN_DEFAULT)
- Custom implementation (LWIP_HOOK_TCP_ISN_CUSTOM)

CONFIG_LWIP_HOOK_IP6_ROUTE

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

*Available options:*
- No hook declared (LWIP_HOOK_IP6_ROUTE_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_ROUTE_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_ROUTE_CUSTOM)
CONFIG_LWIP_HOOK_ND6_GET_GW

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_ND6_GET_GW_NONE)
- Default (weak) implementation (LWIP_HOOK_ND6_GET_GW_DEFAULT)
- Custom implementation (LWIP_HOOK_ND6_GET_GW_CUSTOM)

CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

CONFIG_LWIP_DEBUG

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:

- CONFIG_LWIP_API_LIB_DEBUG
- CONFIG_LWIP_DHCP_DEBUG
- CONFIG_LWIP_DHCP_STATE_DEBUG
- CONFIG_LWIP_ETHARP_DEBUG
- CONFIG_LWIP_ICMP_DEBUG
- CONFIG_LWIP_ICMP6_DEBUG
- CONFIG_LWIP_IP_DEBUG
- CONFIG_LWIP_IP6_DEBUG
- CONFIG_LWIP_NETIF_DEBUG
- CONFIG_LWIP_PBUF_DEBUG
- CONFIG_LWIP_SOCKETS_DEBUG
- CONFIG_LWIP_TCP_DEBUG

CONFIG_LWIP_NETIF_DEBUG

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_PBUF_DEBUG

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ETHARP_DEBUG

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_API_LIB_DEBUG

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SOCKETS_DEBUG

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP_DEBUG

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG & & CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

• No (disabled) if CONFIG_LWIP_DEBUG
CONFIG_LWIP_DHCP_DEBUG
Enable DHCP debug messages

*Default value:*
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_IP6_DEBUG
Enable IP6 debug messages

*Default value:*
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_ICMP6_DEBUG
Enable ICMP6 debug messages

*Default value:*
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_TCP_DEBUG
Enable TCP debug messages

*Default value:*
- No (disabled) if `CONFIG_LWIP_DEBUG`

**mbedTLS** Contains:
- `CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN`

- CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_ROM_MD5
- CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)

Allows to use IRAM memory region as 8bit accessible region. TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN**

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.
However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

Range:
- from 512 to 16384

Default value:
- 16384

CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN
Asymmetric in/out fragment length

Found in: Component config > mbedTLS

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN
TLS maximum incoming fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAXCONTENT_LEN).

Range:
- from 512 to 16384

Default value:
- 16384

CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN
TLS maximum outgoing fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAXCONTENT_LEN).

Range:
- from 512 to 16384

Default value:
- 4096

CONFIG_MBEDTLS_DYNAMIC_BUFFER
Using dynamic TX/RX buffer

Found in: Component config > mbedTLS

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.
By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DYNAMIC_FREE_PEER_CERT**
Free SSL peer certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*
Free peer certificate after its usage in handshake process.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA**
Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*
Free private key and DHM data after its usage in handshake process.
The option will decrease heap cost when handshake, but also lead to problem:
Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT**
Free SSL ca certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*
Free ca certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the ca certificate should once again be registered to the ssl object.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

**CONFIG_MBEDTLS_DEBUG**
Enable mbedTLS debugging

*Found in: Component config > mbedTLS*
Enable mbedTLS debugging functions at compile time.
If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**
- No (disabled)
**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

**Available options:**
- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

**Certificate Bundle**

Contains:
- **CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE**

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Available options:**
- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMP)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE**

Add custom certificates to the default bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

*Found in:* Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedTLS ecp restartable

*Found in:* Component config > mbedTLS

Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CMAC_C

Enable CMAC mode for block ciphers

*Found in:* Component config > mbedTLS

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES

Enable hardware AES acceleration

*Found in:* Component config > mbedTLS

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_MPI

Enable hardware MPI (bignum) acceleration

*Found in:* Component config > mbedTLS

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to 4096 bit results.

These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST
**CONFIG_MBEDTLS_HARDWARE_SHA**

Enable hardware SHA acceleration

*Found in: Component config > mbedtls*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_ROM_MD5**

Use MD5 implementation in ROM

*Found in: Component config > mbedtls*

Use ROM MD5 in mbedtls.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedtls*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedtls*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_HAVE_TIME**

Enable mbedtls time support

*Found in: Component config > mbedtls*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.
**CONFIG_MBEDTLS_HAVE_TIME_DATE**

Enable mbedtls certificate expiry check

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**  
- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedtls*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**  
- Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedtls*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

**Default value:**  
- Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedtls*

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

- Yes (enabled)
Chapter 2. API Reference

- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods** Contains:

- `CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE`
- `CONFIG_MBEDTLS_PSK_MODES`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE`

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedtls > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_PSK**

Enable PSK based ciphersuite modes

*Found in: Component config > mbedtls > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_PSK_MODES`

**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK**

Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedtls > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_PSK_MODES`

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK**

Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedtls > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_PSK_MODES` && `CONFIG_MBEDTLS_ECDH_C`
CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_Modes

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_Modes

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-RSA-WITH-.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-.

**Default value:**
- Yes (enabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA
Enable ECDHE-ECDSA based cipher suite modes

*Default value:* Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA
Enable ECDH-ECDSA based cipher suite modes

*Default value:* Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA
Enable ECDH-RSA based cipher suite modes

*Default value:* Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
Enable ECJPAKE based cipher suite modes

*Default value:* No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

CONFIG_MBEDTLS_SSL_RENEGOTIATION
Support TLS renegotiation

*Default value:* Yes (enabled)
CONFIG_MBEDTLS_SSL_PROTO_SSL3
Legacy SSL 3.0 support

*Found in: Component config > mbedTLS*

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1
Support TLS 1.0 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_1
Support TLS 1.1 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_ALPN
Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)
CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_KEY_USAGE

Enable verification of the keyUsage extension

*Found in: Component config > mbedTLS*

Disabling this avoids problems with mis-issued and/or misused (intermediate) CA and leaf certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_EXTENDED_KEY_USAGE

Enable verification of the extendedKeyUsage extension

*Found in: Component config > mbedTLS*

Disabling this avoids problems with mis-issued and/or misused certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**  Contains:
- CONFIG_MBEDTLS_AES_C
- CONFIG_MBEDTLS_BLOWFISH_C
- CONFIG_MBEDTLS_CAMELLIA_C
- CONFIG_MBEDTLS_CCM_C
- CONFIG_MBEDTLS_DES_C
- CONFIG_MBEDTLS_GCM_C
- CONFIG_MBEDTLS_NIST_KW_C
- CONFIG_MBEDTLS_RC4_MODE
- CONFIG_MBEDTLS_XTEA_C
CONFIG_MBEDTLS_AES_C

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_RC4_MODE

RC4 Stream Cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

*Available options:*
  - Disabled (MBEDTLS_RC4_DISABLED)
  - Enabled, not in default ciphersuites (MBEDTLS_RC4_ENABLED_NO_DEFAULT)
  - Enabled (MBEDTLS_RC4_ENABLED)

CONFIG_MBEDTLS_BLOWFISH_C

Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

*Default value:*
  - No (disabled)
CONFIG_MBEDTLS_XTEA_C
XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CCM_C
CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_GCM_C
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_RIPemd160_C
Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*

Enable the RIPEMD-160 hash algorithm.

**Default value:**
- No (disabled)

Certificates
Contains:
- CONFIG_MBEDTLS_PEM_PARSE_C
- CONFIG_MBEDTLS_PEM_WRITE_C
- CONFIG_MBEDTLS_X509_CRL_PARSE_C
- CONFIG_MBEDTLS_X509_CSR_PARSE_C
CONFIG_MBEDTLS_PEM_PARSE_C
Read & Parse PEM formatted certificates

*Found in: Component config > mbedtls > Certificates*
Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C
Write PEM formatted certificates

*Found in: Component config > mbedtls > Certificates*
Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C
X.509 CRL parsing

*Found in: Component config > mbedtls > Certificates*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C
X.509 CSR parsing

*Found in: Component config > mbedtls > Certificates*
Support for parsing X.509 Certificate Signing Requests

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_C
Elliptic Curve Ciphers

*Found in: Component config > mbedtls*

**Default value:**
- Yes (enabled)

Contains:
- CONFIG_MBEDTLS_ECDH_C
- CONFIG_MBEDTLS_ECJPAKE_C
- CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
- CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED

• CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
• CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
• CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
• CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
• CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
• CONFIG_MBEDTLS_ECP_NIST_OPTIM

CONFIG_MBEDTLS_ECDH_C

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
  • Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C > CONFIG_MBEDTLS_ECP_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
  • Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
  • No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP192R1 Elliptic Curve.

**Default value:**
  • Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP224R1 Elliptic Curve.

**Default value:**
  • Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C
CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP384R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \((CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \&\& CONFIG_MBEDTLS_ECP_C\)

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP521R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \((CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \&\& CONFIG_MBEDTLS_ECP_C\)

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP192K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \((CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \&\& CONFIG_MBEDTLS_ECP_C\)

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP224K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \((CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \&\& CONFIG_MBEDTLS_ECP_C\)

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
Enable SECP256K1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP256K1 Elliptic Curve.
Chapter 2. API Reference

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \& \& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in:* Component config > mbedtls > CONFIG\_MBEDTLS\_ECP\_C

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \& \& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in:* Component config > mbedtls > CONFIG\_MBEDTLS\_ECP\_C

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \& \& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in:* Component config > mbedtls > CONFIG\_MBEDTLS\_ECP\_C

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \& \& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in:* Component config > mbedtls > CONFIG\_MBEDTLS\_ECP\_C

Enable support for CURVE25519 Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \& \& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST ‘modulo p’ optimisations

*Found in:* Component config > mbedtls > CONFIG\_MBEDTLS\_ECP\_C

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance. Disabling this option saves some code size.

# end of Elliptic Curve options

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_POLY1305_C**

Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

*Default value:*

- No (disabled)

**CONFIG_MBEDTLS_CHACHA20_C**

Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

*Default value:*

- No (disabled)

**CONFIG_MBEDTLS_CHACHA_POLY_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

*Default value:*

- No (disabled) if \( \text{CONFIG}_\text{MBEDTLS}_\text{CHACHA20}_\text{C} \) \&\& \( \text{CONFIG}_\text{MBEDTLS}_\text{POLY1305}_\text{C} \)

**CONFIG_MBEDTLS_HKDF_C**

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

*Default value:*

- No (disabled)

**CONFIG_MBEDTLS_THREADING_C**

Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

*Default value:*

- No (disabled)

**CONFIG_MBEDTLS_THREADING_ALT**

Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

*Default value:*
• Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

**Found in:** Component config > mbedtls > CONFIG_MBEDTLS_THREADING_C

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

**Found in:** Component config > mbedtls

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS

Show configurations with potential security risks

**Found in:** Component config > mbedtls

**Default value:**
- No (disabled)

Contains:
- CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

X.509 CRT parsing with unsupported critical extensions

**Found in:** Component config > mbedtls > CONFIG_MBEDTLS_SECURITY_RISKS

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SECURITY_RISKS

mDNS

Contains:
- CONFIG_MDNS_MAX_SERVICES
- CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS
- CONFIG_MDNS.Strict_MODE
- CONFIG_MDNS_TASK_AFFINITY
- CONFIG_MDNS_TASK_PRIORITY
- CONFIG_MDNS_TASK_STACK_SIZE
- CONFIG_MDNS_TIMER_PERIOD_MS
CONFIG_MDNS_MAX_SERVICES
Max number of services

*Found in: Component config > mDNS*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

**Range:**
- from 1 to 64

**Default value:**
- 10

CONFIG_MDNS_TASK_PRIORITY
mDNS task priority

*Found in: Component config > mDNS*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

**Range:**
- from 1 to 255

**Default value:**
- 1

CONFIG_MDNS_TASK_STACK_SIZE
mDNS task stack size

*Found in: Component config > mDNS*

Allows setting mDNS task stack size.

**Default value:**
- 4096

CONFIG_MDNS_TASK_AFFINITY
mDNS task affinity

*Found in: Component config > mDNS*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

**Available options:**
- No affinity (MDNS_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (MDNS_TASK_AFFINITY_CPU0)
- CPU1 (MDNS_TASK_AFFINITY_CPU1)

CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS
mDNS adding service timeout (ms)

*Found in: Component config > mDNS*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

**Range:**
- from 10 to 30000

**Default value:**
• 2000

**CONFIG_MDNS STRICT_MODE**

mDNS strict mode

*Found in: Component config > mDNS*

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mdns resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

**Default value:**

• No (disabled)

**CONFIG_MDNS TIMER PERIOD MS**

mDNS timer period (ms)

*Found in: Component config > mDNS*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**Range:**

• from 10 to 10000

**Default value:**

• 100

**ESP-MQTT Configurations**

Contains:

• `CONFIG_MQTT_CUSTOM_OUTBOX`
• `CONFIG_MQTT_TRANSPORT_SSL`
• `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
• `CONFIG_MQTT_PROTOCOL_311`
• `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
• `CONFIG_MQTT_USE_CUSTOM_CONFIG`
• `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
• `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
• `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
• `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**

• Yes (enabled)

**CONFIG_MQTT_TRANSPORT_SSL**

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**
• Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**

Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**

• Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE**

Enable MQTT over Websocket Secure

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*

Enable MQTT transport over Websocket Secure.

**Default value:**

• Yes (enabled)

**CONFIG_MQTT_MSG_ID_INCREMENTAL**

Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

• No (disabled)

**CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED**

Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

• No (disabled)

**CONFIG_MQTT_REPORT_DELETED_MESSAGES**

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

• No (disabled)
CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.

**Default value:**
- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

**Default value:**
- 1883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_SSL_DEFAULT_PORT

Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over SSL port

**Default value:**
- 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_SSL`

CONFIG_MQTT_WS_DEFAULT_PORT

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket port

**Default value:**
- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

CONFIG_MQTT_WSS_DEFAULT_PORT

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

**Default value:**
- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

CONFIG_MQTT_BUFFER_SIZE

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

**Default value:**
- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`
**CONFIG_MQTT_TASK_STACK_SIZE**

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

**Default value:**

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_DISABLE_API_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**Default value:**

- “false”

**CONFIG_MQTT_TASK_CORE_SELECTION**

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar).

**Default value:**
• No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

• 30000 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

**Newlib** Contains:

• CONFIG_NEWLIB_NANO_FORMAT
• CONFIG_NEWLIB_STDIN_LINE_ENDING
• CONFIG_NEWLIB_STDOUT_LINE_ENDING

**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘n’, LF) appears on stdout. Three options are possible:

- CRLF: whenever LF is encountered, prepend it with CR
- LF: no modification is applied, stdout is sent as is
- CR: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

• CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
• LF (NEWLIB_STDOUT_LINE_ENDING_LF)
• CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘n’, LF) on stdin. Three options are possible:

- CRLF: CRLF is converted to LF
- LF: no modification is applied, input is sent to stdin as is
- CR: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

• CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
• LF (NEWLIB_STDIN_LINE_ENDING_LF)
• CR (NEWLIB_STDIN_LINE_ENDING_CR)
CONFIG_NEWLIB_NANO_FORMAT

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’ : https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

*Default value:*
  * No (disabled)

NVS

Contains:

* CONFIG_NVS_ENCRYPTION

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

*Default value:*
  * Yes (enabled) if CONFIG_SECURE_FLASH_ENC_ENABLED

OpenSSL

Contains:

* CONFIG_OPENSSL_DEBUG
* CONFIG_OPENSSL_ERROR_STACK
* CONFIG_OPENSSL_LOWLEVEL_DEBUG
* CONFIG_OPENSSL_DEBUG_LEVEL
* CONFIG_OPENSSL_ASSERT

CONFIG_OPENSSL_DEBUG

Enable OpenSSL debugging

*Found in: Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL_DEBUG” works.

*Default value:*
  * No (disabled)
CONFIG_OPENSSL_ERROR_STACK
Enable OpenSSL error structure
Found in: Component config > OpenSSL
Enable OpenSSL Error reporting
Default value:
• Yes (enabled)

CONFIG_OPENSSL_DEBUG_LEVEL
OpenSSL debugging level
Found in: Component config > OpenSSL
OpenSSL debugging level.
Only function whose debugging level is higher than "OPENSSL_DEBUG_LEVEL" works.
For example: If OPENSSL_DEBUG_LEVEL = 2, you use function "SSL_DEBUG(1, "malloc failed")". Because 1 < 2, it will not print.
Range:
• from 0 to 255 if CONFIG_OPENSSL_DEBUG
Default value:
• 0 if CONFIG_OPENSSL_DEBUG

CONFIG_OPENSSL_LOWLEVEL_DEBUG
Enable OpenSSL low-level module debugging
Found in: Component config > OpenSSL
If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.
Default value:
• No (disabled) if CONFIG_OPENSSL_DEBUG

CONFIG_OPENSSL_ASSERT
Select OpenSSL assert function
Found in: Component config > OpenSSL
OpenSSL function needs "assert" function to check if input parameters are valid.
If you want to use assert debugging function, "OPENSSL_DEBUG" should be enabled.
Available options:
• Do nothing (OPENSSL_ASSERT_DO_NOTHING)
  Do nothing and "SSL_ASSERT" does not work.
• Check and exit (OPENSSL_ASSERT_EXIT)
  Enable assert exiting, it will check and return error code.
• Show debugging message (OPENSSL_ASSERT_DEBUG)
  Enable assert debugging, it will check and show debugging message.
• Show debugging message and exit (OPENSSL_ASSERT_DEBUG_EXIT)
  Enable assert debugging and exiting, it will check, show debugging message and return error code.
• Show debugging message and block (OPENSSL_ASSERT_DEBUG_BLOCK)
  Enable assert debugging and blocking, it will check, show debugging message and block by "while (1);".
OpenThread Contains:
  • CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_ENABLED
OpenThread
Found in: Component config > OpenThread
Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.
Default value:
  • No (disabled)

CONFIG_OPENTHREAD_RADIO_TYPE
Config the Thread radio type
Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED
Configure how OpenThread connects to the 15.4 radio
Available options:
  • Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
    Select this to use the native 15.4 radio.
  • Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
    Select this to connect to a Radio Co-Processor via UART.

CONFIG_OPENTHREAD_DEVICE_TYPE
Config the Thread device type
Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED
OpenThread can be configured to different device types (FTD, MTD, Radio)
Available options:
  • Full Thread Device (OPENTHREAD_FTD)
    Select this to enable Full Thread Device which can act as router and leader in a Thread network.
  • Minimal Thread Device (OPENTHREAD_MTD)
    Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
  • Radio Only Device (OPENTHREAD_RADIO)
    Select this to enable Radio Only Device which cannot only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_DIAG
Enable diag
Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED
Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.
Default value:
  • Yes (enabled) if CONFIG_OPENTHREAD_ENABLED
**CONFIG_OPENTHREAD_COMMISSIONER**

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_JOINER**

Enable Joiner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_BORDER_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_ESP_LIB_FROM_INTERNAL_SRC**

Build esp_openthread libraries from source

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Override the shipped libopenthread_br.a and libopenthread_port.a, for internal builds.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**PThreads** Contains:
- `CONFIG_PTHREAD_TASK_NAME_DEFAULT`
- `CONFIG_PTHREAD_TASK_CORE_DEFAULT`
- `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
- `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`
- `CONFIG_PTHREAD_STACK_MIN`

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**Range:**
• from 0 to 255

**Default value:**
• 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**
• 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
• 768

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**
• No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
• Core 0 (PTHREAD_DEFAULT_CORE_0)
• Core 1 (PTHREAD_DEFAULT_CORE_1)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
• “pthread”

**SPI Flash driver**  Contains:

• *Auto-detect flash chips*
• **CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**
• **CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE**
• **CONFIG_SPI_FLASH_ENABLE_COUNTERS**
• **CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**
• **CONFIG_SPI_FLASH_YIELD_DURING_ERASE**
• **CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**
• **CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE**
• **CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**
• **CONFIG_SPI_FLASH_SIZE_OVERRIDE**
• **CONFIG_SPI_FLASH_SHARE_SPI1_BUS**
Chapter 2. API Reference

- `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`
- `CONFIG_SPI_FLASH_VERIFY_WRITE`
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`

**CONFIG_SPI_FLASH_VERIFY_WRITE**

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

*Default value:*
- No (disabled)

**CONFIG_SPI_FLASH_LOG_FAILED_WRITE**

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

*Default value:*
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

**CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE**

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

*Default value:*
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

**CONFIG_SPI_FLASH_ENABLE_COUNTERS**

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

*Default value:*
- 0
**CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**
Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

*Default value:*
- Yes (enabled)

**CONFIG_SPI_FLASH_DANGEROUS_WRITE**
Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

*Available options:*
- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

**CONFIG_SPI_FLASH_USE_LEGACY_IMPL**
Use the legacy implementation before IDF v4.0

*Found in: Component config > SPI Flash driver*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

*Default value:*
- No (disabled)

**CONFIG_SPI_FLASH_SHARE_SPI1_BUS**
Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

*Default value:*
- No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL
CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**
- 20

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

**Default value:**
- 1

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**
- from 256 to 8192

**Default value:**
- 8192
**CONFIG_SPI_FLASH_SIZE_OVERRIDE**

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`

**CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the `default_registered_chips` structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`

**Auto-detect flash chips**

Contains:
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`

**CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)
CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by chip_drv member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)

SPIFFS Configuration  Contains:

- Debug Configuration
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_FOLLOW_SYMLINKS
- CONFIG_SPIFFS_MAX_PARTITIONS
- CONFIG_SPIFFS_USE_MTIME
- CONFIG_SPIFFS_GC_MAX_RUNS
Chapter 2. API Reference

- `CONFIG_SPIFFS_OBJ_NAME_LEN`
- `CONFIG_SPIFFS_META_LENGTH`
- SPIFFS Cache Configuration
- `CONFIG_SPIFFS_PAGE_SIZE`
- `CONFIG_SPIFFS_MTIME_WIDE_64_BITS`

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration**

Contains:

- `CONFIG_SPIFFS_CACHE`

**CONFIG_SPIFFS_CACHE**

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_CACHE_WR**

Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_CACHE_STATS**

Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)
CONFIG_SPIFFS_PAGE_CHECK
Enable SPIFFS Page Check

Found in: Component config > SPIFFS Configuration

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:
- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS
Set Maximum GC Runs

Found in: Component config > SPIFFS Configuration

Define maximum number of GC runs to perform to reach desired free pages.

Range:
- from 1 to 255

Default value:
- 10

CONFIG_SPIFFS_GC_STATS
Enable SPIFFS GC Statistics

Found in: Component config > SPIFFS Configuration

Enable/disable statistics on gc. Debug/test purpose only.

Default value:
- No (disabled)

CONFIG_SPIFFS_PAGE_SIZE
SPIFFS logical page size

Found in: Component config > SPIFFS Configuration

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

Range:
- from 256 to 1024

Default value:
- 256

CONFIG_SPIFFS_OBJ_NAME_LEN
Set SPIFFS Maximum Name Length

Found in: Component config > SPIFFS Configuration

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Range:
- from 1 to 256

Default value:
CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**
- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**
- Yes (enabled)
CONFIG_SPIFFS_MTIME_WIDE_64_BITS
The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support time_t 64 bits (see SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS).

**Default value:**
- No (disabled) if `CONFIG_SPIFFS_META_LENGTH >= 8`

**Debug Configuration**  Contains:

- `CONFIG_SPIFFS_DBG`
- `CONFIG_SPIFFS_API_DBG`
- `CONFIG_SPIFFS_CACHE_DBG`
- `CONFIG_SPIFFS_CHECK_DBG`
- `CONFIG_SPIFFS_TEST_VISUALISATION`
- `CONFIG_SPIFFS_GC_DBG`

**CONFIG_SPIFFS_DBG**
Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_API_DBG**
Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_GC_DBG**
Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CACHE_DBG**
Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.
Default value:
  • No (disabled)

**CONFIG_SPIFFS_CHECK_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

Default value:
  • No (disabled)

**CONFIG_SPIFFS_TEST_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

Default value:
  • No (disabled)

**TCP Transport**  Contains:

  • **Websocket**

**Websocket**  Contains:

  • **CONFIG_WS_TRANSPORT**

**CONFIG_WS_TRANSPORT**

Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*

Enable support for creating websocket transport.

Default value:
  • Yes (enabled)

**CONFIG_WS_BUFFER_SIZE**

Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:
  • 1024

**TinyUSB**
Unity unit testing library  Contains:

- CONFIG_UNITY_ENABLE_COLOR
- CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER
- CONFIG_UNITY_ENABLE_FIXTURE
- CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL
- CONFIG_UNITY_ENABLE_64BIT
- CONFIG_UNITY_ENABLE_DOUBLE
- CONFIG_UNITY_ENABLE_FLOAT

**CONFIG_UNITY_ENABLE_FLOAT**
Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**Default value:**
- Yes (enabled)

**CONFIG_UNITY_ENABLE_DOUBLE**
Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

**Default value:**
- Yes (enabled)

**CONFIG_UNITY_ENABLE_64BIT**
Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)

**CONFIG_UNITY_ENABLE_COLOR**
Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

**CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER**
Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:
- TEST_CASE macro which performs automatic registration of test functions
• Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
• Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Default value:
• Yes (enabled)

**CONFIG_UNITY_ENABLE_FIXTURE**

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

Default value:
• No (disabled)

**CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL**

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

Default value:
• No (disabled)

**Virtual file system**  
Contains:

• **CONFIG_VFS_SUPPORT_IO**

**CONFIG_VFS_SUPPORT_IO**

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Default value:
• Yes (enabled)

**CONFIG_VFS_SUPPORT_DIR**

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir
Filesystem drivers can then be registered to handle these functions for specific paths. Disabling this option can save memory when the support for these functions is not required.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_SELECT**

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**Default value:**
- Yes (enabled) if CONFIG_VFS_SUPPORT_IO && CONFIG_LWIP_USE_ONLY_LWIP_SELECT

**CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT**

Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_TERMIOS**

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

**Host File System I/O (Semihosting)**

Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS
- CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN

**CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**
- 1
**CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN**

Host FS: Maximum path length for the host base directory

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum path length for the host base directory which is to be mounted. If host path passed to esp_vfs_semihost_register() is longer than this value it will be truncated.

**Default value:**
- 128

**Wear Levelling** Contains:
- CONFIG_WL_SECTOR_MODE
- CONFIG_WL_SECTOR_SIZE

**CONFIG_WL_SECTOR_SIZE**

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**
- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**
- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager** Contains:
- CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
- CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT
**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**
- from 1 to 255

**Default value:**
- 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**
- from 5 to 600

**Default value:**
- 30

**Supplicant** Contains:

- `CONFIG_WPA_TESTING_OPTIONS`
- `CONFIG_WPA_11KV_SUPPORT`
- `CONFIG_WPA_WAPI_PSK`
- `CONFIG_WPA_DEBUG_PRINT`
- `CONFIG_WPA_WPS_STRICT`
- `CONFIG_WPAMBEDTLS_CRYPTO`

**CONFIG_WPA_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**
- Yes (enabled)

**CONFIG_WPA_WAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**
- No (disabled)
**CONFIG_WPA_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**
- No (disabled)

**CONFIG_WPA_TESTING_OPTIONS**

Add DPP testing code

*Found in: Component config > Supplicant*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

**CONFIG_WPA_WPS_STRICT**

Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workaorunds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**
- No (disabled)

**CONFIG_WPA_11KV_SUPPORT**

Enable 802.11k, 802.11v APIs handling in supplicant

*Found in: Component config > Supplicant*

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)

Contains:
- **CONFIG_WPA_SCAN_CACHE**

**CONFIG_WPA_SCAN_CACHE**

Keep scan results in cache

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
Compatibility options

Contains:

- `CONFIG_LEGACY_INCLUDE_COMMON_HEADERS`

`CONFIG_LEGACY_INCLUDE_COMMON_HEADERS`

Include headers across components as before IDF v4.0

*Found in: Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It’s not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it’s changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

*Default value:*

- No (disabled)

Deprecated options and their replacements

- `CONFIG_A2DP_ENABLE (CONFIG_BT_A2DP_ENABLE)`

2.8.7 Customisations

Because IDF builds by default with *Warning On Undefined Variables*, when the Kconfig tool generates Makefiles (the *auto.conf* file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that *ifdef* and *ifndef* can still be used in Makefiles, because they test if a variable is defined *and has a non-empty value*.)

When generating header files for C & C++, the behaviour is not customised - so *ifdef* can be used to test if a boolean config item is set or not.

2.9 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

- **ESP_FAIL** (-1): Generic esp_err_t code indicating failure
- **ESP_OK** (0): esp_err_t value indicating success (no error)
- **ESP_ERR_NO_MEM** (0x101): Out of memory
- **ESP_ERR_INVALID_ARG** (0x102): Invalid argument
- **ESP_ERR_INVALID_STATE** (0x103): Invalid state
- **ESP_ERR_INVALID_SIZE** (0x104): Invalid size
- **ESP_ERR_NOT_FOUND** (0x105): Requested resource not found
- **ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported
- **ESP_ERR_TIMEOUT** (0x107): Operation timed out
- **ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid
- **ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid
- **ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid
- **ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid
- **ESP_ERR_NOT_FINISHED** (0x10c): There are items remained to retrieve
- **ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes
- **ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized
- **ESP_ERR_NVS_NOT_FOUND** (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY
- **ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
- **ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only
- **ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value
- **ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints
- **ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL
- **ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version

**ESP_ERR_NVS.Keys_Not_Initialized** (0x1116): NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG** (0x1201): Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR** (0x1202): Load address is outside of RTC memory reserved for the ULP

**ESP_ERR_ULP_DUPLICATE_LABEL** (0x1203): More than one label with the same number was defined

**ESP_ERR_ULP_UNDEFINED_LABEL** (0x1204): Branch instructions references an undefined label

**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE** (0x1205): Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE** (0x1500): Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT** (0x1501): Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID** (0x1502): Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED** (0x1503): Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER** (0x1504): Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED** (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE** (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
**Chapter 2. API Reference**

**ESP_ERR_EFUSE (0x1600):** Base error code for efuse api.

**ESP_OK_EFUSE_CNT (0x1601):** OK the required number of bits is set.

**ESP_ERR_EFUSE_CNT_IS_FULL (0x1602):** Error field is full.

**ESP_ERR_EFUSE_REPEAT_PROG (0x1603):** Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING (0x1604):** Error while a encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605):** Error not enough unused key blocks available

**ESP_ERR_DAMAGED_READING (0x1606):** Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**ESP_ERR_IMAGE_BASE (0x2000)**

**ESP_ERR_IMAGE_FLASH_FAIL (0x2001)**

**ESP_ERR_IMAGE_INVALID (0x2002)**

**ESP_ERR_WIFI_BASE (0x3000):** Starting number of WiFi error codes

**ESP_ERR_WIFI_NOT_INIT (0x3001):** WiFi driver was not installed by esp_wifi_init

**ESP_ERR_WIFI_NOT_STARTED (0x3002):** WiFi driver was not started by esp_wifi_start

**ESP_ERR_WIFI_NOT_STOPPED (0x3003):** WiFi driver was not stopped by esp_wifi_stop

**ESP_ERR_WIFI_IF (0x3004):** WiFi interface error

**ESP_ERR_WIFI_MODE (0x3005):** WiFi mode error

**ESP_ERR_WIFI_STATE (0x3006):** WiFi internal state error

**ESP_ERR_WIFI_CONN (0x3007):** WiFi internal control block of station or soft-AP error

**ESP_ERR_WIFI_NVS (0x3008):** WiFi internal NVS module error

**ESP_ERR_WIFI_MAC (0x3009):** MAC address is invalid

**ESP_ERR_WIFI_SSID (0x300a):** SSID is invalid

**ESP_ERR_WIFI_PASSWORD (0x300b):** Password is invalid

**ESP_ERR_WIFI_TIMEOUT (0x300c):** Timeout error

**ESP_ERR_WIFI_WAKE_FAIL (0x300d):** WiFi is in sleep state(RF closed) and wakeup fail

**ESP_ERR_WIFI_Would_Block (0x300e):** The caller would block

**ESP_ERR_WIFI_NOT_CONNECT (0x300f):** Station still in disconnect status

**ESP_ERR_WIFI_POST (0x3012):** Failed to post the event to WiFi task

**ESP_ERR_WIFI_INIT_STATE (0x3013):** Invalid WiFi state when init/deinit is called

**ESP_ERR_WIFI_STOP_STATE (0x3014):** Returned when WiFi is stopping

**ESP_ERR_WIFI_NOT_ASSOC (0x3015):** The WiFi connection is not associated

**ESP_ERR_WIFI_TX_DISALLOW (0x3016):** The WiFi TX is disallowed

**ESP_ERR_WIFI_REGISTRAR (0x3033):** WPS registrar is not supported

**ESP_ERR_WIFI_WPS_TYPE (0x3034):** WPS type error

**ESP_ERR_WIFI_WPS_SM (0x3035):** WPS state machine is not initialized

**ESP_ERR_ESPNOW_BASE (0x3064):** ESPNOW error number base.

**ESP_ERR_ESPNOW_NOT_INIT (0x3065):** ESPNOW is not initialized.

**ESP_ERR_ESPNOW_ARG (0x3066):** Invalid argument

**ESP_ERR_ESPNOW_NO_MEM (0x3067):** Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Acked
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
ESP_ERR_MESH_WIFI_NOT_START (0x4001)
ESP_ERR_MESH_NOT_INIT (0x4002)
ESP_ERR_MESH_NOT_CONFIG (0x4003)
ESP_ERR_MESH_NOT_START (0x4004)
ESP_ERR_MESH_NOT_SUPPORT (0x4005)
ESP_ERR_MESH_NOT_ALLOWED (0x4006)
ESP_ERR_MESH_NO_MEMORY (0x4007)
ESP_ERR_MESH_ARGUMENT (0x4008)
ESP_ERR_MESH_EXCEED_MTU (0x4009)
ESP_ERR_MESH_TIMEOUT (0x400a)
ESP_ERR_MESH_DISCONNECTED (0x400b)
ESP_ERR_MESH_QUEUE_FAIL (0x400c)
ESP_ERR_MESH_QUEUE_FULL (0x400d)
ESP_ERR_MESH_NO_PARENT_FOUND (0x400e)
ESP_ERR_MESH_NO_ROUTE_FOUND (0x400f)
ESP_ERR_MESH_OPTION_NULL (0x4010)
ESP_ERR_MESH_OPTION_UNKNOWN (0x4011)
ESP_ERR_MESH_XON_NO_WINDOW (0x4012)
ESP_ERR_MESH_INTERFACE (0x4013)
ESP_ERR_MESH_DISCARD_DUPLICATE (0x4014)
ESP_ERR_MESH_DISCARD (0x4015)
ESP_ERR_MESH_VOTING (0x4016)
ESP_ERR_MESH_XMIT (0x4017)
ESP_ERR_MESH_QUEUE_READ (0x4018)
ESP_ERR_MESH_PS (0x4019)
ESP_ERR_MESH_RECV_RELEASE (0x401a)
ESP_ERR_ESP_NETIF_BASE (0x5000)
ESP_ERR_ESP_NETIF_INVALID_PARAMS (0x5001)
ESP_ERR_ESP_NETIF_IF_NOT_READY (0x5002)
ESP_ERR_ESP_NETIF_DHCPC_START_FAILED (0x5003)
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED (0x5004)
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED (0x5005)
ESP_ERR_ESP_NETIF_NO_MEM (0x5006)
ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED (0x5007)
ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED (0x5008)
ESP_ERR_ESP_NETIF_INIT_FAILED (0x5009)
ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED (0x500a)
ESP_ERR_ESP_NETIF_MLD6_FAILED (0x500b)
ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED (0x500c)

ESP_ERR_FLASH_BASE (0x6000): Starting number of flash error codes
ESP_ERR_FLASH_OP_FAIL (0x6001)
ESP_ERR_FLASH_OP_TIMEOUT (0x6002)
ESP_ERR_FLASH_NOT_INITIALIZED (0x6003)
ESP_ERR_FLASH_UNSUPPORTED_HOST (0x6004)
ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)
ESP_ERR_FLASH_PROTECTED (0x6006)

ESP_ERR_HTTP_BASE (0x7000): Starting number of HTTP error codes
ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection
ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server
ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme
ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn’t been established yet
ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t
ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008): Read FIN from peer and the connection closed

ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes
ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn’t be resolved upon tls connection
ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket
ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family
ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option
ESP_ERR_MBEDTLS_CERT_PARTLY_OK (0x8006): mbedtls parse certificates was partly successful
ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED (0x8007): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED (0x8008): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED (0x8009): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x800a): mbedtls api returned error
ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED (0x800b): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_OK (0x800c): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SETUP_FAILED (0x800d): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_WRITE_FAILED (0x800e): mbedtls api returned error
ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED (0x800f): mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED (0x8010): mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED (0x8011): mbedtls api returned failed
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8012): new connection in esp_tls_low_level_conn connection timedout
ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED (0x8013): wolfSSL api returned error
ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8014): wolfSSL api returned error
ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED (0x8015): wolfSSL api returned error
ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED (0x8016): wolfSSL api returned error
ESP_ERR_WOLFSSL_CTX_SETUP_FAILED (0x8017): wolfSSL api returned failed
ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x801a): wolfSSL api returned failed
ESP_ERR_HTTPS_OTA_BASE (0x9000)
ESP_ERR_HTTPS_OTA_IN_PROGRESS (0x9001)
ESP_ERR_PING_BASE (0xa000)
ESP_ERR_PING_INVALID_PARAMS (0xa001)
ESP_ERR_PING_NO_MEM (0xa002)
ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated
ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occured while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread
ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes
ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem
ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)
ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)
ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)
Chapter 3

ESP32 Hardware Reference

3.1 Chip Series Comparison

The comparison below covers key features of chips supported by ESP-IDF. For the full list of features please refer to respective datasheets in Section Related Documents.

API Guides

4.1 Application Level Tracing library

4.1.1 Overview

IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behavior analysis, see System Behavior Analysis with SEGGER SystemView
4. Source code coverage, see Gcov (Source Code Coverage)

Tracing components when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode.** This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from HW UP BUFFER buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program’s behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

**Streaming mode.** Tracing module enters this mode when host connects to ESP32. In this mode before writing new data to HW UP BUFFER tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISR, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX. This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.
4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see JTAG Debugging for details.

2. **Target side:** Application tracing functionality can be enabled in menuconfig. Component config > Application Level Tracing menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables CONFIG_APPTRACE_ENABLE option.

**Note:** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see Optimize JTAG speed.

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic** (CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less then 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic they will not be flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic** (CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.
4.1.4 How to use this library

This library provides API for transferring arbitrary data between host and ESP32. When enabled in menuconfig target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

Application Specific Tracing

In general user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. On target side user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apprace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
--ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
   ESP_LOGE(TAG, "Failed to write data to host!");
   return res;
}
```

`esp_apprace_write()` function uses memcpy to copy user data to the internal buffer. In some cases it can be more optimal to use `esp_apprace_buffer_get()` and `esp_apprace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apprace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
--tmo in us*/);
if (ptr == NULL) {
   ESP_LOGE(TAG, "Failed to get buffer!");
   return ESP_FAIL;
}
printf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apprace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/tmo_~
--in us*/);
if (res != ESP_OK) {
   /* in case of error host tracing tool (e.g. OpenOCD) will report_
   --incomplete user buffer */
   ESP_LOGE(TAG, "Failed to put buffer!");
   return res;
}
```

Also according to his needs user may want to receive data from the host. Piece of code below shows an example how to do this.

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);
/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apprace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not_`
--wait*/);
```

(continues on next page)
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

esp_apprace_read() function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use esp_apprace_down_buffer_get() and esp_apprace_down_buffer_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apprace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, ...
    100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 0) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}

esp_err_t res = esp_apprace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
    *tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report---
    incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the Getting Started Guide.

3. Run OpenOCD (see JTAG Debugging).

4. Connect to OpenOCD telnet server. It can be done using the following command in terminal telnet <oocd_host> 4444. If telnet session is opened on the same machine which runs OpenOCD you can use localhost as <oocd_host> in the command above.

5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see OpenOCD Application Level Tracing Commands.

6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in $IDF_PATH/tools/esp_app_trace: apptrace_proc.py (used for feature tests) and logtrace_proc.py (see more details in section Logging to Host).

OpenOCD Application Level Tracing Commands **HW UP BUFFER** is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So
it is possible situation that user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions tracing module prepends all user data chunks with header which contains allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

**Note:** Currently OpenOCD does not provide commands to send arbitrary user data to the target.

Command usage:

```
esp apptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (tracesizestoptriggerisdisabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.
- **wait4halt** If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.
- **skip_size** Number of bytes to skip at the start. By default 0.

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect 2048 bytes of tracing data to a file “trace.log”. The file will be saved in “openocd-esp32” directory.

   ```
   esp apptrace start file://trace.log 1 2048 5 0 0
   ```

   The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

   **Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of time-out. Either increase the timeout or use a function `esp_apptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.
There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp apptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
To configure tracing immediately after reset use the openocd reset halt command.
```

### Logging to Host

IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host. By default IDF’s logging library uses vprintf-like function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of vprintf-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_apptrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

### Limitations

Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for printf arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from `.rodata` section are supported as format strings and arguments.
4. Maximum number of printf arguments is 256.

### How To Use It

In order to use logging via trace module user needs to perform the following steps:

1. On target side special vprintf-like function needs to be installed. As it was mentioned earlier this function is `esp_apptrace_vprintf`. It sends log data to the host. Example code is provided in `system/app_trace_to_host`.
2. Follow instructions in items 2-5 in [Application Specific Tracing](#).
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`. 

[Submit Document Feedback]
Log Trace Processor Command Options

Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

- **trace_file**: Path to log trace file
- **elf_file**: Path to program ELF file

Optional arguments:

- `-h`, `--help`: show this help message and exit
- `--no-errors`, `-n`: Do not print errors

System Behavior Analysis with SEGGER SystemView

Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

**Note:** Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

How To Use It

Support for this feature is enabled by Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG_APPTRACE_SV_ENABLE) menuconfig option. There are several other options enabled under the same menu:

1. ESP32 timer to use as SystemView timestamp source: (CONFIG_APPTRACE_SV_TS_SOURCE) selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In dual-core mode external timer working at 40 Mhz is used, so timestamp granularity is 25 ns.
2. Individually enabled or disabled collection of SystemView events (CONFIG_APPTRACE_SV_EVT_XXX):
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Start Ready State Event
   - Task Stop Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

OpenOCD SystemView Tracing Command Options

Command usage:

```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:

- **start**: Start tracing (continuous streaming).
- **stop**: Stop tracing.
- **status**: Get tracing status.
Chapter 4. API Guides

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1**: Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`
- **outfile2**: Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`
- **poll_period**: Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.
- **trace_size**: Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).
- **stop_tmo**: Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

**Note**: If `poll_period` is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVDat” and “app-cpu.SVDat”. The files will be saved in “openocd-esp32” directory.

   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
   ```

   The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
   ```

   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.

**Data Visualization**  After trace data are collected user can use special tool to visualize the results and inspect behavior of the program.

Unfortunately SystemView does not support tracing from multiple cores. So when tracing from ESP32 working in dual-core mode two files are generated: one for PRO CPU and another one for APP CPU. User can load every file into separate instance of the tool.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called Impulse which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.

Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

**Note**: IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping `$SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt` with `$IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt`. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

**Configure Impulse for Dual Core Traces**  After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs, users can add special Multi Adapter port and load both files into one view. To do this, users need to do the following in Eclipse:
Chapter 4. API Guides

2. In ‘Signal Ports’ view right-click on ‘Ports’ and select ‘Add …’ ->New Multi Adapter Port
4. In open dialog select ‘SystemView Serializer’ as Serializer and set path to PRO CPU trace file. Press OK.
5. Repeat steps 3-4 for APP CPU trace file.
6. Double-click on created port. View for this port should open.
7. Click Start/Stop Streaming button. Data should be loaded.
8. Use ‘Zoom Out’, ‘Zoom In’ and ‘Zoom Fit’ button to inspect data.
9. For settings measurement cursors and other features please see Impulse documentation).

Note: If you have problems with visualization (no data are shown or strange behavior of zoom action is observed) you can try to delete current signal hierarchy and double click on the necessary file or port. Eclipse will ask you to create new signal hierarchy.

Gcov (Source Code Coverage)

Basics of Gcov and Gcovr Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’s runtime. Gcov is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The Gcovr tool is utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the Host will undergo these steps:

1. Compile the source code using GCC with the --coverage option enabled. This will cause the compiler to generate a .gcno notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the --coverage option should have their own .gcno file of the same name (e.g., a main.c will generate a main.gcno when compiled).
2. Execute the program. During execution, the program should generate .gcda data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a .gcda file for each source file compiled with the --coverage option (e.g., main.c will generate a main.gcda.
3. Gcov or Gcovr can be used generate a code coverage based on the .gcno, .gcda, and source files. Gcov will generate a text based coverage report for each source file in the form of a .gcov file, whilst Gcovr will generate a coverage report in HTML format.

Gcov and Gcovr in ESP-IDF Using Gcov in ESP-IDF is complicated by the fact that the program is running remotely from the Host (i.e., on the target). The code coverage data (i.e., the .gcda files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. Setting Up a Project for Gcov
2. Dumping Code Coverage Data
3. Generating Coverage Report

Setting Up a Project for Gcov

Compiler Option In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the --coverage option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

To cause all source files in a component to be compiled with the --coverage option.
- Add target_compile_options({COMPONENT_LIB} PRIVATE --coverage) to the CMakeLists.txt file of the component if using CMake.
- Add CFLAGS += --coverage to the component.mk file of the component if using Make.
To cause a select number of source files (e.g. `source1.c` and `source2.c`) in the same component to be compiled with the

- **Add** `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- **Add** `source1.o: CFLAGS += --coverage` and `source2.o: CFLAGS += --coverage` to the component.mk file of the component if using Make.

When a source file is compiled with the `--coverage` option (e.g. `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project’s build directory.

**Project Configuration** Before building a project with source code coverage, ensure that the following project configuration options are enabled by running `idf.py menuconfig` (or `make menuconfig` if using the legacy Make build system).

- Enable the application tracing module by choosing `Trace Memory` for the `CONFIG_APPTRACE_DESTINATION` option.
- Enable Gcov to host via the `CONFIG_APPTRACE_GCOV_ENABLE`.

**Dumping Code Coverage Data** Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the Host is know as dumping.

The dumping of coverage data is done via OpenOCD (see [JTAG Debugging](https://docs.espressif.com/projects/esp-idf/en/latest/development-tools/openocd.html) on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <oocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project’s build directory. For example, if `gcov_example_main.c` of the main component was compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda` (or `build/main/gcov_example_main.gcda` if using the legacy Make build system). Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application’s life time. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest file will contain the total execution count of each code path over the application’s entire lifetime.

ESP-IDF supports two methods of dumping code coverage data form the target to the host:

- **Instant Run-Time Dump**
- **Hard-coded Dump**

**Instant Run-Time Dump** An Instant Run-Time Dump is triggered by calling the `ESP32 gcov OpenOCD` command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32’s current state and execute a built-in IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the Host. Upon completion, the ESP32 will resume its current state.

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the Host must execute the `esp gcov dump` OpenOCD command (via a telnet session). The `esp gcov dump` command will cause OpenOCD to connect to the ESP32, retrieve the code coverage data, then disconnect from the ESP32 thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application’s lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application’s lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application’s main loop).
GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp gcov dump` automatically via the use of `gdbinit` script (see Using GDB from Command Line).

The following GDB script will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp gcov dump` OpenOCD command.

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.

---

**Generating Coverage Report** Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to Gcov documentation and Gcovr documentation.

**Adding Gcovr Build Target to Project** To make report generation more convenient, users can define additional build targets in their projects such report generation can be done with a single build command.

**CMake Build System** For the CMake build systems, add the following lines to the `CMakeLists.txt` file of your project.

```cmake
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

**Make Build System** For the Make build systems, add the following lines to the `Makefile` of your project.

```make
GCOV := $(call dequote,$(CONFIG_SDK_TOOLPREFIX))gcov
REPORT_DIR := $(BUILD_DIR_BASE)/coverage_report

gcovr-report:
    echo "Generating coverage report in: $(REPORT_DIR)"
    gcovr -r $(PROJECT_PATH) --gcov-executable $(GCOV) -s $(REPORT_DIR)/html/index.html

cov-data-clean:
    echo "Remove coverage data files..."
    find $(BUILD_DIR_BASE) -name "*.gcda" -exec rm {} +
    rm -rf $(REPORT_DIR)

.PHONY: gcovr-report cov-data-clean
```

---
The following commands can now be used:

- `make gcovr-report` will generate an HTML coverage report in `${BUILD_DIR_BASE}/coverage_report/html` directory.
- `make cov-data-clean` will remove all coverage data files.

## 4.2 Application Startup Flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. **First stage bootloader** in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. **Second stage bootloader** loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. **Application startup** executes. At this point the second CPU and RTOS scheduler are started.

This process is explained in detail in the following sections.

### 4.2.1 First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located in the mask ROM of the ESP32 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrapping states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.
2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32 datasheet for a description of SoC boot modes and how to execute them.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

**Note:** During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

Second stage bootloader binary image is loaded from flash starting at address 0x1000. If **Secure Boot** is in use then the first 4 KB sector of flash is used to store secure boot IV and digest of the bootloader image. Otherwise, this sector is unused.

### 4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in `components/bootloader` directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.
When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (configurable value). See partition tables documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the odata partition to determine which one should be booted. See Over The Air Updates (OTA) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see Bootloader.

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal IRAM (Instruction RAM) or DRAM (Data RAM), the contents are copied from flash to the load address.
- For segments which have load addresses in DROM (data stored in Flash) or IROM (code executed from Flash) regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.

Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

### 4.2.3 Application startup

Application startup covers everything that happens after the app starts executing and before the app_main function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling app_main.

**Note:** Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer’s perspective only, skip forward to Running the main task.

**Port Initialization**

ESP-IDF application entry point is call_start_cpu0 function found in components/esp_system/port/cpu_start.c. This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment (CRT) and performs initial configuration of the SoC’s internal hardware:

- Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing Fatal Errors to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
- If the option CONFIG_BOOTLOADER_WDT_ENABLE is not set then the RTC watchdog timer is disabled.
- Initialize internal memory (data & bss).
- Finish configuring the MMU cache.
- Enable PSRAM if configured.
- Set the CPU clocks to the frequencies configured for the project.
- Reconfigure the main SPI flash based on the app header settings (necessary for compatibility with bootloader versions before ESP-IDF V4.0, see Bootloader compatibility).
- If the app is configured to run on multiple cores, start the other core and wait for it to initialize as well (inside the similar “port layer” initialization function call_start_cpu1).

Once call_start_cpu0 completes running, it calls the “system layer” initialization function start_cpu0 found in components/esp_system/startup.c. Other cores will also complete port-layer initialization and call start_other_cores found in the same file.
System Initialization

The main system initialization function is \texttt{start_cpu0}. By default, this function is weak-linked to the function \texttt{start_cpu0_default}. This means that it’s possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

- Log information about this application (project name, \texttt{App version}, etc.) if default log level enables this.
- Initialize the heap allocator (before this point all allocations must be static or on the stack).
- Initialize newlib component syscalls and time functions.
- Configure the brownout detector.
- Setup libc stdin, stdout, and stderr according to the \texttt{serial console configuration}.
- Perform any security-related checks, including burning efuses that should be burned for this configuration (including \texttt{disabling ROM download mode on ESP32 V3, \texttt{CONFIG\_ESP32\_DISABLE\_BASIC\_ROM\_CONSOLE}}).
- Initialize SPI flash API support.
- Call global C++ constructors and any C functions marked with \texttt{__attribute__((constructor))}.

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the \texttt{ESP\_SYSTEM\_INIT\_FN} macro, it will be called as part of secondary initialization.

Running the main task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function \texttt{app\_main} in the firmware.

The main task that runs \texttt{app\_main} has a fixed RTOS priority (one higher than the minimum) and a configurable stack size.

The main task core affinity is also configurable: \texttt{CONFIG\_ESP\_MAIN\_TASK\_AFFINITY}.

Unlike normal FreeRTOS tasks (or embedded C main functions), the \texttt{app\_main} task is allowed to return. If this happens, the task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement \texttt{app\_main} as either a function that creates other application tasks and then returns, or as a main application task itself.

Second core startup

A similar but simpler startup process happens on the APP CPU:

When running system initialization, the code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, APP CPU jumps to \texttt{call\_start\_cpu1} function in components/esp_system/port/cpu_start.c.

While PRO CPU does initialization in \texttt{start_cpu0} function, APP CPU runs \texttt{start_cpu\_other\_cores} function. Similar to \texttt{start_cpu0}, this function is weak-linked and defaults to the \texttt{start_cpu\_other\_cores\_default} function but can be replaced with a different function by the application.

The \texttt{start_cpu\_other\_cores\_default} function does some core-specific system initialization and then waits for the PRO CPU to start the FreeRTOS scheduler, at which point it executes \texttt{esp\_startup\_start\_app\_other\_cores} which is another weak-linked function defaulting to \texttt{esp\_startup\_start\_app\_other\_cores\_default}.

By default \texttt{esp\_startup\_start\_app\_other\_cores\_default} does nothing but spin in a busy-waiting loop until the scheduler of the PRO CPU triggers an interrupt to start the RTOS scheduler on the APP CPU.
4.3 BluFi

4.3.1 Overview

The BluFi for ESP32 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32. Using this information ESP32 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

4.3.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32 into GATT Server mode and then it will send broadcasts with specific advertising data. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32 (see the section The Frame Formats Defined in BluFi for details).
4. After ESP32 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32.
7. When receiving this control frame, ESP32 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of The Frame Formats Defined in BluFi, with the Wi-Fi configuration information to ESP32, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32. When receiving this control frame, ESP32 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

Note:

1. After ESP32 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

4.3.3 The flow chart of BluFi

4.3.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32 are defined as follows:
Fig. 2: BluFi Flow Chart
Chapter 4. API Guides

The frame format with no fragment (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>$[Data Length]</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

If the Frame Ctrl bit is enabled, the Total length bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type (Frag)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control (Frag)</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>Total Content Length 2</td>
</tr>
<tr>
<td></td>
<td>Content</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

Normally, the control frame does not contain data bits, except for Ack Frame.

The format of Ack Frame (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type (Ack)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>Data Length</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>Acked Sequence Number 2</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

1. Type
   The Type field, taking 1 byte, is divided into Type and Subtype, that Type uses the lower 2 bits and Subtype uses the upper 6 bits.
   • The control frame is not encrypted for the time being and supports to be verified;
   • The data frame supports to be encrypted and verified.

1.1 Control Frame (0x0 b' 00)
<table>
<thead>
<tr>
<th>Control Frame (Binary)</th>
<th>Implication</th>
<th>Explanation</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0 (b' 0000 0000)</td>
<td>Ack</td>
<td>The data field of the Ack frame uses the same sequence value of the frame to reply to.</td>
<td>The data field consumes a byte and its value is the same as the sequence field of the frame to reply to.</td>
</tr>
<tr>
<td>0x1 (b' 0000 0001)</td>
<td>Set ESP device to the security mode.</td>
<td>To inform ESP device of the security mode to use when sending data, which is allowed to be reset multiple times during the process. Each setting affects the subsequent security mode used. If it is not set, ESP device will send the control frame and data frame with no checksum and encryption by default. The data transmission from the mobile phone to ESP device is controlled by this control frame.</td>
<td>The data field consumes a byte. The higher 4 bits are for the security mode setting of the control frame, and the lower 4 bits are for the security mode setting of the data frame. b’0000: no checksum and no encryption; b’0001: with checksum but no encryption; b’0010: no checksum but with encryption; b’0011: with both checksum and encryption.</td>
</tr>
<tr>
<td>0x2 (b' 0000 0010)</td>
<td>Set the opmode of Wi-Fi.</td>
<td>The frame contains opmode settings for configuring for the Wi-Fi mode of ESP device.</td>
<td>data[0] is for opmode settings, including: 0x00: NULL; 0x01: STA; 0x02: SoftAP; 0x03: SoftAP&amp;STA. Please set the SSID/Password/Max Connection Number of the AP mode in the first place if an AP gets involved.</td>
</tr>
<tr>
<td>0x3 (b' 0000 0011)</td>
<td>Connect ESP device to the AP.</td>
<td>To notify ESP device that the essential information has been sent and it is allowed to connect to the AP.</td>
<td>No data field is contained.</td>
</tr>
<tr>
<td>0x4 (b' 0000 0011)</td>
<td>Disconnect ESP device from the AP.</td>
<td></td>
<td>No data field is contained.</td>
</tr>
<tr>
<td>0x5 (b' 0000 0100)</td>
<td>To get the information of ESP device’s Wi-Fi mode and its status.</td>
<td></td>
<td>No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi connection state report to the mobile phone with the information of the current opmode, connection status, SSID and so on. The types of information sent to the mobile phone are defined by an application installed on the phone.</td>
</tr>
</tbody>
</table>
## 1.2 Data Frame (0x1 b’ 01)

<table>
<thead>
<tr>
<th>Data Frame(Binary)</th>
<th>Implication</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0 (b’ 000000)</td>
<td>Send the negotiation data.</td>
<td>The negotiation data will be sent to the callback function registered in the application layer.</td>
</tr>
<tr>

2. Frame Control
Control field, takes 1 byte and each bit has a different meaning.
### Chapter 4. API Guides

#### Bit Meaning

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>Indicates whether the frame is encrypted.</td>
</tr>
<tr>
<td></td>
<td>1 means encryption, and 0 means unencrypted.</td>
</tr>
<tr>
<td></td>
<td>The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum).</td>
</tr>
<tr>
<td></td>
<td>Control frame is not encrypted, so this bit is 0.</td>
</tr>
<tr>
<td>0x02</td>
<td>The data field that indicates whether a frame contains a checksum (such as SHA1, MD5, CRC, etc.) for the end of the frame data field includes SEQUCNE + data length + clear text. Both the control frame and the data frame can contain a check bit or not.</td>
</tr>
<tr>
<td>0x04</td>
<td>Represents the data direction.</td>
</tr>
<tr>
<td></td>
<td>0 means the mobile phone to ESP device;</td>
</tr>
<tr>
<td></td>
<td>1 means ESP device to the mobile phone.</td>
</tr>
<tr>
<td>0x08</td>
<td>Indicates whether the other person is required to reply to an ACK.</td>
</tr>
<tr>
<td></td>
<td>0 indicates no requirement;</td>
</tr>
<tr>
<td></td>
<td>1 indicates to reply Ack.</td>
</tr>
<tr>
<td>0x10</td>
<td>Indicates whether there are subsequent data fragments.</td>
</tr>
<tr>
<td></td>
<td>0 indicates that there are no subsequent data fragments for this frame;</td>
</tr>
<tr>
<td></td>
<td>1 indicates that there are subsequent data fragments and used to transmit longer data.</td>
</tr>
<tr>
<td>0x10~0x80</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

3. **Sequence Control**
   - Sequence control field. When a frame is sent, the value of the sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

4. **Length**
   - The length of the data field that does not include CheckSum.

5. **Data**
   - The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

6. **CheckSum**
   - This field takes 2 bytes that is used to check “sequence + data length + clear text data”.

### 4.3.5 The Security Implementation of ESP32

1. **Securing data**
   - To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

2. **Ensuring data integrity**
   - To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

3. **Securing identity (signature)**
   - Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as an companion for signature.

4. **Replay attack prevention**
   - It is added to the Sequence field and used during the checksum verification.

For the coding of ESP32, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.

The application layer needs to register several security-related functions to BluFi:
This function is for ESP32 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output_data and Output_len.

BluFi will send output_data from Negotiate_data_handler after Negotiate_data_handler is called.

Here are two “*”, because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED_FREE.

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

### 4.3.6 GATT Related Instructions

**UUID**

BluFi Service UUID: 0xFFFF, 16 bit
BluFi (the mobile -> ESP32): 0xFF01, writable
Blufi (ESP32 -> the mobile phone): 0xFF02, readable and callable

### 4.4 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Initialize Flash Encryption and/or Secure features, if configured;
3. Select the application partition to boot, based on the partition table and ota_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to it.

Bootloader is located at the address 0x1000 in the flash.

For a full description of the startup process including the the ESP-IDF bootloader, see Application Startup Flow.

### 4.4.1 Bootloader compatibility

It is recommended to update to newer versions of ESP-IDF: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.
The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

**Note:** If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

### Before ESP-IDF V2.1

Bootloaders built from very old versions of ESP-IDF (before ESP-IDF V2.1) perform less hardware configuration than newer versions. When using a bootloader from these early ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS`.

### Before ESP-IDF V3.1

Bootloaders built from versions of ESP-IDF before V3.1 do not support MD5 checksums in the partition table binary. When using a bootloader from these ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`.

### SPI Flash Configuration

Each ESP-IDF application or bootloader .bin file contains a header with `CONFIG_ESPTOOLPY_FLASHMODE`, `CONFIG_ESPTOOLPY_FLASHFREQ`, `CONFIG_ESPTOOLPY_FLASHSIZE` embedded in it. These are used to configure the SPI flash during boot.

The **First stage bootloader** in ROM reads the **Second stage bootloader** header from flash and uses these settings to load it. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the **Second stage bootloader** then runs and re-configures the flash, it reads values from the currently selected app binary header not the bootloader header. This allows an OTA update to change the SPI flash settings in use.

Bootloaders prior to ESP-IDF V4.0 used the bootloader’s own header to configure the SPI flash, meaning these values could not be changed in an update. To maintain compatibility with older bootloaders, the app re-initializes the flash settings during app startup using the configuration found in the app header.

### 4.4.2 Log Level

The default bootloader log level is “Info”. By setting the `CONFIG_BOOTLOADER_LOG_LEVEL` option, it’s possible to increase or decrease this level. This log level is separate from the log level used in the app (see *Logging library*).

Reducing bootloader log verbosity can improve the overall project boot time by a small amount.

### 4.4.3 Factory reset

Sometimes it is desirable to have a way for the device to fall back to a known-good state, in case of some problem with an update.

To roll back to the original “factory” device configuration and clear any user settings, configure the config item `CONFIG_BOOTLOADER_FACTORY_RESET` in the bootloader.

The factory reset mechanism allows to reset the device to factory settings in two ways:

- Clear one or more data partitions. `CONFIG_BOOTLOADER_DATA_FACTORY_RESET` allows customers to select which data partitions will be erased when the factory reset is executed.
Chapter 4. API Guides

Can specify the names of partitions as a comma-delimited list with optional spaces for readability. (Like this: nvs, phy_init, nvs_custom). Make sure that the names of partitions specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

- Boot from “factory” app partition. CONFIG_BOOTLOADER_OTA_DATA_ERASE - the device will boot from the default “factory” app partition (or if there is no factory app partition in the partition table then the default ota app partition) after a factory reset. This is done by erasing the OTA data partition which holds the currently selected OTA partition slot. The “factory” app partition slot (if it exists) is never updated via OTA, so resetting to this allows reverting to a “known good” firmware application.

Either or both of these configuration options can be enabled independently.

In addition, the following configuration options control the reset condition:

- CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET - number of the GPIO input for factory reset uses to trigger a factory reset, this GPIO must be pulled low or high (configurable) on reset to trigger this.
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
- CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL - configure whether a factory reset should trigger on a high or low level of the GPIO. If the GPIO has an internal pullup then this is enabled before the pin is sampled, consult the ESP32 datasheet for details on pin internal pullups.

4.4.4 Boot from Test Firmware

It’s possible to write a special firmware app for testing in production, and boot this firmware when needed. The project partition table will need a dedicated app partition entry for this testing app, type app and subtype test (see Partition Tables).

Implementing a dedicated test app firmware requires creating a totally separate ESP-IDF project for the test app (each project in ESP-IDF only builds one app). The test app can be developed and tested independently of the main project, and then integrated at production testing time as a pre-compiled .bin file which is flashed to the address of the main project’s test app partition.

To support this functionality in the main project’s bootloader, set the configuration item CONFIG_BOOTLOADER_APP_TEST and configure the following two items:

- CONFIG_BOOTLOADER_NUM_PIN_APP_TEST - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the normally configured application will boot (factory or any OTA app partition slot).
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

4.4.5 Rollback

Rollback and anti-rollback features must be configured in the bootloader as well.

Consult the App rollback and Anti-rollback sections in the OTA API reference document.

4.4.6 Watchdog

By default, the hardware RTC Watchdog timer remains running while the bootloader is running and will automatically reset the chip if no app has successfully started after 9 seconds.

- The timeout period can be adjusted by setting CONFIG_BOOTLOADER_WDT_TIME_MS and recompiling the bootloader.
• The app’s behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset or “fed” by the app to avoid a reset. To do this, set the CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE option, modify the app as needed, and then recompile the app.
• The RTC Watchdog can be disabled in the bootloader by disabling the CONFIG_BOOTLOADER_WDT_ENABLE setting and recompiling the bootloader. This is not recommended.

### 4.4.7 Bootloader Size

When enabling additional bootloader functions, including Flash Encryption or Secure Boot, and especially if setting a high CONFIG_BOOTLOADER_LOG_LEVEL level, then it is important to monitor the bootloader .bin file’s size.

When using the default CONFIG_PARTITION_TABLE_OFFSET value 0x8000, the size limit is 0x7000 (28672) bytes.

If the bootloader binary is too large, then the bootloader build will fail with an error “Bootloader binary size […] is too large for partition table offset”. If the bootloader binary is flashed anyhow then the ESP32 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

**Note:** The bootloader size check only happens in the CMake Build System, when using the legacy GNU Make Build System the size is not checked but the ESP32 will fail to boot if bootloader is too large.

Options to work around this are:

• Set bootloader compiler optimization back to “Size” if it has been changed from this default value.
• Reduce bootloader log level. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
• Set CONFIG_PARTITION_TABLE_OFFSET to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the partition table CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than CONFIG_PARTITION_TABLE_OFFSET + 0x1000. (This includes the default partition CSV files supplied with ESP-IDF.)

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 48KB (0xC000 bytes) (excluding the 4KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

### 4.4.8 Fast boot from Deep Sleep

The bootloader has the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP option which allows to reduce the wake-up time (useful to reduce consumption). This option is available when CONFIG_SECURE_BOOT option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

### 4.4.9 Custom bootloader

The current bootloader implementation allows a project to extend it or modify it. There are two ways of doing it: by implementing hooks or by overriding it. Both ways are presented in custom_bootloader folder in ESP-IDF examples:

• bootloader_hooks which presents how to connect some hooks to the bootloader initialization
• bootloader_override which presents how to override the bootloader implementation

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project’s bootloader_components directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the partition table offset value to place the partition table later in the flash. This increases the space available for the bootloader.
**Chapter 4. API Guides**

---

**Note:** Customize the bootloader by using either method is only supported with CMake build system (i.e. not supported with legacy Make build system).

---

### 4.5 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organize and build a new ESP-IDF project or component.

---

**Note:** This document describes the CMake-based build system, which is the default since ESP-IDF V4.0. ESP-IDF also supports a *legacy build system based on GNU Make*, which was the default before ESP-IDF V4.0.

---

#### 4.5.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

**Concepts**

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, i.e. your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “Components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. At the moment, ESP-IDF supports esp32, esp32s2 and esp32c3 targets.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH.
4.5.2 Using the Build System

**idf.py**

The `idf.py` command line tool provides a front-end for easily managing your project builds. It manages the following tools:

- **CMake**, which configures the project to be built
- A command line build tool (either **Ninja** build or **GNU Make**)
- **esptool.py** for flashing the target.

The getting started guide contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects. `idf.py` should be run in an ESP-IDF “project” directory, ie one containing a `CMakeLists.txt` file. Older style projects with a `Makefile` will not work with `idf.py`.

Type `idf.py --help` for a list of commands. Here are a summary of the most useful ones:

- `idf.py set-target <target>` sets the target (chip) for which the project is built. See *Selecting the Target*.
- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
  - Run **CMake** as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool (**Ninja** or **GNU Make**). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete CMake configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes all files in the build directory, so use with care. Project configuration is not deleted.
- `idf.py flash` will automatically build the project if necessary, and then flash it to the target. The `-p` and `-b` options can be used to set serial port name and flasher baud rate, respectively.
- `idf.py monitor` will display serial output from the target. The `-p` option can be used to set the serial port name. Type `Ctrl-~` to exit the monitor. See **IDF Monitor** for more details about using the monitor.

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports shell autocompletion for bash, zsh and fish shells.

In order to make shell autocompletion supported, please make sure you have at least Python 3.5 and `click` 7.1 or newer (*see also*).

To enable autocompletion for `idf.py` use the `export` command (*see this*). Autocompletion is initiated by pressing the TAB key. Type “`idf.py` -” and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

**Note:** The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

**Advanced Commands**

- `idf.py app, idf.py bootloader, idf.py partition_table` can be used to build only the app, bootloader, or partition table from the project as applicable.
• There are matching commands `idf.py app-flash`, etc. to flash only that single part of the project to the target.
  • `idf.py -p PORT erase_flash` will use `esptool.py` to erase the target’s entire flash chip.
  • `idf.py size` prints some size information about the app. `size-components` and `size-files` are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable `-DOUTPUT_JSON=1` when running CMake (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.
  • `idf.py reconfigure` re-runs `CMake` even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.
  • `idf.py python-clean` deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.
  • `idf.py docs` will open direct link to documentation for project’s chip target and version in browser. To see all options use `idf.py docs --help`

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

`idf.py options` To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

  • `-C <dir>` allows overriding the project directory from the default current working directory.
  • `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
  • `--ccache` flag can be used to enable `CCache` when compiling source files, if the `CCache` tool is installed. This can dramatically reduce some build times.

Note that some older versions of `CCache` may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling `CCache` and build again. `CCache` can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

  • `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
  • `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.

Start a new project

Use the command `idf.py create-project` for starting a new project. Execute `idf.py create-project --help` for more information.

Example:

```bash
idf.py create-project --path my_projects my_new_project
```

This example will create a new project called `my_new_project` directly into the directory `my_projects`.

Using CMake Directly

`idf.py` is a wrapper around `CMake` for convenience. However, you can also invoke `CMake` directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):
mkdir -p build

cd build

cmake .. -G Ninja   # or 'Unix Makefiles'
ninja

In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is `Ninja`: running `ninja` actually builds the project.

It’s not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

**Note:** If you’re already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake’s functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more “CMake style” components.

### Flashing with `ninja` or `make`

It’s possible to build and flash directly from `ninja` or `make` by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

**Note:** Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute `idf.py` for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).
Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default Python interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

idf.py and other Python scripts will run with the default Python interpreter, i.e. python. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py ...`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 ...` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the PYTHON value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, checkout the tools `pyenv` or `virtualenv`. These let you change the default Python version.

Possible issues  The user of idf.py may sometimes experience ImportError described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in <module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

The exception is often caused by .pyc files generated by different Python versions. To solve the issue run the following command:

```
idf.py python-clean
```

4.5.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project CMakeLists.txt file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file /tools/cmake/project.cmake which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “sdkconfig” project configuration file. This file is created/updated when idf.py menuconfig runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “sdkconfig” file may or may not be added to the source control system of the project.
• Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, EXTRA_COMPONENT_DIRS can be set in the top-level CMakeLists.txt to look for components in other places. See the renaming main section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “main”.
• “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable COMPONENT_DIRS includes this component but you can modify this variable.
• “build” directory is where build output is created. This directory is created by idf.py if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component CMakeLists.txt file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See Component CMakeLists Files for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via menuconfig. Some components may also include Kconfig.projbuild and project_include.cmake files, which are special files for overriding parts of the project.

4.5.4 Project CMakeLists File

Each project has a single top-level CMakeLists.txt file that contains build settings for the entire project. By default, the project CMakeLists can be quite minimal.

Minimal Example CMakeLists

Minimal project:

```makefile
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

• cmake_minimum_required(VERSION 3.5) tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the CMakeLists.txt file.
• include($ENV{IDF_PATH}/tools/cmake/project.cmake) pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
• project(myProject) creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - i.e myProject.elf, myProject.bin. Only one project can be defined per CMakeLists file.

Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in /tools/cmake/project.cmake for all of the implementation details.

• COMPONENT_DIRS: Directories to search for components. Defaults to IDF_PATH/components, PROJECT_DIR/components, and EXTRA_COMPONENT_DIRS. Override this variable if you don’t want to search for components in these places.
• EXTRA_COMPONENT_DIRS: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
• **COMPONENTS**: A list of component names to build into the project. Defaults to all components found in the `COMPONENT_DIRS` directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the `REQUIRES` or `PRIV_REQUIRES` arguments on component registration will automatically have it added to this list, so the `COMPONENTS` list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` ie `set (VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...)` line but before the `include(...)` line.

### Renaming main component

The build system provides special treatment to the `main` component. It is a component that gets automatically added to the build provided that it is in the expected location, `PROJECT_DIR/main`. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the `main` component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming `main` are as follows:

1. Rename `main` directory.
2. Set `EXTRA_COMPONENT_DIRS` in the project `CMakeLists.txt` to include the renamed `main` directory.
3. Specify the dependencies in the renamed component’s `CMakeLists.txt` file via `REQUIRES` or `PRIV_REQUIRES` arguments on component registration.

### Overriding default build specifications

The build sets some global build specifications (compile flags, definitions, etc.) that gets used in compiling all sources from all components.

For example, one of the default build specifications set is the compile option `-Wextra`. Suppose a user wants to use override this with `-Wno-extra`, it should be done after `project()`:

```cmake
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILE_OPTIONS "-Wno-error" APPEND)
```

This ensures that the compile options set by the user won’t be overridden by the default build specifications, since the latter are set inside `project()`.

### 4.5.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project’s own components directory, or added from custom component directories *(see above)*.

A component is any directory in the `COMPONENT_DIRS` list which contains a `CMakeLists.txt` file.

### Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project’s components. Directories in this list can either be components themselves (ie they contain a `CMakeLists.txt` file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.
Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by COMPO-
ONENT_DIRS; by default, this means ESP-IDF’s internal components first (IDF_PATH/components), then
any components in directories specified in EXTRA_COMPONENT_DIRS, and finally the project’s components
(PROJECT_DIR/components). If two or more of these directories contain component sub-directories with the
same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF com-
ponents with a modified version by copying that component from the ESP-IDF components directory to the project
components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain
untouched.

**Note:** If a component is overridden in an existing project by moving it to a new location, the project will not
automatically see the new component path. Run `idf.py reconfigure` (or delete the project build folder) and
then build again.

Minimal Component CMakeLists

The minimal component `CMakeLists.txt` file simply registers the component to the build system using
`idf_component_register`:

```latex
idf_component_register(SRCS "foo.c" "bar.c"
INCLUDE_DIRS "include"
REQUIRES mbedtls)
```

- **SRCS** is a list of source files (`.c`, `.cpp`, `.cc`, `.S`). These source files will be compiled into the com-
  component library.
- **INCLUDE_DIRS** is a list of directories to add to the global include search path for any component which
  requires this component, and also the main source files.
- **REQUIRES** is not actually required, but it is very often required to declare what other components this com-
  ponent will use. See Component Requirements.

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the `CMakeLists.txt` file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed
here.

See example component requirements and example component CMakeLists for more complete component CMake-
Lists.txt examples.

Create a new component

Use the command `idf.py create-component` for creating a new component. The new component will contain
set of files necessary for building a component. You may include the component’s header file into your project and
use its functionality. For more information execute `idf.py create-component --help`.

Example:

```bash
idf.py -C components create-component my_component
```

The example will create a new component in the subdirectory `components` under the current working directory. For
more information about components follow the documentation page see above.

Preset Component Variables

The following component-specific variables are available for use inside component CMakeLists, but should not be
modified:
Chapter 4. API Guides

- **COMPONENT_DIR**: The component directory. Evaluates to the absolute path of the directory containing `CMakeLists.txt`. The component path cannot contain spaces. This is the same as the `CMAKE_CURRENT_SOURCE_DIR` variable.
- **COMPONENT_NAME**: Name of the component. Same as the name of the component directory.
- **COMPONENT_ALIAS**: Alias of the library created internally by the build system for the component.
- **COMPONENT_LIB**: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- **CONFIG_***: Each value in the project configuration has a corresponding variable available in cmake. All names begin with `CONFIG_`. More information here.
- **ESP_PLATFORM**: Set to 1 when the CMake file is processed within ESP-IDF build system.

### Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using `idf_build_get_property` from the component CMakeLists.txt:

- **PROJECT_NAME**: Name of the project, as set in project CMakeLists.txt file.
- **PROJECT_DIR**: Absolute path of the project directory containing the project CMakeLists. Same as the `CMAKE_SOURCE_DIR` variable.
- **COMPONENTS**: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- **IDF_VER**: Git version of ESP-IDF (produced by `git describe`)
- **IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH**: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. v4.0-dev-*, v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of `IDF_VERSION_*` variables, but different `IDF_VER` values.
- **IDF_TARGET**: Name of the target for which the project is being built.
- **PROJECT_VER**: Project version.
  - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
  - Else, if `PROJECT_VER` variable is set in project CMakeLists.txt file, its value will be used.
  - Else, if the `PROJECT_DIR/version.txt` exists, its contents will be used as `PROJECT_VER`.
  - Else, if the project is located inside a Git repository, the output of `git describe` will be used.
  - Otherwise, `PROJECT_VER` will be “1”.

Other build properties are listed here.

### Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the `target_compile_options` function:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake `set_source_files_properties` command:

```cmake
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
    -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.
4.5.6 Component Configuration

Each component can also have a Kconfig file, alongside CMakeLists.txt. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see Adding conditional configuration.

4.5.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- **ESP_PLATFORM**: Can be used to detect that build happens within ESP-IDF.
- **IDF_VER**: Defined to a git version string. E.g. v2.0 for a tagged release or v1.0-275-g0efaa4f for an arbitrary commit.

4.5.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on ("requires").

When writing a component

```cpp
idf_component_register(...)  
  REQUIRE mbedts  
  PRIV_REQUIRE console spiffs
```

- **REQUIRES** should be set to all components whose header files are #included from the public header files of this component.
- **PRIV_REQUIRES** should be set to all components whose header files are #included from any source files in this component, unless already listed in REQUIRE. Also any component which is required to be linked in order for this component to function correctly.
- The values of **REQUIRES** and **PRIV_REQUIRES** should not depend on any configuration choices (CONFIG_xxx macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both **REQUIRES** variables is fine. If the component has no requirements except for the Common component requirements needed for RTOS, libc, etc.

If a components only supports some target chips (values of IDF_TARGET) then it can specify REQUIRED_IDF_TARGETS in the idf_component_register call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

**Note:** In CMake terms, **REQUIRES** & **PRIV_REQUIRES** are approximate wrappers around the CMake functions `target_link_libraries(...) PUBLIC ...) and target_link_libraries(...) PRIVATE ...`.

**Example of component requirements**

Imagine there is a car component, which uses the engine component, which uses the spark_plug component:
Car component  The car.h header file is the public interface for the car component. This header includes engine.h directly because it uses some declarations from this header:

```c
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

And car.c includes car.h as well:

```c
/* car.c */
#include "car.h"
```

This means the car/CMakeLists.txt file needs to declare that car requires engine:

```c
idf_component_register(
    SRCS "car.c"
    INCLUDE_DIRS "."
    REQUIRES engine
)
```

- SRCS gives the list of source files in the car component.
- INCLUDE_DIRS gives the list of public include directories for this component. Because the public interface is car.h, the directory containing car.h is listed here.
- REQUIRES gives the list of components required by the public interface of this component. Because car.h is a public header and includes a header from engine, we include engine here. This makes sure that any other component which includes car.h will be able to recursively include the required engine.h also.

Engine component  The engine component also has a public header file include/engine.h, but this header is simpler:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start (void);
```

The implementation is in engine.c:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

In this component, engine depends on spark_plug but this is a private dependency. spark_plug.h is needed to compile engine.c, but not needed to include engine.h.

This means that the engine/CMakeLists.txt file can use PRIV_REQUIRES:
Chapter 4. API Guides

idf_component_register(
    SRCS "engine.c"
    INCLUDE_DIRS "include"
    PRIV_REQUIRES spark_plug)

As a result, source files in the car component don’t need the spark_plug include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

Spark Plug Component  The spark_plug component doesn’t depend on anything else. It has a public header file spark_plug.h, but this doesn’t include headers from any other components.

This means that the spark_plug/CMakeLists.txt file doesn’t need any REQUIRES or PRIV_REQUIRES clauses:

idf_component_register(
    SRCS "spark_plug.c"
    INCLUDE_DIRS ".")

Source File Include Directories

Each component’s source file is compiled with these include path directories, as specified in the passed arguments to idf_component_register:

idf_component_register(
    ..
    INCLUDE_DIRS "include"
    PRIV_INCLUDE_DIRS "other")

  • The current component’s INCLUDE_DIRS and PRIV_INCLUDE_DIRS.
  • The INCLUDE_DIRS belonging to all other components listed in the REQUIRES and PRIV_REQUIRES parameters (ie all the current component’s public and private dependencies).
  • Recursively, all of the INCLUDE_DIRS of those components REQUIRES lists (ie all public dependencies of this component’s dependencies, recursively expanded).

Main component requirements

The component named main is special because it automatically requires all other components in the build. So it’s not necessary to pass REQUIRES or PRIV_REQUIRES to this component. See renaming main for a description of what needs to be changed if no longer using the main component.

Common component requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: cxx, newlib, freertos, esp_hw_support, heap, log, lwip, soc, hal, esp_rom, esp_common, esp_system.

Including components in the build

  • By default, every component is included in the build.
  • If you set the COMPONENTS variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
    – Components mentioned explicitly in COMPONENTS.
    – Those components’ requirements (evaluated recursively).
    – The “common” components that every component depends on.
  • Setting COMPONENTS to the minimal list of required components can significantly reduce compile times.
Circular Dependencies

It’s possible for a project to contain Component A that requires (REQUIRES or PRIV_REQUIRES) Component B, and Component B that requires Component A. This is known as a dependency cycle or a circular dependency.

CMake will usually handle circular dependencies automatically by repeating the component library names twice on the linker command line. However, this strategy doesn’t always work, and it’s possible the build will fail with a linker error about “Undefined reference to …”, referencing a symbol defined by one of the components inside the circular dependency. This is particularly likely if there is a large circular dependency, i.e. A->B->C->D->A.

The best solution is to restructure the components to remove the circular dependency. In most cases, a software architecture without circular dependencies has desirable properties of modularity and clean layering and will be more maintainable in the long term. However, removing circular dependencies is not always possible.

To bypass a linker error caused by a circular dependency, the simplest workaround is to increase the CMake LINK_INTERFACE_MULTIPLICITY property of one of the component libraries. This causes CMake to repeat this library and its dependencies more than twice on the linker command line.

For example:

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If possible, place this line in the component that creates the circular dependency by depending on a lot of other components. However, the line can be placed inside any component that is part of the cycle. Choosing the component that owns the source file shown in the linker error message, or the component that defines the symbol(s) mentioned in the linker error message, is a good place to start.
- Usually increasing the value to 3 (default is 2) is enough, but if this doesn’t work then try increasing the number further.
- Adding this option will make the linker command line longer, and the linking stage slower.

Advanced Workaround: Undefined Symbols If only one or two symbols is causing a circular dependency, and all other dependencies are linear, then there is an alternative method to avoid linker errors: Specify the specific symbols required for the “reverse” dependency as undefined symbols at link time.

For example, if component A depends on component B but component B also needs to reference reverse_ops from component A (but nothing else), then you can add a line like the following to the component B CMakeLists.txt to resolve the cycle at link time:

```
# This symbol is provided by 'Component A' at link time
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- The `-u` argument means that the linker will always include this symbol in the link, regardless of dependency ordering.
- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If ‘Component B’ doesn’t need to access any headers of ‘Component A’, only link to a few symbol(s), then this line can be used instead of any REQUIRES from B to A. This further simplifies the component structure in the build system.

See the `target_link_libraries` documentation for more information about this CMake function.

Requirements in the build system implementation

- Very early in the CMake configuration process, the script `expand_requirements.cmake` is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this graph may have cycles). The graph is used to generate a file `component_depends.cmake` in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal BUILD_COMPONENTS variable). The BUILD_COMPONENTS variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed
for all components. The order should be deterministic given the same set of components and component dependencies.

- The value of BUILD_COMPONENTS is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the CMakeLists.txt file is evaluated again to add the component libraries to the build.

**Component Dependency Order**  The order of components in the BUILD_COMPONENTS variable determines other orderings during the build:

- Order that project_include.cmake files are included into the project.
- Order that the list of header paths is generated for compilation (via \-I argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

## 4.5.9 Overriding Parts of the Project

### project_include.cmake

For components that have build requirements which must be evaluated before any component CMakeLists files are evaluated, you can create a file called project_include.cmake in the component directory. This CMake file is included when project.cmake is evaluating the entire project.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

Unlike component CMakeLists.txt files, when including a project_include.cmake file the current source directory (MAKE_CURRENT_SOURCE_DIR and working directory) is the project directory. Use the variable COMPONENT_DIR for the absolute directory of the component.

Note that project_include.cmake isn’t necessary for the most common component uses - such as adding include directories to the project, or LDFLAGS to the final linking step. These values can be customised via the CMakeLists.txt file itself. See Optional Project Variables for details.

project_include.cmake files are included in the order given in BUILD_COMPONENTS variable (as logged by CMake). This means that a component’s project_include.cmake file will be included after it’s all dependencies’ project_include.cmake files, unless both components are part of a dependency cycle. This is important if a project_include.cmake file relies on variables set by another component. See also above.

Take great care when setting variables or targets in a project_include.cmake file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

### KConfig.projbuild

This is an equivalent to project_include.cmake for Component Configuration KConfig files. If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the KConfig.projbuild file alongside the CMakeLists.txt file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a KConfig file for Component Configuration.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

## 4.5.10 Configuration-Only Components

Special components which contain no source files, only Kconfig.projbuild and KConfig, can have a one-line CMakeLists.txt file which calls the function idf_component_register() with no arguments specified. This function will include the component in the project build, but no library will be built and no header files will be added to any include paths.
4.5.11 Debugging CMake

For full details about CMake and CMake commands, see the CMake v3.5 documentation.

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the cmake command line documentation.

When included from a project CMakeLists file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in CMake project function. This function is overridden to add all of the ESP-IDF specific project functionality.

Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to CMake so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don’t want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the `/tools/cmake/project.cmake` file and supporting functions in `/tools/cmake/` for more details.

4.5.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component CMakeLists.txt can be very small or even empty (see Minimal Component CMakeLists). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

Adding conditional configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```ini
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
    This enables the BAR feature of the FOO component.

CMakeLists.txt:
```

```cmake
set(srcs "foo.c" "more_foo.c")
if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c")
endif()
idf_component_register(SRCS "${srcs}"
...)
```

This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:
Chapter 4. API Guides

Kconfig:

```c
// Kconfig configuration

config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
    Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output debugging output to the lcd
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output temperature plots
```

CMakeLists.txt:

```c
// CMakeLists.txt configuration

if (CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()

# We need font if either console or plot is enabled
if (CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
  list(APPEND srcs "font.c")
endif()

idf_component_register({SRCS "${srcs}" ...
```

Conditions which depend on the target

The current target is available to CMake files via IDF_TARGET variable.

In addition to that, if target xyz is used (IDF_TARGET=xyz), then Kconfig variable CONFIG_IDF_TARGET_XYZ will be set.

Note that component dependencies may depend on IDF_TARGET variable, but not on Kconfig variables. Also one can not use Kconfig variables in include statements in CMake files, but IDF_TARGET can be used in such context.

Source Code Generation

Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```c
// Source Code Generation

add_custom_command({OUTPUT logo.h
  COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
  DEPENDS ${COMPONENT_DIR}/logo.bmp
  VERBATIM)
add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)
```

(continues on next page)
This answer is adapted from the CMake FAQ entry, which contains some other examples that will also work with ESP-IDF builds.

In this example, logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the ADDITIONAL_MAKE_CLEAN_FILES property.

**Note:** If generating files as part of the project CMakeLists.txt file, not a component CMakeLists.txt, then use build property PROJECT_DIR instead of ${COMPONENT_DIR} and ${PROJECT_NAME}.elf instead of ${COMPONENT_LIB}.)

If a source file from another component included logo.h, then add_dependencies would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

## Embedding Binary Data

Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can specify argument EMBED_FILES in the component registration, giving space-delimited names of the files to embed:

```cpp
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable EMBED_TXTFILES. This will embed the contents of the text file as a null-terminated string:

```cpp
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```cpp
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_pem_end");
```

The names are generated from the full name of the file, as given in EMBED_FILES. Characters / .. etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function target_add_binary_data like this:

```cpp
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the project() line in your project CMakeLists.txt file. Replace myproject.elf with your project name. The final argument can be TEXT to embed a null-terminated string, or BINARY to embed the content as-is.

For an example of using this technique, see the “main” component of the file_serving example protocols/http_server/file_serving/main/CMakeLists.txt - two files are loaded at build time and linked into the firmware.

It is also possible embed a generated file:
add_custom_command(OUTPUT my_processed_file.bin 
    COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)

In the example above, my_processed_file.bin is generated from my_unprocessed_file.bin through
some command my_process_file_cmd, then embedded into the target.

To specify a dependence on a target, use the DEPENDS argument:

add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)

The DEPENDS argument to target_add_binary_data ensures that the target executes first.

**Code and Data Placements**

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will
be placed in memory through linker fragment files. These files are processed by the build system, and is used to
augment the linker script used for linking app binary. See Linker Script Generation for a quick start guide as well as
a detailed discussion of the mechanism.

**Fully Overriding The Component Build Process**

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the
component is basically a wrapper around another third-party component not originally intended to be compiled under
this build system. In that case, it’s possible to forego the ESP-IDF build system entirely by using a CMake feature
called ExternalProject. Example component CMakeLists:

```cmake
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named quirc that builds the quirc project using its
own Makefile.)

- externalproject_add defines an external build system.
  - SOURCE_DIR, CONFIGURE_COMMAND, BUILD_COMMAND and INSTALL_COMMAND should al-
    ways be set. CONFIGURE_COMMAND can be set to an empty string if the build system has no “configure”
    step. INSTALL_COMMAND will generally be empty for ESP-IDF builds.
  - Setting BUILD_IN_SOURCE means the build directory is the same as the source directory. Otherwise
    you can set BUILD_DIR.
- Consult the ExternalProject documentation for more details about externalproject_add().
  - The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
  - Finally, the generated library is added to ADDITIONAL_MAKE_CLEAN_FILES. This means make clean will delete this library. (Note that the other object files from the build won’t be deleted.)

Note: When using an external build process with PSRAM, remember to add -mfix-esp32-psram-cache-issue to the C compiler arguments. See CONFIG_SPIRAM_CACHE_WORKAROUND for details of this flag.

ExternalProject dependencies, clean builds CMake has some unusual behaviour around external project builds:

- ADDITIONAL_MAKE_CLEAN_FILES only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won’t delete these files when cleaning.
- However, the ExternalProject configure & build commands will always be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external BUILD_COMMAND run a full clean compile of all sources. The build command will be run if any of the dependencies passed to externalproject_add with DEPENDS have changed, or if this is a clean build (ie any of idf.py clean, ninja clean, or make clean was run.)
  2. Have the external BUILD_COMMAND be an incremental build command. Pass the parameter BUILD_ALWAYS 1 to externalproject_add. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn’t take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

4.5.13 Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file sdkconfig.defaults in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn’t yet been set in the sdkconfig file.

To override the name of this file or to specify multiple files, set the SDKCONFIG_DEFAULTS environment variable or set SDKCONFIG_DEFAULTS in top-level CMakeLists.txt. If specifying multiple files, use semicolon as the list separator. File names not specified as full paths are resolved relative to current project.

Target-dependent sdkconfig defaults

In addition to sdkconfig.defaults file, build system will also load defaults from sdkconfig.defaults. TARGET_NAME file, where TARGET_NAME is the value of IDF_TARGET. For example, for esp32 target, default settings will be taken from sdkconfig.defaults first, and then from sdkconfig.defaults.esp32.

If SDKCONFIG_DEFAULTS is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from SDKCONFIG_DEFAULTS value/values using the rule above.

4.5.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py.

After running a project build, the build directory contains binary output files (.bin files) for the project and also the following flashing data files:
Chapter 4. API Guides

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.5.15 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMakeLists.txt file and builds separate .ELF and .BIN files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.5.16 Selecting the Target

ESP-IDF supports multiple targets (chips). The identifiers used for each chip are as follows:

- `esp32`—for ESP32-D0WD, ESP32-D2WD, ESP32-S0WD (ESP-SOLO), ESP32-U4WDH, ESP32-PICO-D4
- `esp32s2`—for ESP32-S2
- `esp32c3`—for ESP32-C3

To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

**Important:** `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

**Note:** The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)  
2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)  
3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the `_default_` value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if
IDF_TARGET is not specified by other method: using an environment variable, CMake variable, or idf.py set-target command.

If the target has not been set by any of these methods, the build system will default to esp32 target.

4.5.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named json:

```cmake
add_library(json STATIC
  cJSON/cJSON.c
  cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF json component /components/json/CMakeLists.txt.
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.)
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

4.5.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects — code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library foo to be used in the main component:

```cmake
# Register the component
idf_component_register(...)  
# Set values of hypothetical variables that control the build of 'foo'
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link 'foo' to 'main' component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at build_system/cmake/import_lib. Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the mbedtls component is a wrapper for Espressif’s fork of mbedtls. See its component CMakeLists.txt.

The CMake variable ESP_PLATFORM is set to 1 whenever the ESP-IDF build system is being used. Tests such as if (ESP_PLATFORM) can be used in generic CMake code if special IDF-specific logic is required.
Using ESP-IDF components from external libraries

The above example assumes that the external library foo (or tinyxml in the case of the import_lib example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as libc, libstdc++, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target idf::<componentname>.

For example, in the foo/CMakeLists.txt file:

```cmake
add_library(foo bar.c fizz.cpp buzz.cpp)
if(ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.5.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (.a file), built by some other build process.

The ESP-IDF build system provides a utility function add_prebuilt_library for users to be able to easily import and use prebuilt libraries:

```cmake
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES req1 req2 ...])
```

where:

- `target_name`- name that can be used to reference the imported library, such as when linking to other targets
- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments REQUIRES and PRIV_REQUIRES specify dependency on other components. These have the same meaning as the arguments for idf_component_register.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at build_system/cmake/import_prebuilt.

4.5.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user’s targets (libraries/ executables).

It is possible to do so by using the build system APIs provided by tools/cmake/idf.cmake. For example:

```cmake
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF_
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
(continues on next page)```
Chapter 4.  API Guides

(continued from previous page)

```cpp
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets,
// dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in `build_system/cmake/idf_as_lib` demonstrates the creation of an application equivalent to hello world application using a custom CMake project.

**Note:** The IDF build system can only set compiler flags for source files that it builds. When an external CMake-Lists.txt file is used and PSRAM is enabled, remember to add `-mfix-esp32-psram-cache-issue` to the C compiler arguments. See `CONFIG_SPIRAM_CACHE_WORKAROUND` for details of this flag.

### 4.5.21 ESP-IDF CMake Build System API

**idf-build-commands**

```cpp
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a build property `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```cpp
idf_build_set_property(property val [APPEND])
```

Set a build property `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/membber instead.

```cpp
idf_build_component(component_dir)
```

Present a directory `component_dir` that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before `idf_build_process`.

This command does not guarantee that the component will be processed during build (see the `COMPONENTS` argument description for `idf_build_process`)

```cpp
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user’s perspective is the libraries creation by calling each component’s `idf_component_register`. This command creates the libraries for each component, which are accessible using aliases in the form `idf::component_name`. These aliases can be used to link the components to the user’s own targets, either libraries or executables.

The call requires the target chip to be specified with `target` argument. Optional arguments for the call include:

- `PROJECT_DIR` - directory of the project; defaults to CMAKE_SOURCE_DIR
• PROJECT_NAME - name of the project; defaults to CMAKE_PROJECT_NAME
• PROJECT_VER - version/revision of the project; defaults to “1”
• SDKCONFIG - output path of generated sdkconfig file; defaults to PROJECT_DIR/sdkconfig or CMAKE_SOURCE_DIR/sdkconfig depending if PROJECT_DIR is set
• SDKCONFIG_DEFAULTS - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value filename in the list, the config from file filename.target, if it exists, is also loaded.
• BUILD_DIR - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to CMAKE_BINARY_DIR
• COMPONENTS - select components to process among the components known by the build system (added via idf_build_component). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```cpp
idf_build_executable(executable)
```

Specify the executable executable for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after idf_build_process.

```cpp
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying GENERATOR_EXPRESSION will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to idf_build_process, however.

### idf-build-properties

These are properties that describe the build. Values of build properties can be retrieved by using the build command idf_build_get_property. For example, to get the Python interpreter used for the build:

```cpp
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- BUILD_DIR - build directory; set from idf_build_process BUILD_DIR argument
- BUILD_COMPONENTS - list of components included in the build; set by idf_build_process
- BUILD_COMPONENTAliases - list of library alias of components included in the build; set by idf_build_process
- C_COMPILE_OPTIONS - compile options applied to all components’ C source files
- COMPIL_OPTIONS - compile options applied to all components’ source files, regardless of it being C or C++
- COMPIL_DEFINITIONS - compile definitions applied to all component source files
- CXX_COMPILE_OPTIONS - compile options applied to all components’ C++ source files
- EXECUTABLE - project executable; set by call to idf_build_executable
- EXECUTABLE_NAME - name of project executable without extension; set by call to idf_build_executable
- EXECUTABLE_DIR - path containing the output executable
- IDF_PATH - ESP-IDF path; set from IDF_PATH environment variable, if not, inferred from the location of idf.cmake
- IDF_TARGET - target chip for the build; set from the required target argument for idf_build_process
- IDF_VER - ESP-IDF version; set from either a version file or the Git revision of the IDF_PATH repository
- INCLUDE_DIRECTORIES - include directories for all component source files
- KCONFIGS - list of Kconfig files found in components in build; set by idf_build_process
- KCONFIG_PROJBuilds - list of Kconfig.projbuild files found in components in build; set by idf_build_process
- PROJECT_NAME - name of the project; set from idf_build_process PROJECT_NAME argument
- PROJECT_DIR - directory of the project; set from idf_build_process PROJECT_DIR argument
Chapter 4. API Guides

- **PROJECT_VER** - version of the project; set from `idf_build_process PROJECT_VER` argument
- **PYTHON** - Python interpreter used for the build; set from PYTHON environment variable if available, if not "python" is used
- **SDKCONFIG** - full path to output config file; set from `idf_build_process SDKCONFIG` argument
- **SDKCONFIG_DEFAULTS** - list of files containing default config to use in the build; set from `idf_build_process SDKCONFIG_DEFAULTS` argument
- **SDKCONFIG_HEADER** - full path to C/C++ header file containing component configuration; set by `idf_build_process`
- **SDKCONFIG_CMAKE** - full path to CMake file containing component configuration; set by `idf_build_process`
- **SDKCONFIG_JSON** - full path to JSON file containing component configuration; set by `idf_build_process`
- **SDKCONFIG_JSON_MENUS** - full path to JSON file containing config menus; set by `idf_build_process`

### idf-component-commands

```c
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

Retrieve a specified component’s component property, property and store it in var accessible from the current scope. Specifying GENERATOR_EXPRESSION will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```c
idf_component_set_property(component property val [APPEND])
```

Set a specified component’s component property, property with value val. Specifying APPEND will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```c
idf_component_register([ [SRCS src1 src2 ...] | [SRC_DIRS dir1 dir2 ...] ] [EXCLUDE_SRCS src1 src2 ...] )
```

Register a component to the build system. Much like the project() CMake command, this should be called from the component’s CMakeLists.txt directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can not be called before `idf_component_register`:

- commands that are not valid in CMakescript mode
- custom commands defined in project include.cmake
- build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`.

The arguments for `idf_component_register` include:

- **SRCS** - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- **SRC_DIRS, EXCLUDE_SRCS** - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via SRCS. Note that this is subject to the limitations of globbing in CMake. Source files specified in EXCLUDE_SRCS are removed from the globbed files.
Chapter 4. API Guides

- **INCLUDE_DIRS** - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
- **PRIV_INCLUDE_DIRS** - directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only
- **REQUIRES** - public component requirements for the component
- **PRIV_REQUIRES** - private component requirements for the component; ignored on config-only components
- **LDFFRAGMENTS** - component linker fragment files
- **REQUIRED_IDF_TARGETS** - specify the only target the component supports
- **KCONFIG** - override the default Kconfig file
- **KCONFIG_PROJBUILD** - override the default Kconfig.projbuild file

The following are used for embedding data into the component, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- **EMBED_FILES** - binary files to be embedded in the component
- **EMBED_TXTFILES** - text files to be embedded in the component

### idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the freertos component:

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- **COMPONENT_ALIAS** - alias for COMPONENT_LIB used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- **COMPONENT_DIR** - component directory; set by `idf_build_component`
- **COMPONENT_OVERRIDEN_DIR** - contains the directory of the original component if this component overrides another component
- **COMPONENT_LIB** - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- **COMPONENT_NAME** - name of the component; set by `idf_build_component` based on the component directory name
- **COMPONENT_TYPE** - type of the component, whether LIBRARY or CONFIG_ONLY. A component is of type LIBRARY if it specifies source files or embeds a file
- **EMBED_FILES** - list of files to embed in component; set from `idf_component_register EMBED_FILES` argument
- **EMBED_TXTFILES** - list of text files to embed in component; set from `idf_component_register EMBED_TXTFILES` argument
- **INCLUDE_DIRS** - list of component include directories; set from `idf_component_register INCLUDE_DIRS` argument
- **KCONFIG** - component Kconfig file; set by `idf_build_component`
- **KCONFIG_PROJBUILD** - component Kconfig.projbuild; set by `idf_build_component`
- **LDFFRAGMENTS** - list of component linker fragment files; set from `idf_component_register LDFFRAGMENTS` argument
- **PRIV_INCLUDE_DIRS** - list of component private include directories; set from `idf_component_register PRIV_INCLUDE_DIRS` on components of type LIBRARY
- **PRIV_REQUIRES** - list of private component dependences; set from `idf_component_register PRIV_REQUIRES` argument
- **REQUIRED_IDF_TARGETS** - list of targets the component supports; set from `idf_component_register REQUIRED_IDF_TARGETS` argument
- **REQUIRES** - list of public component dependencies; set from `idf_component_register REQUIRES` argument
- **SRCS** - list of component source files; set from `SRCS` or `SRC_DIRS/EXCLUDE_SRCS` argument of `idf_component_register`
### 4.5.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via SRCS argument to `idf_component_register`:

```c
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...
```

This preference reflects the CMake best practice of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using SRC_DIRS:

```c
idf_component_register(SRC_DIRS library platform ...
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won’t know to automatically re-run and this file won’t be added to the build.

The trade-off is acceptable when you’re adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git.

For components which are part of ESP-IDF, we use a third party Git CMake integration module (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git.describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use SRCS argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

### 4.5.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains esptool.py arguments to flash the project’s binary files. There are also `flash_*_args` files which can be used directly with esptool.py. See Flash arguments.
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in menuconfig, for use in external IDE UIs.
Chapter 4. API Guides

4.5.24 Build System Internals

Build Scripts

The list files for the ESP-IDF build system reside in /tools/cmake. The modules which implement core build system functionality are as follows:

- build.cmake - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- component.cmake - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- kconfig.cmake - Generation of configuration files (sdkconfig, sdkconfig.h, sdkconfig.cmake, etc.) from Kconfig files.
- ldgen.cmake - Generation of final linker script from linker fragment files.
- target.cmake - Setting build target and toolchain file.
- utilities.cmake - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in /tools/cmake:

- idf.cmake - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- project.cmake - Includes idf.cmake and provides a custom project() command that takes care of all the heavy lifting of building an executable. Included in the top-level CMakeLists.txt of standard ESP-IDF projects.

The rest of the files in /tools/cmake are support or third-party scripts used in the build process.

Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

```
| Initialization | Enumeration | Processing | Finalization |
```

Fig. 3: ESP-IDF Build System Process

Initialization  This phase sets up necessary parameters for the build.

- Upon inclusion of idf.cmake in project.cmake, the following steps are performed:
  - Set IDF_PATH from environment variable or inferred from path to project.cmake included in the top-level CMakeLists.txt.
  - Add /tools/cmake to CMAKE_MODULE_PATH and include core modules plus the various helper/third-party scripts.
– Set build tools/executables such as default Python interpreter.
– Get ESP-IDF git revision and store as IDF_VER.
– Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
– Add components in components to the build.

• The initial part of the custom project() command performs the following steps:
  – Set IDF_TARGET from environment variable or CMake cache and the corresponding CMAKE_TOOLCHAIN_FILE to be used.
  – Add components in EXTRA_COMPONENTS_DIRS to the build.
  – Prepare arguments for calling command idf_build_process() from variables such as COMPONENTS/EXCLUDE_COMPONENTS, SDKCONFIG, SDKCONFIG_DEFAULTS.

The call to idf_build_process() command marks the end of this phase.

Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of idf_build_process().

• Retrieve each component’s public and private requirements. A child process is created which executes each component’s CMakeLists.txt in script mode. The values of idf_component_register REQUIRES and PRIV_REQUIRES argument is returned to the parent build process. This is called early expansion. The variable CMAKE_BUILD_EARLY_EXPANSION is defined during this step.
• Recursively include components based on public and private requirements.

Processing

This phase processes the components in the build, and is the second half of idf_build_process().

• Load project configuration from sdkconfig file and generate an sdkconfig.cmake and sdkconfig.h header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
• Include each component’s project_include.cmake.
• Add each component as a subdirectory, processing its CMakeLists.txt. The component CMakeLists.txt calls the registration command, idf_component_register which adds source files, include directories, creates component library, links dependencies, etc.

Finalization

This phase is everything after idf_build_process().

• Create executable and link the component libraries to it.
• Generate project metadata files such as project_description.json and display relevant information about the project built.

Browse /tools/cmake/project.cmake for more details.

4.5.25 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, idf_component_register.
Automatic Conversion Tool

An automatic project conversion tool is available in /tools/cmake/convert_to_cmake.py. Run this command line tool with the path to a project like this:

```
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
```

The project directory must contain a Makefile, and GNU Make (`make`) must be installed and available on the PATH.

The tool will convert the project Makefile and any component `component.mk` files to their equivalent `CMakeLists.txt` files.

It does so by running `make` to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent CMake lists files to set the same variables.

**Important:** When the conversion tool converts a `component.mk` file, it doesn’t determine what other components that component depends on. This information needs to be added manually by editing the new component `CMakeLists.txt` file and adding `REQUIRES` and/or `PRIV_REQUIRES` clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See Component Requirements.

The conversion tool is not capable of dealing with complex Makefile logic or unusual targets. These will need to be converted by hand.

No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- `COMPONENT_BUILD_DIR`: Use `CMAKE_CURRENT_BINARY_DIR` instead.
- `COMPONENT_LIBRARY`: Defaulted to `$(COMPONENT_NAME).a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- `CC`, `LD`, `AR`, `OBJCOPY`: Full paths to each tool from the gcc xtensa cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. Full list here.
- `HOSTCC`, `HOSTLD`, `HOSTAR`: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- `COMPONENT_ADD_LDFLAGS`: Used to override linker flags. Use the CMake `target_link_libraries` command instead.
- `COMPONENT_ADD_LINKER_DEPS`: List of files that linking should depend on. `target_link_libraries` will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- `COMPONENT_SUBMODULES`: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- `COMPONENT_EXTRA_INCLUDES`: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- `COMPONENT_OBJS`: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCS` argument to `idf_component_register` instead.
- `COMPONENT_OBJEXCLUDE`: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- `COMPONENT_EXTRA_CLEAN`: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note `CMake has some restrictions around this functionality.`
- `COMPONENT_CONFIG_ONLY`: Call `idf_component_register` without any arguments instead. See Configuration-Only Components.
- `CFLAGS`, `CPPFLAGS`, `CXXFLAGS`: Use equivalent CMake commands instead. See Controlling Component Compilation.
Chapter 4. API Guides

No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (COMPONENT_SRCDIRS variable in Make, SRC_DIRS argument to idf_component_register in CMake)
- Include directories (COMPONENT_ADD_INCLUDEDIRS variable in Make, INCLUDE_DIRS argument to idf_component_register in CMake)

No Longer Necessary

- In the legacy Make-based build system, it is required to also set COMPONENT_SRCDIRS if COMPONENT_SRCS is set. In CMake, the equivalent is not necessary i.e. specifying SRC_DIRS to idf_component_register if SRCS is also specified (in fact, SRCS is ignored if SRC_DIRS is specified).

Flashing from make

make flash and similar targets still work to build and flash. However, project sdkconfig no longer specifies serial port and baud rate. Environment variables can be used to override these. See Flashing with ninja or make for more details.

4.6 Build System (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document explains the legacy GNU Make Espressif IoT Development Framework build system and the concept of “components”

Read this document if you want to know how to organise an ESP-IDF project using GNU Make build system.

We recommend using the esp-idf-template project as a starting point for your project.

4.6.1 Using the Build System

The esp-idf README file contains a description of how to use the build system to build your project.

4.6.2 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP32 base libraries (libc, rom bindings etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together
ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build environment will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build process will compile the project.

Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting output such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called sdkconfig in the root directory of the project. This configuration file is modified via make menuconfig to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by esp-idf. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by esp-idf itself, others may be sourced from other places.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the IDF_PATH environment variable which holds the path of the esp-idf directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH, or the path to the toolchain can be set as part of the compiler prefix in the project configuration.

Example Project

An example project directory tree might look like this:

```
- myProject/
  - Makefile
  - sdkconfig
  - components/
    - component1/
      - component.mk
      - Kconfig
      - src1.c
    - component2/
      - component.mk
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - src1.c
    - src2.c
  - component.mk
  - build/
```

This example “myProject” contains the following elements:

- A top-level project Makefile. This Makefile sets the PROJECT_NAME variable and (optionally) defines other project-wide make variables. It includes the core $(IDF_PATH)/make/project.mk makefile which implements the rest of the ESP-IDF build system.
- “sdkconfig” project configuration file. This file is created/updated when “make menuconfig” runs, and holds configuration for all of the components in the project (including esp-idf itself). The “sdkconfig” file may or may not be added to the source control system of the project.
- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF.
• “main” directory is a special “pseudo-component” that contains source code for the project itself. “main” is a default name, the Makefile variable COMPONENT_DIRS includes this component but you can modify this variable (or set EXTRA_COMPONENT_DIRS) to look for components in other places.

• “build” directory is where build output is created. After the make process is run, this directory will contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories contain a component makefile - component.mk. This may contain variable definitions to control the build process of the component, and its integration into the overall project. See Component Makefiles for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via the project configuration. Some components may also include Kconfig.projbuild and Makefile.projbuild files, which are special files for overriding parts of the project.

Project Makefiles

Each project has a single Makefile that contains build settings for the entire project. By default, the project Makefile can be quite minimal.

Minimal Example Makefile

```
PROJECT_NAME := myProject

include $(IDF_PATH)/make/project.mk
```

Mandatory Project Variables

- PROJECT_NAME: Name of the project. Binary output files will use this name - ie myProject.bin, myProject.elf.

Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in make/project.mk for all of the implementation details.

- PROJECT_PATH: Top-level project directory. Defaults to the directory containing the Makefile. Many other project variables are based on this variable. The project path cannot contain spaces.
- BUILD_DIR_BASE: The build directory for all objects/libraries/binaries. Defaults to $(PROJECT_PATH)/build.
- COMPONENT_DIRS: Directories to search for components. Defaults to $(IDF_PATH)/components, $(PROJECT_PATH)/components, $(PROJECT_PATH)/main and EXTRA_COMPONENT_DIRS. Override this variable if you don’t want to search for components in these places.
- EXTRA_COMPONENT_DIRS: Optional list of additional directories to search for components.
- COMPONENTS: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories.
- EXCLUDE_COMPONENTS: Optional list of component names to exclude during the build process. Note that this decreases build time, but not binary size.
- TEST_EXCLUDE_COMPONENTS: Optional list of component names to exclude during the build process of unit tests.

Any paths in these Makefile variables should be absolute paths. You can convert relative paths using $(PROJECT_PATH)/xxx, $(IDF_PATH)/xxx, or use the Make function $(abspath xxx).

These variables should all be set before the line include $(IDF_PATH)/make/project.mk in the Makefile.

Component Makefiles

Each project contains one or more components, which can either be part of esp-idf or added from other component directories.
A component is any directory that contains a `component.mk` file.

**Searching for Components**

The list of directories in `COMPONENT_DIRS` is searched for the project’s components. Directories in this list can either be components themselves (i.e., they contain a `component.mk` file), or they can be top-level directories whose subdirectories are components.

Running the `make list-components` target dumps many of these variables and can help debug the discovery of component directories.

**Multiple components with the same name**  When esp-idf is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`; by default, this means the idf components first, the project components second and optionally the components in `EXTRA_COMPONENT_DIRS` last. If two or more of these directories contain component subdirectories with the same name, the component in the last place searched is used. This allows, for example, overriding esp-idf components with a modified version by simply copying the component from the esp-idf component directory to the project component tree and then modifying it there. If used in this way, the esp-idf directory itself can remain untouched.

**Minimal Component Makefile**  The minimal `component.mk` file is an empty file(!). If the file is empty, the default component behaviour is set:

- All source files in the same directory as the makefile (`*.c, *.cpp, *.cc, *.S`) will be compiled into the component library
- A sub-directory “include” will be added to the global include search path for all other components.
- The component library will be linked into the project app.

See example component makefiles for more complete component makefile examples.

Note that there is a difference between an empty `component.mk` file (which invokes default component build behaviour) and no `component.mk` file (which means no default component build behaviour will occur.) It is possible for a component to have no `component.mk` file, if it only contains other files which influence the project configuration or build process.

**Preset Component Variables**  The following component-specific variables are available for use inside `component.mk`, but should not be modified:

- `COMPONENT_PATH`: The component directory. Evaluates to the absolute path of the directory containing `component.mk`. The component path cannot contain spaces.
- `COMPONENT_NAME`: Name of the component. Defaults to the name of the component directory.
- `COMPONENT_BUILD_DIR`: The component build directory. Evaluates to the absolute path of a directory inside `$(BUILD_DIR_BASE)` where this component’s source files are to be built. This is also the Current Working Directory any time the component is being built, so relative paths in make targets, etc. will be relative to this directory.
- `COMPONENT_LIBRARY`: Name of the static library file (relative to the component build directory) that will be built for this component. Defaults to `$(COMPONENT_NAME).a`.

The following variables are set at the project level, but exported for use in the component build:

- `PROJECT_NAME`: Name of the project, as set in project Makefile
- `PROJECT_PATH`: Absolute path of the project directory containing the project Makefile.
- `COMPONENTS`: Name of all components that are included in this build.
- `CONFIG_*`: Each value in the project configuration has a corresponding variable available in make. All names begin with `CONFIG_`.
- `CC, LD, AR, OBJCOPY`: Full paths to each tool from the gcc xtensa cross-toolchain.
- `HOSTCC, HOSTLD, HOSTAR`: Full names of each tool from the host native toolchain.
- `IDF_VER`: ESP-IDF version, retrieved from either `$(IDF_PATH)/version.txt` file (if present) else using `git` command `git describe`. Recommended format here is single liner that specifies major IDF release.
version, e.g. v2.0 for a tagged release or v2.0-275-g0efaa4f for an arbitrary commit. Application can make use of this by calling `esp_get_idf_version()`.

- **IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH**: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. v4.0-dev-* , v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of `ESP_IDF_VERSION_` variables, but different `IDF_VER` values.

- **PROJECT_VER**: Project version.
  - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
  - Else, if `PROJECT_VER` variable is set in project Makefile file, its value will be used.
  - Else, if the `$PROJECT_PATH/version.txt` exists, its contents will be used as `PROJECT_VER`.
  - Otherwise, `PROJECT_VER` will be “1”.

If you modify any of these variables inside `component.mk` then this will not prevent other components from building but it may make your component hard to build and/or debug.

### Optional Project-Wide Component Variables

The following variables can be set inside `component.mk` to control build settings across the entire project:

- **COMPONENT_ADD_INCLUDEDIRS**: Paths, relative to the component directory, which will be added to the include search path for all components in the project. Defaults to include if not overridden. If an include directory is only needed to compile this specific component, add it to `COMPONENT_PRIV_INCLUDEDIRS` instead.

- **COMPONENT_ADD_LDFLAGS**: Add linker arguments to the LDFLAGS for the app executable. Defaults to `-l$(COMPONENT_NAME)`. If adding pre-compiled libraries to this directory, add them as absolute paths - ie `$/(COMPONENT_PATH)/libwhatever.a`

- **COMPONENT_DEPENDS**: Optional list of component names that should be compiled before this component. This is not necessary for link-time dependencies, because all component include directories are available at all times. It is necessary if one component generates an include file which you then want to include in another component. Most components do not need to set this variable.

- **COMPONENT_ADD_LINKER_DEPS**: Optional list of component-relative paths to files which should trigger a re-link of the ELF file if they change. Typically used for linker script files and binary libraries. Most components do not need to set this variable.

The following variable only works for components that are part of esp-idf itself:

- **COMPONENT_SUBMODULES**: Optional list of git submodule paths (relative to `COMPONENT_PATH`) used by the component. These will be checked (and initialised if necessary) by the build process. This variable is ignored if the component is outside the IDF_PATH directory.

### Optional Component-Specific Variables

The following variables can be set inside `component.mk` to control the build of that component:

- **COMPONENT_PRIV_INCLUDEDIRS**: Directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only.

- **COMPONENT_EXTRA_INCLUDES**: Any extra include paths used when compiling the component’s source files. These will be prefixed with ‘-I’ and passed as-is to the compiler. Similar to the `COMPONENT_PRIV_INCLUDEDIRS` variable, except these paths are not expanded relative to the component directory.

- **COMPONENT_SRCDIRS**: Directory paths, must be relative to the component directory, which will be searched for source files (‘*.cpp’, ‘.c’, ‘.s’). Defaults to ‘.’, i.e the component directory itself. Override this to specify a different list of directories which contain source files.

- **COMPONENT_OBJJS**: Object files to compile. Default value is a .o file for each source file that is found in `COMPONENT_SRCDIRS`. Overriding this list allows you to exclude source files in `COMPONENT_SRCDIRS` that would otherwise be compiled. See “Specifying source files”.

- **COMPONENT_EXTRA_CLEAN**: Paths, relative to the component build directory, of any files that are generated using custom make rules in the component.mk file and which need to be removed as part of `make clean`. See “Source Code Generation” for an example.
Chapter 4. API Guides

- **COMPONENT_OWNBUildeTFTARGET & COMPONENT_OWNCleanTARGET**: These targets allow you to fully override the default build behaviour for the component. See *Fully Overriding The Component Makefile* for more details.

- **COMPONENT_CONFIG_ONLY**: If set, this flag indicates that the component produces no built output at all (ie COMPONENT_LIBRARY is not built), and most other component variables are ignored. This flag is used for IDF internal components which contain only KConfig.projbuild and/or Makefile.projbuild files to configure the project, but no source files.

- **CFLAGS**: Flags passed to the C compiler. A default set of CFLAGS is defined based on project settings. Component-specific additions can be made via CFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- **CPPFLAGS**: Flags passed to the C preprocessor (used for .c, .cpp and .S files). A default set of CPPFLAGS is defined based on project settings. Component-specific additions can be made via CPPFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- **CXXFLAGS**: Flags passed to the C++ compiler. A default set of CXXFLAGS is defined based on project settings. Component-specific additions can be made via CXXFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- **COMPONENT_ADD_LDFRAGMENTS**: Paths to linker fragment files for the linker script generation functionality. See *Linker Script Generation*.

To apply compilation flags to a single source file, you can add a variable override as a target, ie:

```
apps/dhcpserver.o: CFLAGS += -Wno-unused-variable
```

This can be useful if there is upstream code that emits warnings.

### Component Configuration

Each component can also have a Kconfig file, alongside component.mk. This contains configuration settings to add to the “make menuconfig” for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component KConfig file, it is easiest to start with one of the KConfig files distributed with esp-idf.

For an example, see *Adding conditional configuration*.

### Preprocessor Definitions

ESP-IDF build systems adds the following C preprocessor definitions on the command line:

- **ESP_PLATFORM** — Can be used to detect that build happens within ESP-IDF.
- **IDF_VER** — ESP-IDF version, see *Preset Component Variables* for more details.

### Build Process Internals

#### Top Level: Project Makefile

- “make” is always run from the project directory and the project makefile, typically named Makefile.
- The project makefile sets PROJECT_NAME and optionally customises other *optional project variables*.
- The project makefile includes $(IDF_PATH)/make/project.mk which contains the project-level Make logic.
- project.mk fills in default project-level make variables and includes make variables from the project configuration. If the generated makefile containing project configuration is out of date, then it is regenerated (via targets in project_config.mk) and then the make process restarts from the top.
- project.mk builds a list of components to build, based on the default component directories or a custom list of components set in *optional project variables*. 
• Each component can set some optional project-wide component variables. These are included via generated makefiles named component_project_vars.mk - there is one per component. These generated makefiles are included into project.mk. If any are missing or out of date, they are regenerated (via a recursive make call to the component makefile) and then the make process restarts from the top.

• Makefile.projbuild files from components are included into the make process, to add extra targets or configuration.

• By default, the project makefile also generates top-level build & clean targets for each component and sets up app and clean targets to invoke all of these sub-targets.

• In order to compile each component, a recursive make is performed for the component makefile.

To better understand the project make process, have a read through the project.mk file itself.

Second Level: Component Makefiles

• Each call to a component makefile goes via the $(IDF_PATH)/make/component_wrapper.mk wrapper makefile.

• This component wrapper includes all component Makefile.componentbuild files, making any recipes, variables etc in these files available to every component.

• The component_wrapper.mk is called with the current directory set to the component build directory, and the COMPONENT_MAKEFILE variable is set to the absolute path to component.mk.

• component_wrapper.mk sets default values for all component variables, then includes the component.mk file which can override or modify these.

• If COMPONENT_OWNBUILDTARGET and COMPONENT_OWNCLEANTARGET are not defined, default build and clean targets are created for the component’s source files and the prerequisite COMPONENT_LIBRARY static library file.

• The component_project_vars.mk file has its own target in component_wrapper.mk, which is evaluated from project.mk if this file needs to be rebuilt due to changes in the component makefile or the project configuration.

To better understand the component make process, have a read through the component_wrapper.mk file and some of the component.mk files included with esp-idf.

Running Make Non-Interactively

When running make in a situation where you don’t want interactive prompts (for example: inside an IDE or an automated build system) append BATCH_BUILD=1 to the make arguments (or set it as an environment variable).

Setting BATCH_BUILD implies the following:

• Verbose output (same as V=1, see below). If you don’t want verbose output, also set V=0.

• If the project configuration is missing new configuration items (from new components or esp-idf updates) then the project uses the default values, instead of prompting the user for each item.

• If the build system needs to invoke menuconfig, an error is printed and the build fails.

Advanced Make Targets

• make app, make bootloader, make partition table can be used to build only the app, bootloader, or partition table from the project as applicable.

• make erase_flash and make erase_otadata will use esptool.py to erase the entire flash chip and the OTA selection setting from the flash chip, respectively.

• make size prints some size information about the app. make size-components and make size-files are similar targets which print more detailed per-component or per-source-file information, respectively.

Debugging The Make Process

Some tips for debugging the esp-idf build system:
• Appending \texttt{\textbackslash V=1} to the make arguments (or setting it as an environment variable) will cause make to echo all commands executed, and also each directory as it is entered for a sub-make.

• Running \texttt{make -w} will cause make to echo each directory as it is entered for a sub-make - same as \texttt{\textbackslash V=1} but without also echoing all commands.

• Running \texttt{make --trace} (possibly in addition to one of the above arguments) will print out every target as it is built, and the dependency which caused it to be built.

• Running \texttt{make -p} prints a (very verbose) summary of every generated target in each makefile.

For more debugging tips and general make information, see the \textit{GNU Make Manual}.

\textbf{Warning On Undefined Variables} \ By default, the build process will print a warning if an undefined variable is referenced (like \texttt{$(DOES\_NOT\_EXIST)$}). This can be useful to find errors in variable names.

If you don’t want this behaviour, it can be disabled in menuconfig’s top level menu under \textit{SDK tool configuration}.

Note that this option doesn’t trigger a warning if \texttt{ifdef} or \texttt{ifndef} are used in Makefiles.

\textbf{Overriding Parts of the Project}

\textbf{Makefile.projbuild} \ For components that have build requirements that must be evaluated in the top-level project make pass, you can create a file called \texttt{Makefile.projbuild} in the component directory. This makefile is included when \texttt{project.mk} is evaluated.

For example, if your component needs to add to CFLAGS for the entire project (not just for its own source files) then you can set \texttt{CFLAGS +=} in \texttt{Makefile.projbuild}.

\texttt{Makefile.projbuild} files are used heavily inside esp-idf, for defining project-wide build features such as \texttt{esp-tool.py} command line arguments and the \textit{bootloader “special app”}.

Note that \texttt{Makefile.projbuild} isn’t necessary for the most common component uses - such as adding include directories to the project, or LDFlags to the final linking step. These values can be customised via the \texttt{component.mk} file itself. See \textit{Optional Project-Wide Component Variables} for details.

Take care when setting variables or targets in this file. As the values are included into the top-level project makefile pass, they can influence or break functionality across all components!

\textbf{KConfig.projbuild} \ This is an equivalent to \texttt{Makefile.projbuild} for component configuration \texttt{KConfig} files.

If you want to include configuration options at the top-level of menuconfig, rather than inside the \textit{“Component Configuration”} sub-menu, then these can be defined in the \texttt{KConfig.projbuild} file alongside the \texttt{component.mk} file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a \texttt{KConfig} file for component configuration.

\textbf{Makefile.componentbuild} \ For components that e.g. include tools to generate source files from other files, it is necessary to be able to add recipes, macros or variable definitions into the component build process of every components. This is done by having a \texttt{Makefile.componentbuild} in a component directory. This file gets included in \texttt{component_wrapper.mk}, before the \texttt{component.mk} of the component is included. As with the \texttt{Makefile.projbuild}, take care with these files: as they’re included in each component build, a \texttt{Makefile.componentbuild} error may only show up when compiling an entirely different component.

\textbf{Configuration-Only Components} \ Some special components which contain no source files, only \texttt{KConfig.projbuild} and \texttt{Makefile.projbuild}, may set the flag \texttt{COMPONENT_CONFIG_ONLY} in the component.mk file. If this flag is set, most other component variables are ignored and no build step is run for the component.
Example Component Makefiles

Because the build environment tries to set reasonable defaults that will work most of the time, component.mk can be very small or even empty (see Minimal Component Makefile). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component.mk makefiles:

Adding source directories By default, sub-directories are ignored. If your project has sources in sub-directories instead of in the root of the component then you can tell that to the build system by setting COMPONENT_SRCDIRS:

```
COMPONENT_SRCDIRS := src1 src2
```

This will compile all source files in the src1/ and src2/ sub-directories instead.

Specifying source files The standard component.mk logic adds all .S and .c files in the source directories as sources to be compiled unconditionally. It is possible to circumvent that logic and hard-code the objects to be compiled by manually setting the COMPONENT_OBJS variable to the name of the objects that need to be generated:

```
COMPONENT_OBJS := file1.o file2.o thing/filea.o thing/fileb.o anotherthing/main.o
COMPONENT_SRCDIRS := . thing anotherthing
```

Note that COMPONENT_SRCDIRS must be set as well.

Adding conditional configuration The configuration system can be used to conditionally compile some files depending on the options selected in make menuconfig. For this, ESP-IDF has the compile_only_if and compile_only_if_not macros:

Kconfig:

```
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
      This enables the BAR feature of the FOO component.
```

component.mk:

```
$(call compile_only_if,$(CONFIG_FOO_ENABLE_BAR),bar.o)
```

As can be seen in the example, the compile_only_if macro takes a condition and a list of object files as parameters. If the condition is true (in this case: if the BAR feature is enabled in menuconfig) the object files (in this case: bar.o) will always be compiled. The opposite goes as well: if the condition is not true, bar.o will never be compiled. compile_only_if_not does the opposite: compile if the condition is false, not compile if the condition is true.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
      Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
      Select this to output debugging output to the lcd
```

(continues on next page)
bool "Output temperature plots to LCD" depends on ENABLE_LCD_OUTPUT.

Select this to output temperature plots.

component.mk:

```bash
# If LCD is enabled, compile interface to it, otherwise compile dummy interface
$(call compile_only_if,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-real.o lcd-spi.o)
$(call compile_only_if_not,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-dummy.o)

# We need font if either console or plot is enabled
$(call compile_only_if,$(or $(CONFIG_ENABLE_LCD_CONSOLE),$(CONFIG_ENABLE_LCD_\!PLOT)), font.o)
```

Note the use of the Make `or' function to include the font file. Other substitution functions, like `and' and `if' will also work here. Variables that do not come from menuconfig can also be used: ESP-IDF uses the default Make policy of judging a variable which is empty or contains only whitespace to be false while a variable with any non-whitespace in it is true.

(Source: Older versions of this document advised conditionally adding object file names to COMPONENT_OBJS. While this still is possible, this will only work when all object files for a component are named explicitly, and will not clean up deselected object files in a make clean pass.)

**Source Code Generation** Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```bash
COMPONENT_EXTRA_CLEAN := logo.h

graphics_lib.o: logo.h

logo.h: $(COMPONENT_PATH)/logo.bmp
    bmp2h -i $^ -o $@
```

In this example, graphics_lib.o and logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it needs to be cleaned when make clean is called which why it is added to the COMPONENT_EXTRA_CLEAN variable.

**Cosmetic Improvements** Adding logo.h to the graphics_lib.o dependencies causes it to be generated before graphics_lib.c is compiled.

If a a source file in another component included logo.h, then this component’s name would have to be added to the other component’s COMPONENT_DEPENDS list to ensure that the components were built in-order.

**Embedding Binary Data** Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can set a variable COMPONENT_EMBED_FILES in component.mk, giving the names of the files to embed in this way:

```bash
COMPONENT_EMBED_FILES := server_root_cert.der
```

Or if the file is a string, you can use the variable COMPONENT_EMBED_TXTFILES. This will embed the contents of the text file as a null-terminated string.
The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```c
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_pem_end");
```

The names are generated from the full name of the file, as given in COMPONENT_EMBED_FILES. Characters /, ., etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

For an example of using this technique, see the “main” component of the file_serving example protocols/http_server/file_serving/main/component.mk - two files are loaded at build time and linked into the firmware.

### Code and Data Placements

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See [Linker Script Generation](#) for a quick start guide as well as a detailed discussion of the mechanism.

### Fully Overriding The Component Makefile

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the esp-idf build system entirely by setting COMPONENT_OWNBUILDTARGET and possibly COMPONENT_OWNCLEANTARGET and defining your own targets named build and clean in component.mk target. The build target can do anything as long as it creates $(COMPONENT_LIBRARY) for the project make process to link into the app binary.

(Actually, even this is not strictly necessary - if the COMPONENT_ADD_LDFLAGS variable is overridden then the component can instruct the linker to link other binaries instead.)

**Note:** When using an external build process with PSRAM, remember to add -mfix-esp32-psram-cache-issue to the C compiler arguments. See [CONFIG_SPIRAM_CACHE_WORKAROUND](#) for details of this flag.

### Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the esp-idf defaults, it is possible to create a file sdkconfig.defaults in the project directory. This file will be used when running make defconfig, or creating a new config from scratch.

To override the name of this file, set the SDKCONFIG_DEFAULTS environment variable.

### Save flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write flash arguments. It’s simple to write a script to save binaries and esptool.py. We can use command make print_flash_cmd, it will print the flash arguments:

```
--flash_mode dio --flash_freq 40m --flash_size detect 0x1000 bootloader/bootloader.
--bin 0x10000 example_app.bin 0x8000 partition_table_unit_test_app.bin
```
Then use flash arguments as the arguments for esptool write_flash arguments:

```
python esptool.py --chip esp32 --port /dev/ttyUSB0 --baud 921600 --before default_
--reset --after hard_reset write_flash -z --flash_mode dio --flash_freq 40m --
flash_size detect 0x1000 bootloader/bootloader.bin 0x10000 example_app.bin_
--0x8000 partition_table_unit_test_app.bin
```

### 4.6.3 Building the Bootloader

The bootloader is built by default as part of “make all”, or can be built standalone via “make bootloader-clean”. There is also “make bootloader-list-components” to see the components included in the bootloader build.

The component in IDF components/bootloader is special, as the second stage bootloader is a separate .ELF and .BIN file to the main project. However it shares its configuration and build directory with the main project.

This is accomplished by adding a subproject under components/bootloader/subproject. This subproject has its own Makefile, but it expects to be called from the project’s own Makefile via some glue in the components/bootloader/Makefile.projectbuild file. See these files for more details.

### 4.7 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

#### 4.7.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

#### 4.7.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.
All of these functions are declared in the esp_sleep.h header under components/esp32.

### 4.7.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the RTC_IRAM_ATTR attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with rtc_wake_stub. Files names rtc_wake_stub* have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.7.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the RTC_DATA_ATTR and RTC_RODATA_ATTR to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named CONFIG_ESP32_RTCDATA_IN_FAST_MEM. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with RTC_DATA_ATTR and RTC_RODATA_ATTR are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the CONFIG_FREERTOS_unicore because RTC fast memory can be accessed only by PRO_CPU.

The attributes RTC_FAST_ATTR and RTC_SLOW_ATTR can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with RTC_FAST_ATTR is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with RTC_RODATA_ATTR, as shown in the example above.

The second way is to place the data into any source file whose name starts with rtc_wake_stub.

For example, the equivalent example in rtc_wake_stub_counter.c:

```c
int wake_count;
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count);
}
```
Chapter 4. API Guides

The second way is a better option if you need to use strings, or write other more complex code. To reduce wake-up time use the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP Kconfig option, see more information in Fast boot from Deep Sleep.

4.8 Error Handling

4.8.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using `throw` keyword

- Unrecoverable (fatal) errors:
  - Failed assertions (using `assert` macro and equivalent methods, see Assertions) and `abort()` calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see Fatal Errors.

4.8.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with `ESP_OK` code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR_` prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see Error Code Reference.

4.8.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing `0x101` to `esp_err_to_name()` will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a standard POSIX error code, if no matching `ESP_ERR_` value is found. This is done using `strerror_r` function. POSIX error codes (such as `ENOENT`, `ENOMEM`) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See `CONFIG_ESP_ERR_TO_NAME_LOOKUP`. When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return UNKNOWN ERROR, and `esp_err_to_name_r()` will return Unknown error `0xXXXX`(`YYYYY`), where `0xXXXX` and `YYYYY` are the hexadecimal and decimal representations of the error code, respectively.
4.8.4 ESP_ERROR_CHECK macro

ESP_ERROR_CHECK() macro serves similar purpose as assert, except that it checks _esp_err_t value rather than a bool condition. If the argument of ESP_ERROR_CHECK() is not equal _ESP_OK, then an error message is printed on the console, and abort() is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)
Backtrace: 0x40086e7c 0x3ffb4ff0 0x40087328 0x3ffb5010 0x400d1fdf:0x3ff5030 ...
```

**Note:** If IDF monitor is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on CONFIG_ESP_ERR_TO_NAME_LOOKUP option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where ESP_ERROR_CHECK() macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See Fatal Errors for more information about the backtrace.

4.8.5 ESP_ERROR_CHECK_WITHOUT_ABORT macro

ESP_ERROR_CHECK_WITHOUT_ABORT() macro serves similar purpose as ESP_ERROR_CHECK, except that it won’t call abort().

4.8.6 ESP_RETURN_ON_ERROR macro

ESP_RETURN_ON_ERROR() macro checks the error code, if the error code is not equal _ESP_OK, it prints the message and returns.

4.8.7 ESP_GOTO_ON_ERROR macro

ESP_GOTO_ON_ERROR() macro checks the error code, if the error code is not equal _ESP_OK, it prints the message, sets the local variable ret to the code, and then exits by jumping to goto_tag.

4.8.8 ESP_RETURN_ON_FALSE macro

ESP_RETURN_ON_FALSE() macro checks the condition, if the condition is not equal true, it prints the message and returns with the supplied err_code.

4.8.9 ESP_GOTO_ON_FALSE macro

ESP_GOTO_ON_FALSE() macro checks the condition, if the condition is not equal true, it prints the message, sets the local variable ret to the supplied err_code, and then exits by jumping to goto_tag.
4.8.10 CHECK MACROS Examples

Some examples:

```c
static const char* TAG = "Test";

esp_err_t test_func(void)
{
  esp_err_t ret = ESP_OK;

  ESP_ERROR_CHECK(x);  // err message,
  // printed if 'x' is not 'ESP_OK', and then 'abort()'.
  ESP_ERROR_CHECK_WITHOUT_ABORT(x);  // err message,
  // printed if 'x' is not 'ESP_OK', without 'abort()'.
  ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1");  // err message,
  // printed if 'x' is not 'ESP_OK', and then function returns with code 'x'.
  ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 2");  // err message,
  // printed if 'a' is not 'true', and then function returns with code 'err_code'.
  ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 3");  // err message,
  // printed if 'x' is not 'ESP_OK', 'ret' is set to 'x', and then jumps to 'err'.
  ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4");  // err message,
  // printed if 'a' is not 'true', 'ret' is set to 'err_code', and then jumps to 'err'.

  err:  // clean up
    return ret;
}
```

Note: If the option `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` in Kconfig is enabled, the err message will be discarded, while the other action works as is.

The ESP_RETURN_XX and ESP_GOTO_xx macros can’t be called from ISR. While there are xx_ISR versions for each of them, e.g., ESP_RETURN_ON_ERROR_ISR, these macros could be used in ISR.

4.8.11 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g. reset an external peripheral which is not responding).

   Example:

   ```c
   esp_err_t err;
   do {
       err = sdio_slave_send_queue(addr, len, arg, timeout);
       // keep retrying while the sending queue is full
   } while (err == ESP_ERR_TIMEOUT);
   if (err != ESP_OK) {
       // handle other errors
   }
   ```

2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.

   Example:

   ```c
   sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
   if (card == NULL) {
       return ESP_ERR_NO_MEM;
   }
   ```

   (continues on next page)
3. Convert into unrecoverable error, for example using ESP_ERROR_CHECK. See ESP_ERROR_CHECK macro section for details.
   Terminating the application in case of an error is usually undesirable behaviour for middleware components,
   but is sometimes acceptable at application level.
   Many ESP-IDF examples use ESP_ERROR_CHECK to handle errors from various APIs. This is not the best
   practice for applications, and is done to make example code more concise.
   Example:

   ```c
   ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
   ```

### 4.8.12 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using CONFIG_COMPILER_CXX_EXCEPTIONS option.

Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary
 to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible
to allocate exception object from the heap. Amount of memory in the emergency pool can be set using
 CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE variable.

If an exception is thrown, but there is no catch block, the program will be terminated by abort function, and
 backtrace will be printed. See Fatal Errors for more information about backtraces.

See cxx/exceptions for an example of C++ exception handling.

### 4.9 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating
large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks
can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation,
sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely
communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is de-
pendent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and
node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the ESP-BLE-MESH Architecture for information about the implementation of ESP-BLE-MESH architecture and ESP-BLE-MESH API Reference for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer here for the
certification details of ESP-BLE-MESH.

**Note:** If you are looking for Wi-Fi based implementation of mesh for ESP32, please check another product by
Espressif called ESP-WIF-MESH. For more information and documentation see ESP-WIFI-MESH.
4.9.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF Get Started documentation.

What You Need

Hardware:
- Three ESP32 boards, see options.
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

Software:
- Example application bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server code to load to the ESP32 boards.
- Mobile App: nRF Mesh for Android or iOS. Optionally you can use some other Apps:
  - EspBleMesh Android App
  - Silicon Labs Android or iOS App

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

**Step 1. Check Hardware**  Both ESP32-DevKitC and ESP-WROVER-KIT development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: idf.py menuconfig

> Example Configuration > Board selection for ESP-BLE-MESH

**Note:** If you plan to use ESP32-DevKitC, connect a RGB LED to GPIO pins 25, 26 and 27.

**Step 2. Configure Software**  Enter the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example directory, run idf.py menuconfig to select your board and then run idf.py build to compile the example.

**Step 3. Upload Application to Nodes**  After the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example is compiled successfully, users can run idf.py flash to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn GREEN.

**Step 4. Provision Nodes**  In this section, we will use the nRF Mesh Android App to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

**4.1 Scanner**  The Scanner is App’s functionality to search for unprovisioned devices in range. Open the App, press Scanner at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.
Fig. 4: ESP-BLE-MESH Devices Power On

Fig. 5: nRF Mesh - Scanner
Chapter 4. API Guides

4.2 Identify  Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the IDENTIFY interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

**Note:** The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the IDENTIFY interface button, no signs can be seen from the device except from the log on the serial monitor.

After the IDENTIFY interface button is pressed, users can see the PROVISION interface button.

![Fig. 6: nRF Mesh - IDENTIFY - PROVISION](image)

4.3 Provision  Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing OK, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing OK, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press CONNECT on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing CONNECT, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.
Chapter 4. API Guides

Fig. 7: nRF Mesh - Configuration Complete

Fig. 8: nRF Mesh - Initial Configuration Failed
Here an example of three devices listed.

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

### 4.4 Configuration

When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.

**Note:** No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

### Step 5. Operate Network

After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

The following screenshot shows different board with different color on.

**Note:** For **nRF Mesh** iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

4.9.2 ESP-BLE-MESH Examples

- **ESP-BLE-MESH Node OnOff Server** - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see example code.
- **ESP-BLE-MESH Node OnOff Client** - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see example code.
- **ESP-BLE-MESH Provisioner** - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see example code.
- **ESP-BLE-MESH Fast Provisioning - Client and Server** - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see example client code and example server code.
- **ESP-BLE-MESH and Wi-Fi Coexistence** - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32. Simply put, users can use the Wi-Fi while operating Bluetooth, see example code.
- **ESP-BLE-MESH Console** - an example that implements BLE Mesh basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see example node code.

ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.
• **ESP-BLE-MESH Architecture Overview**  
  – Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.

• **ESP-BLE-MESH Architecture Implementation**  
  – Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.

• **ESP-BLE-MESH Auxiliary Routines**  
  – Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

1. **ESP-BLE-MESH Architecture Overview**  
   Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth certification.

ESP-BLE-MESH architecture includes five key parts:

• **Mesh Protocol Stack**  
  – **Mesh Networking** is responsible for processing of messages of ESP-BLE-MESH nodes.  
  – **Mesh Provisioning** is responsible for provisioning flow of ESP-BLE-MESH devices.  
  – **Mesh Models** is responsible for the implementation of SIG-defined models.

• **Network Management**  
  – Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.

• **Features**  
  – Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.

• **Mesh Bearer Layer**  
  – Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.

• **Applications**  
  – Based on ESP-BLE-MESH protocol stack and Mesh Models.  
  – By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

1.1 **Mesh Protocol Stack**

1.1.1 **Mesh Networking**  
   Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see **ESP-BLE-MESH Feature List**.

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:
Fig. 14: Figure 1.1 ESP-BLE-MESH Architecture Diagram
Table 1.1 Mesh Networking Architecture Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Layer</td>
<td>Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.</td>
</tr>
<tr>
<td>Upper Transport Layer</td>
<td>Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages”, including messages related to “friendship” and heartbeat messages.</td>
</tr>
<tr>
<td>Lower Transport Layer</td>
<td>Lower Transport Layer handles segmentation and reassembly of PDU.</td>
</tr>
<tr>
<td>Network Layer</td>
<td>Network Layer defines the address type and format of the network messages, and implements the relay function of the device.</td>
</tr>
</tbody>
</table>

1.1.2 Mesh Provisioning  
Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

Table 1.2 Mesh Provisioning Architecture Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>Provisioning PDUs from different layers are handled using provisioning protocol.</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT</td>
<td>These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.</td>
</tr>
</tbody>
</table>

1.1.3 Mesh Models  
Mesh Models in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:

Table 1.3 Mesh Models Architecture Description

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model Layer</td>
<td>Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.</td>
</tr>
<tr>
<td>Foundation Model Layer</td>
<td>Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.</td>
</tr>
</tbody>
</table>

1.2 Mesh Network Management  
Network Management implements the following functions:

- Node removal procedure is used to remove a node from the network.
• IV Index recovery procedure is used to recover a node’s IV Index.
• IV update procedure is used to update the nodes’ IV Index.
• Key refresh procedure is used to update the nodes’ NetKey, AppKey, etc.
• Network creation procedure is used to create a mesh network.
• NVS storage is used to store node’s networking information.

1.3 Mesh Features  Features includes the following options:
• Low Power feature is used to reduce node’s power consumption.
• Friend feature is used to store messages for Low Power nodes.
• Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
• Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

1.4 Mesh Bearer Layer  Bearers in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

Bearers can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT Bearer</td>
<td>The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.</td>
</tr>
<tr>
<td>Advertising Bearer</td>
<td>When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.</td>
</tr>
</tbody>
</table>

1.5 Mesh Applications  The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

• Application layer calls API
  – Call the provisioning-related API for provisioning.
  – Call the model-related API to send messages.
  – Call the device-attributes-related API to get local information about the device.
• Application layer processes Event
The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.
  – The events completed by calling API.
    * Such as nodes sending messages.
  – The events that the protocol stack actively reports to the application layer.
    * The Event that the protocol stack actively reports.
    * The Event that Model actively reports.
• The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between API / Event and ESP-BLE-MESH protocol stack

• API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
• The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.
Chapter 4. API Guides

2. ESP-BLE-MESH Architecture Implementation  The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

- **Layer-based Approach**: With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.

- **Module-based Approach**: Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

2.1 Mesh Protocol Stack Implementation

2.1.1 Mesh Networking Implementation  The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>ESP-BLE-MESH Access Layer</td>
</tr>
<tr>
<td>transport.c</td>
<td>ESP-BLE-MESH Lower/Upper Transport Layer</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Network Layer</td>
</tr>
<tr>
<td>adv.c</td>
<td>A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers</td>
</tr>
</tbody>
</table>

2.1.2 Mesh Provisioning Implementation  The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>ESP-BLE-MESH Node provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>beacon.c</td>
<td>APIs used to handle ESP-BLE-MESH Beacons</td>
</tr>
</tbody>
</table>

Specific files that implement functions of Provisioner are shown in Table 2.3:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>ESP-BLE-MESH Provisioner provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>ESP-BLE-MESH Provisioner networking related functionalities</td>
</tr>
</tbody>
</table>

2.1.3 Mesh Models Implementation  Mesh Models are used to implement the specific functions of model in nodes.

Server model is used to maintain node status. Client model is used to obtain and modify node state.
Table 9: Table 2.4 Mesh Models File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg_cli.c</td>
<td>Send Configuration Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>cfg_srv.c</td>
<td>Receive Configuration Client messages and send proper response messages</td>
</tr>
<tr>
<td>health_cli.c</td>
<td>Send Health Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>health_srv.c</td>
<td>Receive Health Client messages and send proper response messages</td>
</tr>
<tr>
<td>client_common.c</td>
<td>ESP-BLE-MESH model related operations</td>
</tr>
<tr>
<td>generic_client.c</td>
<td>Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>lighting_client.c</td>
<td>Send ESP-BLE-MESH Lighting Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>sensor_client.c</td>
<td>Send ESP-BLE-MESH Sensor Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>time_scene_client.c</td>
<td>Send ESP-BLE-MESH Time Scene Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>generic_server.c</td>
<td>Receive ESP-BLE-MESH Generic Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>lighting_server.c</td>
<td>Receive ESP-BLE-MESH Lighting Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>sensor_server.c</td>
<td>Receive ESP-BLE-MESH Sensor Client messages and send corresponding response messages</td>
</tr>
<tr>
<td>time_scene_server.c</td>
<td>Receive ESP-BLE-MESH Time Scene Client messages and send corresponding response messages</td>
</tr>
</tbody>
</table>

2.2 Mesh Bearers Implementation  Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify mesh_bearer_adapt.c (example of NimBLE version).

Table 10: Table 2.5 Mesh Bearers File Description

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh_bearer_adapt.c</td>
<td>ESP-BLE-MESH Bearer Layer adapter, This file provides the interfaces used to receive and send ESP-BLE-MESH ADV &amp; GATT related packets.</td>
</tr>
</tbody>
</table>

Note: mesh_bearer_adapt.c is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

2.3 Mesh Applications Implementation  We have provided a series of application examples for customer development, and users can develop products based on ESP-BLE-MESH Examples.

3. Auxiliary Routine  Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through CONFIG_BLE_MESH.

3.1 Features

- Low Power
- Friend
- Relay
- Proxy Client/Server
Chapter 4. API Guides

3.2 Network Management

- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

3.3 Auxiliary Routine Implementation

When adopting the design of independent module, the two main factors should be considered:

- The module cannot be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpn.c</td>
<td>ESP-BLE-MESH Low Power functionality</td>
</tr>
<tr>
<td>friend.c</td>
<td>ESP-BLE-MESH Friend functionality</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Relay feature, network creation, IV Update procedure, IV Index recovery procedure, Key Refresh procedure related functionalities</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>settings.c</td>
<td>ESP-BLE-MESH NVS storage functionality</td>
</tr>
<tr>
<td>main.c</td>
<td>ESP-BLE-MESH stack initialize, stack enable, node removal related functionalities</td>
</tr>
</tbody>
</table>

ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:

- 1. Provisioner Development
- 2. Node Development
- 3. ESP-BLE-MESH and Wi-Fi Coexistence
- 4. Fast Provisioning
- 5. Log Help
- 6. Example Help
- 7. Others

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

1. Provisioner Development

Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.

1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.
• The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

• Client model that corresponds to server model of the node is required.
• NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
• The address owned by the node shall be known, which could be its unicast address or subscription address.

1.3 How can NetKey and AppKey be used?

• NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
• AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

• The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
• The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can’t be changed afterwards.

1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message?

The unicast address of Provisioner can be set only once during initialization and can’t be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address. Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.

1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used by Provisioner to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can’t be changed afterwards.

1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.

1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner to set unprovisioned device during provisioning. It can be set only once during initialization and can’t be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.
1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples?

There are four authentication methods, i.e. NoOOB, StaticOOB, OutputOOB and InputOOB. In the provided examples, NoOOB is used.

1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?

- Device UUID
- OOB Info
- URL Hash (optional)

1.12 Can such information be used for device identification?

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?

- Provisioner can get the Composition Data of nodes using the Configuration Client Model API esp_ble_mesh_config_client_set_state() with comp_data_get in the parameter esp_ble_mesh_cfg_client_get_state_t set properly.
- Users can refer to the following code to parse the Composition Data:

```c
#include <stdio.h>
#include <string.h>
#include <stdint.h>

    esp_ble_mesh_composition_head head = {0};
}
```
1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the Configuration Client Model API esp_ble_mesh_config_client_set_state().

- Add AppKey to nodes with app_key_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Add subscription address to the models of nodes with model_sub_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Set publication information to the models of nodes with model_pub_set in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.

1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;
    
    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }
    
    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }
    
    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        
    }
    for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
        if (model->groups[j] == group_addr) {
            break;
        }
    }
}
```
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGW(TAG, "%s: Group address already exists, element-\n    -index: %d", __func__, i);
    continue;
}
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
        model->groups[j] = group_addr;
        break;
    }
}
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element-\n    -index: %d", __func__, i);
}
return ESP_OK;

Note: When the NVS storage of the node is enabled, group address added and AppKey bound by this method will not be saved in the NVS when the device is powered off currently. These configuration information can only be saved if they are configured by Configuration Client Model.

1.17 How does Provisioner control nodes by grouping?

Generally there are two approaches to implement group control in ESP-BLE-MESH network, group address approach and virtual address approach. And supposing there are 10 devices, i.e., five devices with blue lights and five devices with red lights.

- Method 1: 5 blue lights can subscribe to a group address, 5 red lights subscribe to another one. By sending messages to different group addresses, Provisioner can realize group control.
- Method 2: 5 blue lights can subscribe to a virtual address, 5 red lights subscribe to another one. By sending messages to different virtual addresses, Provisioner can realize group control.

1.18 How does Provisioner add nodes to multiple subnets?

Provisioner can add multiple NetKeys to nodes during configuration, and nodes sharing the same NetKey belong to the same subnet. Provisioner can communicate with nodes on different subnets by using different NetKeys.

1.19 How does Provisioner know if a node in the mesh network is offline?

Node offline is usually defined as: the condition that the node cannot be properly communicated with other nodes in the mesh network due to power failure or some other reasons.

There is no connection between nodes and nodes in the ESP-BLE-MESH network. They communicate with each other through advertising channels.

An example is given here to show how to detect a node is offline by Provisioner.

- The node can periodically send heartbeat messages to Provisioner. And if Provisioner failed to receive heartbeat messages in a certain period, the node is considered to be offline.
Chapter 4. API Guides

Note: The heartbeat message should be designed into a single package (less than 11 bytes), so the transmission and reception of it can be more efficient.

1.20 What operations should be performed when Provisioner removes nodes from the network?

Usually when Provisioner tries to remove node from the mesh network, the procedure includes three main steps:

- Firstly, Provisioner adds the node that need to be removed to the “blacklist”.
- Secondly, Provisioner performs the Key Refresh procedure.
- Lastly, the node performs node reset procedure, and switches itself to an unprovisioned device.

1.21 In the Key Refresh procedure, how does Provisioner update the Netkey owned by nodes?

- Provisioner updates the NetKey of nodes using the Configuration Client Model API `esp_ble_mesh_config_client_set_state()` with `net_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Provisioner updates the AppKey of nodes using the Configuration Client Model API `esp_ble_mesh_config_client_set_state()` with `app_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

1.22 How does Provisioner manage nodes in the mesh network?

ESP-BLE-MESH implements several functions related to basic node management in the example, such as `esp_ble_mesh_store_node_info()`. And ESP-BLE-MESH also provides the API `esp_ble_mesh_provisioner_set_node_name()` which can be used to set the node’s local name and the API `esp_ble_mesh_provisioner_get_node_name()` which can be used to get the node’s local name.

1.23 What does Provisioner need when trying to control the server model of nodes?

Provisioner must include corresponding client model before controlling the server model of nodes. Provisioner shall add its local NetKey and AppKey.

- Provisioner add NetKey by calling the API `esp_ble_mesh_provisioner_add_local_net_key()`.
- Provisioner add AppKey by calling the API `esp_ble_mesh_provisioner_add_local_app_key()`.

Provisioner shall configure its own client model.

- Provisioner bind AppKey to its own client model by calling the API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()`.

1.24 How does Provisioner control the server model of nodes?

ESP-BLE-MESH supports all SIG-defined client models. Provisioner can use these client models to control the server models of nodes. And the client models are divided into 6 categories with each category has the corresponding functions.

- Configuration Client Model
  - The API `esp_ble_mesh_config_client_get_state()` can be used to get the `esp_ble_mesh_cfg_client_get_state_t` values of Configuration Server Model.
  - The API `esp_ble_mesh_config_client_set_state()` can be used to set the `esp_ble_mesh_cfg_client_set_state_t` values of Configuration Server Model.

- Health Client Model
  - The API `esp_ble_mesh_health_client_get_state()` can be used to get the `esp_ble_mesh_health_client_get_state_t` values of Health Server Model.
Chapter 4. API Guides

- The API `esp_ble_mesh_health_client_set_state()` can be used to set the `esp_ble_mesh_health_client_set_state_t` values of Health Server Model.

  • **Generic Client Models**
  - The API `esp_ble_mesh_generic_client_get_state()` can be used to get the `esp_ble_mesh_generic_client_get_state_t` values of Generic Server Models.
  - The API `esp_ble_mesh_generic_client_set_state()` can be used to set the `esp_ble_mesh_generic_client_set_state_t` values of Generic Server Models.

  • **Lighting Client Models**
  - The API `esp_ble_mesh_light_client_get_state()` can be used to get the `esp_ble_mesh_light_client_get_state_t` values of Lighting Server Models.
  - The API `esp_ble_mesh_light_client_set_state()` can be used to set the `esp_ble_mesh_light_client_set_state_t` values of Lighting Server Models.

  • **Sensor Client Models**
  - The API `esp_ble_mesh_sensor_client_get_state()` can be used to get the `esp_ble_mesh_sensor_client_get_state_t` values of Sensor Server Model.
  - The API `esp_ble_mesh_sensor_client_set_state()` can be used to set the `esp_ble_mesh_sensor_client_set_state_t` values of Sensor Server Model.

  • **Time and Scenes Client Models**
  - The API `esp_ble_mesh_time_scene_client_get_state()` can be used to get the `esp_ble_mesh_time_scene_client_get_state_t` values of Time and Scenes Server Models.
  - The API `esp_ble_mesh_time_scene_client_set_state()` can be used to set the `esp_ble_mesh_time_scene_client_set_state_t` values of Time and Scenes Server Models.

2. Node Development

2.1 What kind of models are included by nodes?

  • In ESP-BLE-MESH, nodes are all composed of a series of models with each model implements some functions of the node.
  • Model has two types, client model and server model. Client model can get and set the states of server model.
  • Model can also be divided into SIG model and vendor model. All behaviors of SIG models are officially defined while behaviors of vendor models are defined by users.

2.2 Is the format of messages corresponding to each model fixed?

  • Messages, which consist of opcode and payload, are divided by opcode.
  • The type and the format of the messages corresponding to models are both fixed, which means the messages transmitted between models are fixed.

2.3 Which functions can be used to send messages with the models of nodes?

  • For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` to send messages.
  • For server models, users can use the API `esp_ble_mesh_server_model_send_msg()` to send messages.
  • For publication, users call the API `esp_ble_mesh_model_publish()` to publish messages.

2.4 How to achieve the transmission of messages without packet loss?

Acknowledged message is needed if users want to transmit messages without packet loss. The default time to wait for corresponding response is set in `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`. If the sender waits for the response until the timer expires, the corresponding timeout event would be triggered.
Chapter 4. API Guides

Note: Response timeout can be set in the API `esp_ble_mesh_client_model_send_msg()`. The default value (4 seconds) would be applied if the parameter `msg_timeout` is set to 0.

2.5 How to send unacknowledged messages?

For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` to send unacknowledged messages.

For server models, the messages sent by using the API `esp_ble_mesh_server_model_send_msg()` are always unacknowledged messages.

2.6 How to add subscription address to models?

Subscription address can be added through Configuration Client Model.

2.7 What is the difference between messages sent and published by models?

Messages sent by calling the API `esp_ble_mesh_client_model_send_msg()` or `esp_ble_mesh_server_model_send_msg()` will be sent in the duration determined by the Network Transmit state.

Messages published by calling the API `esp_ble_mesh_model_publish()` will be published determined by the Model Publication state. And the publication of messages is generally periodic or with a fixed number of counts. The publication period and publication count are controlled by the Model Publication state, and can be configured through Configuration Client Model.

2.8 How many bytes can be carried when sending unsegmented messages?

The total payload length (which can be set by users) of unsegmented message is 11 octets, so if the opcode of the message is 2 octets, then the message can carry 9-octets of valid information. For vendor messages, due to the 3-octets opcode, the remaining payload length is 8 octets.

2.9 When should the Relay feature of nodes be enabled?

Users can enable the Relay feature of all nodes when nodes detected in the mesh network are sparse.

For dense mesh network, users can choose to just enable the Relay feature of several nodes.

And users can enable the Relay feature by default if the mesh network size is unknown.

2.10 When should the Proxy feature of node be enabled?

If the unprovisioned device is expected to be provisioned by a phone, then it should enable the Proxy feature since almost all the phones do not support sending ESP-BLE-MESH packets through advertising bearer currently. And after the unprovisioned device is provisioned successfully and becoming a Proxy node, it will communicate with the phone using GATT bearer and using advertising bearer to communicate with other nodes in the mesh network.

2.11 How to use the Proxy filter?

The Proxy filter is used to reduce the number of Network PDUs exchanged between a Proxy Client (e.g. the phone) and a Proxy Server (e.g. the node). And with the Proxy filter, Proxy Client can explicitly request to receive only mesh messages with certain destination addresses from Proxy Server.
2.12 When a message can be relayed by a Relay node?

If a message need to be relayed, the following conditions should be met.

- The message is in the mesh network.
- The message is not sent to the unicast address of the node.
- The value of TTL in the message is greater than 1.

2.13 If a message is segmented into several segments, should the other Relay nodes just relay when one of these segments is received or wait until the message is received completely?

Relay nodes will forward segments when one of them are received rather than keeping waiting until all the segments are received.

2.14 What is the principle of reducing power consumption using Low Power feature?

- When the radio is turned on for listening, the device is consuming energy. When low power feature of the node is enabled, it will turn off its radio in the most of the time.
- And cooperation is needed between low power node and friend node, thus low power node can receive messages at an appropriate or lower frequency without the need to keep listening.
- When there are some new messages for low power node, its friend node will store the messages for it. And low power node can poll friend nodes to see if there are new messages at a fixed interval.

2.15 How to continue the communication on the network after powering-down and powering-up again?

Enable the configuration Store ESP-BLE-MESH Node configuration persistently in menuconfig.

2.16 How to send out the self-test results of nodes?

It is recommended that nodes can publish its self-test results periodically through Health Server Model.

2.17 How to transmit information between nodes?

One possible application scenario for transmitting information between nodes is that spray nodes would be triggered once smoke alarm detected high smoke concentration. There are two approaches in implementation.

- Approach 1 is that spray node subscribes to a group address. When smoke alarm detects high smoke concentration, it will publish a message whose destination address is the group address which has been subscribed by spray node.
- Approach 2 is that Provisioner can configure the unicast address of spray node to the smoke alarm. When high smoke concentration is detected, smoke alarm can use send messages to the spray node with the spray node’s unicast address as the destination address.

2.18 Is gateway a must for nodes communication?

- Situation 1: nodes only communicate within the mesh network. In this situation, no gateway is needed. ESP-BLE-MESH network is a flooded network, messages in the network have no fixed paths, and nodes can communicate with each other freely.
- Situation 2: if users want to control the nodes remotely, for example turn on some nodes before getting home, then a gateway is needed.

2.19 When will the IV Update procedure be performed?

IV Update procedure would be performed once sequence number of messages sent detected by the bottom layer of node reached a critical value.
2.20 How to perform IV Update procedure?

Nodes can perform IV Update procedure with Secure Network Beacon.

3. ESP-BLE-MESH and Wi-Fi Coexistence

3.1 Which modes does Wi-Fi support when it coexists with ESP-BLE-MESH?

Currently only Wi-Fi station mode supports the coexistence.

3.2 Why is the Wi-Fi throughput so low when Wi-Fi and ESP-BLE-MESH coexist?

The ESP32-DevKitC board without PSRAM can run properly but the throughput of it is low since it has no PSRAM. When Bluetooth and Wi-Fi coexist, the throughput of ESP32-DevKitC with PSRAM can be stabilized to more than 1Mbps.

And some configurations in menuconfig shall be enabled to support PSRAM:

- ESP32-specific --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
- Bluetooth --> Bluedroid Enable --> BT/BLE will first malloc the memory from the PSRAM
- Bluetooth --> Bluedroid Enable --> Use dynamic memory allocation in BT/BLE stack.
- Bluetooth --> Bluetooth controller --> BLE full scan feature supported.
- Wi-Fi --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi

4. Fast Provisioning

4.1 Why is fast provisioning needed?

Normally when they are several unprovisioned devices, users can provision them one by one. But when it comes to a large number of unprovisioned devices (e.g. 100), provisioning them one by one will take huge amount of time. With fast provisioning, users can provision 100 unprovisioned devices in about 50 seconds.

4.2 Why EspBleMesh App would wait for a long time during fast provisioning?

After the App provisioned one Proxy node, it will disconnect from the App during fast provisioning, and reconnect with the App when all the nodes are provisioned.

4.3 Why is the number of node addresses displayed in the App is more than that of existing node addresses?

Each time after a fast provisioning process, and before starting a new one, the node addresses in the App should be cleared, otherwise the number of the node address will be incorrect.

4.4 What is the usage of the count value which was input in EspBleMesh App?

The count value is provided to the Proxy node which is provisioned by the App so as to determine when to start Proxy advertising in advance.

4.5 When will Configuration Client Model of the node running fast_prov_server example start to work?

Configuration Client Model will start to work after the Temporary Provisioner functionality is enabled.
4.6 Will the Temporary Provisioner functionality be enabled all the time?

After the nodes receive messages used to turn on/off lights, all the nodes will disable its Temporary Provisioner functionality and become nodes.

5. Log Help  You can find meaning of errors or warnings when they appear at the bottom of ESP-BLE-MESH stack.

5.1 What is the meaning of warning ran out of retransmit attempts?

When the node transmits a segmented message, and due to some reasons, the receiver doesn’t receive the complete message. Then the node will retransmit the message. When the retransmission count reaches the maximum number, which is 4 currently, then this warning will appear.

5.2 What is the meaning of warning Duplicate found in Network Message Cache?

When the node receives a message, it will compare the message with the ones stored in the network cache. If the same has been found in the cache, which means it has been received before, then the message will be dropped.

5.3 What is the meaning of warning Incomplete timer expired?

When the node doesn’t receive all the segments of a segmented message during a certain period (e.g. 10 seconds), then the Incomplete timer will expire and this warning will appear.

5.4 What is the meaning of warning No matching TX context for ack?

When the node receives a segment ack and it doesn’t find any self-send segmented message related with this ack, then this warning will appear.

5.5 What is the meaning of warning No free slots for new incoming segmented messages?

When the node has no space for receiving new segmented message, this warning will appear. Users can make the space larger through the configuration \texttt{CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT}.

5.6 What is the meaning of error Model not bound to Appkey 0x0000?

When the node sends messages with a model and the model has not been bound to the AppKey with AppKey Index 0x000, then this error will appear.

5.7 What is the meaning of error Busy sending message to DST xxxx?

This error means client model of the node has transmitted a message to the target node and now is waiting for a response, users can not send messages to the same node with the same unicast address. After the corresponding response is received or timer is expired, then another message can be sent.

6. Example Help

6.1 How are the ESP-BLE-MESH callback functions classified?

- The API \texttt{esp\_ble\_mesh\_register\_prov\_callback()} is used to register callback function used to handle provisioning and networking related events.
- The API \texttt{esp\_ble\_mesh\_register\_config\_client\_callback()} is used to register callback function used to handle Configuration Client Model related events.
- The API \texttt{esp\_ble\_mesh\_register\_config\_server\_callback()} is used to register callback function used to handle Configuration Server Model related events.
The API `esp_ble_mesh_register_health_client_callback()` is used to register callback function used to handle Health Client Model related events.

The API `esp_ble_mesh_register_health_server_callback()` is used to register callback function used to handle Health Server Model related events.

The API `esp_ble_mesh_register_generic_client_callback()` is used to register callback function used to handle Generic Client Models related events.

The API `esp_ble_mesh_register_light_client_callback()` is used to register callback function used to handle Lighting Client Models related events.

The API `esp_ble_mesh_register_sensor_client_callback()` is used to register callback function used to handle Sensor Client Model related events.

The API `esp_ble_mesh_register_time_scene_client_callback()` is used to register callback function used to handle Time and Scenes Client Models related events.

The API `esp_ble_mesh_register_custom_model_callback()` is used to register callback function used to handle vendor model and unrealized server models related events.

7. Others

7.1 How to print the message context?

The examples use `ESP_LOG_BUFFER_HEX()` to print the message context while the ESP-BLE-MESH protocol stack uses `bt_hex()`.

7.2 Which API can be used to restart ESP32?

The API `esp_restart()`.

7.3 How to monitor the remaining space of the stack of a task?

The API `vTaskList()` can be used to print the remaining space of the task stack periodically.

7.4 How to change the level of log without changing the menuconfig output level?

The API `esp_log_level_set()` can be used to change the log output level rather than using menu-config to change it.
## ESP-BLE-MESH Terminology

### Table 12: Table 1 ESP-BLE-MESH Terminology - Role

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unprovisioned Device</strong></td>
<td>A device that is not a member of a mesh network is known as an unprovisioned device.</td>
<td>Examples: lighting devices, temperature control devices, manufacturing equipments and electric doors, etc.</td>
</tr>
<tr>
<td><strong>Node</strong></td>
<td>A node is a provisioned device.</td>
<td>The role of unprovisioned device will change to node after being provisioned to ESP-BLE-MESH network. Nodes (such as lighting devices, temperature control devices, manufacturing equipments, and electric doors) are devices that can send, receive, or relay messages in ESP-BLE-MESH network, and they can optionally support one or more subnets.</td>
</tr>
<tr>
<td><strong>Relay Node</strong></td>
<td>A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.</td>
<td>Relay nodes can receive and resend ESP-BLE-MESH messages, so the messages can be transferred further. Users can decide whether or not to enable forwarding function of nodes according to nodes’ status. Messages can be relayed for multiple times, and each relay is considered as a “hop”. Messages can hop up to 126 times, which is enough for message transmission in a wide area.</td>
</tr>
<tr>
<td><strong>Proxy Node</strong></td>
<td>A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.</td>
<td>Proxy nodes receive messages from one bearer (it generally includes advertising bearer and GATT bearer) and resend it from another one. The purpose is to connect communication equipments that only support GATT bearer to ESP-BLE-MESH network. Generally, mobile apps need a Proxy node to access Mesh network. Without Proxy nodes, mobile apps cannot communicate with members in Mesh network.</td>
</tr>
<tr>
<td><strong>Friend Node</strong></td>
<td>A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.</td>
<td>Friend node, like the backup of Low Power node (LPN), can store messages that are sent to Low Power node and security updates; the stored information will be transferred to Low Power node when Low Power node needs it. Low Power node must establish “friendship” with another node that supports the Friend Feature to reduce duty cycle of its receiver, thus power consumption of Low Power node can be reduced. Low Power node needs to find a Friend node to establish a friendship with it. The process involved is called “friendship establishment”. Cooperation between Low Power node and Friend nodes enables Low Power node to schedule the use of the radio, thus Low Power node can receive messages at an appropriate or lower frequency without the need of keeping listening. Low Power node will poll Friend node to see if there is new message.</td>
</tr>
<tr>
<td><strong>Low Power Node</strong></td>
<td>A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.</td>
<td>By polling, Low Power node gets information from Friend node, such as messages, security updates, and etc.</td>
</tr>
<tr>
<td><strong>Provisioner</strong></td>
<td>A node that is capable of adding a device to a mesh network.</td>
<td>The device that can provision unprovisioned devices is called a Provisioner. This process usually needs to be implemented through an app that is typically provided by the product manufacturer and can be used on a gateway, a smartphone, tablet or other carriers.</td>
</tr>
</tbody>
</table>
### Table 13: Table 2 ESP-BLE-MESH Terminology - Composition

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>A value representing a condition of an element that is exposed by an element of a node.</td>
<td>Each node in a ESP-BLE-MESH network has an independent set of state values that indicate certain states of the device, like brightness, and color of lighting device. Change of state value will lead to change of the physical state of devices. For example, changing the on/off state of a device is actually turning on/off the device.</td>
</tr>
<tr>
<td>Model</td>
<td>A model defines the basic functionality of a node.</td>
<td>A node may contain multiple models, and each model defines basic functionalities of nodes, like the states needed by the nodes, the messages controlling the states, and actions resulted from messages handling. The function implementation of the nodes is based on models, which can be divided into SIG Model and Vendor Model, with the former defined by SIG and latter defined by users.</td>
</tr>
<tr>
<td>Element</td>
<td>An addressable entity within a device.</td>
<td>A node can contain one or more elements, with each having a unicast address and one or more models, and the models contained by the same element must not be the same.</td>
</tr>
<tr>
<td>Composition Data</td>
<td>The Composition Data state contains information about a node, the elements it includes, and the supported models.</td>
<td>By reading the value of the Composition Data state, users can know basic information of the node, such as the number of elements, and the models in each element. Provisioner gets this message to further provision the device, such as configuring subscription address and publishing address of nodes.</td>
</tr>

### Table 14: Table 3 ESP-BLE-MESH Terminology - Features

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Power Feature</td>
<td>The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.</td>
<td>Low Power feature reduces power consumption of nodes. When a Low Power node is searching for a Friend node, and there are multiple Friend nodes nearby, it selects the most suitable Friend node through algorithm.</td>
</tr>
<tr>
<td>Friend Feature</td>
<td>The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.</td>
<td>By enabling friend feature, the node can help to store information for Low Power node. The nodes enabled with friend feature may cause more power and memory consumption.</td>
</tr>
<tr>
<td>Relay Feature</td>
<td>The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.</td>
<td>The relay feature enables ESP-BLE-MESH messages to hop among nodes for multiple times, and the transmission distance can exceed the range of direct radio transmission between two nodes, thereby covering the entire network. When a node is enabled with the relay feature to relay messages, it only relays the messages of its own subnet, and does not relay the messages of other subnets. The data integrity will not be considered when the node enabled with relay feature relays segmented messages. The node would relay every segmented message once it receives one rather than waiting for the complete message.</td>
</tr>
<tr>
<td>Proxy Feature</td>
<td>The ability to receive and retransmit mesh messages between GATT and advertising bearers.</td>
<td>The purpose of the proxy feature is to allow nodes without an advertising bearer to access the ESP-BLE-MESH network. The proxy feature is typically used in nodes that need to connect to mobile apps.</td>
</tr>
<tr>

<td>Detailed Explanation</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PB-ADV</td>
<td>PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.</td>
<td>PB-ADV transfers packets generated during the provisioning process over the advertising channels. This way can only be used for provisioning when provisioner and unprovisioned device both support PB-ADV.</td>
</tr>
<tr>
<td>PB-GATT</td>
<td>PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.</td>
<td>PB-GATT uses connection channels to transfer packets generated during the provisioning process. If an unprovisioned device wants to be provisioned through this method, it needs to implement the related Mesh Provisioning Service. Unprovisioned devices which don’t implement such service cannot be provisioned into mesh network through PB-GATT bearer.</td>
</tr>
<tr>
<td>Provisioning</td>
<td>Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.</td>
<td>The process of provisioning turns the “unprovisioned device” into a “node”, making it a member of the ESP-BLE-MESH network.</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Authentication is a step during the provisioning of nodes.</td>
<td>There are four authentication methods for unprovisioned devices: Output OOB, Input OOB, Static OOB, and No OOB.</td>
</tr>
<tr>
<td>Input OOB</td>
<td>Input Out-of-Band</td>
<td>For example, a Provisioner generates and displays a random number, and then prompts users to take appropriate actions to input the random number into the unprovisioned device. Taking lighting switch as an example, users can press the button for several times in a certain period of time to input the random number displayed on the Provisioner. Authentication method of the Input OOB is similar to that of Output OOB, but the role of the device is reversed.</td>
</tr>
<tr>
<td>Output OOB</td>
<td>Output Out-of-Band</td>
<td>For example, an unprovisioned device will choose a random number and output the number in a way that is compatible with its functionality. If the unprovisioned device is a bulb, it can flash a specified number of times. If the unprovisioned device has an LCD screen, the random number can display as a multi-digit value. Users who start provisioning should input the observed number to authenticate the unprovisioned device.</td>
</tr>
<tr>
<td>Static OOB</td>
<td>Static Out-of-Band</td>
<td>Authentication method of Static OOB: use Static OOB information. Use 0 as Static OOB information if No OOB information is needed. Use Static OOB information to authenticate devices which are going through provisioning if OOB information is needed.</td>
</tr>
<tr>
<td>No OOB</td>
<td>No Out-of-Band</td>
<td>Authentication method of No OOB: Set the value of the Static OOB field to 0. Using this way is like not authenticating the unprovisioned devices.</td>
</tr>
<tr>

<td>-------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unassigned Address</td>
<td>This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.</td>
<td>The addresses owned by elements which has not been configured yet or no address has been allocated are unassigned addresses. These elements will not be used for messages transfer because they have no fixed address. Unassigned address is recommended to set as the value of the address before setting the address of user code.</td>
</tr>
<tr>
<td>Unicast Address</td>
<td>A unicast address is a unique address allocated to each element.</td>
<td>During provisioning, the Provisioner will assign a unicast address to each element of node within the life cycle of the nodes in the network. A unicast address may appear in the source/destination address field of a message. Messages sent to a unicast address can only be processed by the element that owns the unicast address.</td>
</tr>
<tr>
<td>Virtual Address</td>
<td>A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.</td>
<td>Associated with specific UUID labels, a virtual address may serve as the publishing or subscription address of the model. A UUID label is a 128-bit value associated with elements of one or more nodes. For virtual addresses, the 15th and 14th bits are set to 1 and 0 respectively; bits from 13th to 0 are set to hash values (providing 16384 hash values). The hash is a derivation of the Label UUID. To use subscribing elements to check the full 128-bit UUID is very inefficient while hash values provide a more efficient way to determine which elements that which messages are finally sent to.</td>
</tr>
<tr>
<td>Group Address</td>
<td>A group address is an address that is programmed into zero or more elements</td>
<td>Group address is another kind of multicast address in the ESP-BLE-MESH network, which is usually used to group nodes. A message sent to the all-proxies address shall be processed by the primary element of all nodes that have the proxy functionality enabled. A message sent to the all-friends address shall be processed by the primary element of all nodes that have the friend functionality enabled. A message sent to the all-relays address shall be processed by the primary element of all nodes that have the relay functionality enabled. A message sent to the all-nodes address shall be processed by the primary element of all nodes.</td>
</tr>

<tbody>
<tr>
<td>Device Key (DevKey)</td>
<td>There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.</td>
<td>The device key enables you to provision the devices, configure the nodes. The device key is used to encrypt Configuration Messages, i.e. the message transferred between the Provisioner and the node when the device is configured.</td>
</tr>
<tr>
<td>Application Key (App-Key)</td>
<td>Application keys are used to secure communications at the upper transport layer.</td>
<td>Application key is used for decryption of application data before delivering application data to application layer and encryption of them during the delivery of application layer. Some nodes in the network have a specific purpose and can restrict access to potentially sensitive data based on the needs of the application. With specific application keys, these nodes are associated with specific applications. Generally speaking, the fields using different application keys include security (access control of buildings, machine rooms and CEO offices), lighting (plant, exterior building and sidewalks) and HVAC systems. Application keys are bound to Network keys. This means application keys are only used in a context of a Network key they are bound to. An application key shall only be bound to a single Network key.</td>
</tr>
<tr>
<td>Master Security Material</td>
<td>The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network.</td>
<td>The corresponding friendship messages encrypted with the friendship security material: 1. Friend Poll, 2. Friend Update, 3. Friend Subscription List, add/delete/confirm, 4. The Stored Messages sent by friend nodes to Low Power node. The corresponding friendship messages encrypted with the master security material: 1. Friend Clear, 2. Friend Clear Confirm. Based on the setup of the applications, the messages sent from the Low Power node to the friend nodes will be encrypted with the friendship security material or master security material, with the former being used by the messages transmitted between Low Power node and friend nodes and the latter being used by other network messages.</td>

<tr>
<td>Key Refresh procedure</td>
<td></td>
<td>Key Refresh Procedure is used to update network key and application key of ESP-BLE-MESH network. Key Refresh Procedure is used when the security of one or more network keys and/or one or more application keys is threatened or potentially threatened. Keys are usually updated after some nodes in the network are removed.</td>
</tr>
<tr>
<td>IV (Initialisation Vector)</td>
<td></td>
<td>The IV Update procedure is used to update the value of ESP-BLE-MESH network’s IV Index. This value is related to the random number required for message encryption. To ensure that the value of the random number is not repeated, this value is periodically incremented. IV Index is a 32-bit value and a shared network resource. For example, all nodes in a mesh network share the same IV Index value. Starting from 0x00000000, the IV Index increments during the IV Update procedure and maintained by a specific process, ensuring the IV Index shared in the mesh network is the same. This can be done when the node believes that it has the risk of exhausting its sequence number, or when it determines that another node is nearly exhausting its sequence number. Note: The update time must not be less than 96 hours. It can be triggered when a secure network beacon is received, or when the node determines that its sequence number is greater than a certain value.</td>

4.10 ESP-WIFI-MESH

This guide provides information regarding the ESP-WIFI-MESH protocol. Please see the ESP-WIFI-MESH API Reference for more information about API usage.

4.10.1 Overview

ESP-WIFI-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-WIFI-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-WIFI-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-WIFI-MESH guide is split into the following sections:

1. **Introduction**
2. **ESP-WIFI-MESH Concepts**
3. **Building a Network**
4. **Managing a Network**
5. **Data Transmission**
6. **Channel Switching**
7. **Performance**
8. **Further Notes**

4.10.2 Introduction

![Fig. 16: Traditional Wi-Fi Network Architecture](image)

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and
forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

ESP-WIFI-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for relaying each other’s transmissions. This allows an ESP-WIFI-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-WIFI-MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

<tbody>
<tr>
<td>Node</td>
<td>Any device that is or can be part of an ESP-WIFI-MESH network</td>
</tr>
<tr>
<td>Root Node</td>
<td>The top node in the network</td>
</tr>
<tr>
<td>Child Node</td>
<td>A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).</td>
</tr>
<tr>
<td>Parent Node</td>
<td>The converse notion of a child node</td>
</tr>
<tr>
<td>Descendant Node</td>
<td>Any node reachable by repeated proceeding from parent to child</td>
</tr>
<tr>
<td>Sibling Nodes</td>
<td>Nodes that share the same parent node</td>
</tr>
<tr>
<td>Connection</td>
<td>A traditional Wi-Fi association between an AP and a station. A node in ESP-WIFI-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.</td>
</tr>
<tr>
<td>Upstream Connection</td>
<td>The connection from a node to its parent node</td>
</tr>
<tr>
<td>Downstream Connection</td>
<td>The connection from a node to one of its child nodes</td>
</tr>
<tr>
<td>Wireless Hop</td>
<td>The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as single-hop whereas traversing multiple connections is known as multi-hop.</td>
</tr>
<tr>
<td>Subnetwork</td>
<td>A subnetwork is subdivision of an ESP-WIFI-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-WIFI-MESH network.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Media Access Control Address used to uniquely identify each node or router within an ESP-WIFI-MESH network.</td>
</tr>
<tr>
<td>DS</td>
<td>Distribution System (External IP Network)</td>
</tr>
</tbody>
</table>

Tree Topology

ESP-WIFI-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-WIFI-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-WIFI-MESH can have multiple downstream connections using its softAP interface, whilst simultaneously having a single upstream connection using its station interface. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-WIFI-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-WIFI-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-WIFI-MESH network can communicate.

Note: The size (total number of nodes) in an ESP-WIFI-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.

Node Types

Root Node: The root node is the top node in the network and serves as the only interface between the ESP-WIFI-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-WIFI-MESH network. There can only be one root node within an ESP-WIFI-MESH network and the root node’s upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.
Fig. 18: ESP-WIFI-MESH Tree Topology

Fig. 19: ESP-WIFI-MESH Node Types
**Leaf Nodes:** A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network’s maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the network’s maximum permitted layer hence have been assigned as leaf nodes.

**Intermediate Parent Nodes:** Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

**Idle Nodes:** Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see **Automatic Root Node Selection**). Referring to the diagram above, nodes K and O are idle nodes.

**Beacon Frames & RSSI Thresholding**

Every node in ESP-WIFI-MESH that is able to form downstream connections (i.e., has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-WIFI-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)
- Current layer of Node
- Maximum number of layers permitted in the network
- Current number of child nodes
- Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-WIFI-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

**Panel A** of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has. **Panel B** of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

**Note:** Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-WIFI-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.

**Preferred Parent Node**

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the **preferred parent node**. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has
The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-WIFI-MESH network when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

**Panel A** of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due it having fewer downstream connections (fewer child nodes) compared to node B.

**Panel B** of the illustration above demonstrates the case where the root node is within range of the idle node G. In
other words, the root node’s beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-WIFI-MESH network hence is always the preferred parent node given multiple parent node candidates.

Note: Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the Mesh Manual Networking Example).

Routing Tables

Each node within an ESP-WIFI-MESH network will maintain its individual routing table used to correctly route ESP-WIFI-MESH packets (see ESP-WIFI-MESH Packet) to the correct destination node. The routing table of a particular node will consist of the MAC addresses of all nodes within the particular node’s subnetwork (including the MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

Fig. 22: ESP-WIFI-MESH Routing Tables Example

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e. equivalent to the subnetwork of node B). Node B’s routing table is internally partitioned into two subtables containing of nodes C to F and nodes G to I (i.e. equivalent to the subnetworks of nodes C and G respectively).

ESP-WIFI-MESH utilizes routing tables to determine whether an ESP-WIFI-MESH packet should be forwarded upstream or downstream based on the following rules.

1. If the packet’s destination MAC address is within the current node’s routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.

2. If the destination MAC address is not within the current node’s routing table, forward the data packet upstream to the current node’s parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

Note: Users can call esp_mesh_get_routing_table() to obtain a node’s routing table, or esp_mesh_get_routing_table_size() to obtain the size of a node’s routing table. esp_mesh_get_subnet_nodes_list() can be used to obtain the corresponding subtable of a specific child node. Likewise esp_mesh_get_subnet_nodes_num() can be used to obtain the size of the
4.10.4 Building a Network

General Process

**Warning:** Before the ESP-WIFI-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with the same Mesh Network ID, router configuration, and softAP configuration.

An ESP-WIFI-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-WIFI-MESH network building process can be generalized into the following steps:

1. **Root Node Selection** The root node can be designated during configuration (see section on *User Designated Root Node*), or dynamically elected based on the signal strength between each node and the router (see *Automatic Root Node Selection*). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

2. **Second Layer Formation** Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected, these nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore, nodes B to D form upstream connections with the root node and become intermediate parent nodes.

3. **Formation of remaining layers** The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idle nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle nodes.
nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.

4. Limiting Tree Depth To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer form forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network’s number of maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. The MAC address is used to uniquely identify each node in the network whilst the router RSSI is used to indicate a node’s signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e. voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its vote percentage (number of votes/number of nodes participating in election) to determine if it should become the root node. If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.

The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is automatically selected.

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.
2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10 dB) hence its beacon frame is propagated...
throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.

3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e. the shallowest node). Nodes A/B/D/E form the second layer of the network.

4. Node F and G connect with nodes D and E respectively and the network building process is complete.

Note: The minimum number of iterations for the election process can be configured using esp_mesh_set_attempts(). Users should adjust the number of iterations based on the number of nodes within the network (i.e. the larger the network the larger number of scan iterations required).

Warning: Vote percentage threshold can also be configured using esp_mesh_set_vote_percentage(). Setting a low vote percentage threshold can result in two or more nodes becoming root nodes within the same ESP-WIFI-MESH network leading to the building of multiple networks. If such is the case, ESP-WIFI-MESH has internal mechanisms to autonomously resolve the root node conflict. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

User Designated Root Node

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is designated by the user.

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.

2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.
3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.

4. Node G connects with node E, forming the fourth layer of the network. However the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.

**Note:** When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.

### Parent Node Selection

By default, ESP-WIFI-MESH is self organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-WIFI-MESH network and to balance the number of downstream connections between potential parent nodes (see section on **Preferred Parent Node**).

However ESP-WIFI-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the [Mesh Manual Networking Example](#)).

### Asynchronous Power-on Reset

ESP-WIFI-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e. separated by several minutes), the final structure of the network could differ from the ideal case where all nodes are powered on synchronously. Nodes that are delayed in powering on will adhere to the following rules:

**Rule 1:** If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

**Rule 2:** If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e. being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see **Parent Node Switching**).

**Rule 3:** If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.

1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.

2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.

3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20 dB and -10 dB) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both nodes B/E become intermediate parent nodes after connecting.

4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.
Fig. 26: Network Building with Asynchronous Power On Example
**Synchronous Power-On**: Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10 dB). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. **However the synchronous power-on network layout can still be reached if the user manually switches the root node** (see `esp_mesh_waive_root()`).

**Note**: Differences in parent node selection caused by asynchronous power-on are autonomously corrected for to some extent in ESP-WIFI-MESH (see *Parent Node Switching*).

**Loop-back Avoidance, Detection, and Handling**

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node’s subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-WIFI-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node’s routing table (see *Routing Tables*) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-WIFI-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

**4.10.5 Managing a Network**

ESP-WIFI-MESH is a self-healing network meaning it can detect and correct for failures in network routing. Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-WIFI-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-WIFI-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

**Root Node Failure**

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. **The second layer node with the strongest router RSSI will be elected as the new root node** whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g. root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.
3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

**Note**: If a designated root node breaks down, the remaining nodes will not autonomously attempt to elect a new root node as an election process will never be attempted whilst a designated root node is used.
Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see **Beacon Frames & RSSI Thresholding**).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see **Preferred Parent Node**) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

1. The following branch of the network consists of nodes A to G.
2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.
3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

**Note:** If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.
**Root Node Switching**

ESP-WIFI-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node’s router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.

To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see *Automatic Root Node Selection*) whilst remaining connected to the network (i.e. not idle). If another node receives more votes than the current root node, a root node switch will be initiated. The root node will remain unchanged otherwise.

A newly elected root node sends a switch request to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router whilst maintaining all of its downstream connections and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames whilst still being connected.
2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a switch request and node C responds with an acknowledgment.
3. Node B disconnects from its parent and connects with the router becoming the network’s new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. **Node C maintains all its downstream connections throughout this process.**
4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C’s subnetwork has been placed one layer deeper as a result of the switch. **Parent Node Switching** may adjust the network layout Afterwards if any nodes have a new preferred parent node as a result of the root node switch.

---

**Fig. 29: Root Node Switch Example**

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames whilst still being connected.
2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a switch request and node C responds with an acknowledgment.
3. Node B disconnects from its parent and connects with the router becoming the network’s new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. **Node C maintains all its downstream connections throughout this process.**
4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C’s subnetwork has been placed one layer deeper as a result of the switch. **Parent Node Switching** may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.
Note: Root node switching must require an election hence is only supported when using a self-organized ESP-WIFI-MESH network. In other words, root node switching cannot occur if a designated root node is used.

Parent Node Switching

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e. due to a *Asynchronous Power-on Reset*).

All potential parent nodes periodically transmit beacon frames (see *Beacon Frames & RSSI Thresholding*) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-WIFI-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

4.10.6 Data Transmission

ESP-WIFI-MESH Packet

ESP-WIFI-MESH network data transmissions use ESP-WIFI-MESH packets. ESP-WIFI-MESH packets are **entirely contained within the frame body of a Wi-Fi data frame**. A multi-hop data transmission in an ESP-WIFI-MESH network will involve a single ESP-WIFI-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-WIFI-MESH packet and its relation with a Wi-Fi data frame.

![Fig. 30: ESP-WIFI-MESH Packet](image)

The **header** of an ESP-WIFI-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-WIFI-MESH packets such as a group transmission or a packet originating from the external IP network (see `MESH_OPT_SEND_GROUP` and `MESH_OPT_RECV_DS_ADDR`).

The **payload** of an ESP-WIFI-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see `mesh_proto_t`).

**Note:** When sending an ESP-WIFI-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see `mesh_addr_t`). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

Group Control & Multicasting

Multicasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-WIFI-MESH can be achieved by either specifying a list
of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via
\texttt{esp\_mesh\_send()}. To multicast by specifying a list of target nodes, users must first set the ESP-WIFI-MESH packet’s destination address to the \textit{Multicast-Group Address} (01:00:5E:xx:xx:xx). This signifies that the ESP-WIFI-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see \texttt{mesh\_opt\_t} and \texttt{MESH\_OPT\_SEND\_GROUP}). This method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node’s MAC address must be listed in the options field of the header.

Multicasting by group allows a ESP-WIFI-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via \texttt{esp\_mesh\_set\_group\_id()}. Multicasting to a group involves setting the destination address of the ESP-WIFI-MESH packet to the target group ID. Furthermore, the \texttt{MESH\_DATA\_GROUP} flag must set. Using groups to multicast incurs less overhead, but requires nodes to previously added into groups.

\textbf{Note:} During a multicast, all nodes within the network still receive the ESP-WIFI-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

\section*{Broadcasting}

Broadcasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-WIFI-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to its parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet.

\section*{Upstream Flow Control}

ESP-WIFI-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node’s message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a \textit{receiving window} for each of its child nodes. Each child node must apply for a receiving window before it is permitted to transmit upstream. The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node’s data packet that is pending transmission.
2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.

3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving window by sending a request before it is permitted to continue transmitting.

**Note:** ESP-WIFI-MESH does not support any downstream flow control.

**Warning:** Due to *Parent Node Switching*, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node’s connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-WIFI-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling `esp_mesh_post_toDS_state()`.

**Bi-Directional Data Stream**

The following diagram illustrates the various network layers involved in an ESP-WIFI-MESH Bidirectional Data Stream.

![Fig. 31: ESP-WIFI-MESH Bidirectional Data Stream](image)

Due to the use of *Routing Tables*, ESP-WIFI-MESH is able to handle pack forwarding entirely on the mesh layer. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP network.

**4.10.7 Channel Switching**

**Background**

In traditional Wi-Fi networks, channels are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.
In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for network channel switching. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a Channel Switch Announcement (CSA) element within the AP’s periodically transmitted beacon frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the New Channel Number and a Channel Switch Count which indicates the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

**ESP-WIFI-MESH Network Channel Switching**

ESP-WIFI-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-WIFI-MESH is more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e. in a single hop). Therefore, an ESP-WIFI-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e. with the same New Channel Number and Channel Switch Count). Given that all nodes within an ESP-WIFI-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-WIFI-MESH network channel switch can be triggered by either the router or the root node.

**Root Node Triggered** A root node triggered channel switch can only occur when the ESP-WIFI-MESH network is not connected to a router. By calling `esp_mesh_switch_channel()`, the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in the their own beacon frames.

**Router Triggered** When an ESP-WIFI-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, the root node will not be permitted to trigger a channel switch when it is connected to a router.

When the root node receives beacon frame containing a CSA element from the router, the root node will set Channel Switch Count value in the CSA element to a custom value before forwarding it downstream via beacon frames. It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-WIFI-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by the router is irrelevant to an ESP-WIFI-MESH network. By using a custom value, nodes within the ESP-WIFI-MESH network are able to switch channels synchronously relative to the ESP-WIFI-MESH network’s beacon interval. However, this will also result in the ESP-WIFI-MESH network’s channel switch being unsynchronized with the channel switch of the router and its connected stations.

**Impact of Network Channel Switching**

- Due to the ESP-WIFI-MESH network channel switch being unsynchronized with the router’s channel switch, there will be a temporary channel discrepancy between the ESP-WIFI-MESH network and the router.

  - The ESP-WIFI-MESH network’s channel switch time is dependent on the ESP-WIFI-MESH network’s beacon interval and the root node’s custom Channel Switch Count value.
– The channel discrepancy prevents any data exchange between the root node and the router during that ESP-WIFI-MESH network’s switch.

– In the ESP-WIFI-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the **Channel Switch Mode** field in the CSA element to 1.

– Frequent router triggered network channel switches can degrade the ESP-WIFI-MESH network’s performance. Note that this can be caused by the ESP-WIFI-MESH network itself (e.g. due to wireless medium contention with ESP-WIFI-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.

• **When there is a temporary channel discrepancy, the root node remains technically connected to the router.**

  – Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.

  – Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.

• **If the root node is unable to receive any of the router’s CSA beacon frames (e.g. due to short switch time given by the router).**

  – After the router switches channels, the root node will no longer be able to receive the router’s beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.

  – The root node will re-scan all channels for the router after disconnection.

  – The root node will maintain downstream connections throughout this process.

**Note:** Although ESP-WIFI-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g. due to reasons such as node failures).

---

**Channel and Router Switching Configuration**

ESP-WIFI-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e. when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

**Allow Channel Switch:** This parameter is set via the `allow_channel_switch` field of the `mesh_cfg_t` structure and permits an ESP-WIFI-MESH network to dynamically switch channels when set.

**Preset Channel:** An ESP-WIFI-MESH network can have a preset channel by setting the `channel` field of the `mesh_cfg_t` structure to the desired channel number. If this field is unset, the `allow_channel_switch` parameter is overridden such that channel switches are always permitted.

**Allow Router Switch:** This parameter is set via the `allow_router_switch` field of the `mesh_router_t` and permits an ESP-WIFI-MESH to dynamically switch to a different router when set.

**Preset Router BSSID:** An ESP-WIFI-MESH network can have a preset router by setting the `bssid` field of the `mesh_router_t` structure to the BSSID of the desired router. If this field is unset, the `allow_router_switch` parameter is overridden such that router switches are always permitted.

**Root Node Present:** The presence of a root node will also affect whether or a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that X represents a “don’t care” for the parameter.
4.10.8 Performance

The performance of an ESP-WIFI-MESH network can be evaluated based on multiple metrics such as the following:

**Network Building Time:** The amount of time taken to build an ESP-WIFI-MESH network from scratch.

**Healing Time:** The amount of time taken for the network to detect a node break down and carry out appropriate actions to heal the network (such as generating a new root node or forming new connections).

**Per-hop latency:** The latency of data transmission over one wireless hop. In other words, the time taken to transmit a data packet from a parent node to a child node or vice versa.

**Network Node Capacity:** The total number of nodes the ESP-WIFI-MESH network can simultaneously support. This number is determined by the maximum number of downstream connections a node can accept and the maximum number of layers permissible in the network.

The following table lists the common performance figures of an ESP-WIFI-MESH network:

<table>

</tbody>
</table>

**Note:** The following test conditions were used to generate the performance figures above.

- Number of test devices: **100**
- Maximum Downstream Connections to Accept: **6**
- Maximum Permissible Layers: **6**

**Note:** Throughput depends on packet error rate and hop count.

**Note:** The throughput of root node’s access to the external IP network is directly affected by the number of nodes in the ESP-WIFI-MESH network and the bandwidth of the router.
**Note:** The performance figures can vary greatly between installations based on network configuration and operating environment.

### 4.10.9 Further Notes

- Data transmission uses Wi-Fi WPA2-PSK encryption
- Mesh networking IE uses AES encryption

Router and internet icon made by Smashicons from www.flaticon.com

### 4.11 Core Dump

#### 4.11.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script `espcoredump.py` to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- `info_corefile` - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `dbg_corefile` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

#### 4.11.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

**Core dump data destination (Components -> Core dump -> Data destination)**

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

**Core dump data format (Components -> Core dump -> Core dump data format)**

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

**Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)**

- Use CRC32 for core dump integrity verification
• Use SHA256 for core dump integrity verification (only work in ELF format)

The CRC32 option provides better calculation performance and consumes less memory for storage.

The SHA256 hash algorithm provides greater probability of detecting corruption than a CRC32 with multiple bit errors.

Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)

Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)

The value is in ms.

Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)

The value is base64 encoded.

• Decode and show summary (info_corefile)
• Don’t decode

4.11.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash, But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```plaintext
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets...
# to avoid overlap
nvs,   data, nvs,   0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file> or espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>

4.11.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: espcoredump.py --chip <target_chip_type> info_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file> or espcoredump.py --chip <target_chip_type> dbg_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>

Base64-encoded body of core dump will be between the following header and footer:

```
================================ CORE DUMP START ===========================
<body of base64-encoded core dump, save it to file on disk>
================================ CORE DUMP END ===========================
```

The CORE DUMP START and CORE DUMP END lines must not be included in core dump text file.
4.11.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32_rom.elf) and pass it to ‘espcoredump.py’.

4.11.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

Supported notations and RAM regions

- COREDUMP_DRAM_ATTR places variable into DRAM area which will be included into dump.
- COREDUMP_RTC_ATTR places variable into RTC area which will be included into dump.
- COREDUMP_RTC_FAST_ATTR places variable into RTC_FAST area which will be included into dump.

Example

1. In Project Configuration Menu, enable COREDUMP TO FLASH, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

```c
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

```c
global_var = 25;
assert(0);
```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where PORT is the device USB port:

```bash
espcoredump.py -p PORT dbg_corefile <path/to/elf>
```

6. In GDB shell, type `p global_var` to get the variable content:

```gdb
(gdb) p global_var
$1 = 25 '\031'
```

4.11.7 Running espcoredump.py

Generic command syntax: espcoredump.py [options] command [args]

Script Options
- `--chip {auto,esp32,esp32s2,esp32c3}` Target chip type. Default value is “auto”
- `--port PORT, -p PORT` Serial port device. Either “chip” or “port” need to be specified to determine the port when you have multi-target connected at the same time.
- `--baud BAUD, -b BAUD` Serial port baud rate used when flashing/reading
- `--gdb-timeout-sec GDB_TIMEOUT_SEC` Overwrite the default internal delay for gdb responses

Commands
- `dbg_corefile` Starts GDB debugging session with specified corefile
- `info_corefile` Print core dump info from file
Command Arguments

--debug DEBUG, -d DEBUG  Log level (0..3)
--gdb GDB, -g GDB  Path to gdb
--core CORE, -c CORE  Path to core dump file (if skipped core dump will be read from flash)
--core-format {b64,elf,raw}, -t {b64,elf,raw}  File specified with "-c" is an ELF ("elf"), raw (raw) or base64-encoded (b64) binary
--off OFF, -o OFF  Offset of coredump partition in flash (type "make partition_table" to see).
--save-core SAVE_CORE, -s SAVE_CORE  Save core to file. Otherwise temporary core file will be deleted. Does not work with "-c"
--rom-elf ROM_ELF, -r ROM_ELF  Path to ROM ELF file. Will use "<target>_rom.elf" if not specified
--print-mem, -m  Print memory dump. Only valid when info_corefile.
<prog>  Path to program ELF file.

4.12 Event Handling

Several ESP-IDF components use events to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

4.12.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of esp_event library, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called legacy event loop. The following sections explain each of the methods.

esp_event Library Event Loop

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in system_event_id_t enumeration and system_event_info_t union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See esp_event library API reference for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the default event loop provided by this library.

Legacy Event Loop

This event loop implementation is started using esp_event_loop_init() function. Application typically supplies an event handler, a function with the following signature:

```
esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to esp_event_loop_init().

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority event task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE and CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE options, respectively.
Event handler receives a pointer to the event structure \((\text{system\_event\_t})\) which describes current event. This structure follows a \textit{tagged union} pattern: \textit{event\_id} member indicates the type of event, and \textit{event\_info} member is a union of description structures. Application event handler will typically use \texttt{switch(event->event\_id)} to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

### Event IDs and Corresponding Data Structures

</table>
4.12.2 Mesh Events

ESP-WIFI-MESH uses a system similar to the Legacy Event Loop to deliver events to the application. See System Events for details.

4.12.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameter type.

- **BLE GAP**: esp_ble_gap_register_callback(), esp_gap_ble_cb_event_t, esp_gap_ble_cb_param_t.
- **BT GAP**: esp_bt_gap_register_callback(), esp_bt_gap_cb_event_t, esp_bt_gap_cb_param_t.
- **GATT**: esp_ble_gattc_register_callback(), esp_gattc_cb_event_t, esp_gattc_cb_param_t.
- **GATT**: esp_ble_gatts_register_callback(), esp_gatts_cb_event_t, esp_gatts_cb_param_t.
- **SPP**: esp_spp_register_callback(), esp_spp_cb_event_t, esp_spp_cb_param_t.
- **Blufi**: esp_blufi_register_callbacks(), esp_blufi_cb_event_t, esp_blufi_cb_param_t.
- **A2DP**: esp_a2d_register_callback(), esp_a2d_cb_event_t, esp_a2d_cb_param_t.
- **AVRC**: esp_avrc_ct_register_callback(), esp_avrc_ct_cb_event_t, esp_avrc_ct_cb_param_t.
- **HFP Client**: esp_hf_client_register_callback(), esp_hf_client_cb_event_t, esp_hf_client_cb_param_t.
- **HFP AG**: esp_hf_ag_register_callback(), esp_hf_ag_cb_event_t, esp_hf_ag_cb_param_t.

4.13 Support for external RAM

4.13.1 Introduction

ESP32 has a few hundred kilobytes of internal RAM, residing on the same die as the rest of the chip components. It can be insufficient for some purposes, so ESP32 has the ability to also use up to 4 MB of external SPI RAM memory. The external memory is incorporated in the memory map and, with certain restrictions, is usable in the same way as internal data RAM.

4.13.2 Hardware

ESP32 supports SPI PSRAM connected in parallel with the SPI flash chip. While ESP32 is capable of supporting several types of RAM chips, ESP-IDF currently only supports Espressif branded PSRAM chips (ESP-PSRAM32, ESP-PSRAM64, etc).

**Note**: Some PSRAM chips are 1.8 V devices and some are 3.3 V. The working voltage of the PSRAM chip must match the working voltage of the flash component. Consult the datasheet for your PSRAM chip and ESP32 device to find out the working voltages. For a 1.8 V PSRAM chip, make sure to either set the MTDI pin to a high signal level on bootup, or program ESP32 eFuses to always use the VDD_SIO level of 1.8 V. Not doing this can damage the PSRAM and/or flash chip.
Note: Espressif produces both modules and system-in-package chips that integrate compatible PSRAM and flash and are ready to mount on a product PCB. Consult the Espressif website for more information.

For specific details about connecting the SoC or module pins to an external PSRAM chip, consult the SoC or module datasheet.

### 4.13.3 Configuring External RAM

ESP-IDF fully supports the use of external memory in applications. Once the external RAM is initialized at startup, ESP-IDF can be configured to handle it in several ways:

- **Integrate RAM into the ESP32 memory map**
- **Add external RAM to the capability allocator**
- **Provide external RAM via `malloc()`** (default)
- **Allow .bss segment placed in external memory**

#### Integrate RAM into the ESP32 memory map

Select this option by choosing "Integrate RAM into memory map" from `CONFIG_SPIRAM_USE`.

This is the most basic option for external SPI RAM integration. Most likely, you will need another, more advanced option.

During the ESP-IDF startup, external RAM is mapped into the data address space, starting at address `0x3F800000` (byte-accessible). The length of this region is the same as the SPI RAM size (up to the limit of 4 MB).

Applications can manually place data in external memory by creating pointers to this region. So if an application uses external memory, it is responsible for all management of the external SPI RAM: coordinating buffer usage, preventing corruption, etc.

#### Add external RAM to the capability allocator

Select this option by choosing “Make RAM allocatable using `heap_caps_malloc(…)`, `MALLOC_CAP_SPIRAM`” from `CONFIG_SPIRAM_USE`.

When enabled, memory is mapped to address `0x3F800000` and also added to the capabilities-based heap memory allocator using `MALLOC_CAP_SPIRAM`.

To allocate memory from external RAM, a program should call `heap_caps_malloc(size, MALLOC_CAP_SPIRAM)`. After use, this memory can be freed by calling the normal `free()` function.

#### Provide external RAM via `malloc()`

Select this option by choosing “Make RAM allocatable using `malloc()` as well” from `CONFIG_SPIRAM_USE`. This is the default option.

In this case, memory is added to the capability allocator as described for the previous option. However, it is also added to the pool of RAM that can be returned by the standard `malloc()` function.

This allows any application to use the external RAM without having to rewrite the code to use `heap_caps_malloc(…, MALLOC_CAP_SPIRAM)`.

An additional configuration item, `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`, can be used to set the size threshold when a single allocation should prefer external memory:

- When allocating a size less than the threshold, the allocator will try internal memory first.
- When allocating a size equal to or larger than the threshold, the allocator will try external memory first.
If a suitable block of preferred internal/external memory is not available, the allocator will try the other type of memory.

Because some buffers can only be allocated in internal memory, a second configuration item `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL` defines a pool of internal memory which is reserved for only explicitly internal allocations (such as memory for DMA use). Regular `malloc()` will not allocate from this pool. The `MALLOC_CAP_DMA` and `MALLOC_CAP_INTERNAL` flags can be used to allocate memory from this pool.

**Allow .bss segment placed in external memory**

Enable this option by checking `CONFIG_SPIRAM_ALLOW_BSS_SEGEXTERNAL_MEMORY`. This configuration setting is independent of the other three.

If enabled, a region of the address space starting from 0x3F800000 will be used to store zero-initialized data (BSS segment) from the lwIP, net80211, libpp, and bluedroid ESP-IDF libraries.

Additional data can be moved from the internal BSS segment to external RAM by applying the macro `EXT_RAM_ATTR` to any static declaration (which is not initialized to a non-zero value).

It is also possible to place the BSS section of a component or a library to external RAM using linker fragment scheme `extram_bss`.

This option reduces the internal static memory used by the BSS segment.

Remaining external RAM can also be added to the capability heap allocator using the method shown above.

### 4.13.4 Restrictions

External RAM use has the following restrictions:

- When flash cache is disabled (for example, if the flash is being written to), the external RAM also becomes inaccessible; any reads from or writes to it will lead to an illegal cache access exception. This is also the reason why ESP-IDF does not by default allocate any task stacks in external RAM (see below).
- External RAM cannot be used as a place to store DMA transaction descriptors or as a buffer for a DMA transfer to read from or write into. Any buffers that will be used in combination with DMA must be allocated using `heap_caps_malloc(size, MALLOC_CAP_DMA)` and can be freed using a standard `free()` call.
- External RAM uses the same cache region as the external flash. This means that frequently accessed variables in external RAM can be read and modified almost as quickly as in internal ram. However, when accessing large chunks of data (>32 KB), the cache can be insufficient, and speeds will fall back to the access speed of the external RAM. Moreover, accessing large chunks of data can “push out” cached flash, possibly making the execution of code slower afterwards.
- In general, external RAM cannot be used as task stack memory. Due to this, `xTaskCreate()` and similar functions will always allocate internal memory for stack and task TCBs, and functions such as `xTaskCreateStatic()` will check if the pointers passed are internal.

The option `CONFIG_SPIRAM_ALLOW_STACKEXTERNAL_MEMORY` can be used to place task stacks into external memory. In these cases `xTaskCreateStatic()` must be used to specify a task stack buffer allocated from external memory, otherwise task stacks will still be allocated from internal memory.

### 4.13.5 Failure to initialize

By default, failure to initialize external RAM will cause the ESP-IDF startup to abort. This can be disabled by enabling the config item `CONFIG_SPIRAM_IGNORENOTFOUND`.

If `CONFIG_SPIRAM_ALLOW_BSS_SEGEXTERNAL_MEMORY` is enabled, the option to ignore failure is not available as the linker will have assigned symbols to external memory addresses at link time.

- Regarding stacks in PSRAM: For tasks not calling on code in ROM in any way, directly or indirectly, the menuconfig option `CONFIG_SPIRAM_ALLOW_STACKEXTERNAL_MEMORY` will eliminate the check in `xTaskCreateStatic`, allowing a task’s stack to be in external RAM. Using this is not advised, however.
4.13.6 Chip revisions

There are some issues with certain revisions of ESP32 that have repercussions for use with external RAM. The issues are documented in the ESP32 ECO document. In particular, ESP-IDF handles the bugs mentioned in the following ways:

ESP32 rev v0

ESP-IDF has no workaround for the bugs in this revision of silicon, and it cannot be used to map external PSRAM into ESP32’s main memory map.

ESP32 rev v1

The bugs in this revision of silicon cause issues if certain sequences of machine instructions operate on external memory. (ESP32 ECO 3.2). As a workaround, the GCC compiler received the flag `-mfix-esp32-psram-cache-issue` to filter these sequences and only output the code that can safely be executed. Enable this flag by checking `CONFIG_SPIRAM_CACHE_WORKAROUND`.

Aside from linking to a recompiled version of Newlib with the additional flag, ESP-IDF also does the following:

- Avoids using some ROM functions
- Allocates static memory for the WiFi stack

ESP32 rev v3

ESP32 revision 3 ("ECO V3") fixes the PSRAM cache issue found in rev. 1. When `CONFIG_ESP32_REV_MIN` option is set to rev. 3, compiler workarounds related to PSRAM will be disabled. For more information about ESP32 ECO V3, see ESP32 ECO V3 User Guide.

4.14 Fatal Errors

4.14.1 Overview

In certain situations, execution of the program cannot be continued in a well defined way. In ESP-IDF, these situations include:

- CPU Exceptions: Illegal Instruction, Load/Store Alignment Error, Load/Store Prohibited error, Double Exception.
- System level checks and safeguards:
  - `Interrupt watchdog` timeout
  - `Task watchdog` timeout (only fatal if `CONFIG_ESP_TASK_WDT_PANIC` is set)
  - Cache access error
  - Brownout detection event
  - Stack overflow
  - Stack smashing protection check
  - Heap integrity check
  - Undefined behavior sanitizer (UBSAN) checks
- Failed assertions, via `assert`, `configASSERT` and similar macros.

This guide explains the procedure used in ESP-IDF for handling these errors, and provides suggestions on troubleshooting the errors.
4.14.2 Panic Handler

Every error cause listed in the Overview will be handled by panic handler.

Panic handler will start by printing the cause of the error to the console. For CPU exceptions, the message will be similar to

Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was unhandled.

For some of the system level checks (interrupt watchdog, cache access error), the message will be similar to

Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory region accessed). Exception was unhandled.

In all cases, error cause will be printed in parentheses. See Guru Meditation Errors for a list of possible error causes.

Subsequent behavior of the panic handler can be set using CONFIG_ESP_SYSTEM_PANIC configuration choice. The available options are:

- Print registers and reboot (CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT) — default option.
  This will print register values at the point of the exception, print the backtrace, and restart the chip.
- Print registers and halt (CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT)
  Similar to the above option, but halt instead of rebooting. External reset is required to restart the program.
- Silent reboot (CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Don’t print registers or backtrace, restart the chip immediately.
- Invoke GDB Stub (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)
  Start GDB server which can communicate with GDB over console UART port. See GDB Stub for more details.

Behavior of panic handler is affected by two other configuration options.

- If CONFIG_ESP32_DEBUG_OCDWARE is enabled (which is the default), panic handler will detect whether a JTAG debugger is connected. If it is, execution will be halted and control will be passed to the debugger. In this case registers and backtrace are not dumped to the console, and GDBStub / Core Dump functions are not used.
- If Core Dump feature is enabled, then system state (task stacks and registers) will be dumped either to Flash or UART, for later analysis.
- If CONFIG_ESP_PANIC_HANDLER_IRAM is disabled (disabled by default), the panic handler code is placed in flash memory not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

The following diagram illustrates panic handler behavior:

4.14.3 Register Dump and Backtrace

Unless CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT option is enabled, panic handler prints some of the CPU registers, and the backtrace, to the console

<table>
<thead>
<tr>
<th>Core 0 register dump:</th>

(continues on next page)
Fig. 32: Panic Handler Flowchart (click to enlarge)
Register values printed are the register values in the exception frame, i.e. values at the moment when CPU exception or other fatal error has occurred.

Register dump is not printed if the panic handler was executed as a result of an `abort()` call.

In some cases, such as interrupt watchdog timeout, panic handler may print additional CPU registers (EPC1-EPC4) and the registers/backtrace of the code running on the other CPU.

Backtrace line contains PC:SP pairs, where PC is the Program Counter and SP is Stack Pointer, for each stack frame of the current task. If a fatal error happens inside an ISR, the backtrace may include PC:SP pairs both from the task which was interrupted, and from the ISR.

If **IDF Monitor** is used, Program Counter values will be converted to code locations (function name, file name, and line number), and the output will be annotated with additional lines.

To find the location where a fatal error has happened, look at the lines which follow the “Backtrace” line. Fatal error location is the top line, and subsequent lines show the call stack.

### 4.14.4 GDB Stub

If **CONFIG_ESP_SYSTEM_PANIC_GDBSTUB** option is enabled, panic handler will not reset the chip when fatal error happens. Instead, it will start GDB remote protocol server, commonly referred to as GDB Stub. When this happens, GDB instance running on the host computer can be instructed to connect to the ESP32 UART port.

If **IDF Monitor** is used, GDB is started automatically when GDB Stub prompt is detected on the UART. The output would look like this:

---

**Entering gdb stub now.**

$70b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-esp32-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see: <http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at: <http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
0x400e1b41 in app_main ()
at /Users/user/esp/example/main/main.cpp:36
36 *((int*) 0) = 0;
(gdb)

GDB prompt can be used to inspect CPU registers, local and static variables, and arbitrary locations in memory. It is not possible to set breakpoints, change PC, or continue execution. To reset the program, exit GDB and perform external reset: Ctrl-T Ctrl-R in IDF Monitor, or using external reset button on the development board.

4.14.5 Guru Meditation Errors

This section explains the meaning of different error causes, printed in parens after Guru Meditation Error: Core panic'ed message.

Note: See Wikipedia article for historical origins of “Guru Meditation”.

IllegalInstruction

This CPU exception indicates that the instruction which was executed was not a valid instruction. Most common reasons for this error include:

- FreeRTOS task function has returned. In FreeRTOS, if task function needs to terminate, it should call vTaskDelete() function and delete itself, instead of returning.
- Failure to load next instruction from SPI flash. This usually happens if:
  - Application has reconfigured SPI flash pins as some other function (GPIO, UART, etc.). Consult Hardware Design Guidelines and the Datasheet for the chip or module for details about SPI flash pins.
  - Some external device was accidentally connected to SPI flash pins, and has interfered with communication between ESP32 and SPI flash.

InstrFetchProhibited

This CPU exception indicates that CPU could not load an instruction because the the address of the instruction did not belong to a valid region in instruction RAM or ROM.

Usually this means an attempt to call a function pointer, which does not point to valid code. PC (Program Counter) register can be used as an indicator: it will be zero or will contain garbage value (not 0x4xxxxxxxxx).

LoadProhibited, StoreProhibited

This CPU exception happens when application attempts to read from or write to an invalid memory location. The address which was written/read is found in EXCVADDR register in the register dump. If this address is zero, it usually means that application attempted to dereference a NULL pointer. If this address is close to zero, it usually means that
application attempted to access member of a structure, but the pointer to the structure was NULL. If this address is something else (garbage value, not in 0x3fxxxxxx - 0x6xxxxxxx range), it likely means that the pointer used to access the data was either not initialized or was corrupted.

**IntegerDivideByZero**

Application has attempted to do integer division by zero.

**LoadStoreAlignment**

Application has attempted to read or write memory location, and address alignment did not match load/store size. For example, 32-bit load can only be done from 4-byte aligned address, and 16-bit load can only be done from a 2-byte aligned address.

**LoadStoreError**

This exception may happen in the following cases:

- If the application has attempted to do an 8- or 16-bit load/store from a memory region which only supports 32-bit loads/stores. For example, dereferencing a char* pointer to instruction memory (IRAM, IROM) will result in such an error.
- If the application has attempted a store to a read-only memory region, such as IROM or DROM.

**Unhandled debug exception**

This will usually be followed by a message like:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

This error indicates that application has written past the end of the stack of task_name task. Note that not every stack overflow is guaranteed to trigger this error. It is possible that the task writes to stack beyond the stack canary location, in which case the watchpoint will not be triggered.

**Interrupt wdt timeout on CPU0 / CPU1**

Indicates that interrupt watchdog timeout has occurred. See Watchdogs for more information.

**Cache disabled but cached memory region accessed**

In some situations ESP-IDF will temporarily disable access to external SPI Flash and SPI RAM via caches. For example, this happens with spi_flash APIs are used to read/write/erase/mmap regions of SPI Flash. In these situations, tasks are suspended, and interrupt handlers not registered with ESP_INTR_FLAG_IRAM are disabled. Make sure that any interrupt handlers registered with this flag have all the code and data in IRAM/DRAM. Refer to the SPI flash API documentation for more details.

### 4.14.6 Other Fatal Errors

**Brownout**

ESP32 has a built-in brownout detector, which is enabled by default. Brownout detector can trigger system reset if supply voltage goes below safe level. Brownout detector can be configured using `CONFIG_ESP32_BROWNOUT_DET` and `CONFIG_ESP32_BROWNOUT_DET_LVL_SEL` options.

When brownout detector triggers, the following message is printed:
Brownout detector was triggered

Chip is reset after the message is printed.

Note that if supply voltage is dropping at a fast rate, only part of the message may be seen on the console.

**Corrupt Heap**

ESP-IDF heap implementation contains a number of run-time checks of heap structure. Additional checks ( "Heap Poisoning" ) can be enabled in menuconfig. If one of the checks fails, message similar to the following will be printed:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "~/Users/user/esp/esp-idf/components/heap/
~multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

Consult *Heap Memory Debugging* documentation for further information.

**Stack Smashing**

Stack smashing protection (based on GCC `-fstack-protector*` flags) can be enabled in ESP-IDF using `CONFIG_COMPILER_STACK_CHECK_MODE` option. If stack smashing is detected, message similar to the following will be printed:

```
Stack smashing protect failure!
abort() was called at PC 0x400d2138 on core 0
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3fffc17a0 0x400d2138:0x3ffe270a...
 0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffe1840 0x400e79df:0x3fffc18a0...
 0x400e2235:0x3ffe1916:0x3ffe18f0 0x400e19cd:0x3ffe1910...
 0x400e1a11:0x3ffe1930 0x400e1bb2:0x3ffe1950 0x400d2c44:0x3ffca80
```

The backtrace should point to the function where stack smashing has occurred. Check the function code for unbounded access to local arrays.

**Undefined behavior sanitizer (UBSAN) checks**

Undefined behavior sanitizer (UBSAN) is a compiler feature which adds run-time checks for potentially incorrect operations, such as:

- overflows (multiplication overflow, signed integer overflow)
- shift base or exponent errors (e.g. shift by more than 32 bits)
- integer conversion errors

See [GCC documentation](https://gcc.gnu.org/onlinedocs/using-gcc-user/undefined-handling.html) of `-fsanitize=undefined` option for the complete list of supported checks.

**Enabling UBSAN**

UBSAN is disabled by default. It can be enabled at file, component, or project level by adding `-fsanitize=undefined` compiler option in the build system.

When enabling UBSAN for the code which uses hardware register header files (`soc/xxx_reg.h`), it is recommended to disable shift-base sanitizer using `-fno-sanitize=shift-base` option. This is due to the fact that ESP-IDF register header files currently contain patterns which cause false positives for this specific sanitizer option.

To enable UBSAN at project level, add the following at the end of the project `CMakeLists.txt` file:

```
idf_build_set_property(COMPILE_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-
  _base" APPEND)
```
Alternatively, pass these options through `EXTRA_CFLAGS` and `EXTRA_CXXFLAGS` environment variables.

Enabling UBSAN results in significant increase of code and data size. Most applications, except for the trivial ones, will not fit into the available RAM of the microcontroller when UBSAN is enabled for the whole application. Therefore it is recommended that UBSAN is instead enabled for specific components under test.

To enable UBSAN for the specific component `(component_name)` from the project CMakeLists.txt file, add the following at the end of the file:

```cmake
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

**Note:** See the build system documentation for more information about `build properties` and `component properties`.

To enable UBSAN for the specific component `(component_name)` from CMakeLists.txt of the same component, add the following at the end of the file:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

**UBSAN output** When UBSAN detects an error, a message and the backtrace are printed, for example:

```
Undefined behavior of type out_of_bounds
Backtrace:0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367
c:c:106
0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api.c:152
0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/ubsan.c:223
0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/ubsan.c:223
0x400db74f: test_ub at main.c:128
0x400db99c: app_main at main.c:56 (discriminator 1)
```

The types of errors reported by UBSAN can be as follows:
<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>type_mismatch</td>
<td>Incorrect pointer value: null, unaligned, not compatible with the given type.</td>
</tr>
<tr>
<td>type_mismatch_v1</td>

</tr>
<tr>
<td>builtin_unreachable</td>
<td>__builtin_unreachable function called.</td>
</tr>
<tr>
<td>pointer_overflow</td>
<td>Overflow in pointer arithmetic.</td>
</tr>
</tbody>
</table>

### 4.15 Flash Encryption

This is a quick start guide to ESP32’s flash encryption feature. Using an application code example, it demonstrates how to test and verify flash encryption operations during development and production.

### 4.15.1 Introduction

Flash encryption is intended for encrypting the contents of the ESP32’s off-chip flash memory. Once this feature is enabled, firmware is flashed as plaintext, and then the data is encrypted in place on the first boot. As a result, physical readout of flash will not be sufficient to recover most flash contents.

With flash encryption enabled, the following types of data are encrypted by default:

- Firmware bootloader
- Partition Table
- All “app” type partitions

Other types of data can be encrypted conditionally:

- Any partition marked with the encrypted flag in the partition table. For details, see Encrypted Partition Flag.
- Secure Boot bootloader digest if Secure Boot is enabled (see below).

Secure Boot is a separate feature which can be used together with flash encryption to create an even more secure environment.

**Important:** For production use, flash encryption should be enabled in the “Release” mode only.

**Important:** Enabling flash encryption limits the options for further updates of ESP32. Before using this feature, read the document and make sure to understand the implications.
4.15.2 Relevant eFuses

The flash encryption operation is controlled by various eFuses available on ESP32. The list of eFuses and their descriptions is given in the table below. The names in eFuse column are also used by espefuse.py tool. For usage in the eFuse API, modify the name by adding ESP_EFUSE_, for example: esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT).

Table 21: eFuses Used in Flash Encryption

<table>
<thead>
<tr>
<th>eFuse</th>
<th>Description</th>
<th>Bit Depth</th>
</tr>
</thead>
<tbody>
<tr>
<td>CODING_SCHEME</td>
<td>Controls actual number of block1 bits used to derive final 256-bit AES key. Possible values: 0 for 256 bits, 1 for 192 bits, 2 for 128 bits. Final AES key is derived based on the FLASH_CRYPT_CONFIG value.</td>
<td>2</td>
</tr>
<tr>
<td>flash_encryption (block1)</td>
<td>AES key storage.</td>
<td>256 bit key block</td>
</tr>
<tr>
<td>FLASH_CRYPT_CONFIG</td>
<td>Controls the AES encryption process.</td>
<td>4</td>
</tr>
<tr>
<td>DISABLE_DL_ENCRYPT</td>
<td>If set, disables flash encryption operation while running in Firmware Download mode.</td>
<td>1</td>
</tr>
<tr>
<td>DISABLE_DL_DECRYPT</td>
<td>If set, disables flash decryption while running in UART Firmware Download mode.</td>
<td>1</td>
</tr>
<tr>
<td>FLASH_CRYPT_CNT</td>
<td>Enables/disables encryption at boot time. If even number of bits set (0, 2, 4, 6) - encrypt flash at boot time. If odd number of bits set (1, 3, 5, 7) - do not encrypt flash at boot time.</td>
<td>7</td>
</tr>
</tbody>
</table>

Note:

- R/W access control is available for all the eFuse bits listed in the table above.
- The default value of these bits is 0 after manufacturing.

Read and write access to eFuse bits is controlled by appropriate fields in the registers WR_DIS and RD_DIS. For more information on ESP32 eFuses, see eFuse manager. To change protection bits of eFuse field using espefuse.py, use these two commands: read_protect_efuse and write_protect_efuse. Example espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT.

4.15.3 Flash Encryption Process

Assuming that the eFuse values are in their default states and the firmware bootloader is compiled to support flash encryption, the flash encryption process executes as shown below:

1. On the first power-on reset, all data in flash is un-encrypted (plaintext). The ROM bootloader loads the firmware bootloader.
2. Firmware bootloader reads the FLASH_CRYPT_CNT eFuse value (0b0000000). Since the value is 0 (even number of bits set), it configure and enables the flash encryption block. It also sets the FLASH_CRYPT_CONFIG eFuse to 0xF. For more information on the flash encryption block, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) > Flash Encryption Block [PDF].
3. Firmware bootloader uses RNG (random) module to generate an AES-256 bit key and then writes it into the flash_encryption eFuse. The key cannot be accessed via software as the write and read protection bits for the flash_encryption eFuse are set. The flash encryption operations happen entirely by hardware, and the key cannot be accessed via software.
4. Flash encryption block encrypts the flash contents - the firmware bootloader, applications and partitions marked as encrypted. Encrypting in-place can take time, up to a minute for large partitions.
5. Firmware bootloader sets the first available bit in FLASH_CRYPT_CNT (0b0000001) to mark the flash contents as encrypted. Odd number of bits is set.
6. For **Development Mode**, the firmware bootloader sets only the eFuse bits `DISABLE_DL_DECRYPT` and `DISABLE_DL_CACHE` to allow the UART bootloader to re-flash encrypted binaries. Also, the `FLASH_CRYPT_CNT` eFuse bits are NOT write-protected.

7. For **Release Mode**, the firmware bootloader sets the eFuse bits `DISABLE_DL_ENCRYPT`, `DISABLE_DL_DECRYPT`, and `DISABLE_DL_CACHE` to 1 to prevent the UART bootloader from decrypting the flash contents. It also write-protects the `FLASH_CRYPT_CNT` eFuse bits. To modify this behavior, see *Enabling UART Bootloader Encryption/Decryption*.

8. The device is then rebooted to start executing the encrypted image. The firmware bootloader calls the flash decryption block to decrypt the flash contents and then loads the decrypted contents into IRAM.

During the development stage, there is a frequent need to program different plaintext flash images and test the flash encryption process. This requires that Firmware Download mode is able to load new plaintext images as many times as it might be needed. However, during manufacturing or production stages, Firmware Download mode should not be allowed to access flash contents for security reasons.

Hence, two different flash encryption configurations were created: for development and for production. For details on these configurations, see Section *Flash Encryption Configuration*.

### 4.15.4 Flash Encryption Configuration

The following flash encryption modes are available:

- **Development Mode** - recommended for use ONLY DURING DEVELOPMENT, as it does not prevent modification and readout of encrypted flash contents.
- **Release Mode** - recommended for manufacturing and production to prevent physical readout of encrypted flash contents.

This section provides information on the mentioned flash encryption modes and step by step instructions on how to use them.

#### Development Mode

During development, you can encrypt flash using either an ESP32 generated key or external host-generated key.

**Using ESP32 Generated Key**  Development mode allows you to download multiple plaintext images using Firmware Download mode.

To test flash encryption process, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in *Relevant eFuses*.
   See how to check *ESP32 Flash Encryption Status*.

2. In **Project Configuration Menu**, do the following:
   - **Enable flash encryption on boot**
   - **Select encryption mode** *(Development mode)* by default)
   - **Select UART ROM download mode** *(CONFIG_SECURE_UART_ROM_DL_MODE)* (enabled) by default. Note that for the esp32 target, the choice is only available when CONFIG_ESP32_REV_MIN level is set to 3 (ESP32 V3).
   - **Select the appropriate bootloader log verbosity**
   - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See *Bootloader Size*.

3. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```
This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

A sample output of the first ESP32 boot after enabling flash encryption is given below:

```

(continues on next page)
At this stage, if you need to update and re-flash binaries, see Re-flashing Updated Partitions.

Using Host Generated Key  It is possible to pre-generate a flash encryption key on the host computer and burn it into the eFuse. This allows you to pre-encrypt data on the host and flash already encrypted data without needing a plaintext flash update. This feature can be used in both Development Mode and Release Mode. Without a pre-generated key, data is flashed in plaintext and then ESP32 encrypts the data in-place.
To use a host generated key, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses. See how to check ESP32 Flash Encryption Status.

2. Generate a random key by running:

   ```
   espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
   ```

3. Before the first encrypted boot, burn the key into your device’s eFuse using the command below. This action can be done only once.

   ```
   espefuse.py --port PORT burn_key flash_encryption my_flash_encryption_key.bin
   ```

If the key is not burned and the device is started after enabling flash encryption, the ESP32 will generate a random key that software cannot access or modify.

4. In Project Configuration Menu, do the following:
   - Enable flash encryption on boot
   - Select encryption mode (Development mode by default)
   - Select the appropriate bootloader log verbosity
   - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See Bootloader Size.

5. Run the command given below to build and flash the complete images.

   ```
   idf.py flash monitor
   ```

   **Note:** This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

If using Development Mode, then the easiest way to update and re-flash binaries is Re-flashing Updated Partitions.

If using Release Mode, then it is possible to pre-encrypt the binaries on the host and then flash them as ciphertext. See Manually Encrypting Files.

**Re-flashing Updated Partitions** If you update your application code (done in plaintext) and want to re-flash it, you will need to encrypt it before flashing. To encrypt the application and flash it in one step, run:

   ```
   idf.py encrypted-app-flash monitor
   ```

If all partitions needs to be updated in encrypted format, run:

   ```
   idf.py encrypted-flash monitor
   ```
Release Mode

In Release mode, UART bootloader cannot perform flash encryption operations. New plaintext images can ONLY be downloaded using the over-the-air (OTA) scheme which will encrypt the plaintext image before writing to flash.

To use this mode, take the following steps:

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in Relevant eFuses. See how to check ESP32 Flash Encryption Status.

2. In Project Configuration Menu, do the following:
   - Enable flash encryption on boot
   - Select Release mode (Note that once Release mode is selected, the DISABLE_DL_ENCRYPT and DISABLE_DL_DECRYPT eFuse bits will be burned to disable flash encryption hardware in ROM Download Mode.)
   - Select UART ROM download mode (Permanently disabled (recommended)) (Note that this option is only available when CONFIG_ESP32_REV_MIN is set to 3 (ESP32 V3).) The default choice is to keep UART ROM download mode enabled, however it’s recommended to permanently disable this mode to reduce the options available to an attacker.
   - Select the appropriate bootloader log verbosity
   - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See Bootloader Size.

3. Run the command given below to build and flash the complete images.

   ```
   idf.py flash monitor
   ```

   **Note:** This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

   This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

   Once the flash encryption is enabled in Release mode, the bootloader will write-protect the FLASH_CRYPT_CNT eFuse.

   For subsequent plaintext field updates, use OTA scheme.

   **Note:** If you have pre-generated the flash encryption key and stored a copy, and the UART download mode is not permanently disabled via CONFIG_SECURE_UART_ROM_DL_MODE (ESP32 V3 only), then it is possible to update the flash locally by pre-encrypting the files and then flashing the ciphertext. See Manually Encrypting Files.

Best Practices

When using Flash Encryption in production:

- Do not reuse the same flash encryption key between multiple devices. This means that an attacker who copies encrypted data from one device cannot transfer it to a second device.
- When using ESP32 V3, if the UART ROM Download Mode is not needed for a production device then it should be disabled to provide an extra level of protection. Do this by calling
esp_efuse_disable_rom_download_mode() during application startup. Alternatively, configure the project CONFIG_ESP32_REV_MIN level to 3 (targeting ESP32 V3 only) and select the CONFIG_SECURE_UART_ROM_DL_MODE to “Permanently disable ROM Download Mode (recommended)”. The ability to disable ROM Download Mode is not available on earlier ESP32 versions.

- Enable Secure Boot as an extra layer of protection, and to prevent an attacker from selectively corrupting any part of the flash before boot.

### 4.15.5 Possible Failures

Once flash encryption is enabled, the FLASH_CRYPT_CNT eFuse value will have an odd number of bits set. It means that all the partitions marked with the encryption flag are expected to contain encrypted ciphertext. Below are the three typical failure cases if the ESP32 is erroneously loaded with plaintext data:

1. If the bootloader partition is re-flashed with a **plaintext firmware bootloader image**, the ROM bootloader will fail to load the firmware bootloader resulting in the following failure:

   ```
   rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   
   rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   ```

   **Note:** This error also appears if the flash contents are erased or corrupted.

2. If the firmware bootloader is encrypted, but the partition table is re-flashed with a **plaintext partition table image**, the bootloader will fail to read the partition table resulting in the following failure:

   ```
   rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
   configsip: 0, SPIWP:0xee
   clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
   mode:DIO, clock div:2
   load:0x3fff0018,len:4
   load:0x3fff001c,len:10464
   ho 0 tail 12 room 4
   load:0x40078000,len:19168
   load:0x40080400,len:6664
   entry 0x40080764
   I (60) boot: ESP-IDF v4.0-dev-763-g2c55fae6c-dirty 2nd stage bootloader
   I (60) boot: compile time 19:15:54
   I (62) boot: Enabling RNG early entropy source...
   ```

(continues on next page)
3. If the bootloader and partition table are encrypted, but the application is re-flashed with a plaintext application image, the bootloader will fail to load the application resulting in the following failure:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configskip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0018,len:4
load:0x3fff001c,len:8452
load:0x40078000,len:13616
load:0x40080400,len:6664
entry 0x40080764
```

```
I (56) boot: ESP-IDF v4.0-dev-850-gc4447462-dirty 2nd stage bootloader
I (56) boot: compile time 15:37:14
I (58) boot: Enabling RNG early entropy source...
I (64) boot: SPI Speed : 40MHz
I (68) boot: SPI Mode : DIO
I (72) boot: SPI Flash Size : 4MB
I (76) boot: Partition Table:
  I (79) boot: ## Label Usage Type ST Offset Length
I (87) boot: 0 nvs WiFi data 01 01 00000a00 00006000
I (94) boot: 1 phy_init RF data 01 01 00010000 00001000
I (102) boot: 2 factory factory app 00 00 00200000 00100000
I (109) boot: End of partition table
E (113) esp_image: image at 0x20000 has invalid magic byte
W (120) esp_image: image at 0x20000 has invalid SPI mode 108
W (126) esp_image: image at 0x20000 has invalid SPI size 11
E (132) boot: Factory app partition is not bootable
E (138) boot: No bootable app partitions in the partition table
```

### 4.15.6 ESP32 Flash Encryption Status

1. Ensure that you have an ESP32 device with default flash encryption eFuse settings as shown in `Relevant eFuses`.

To check if flash encryption on your ESP32 device is enabled, do one of the following:

- flash the application example `security/flash_encryption` onto your device. This application prints the `FLASH_CRYPT_CNT` eFuse value and if flash encryption is enabled or disabled.
- Find the serial port name under which your ESP32 device is connected, replace `PORT` with your port name in the following command, and run it:

```
espefuse.py -p PORT summary
```

### 4.15.7 Reading and Writing Data in Encrypted Flash

ESP32 application code can check if flash encryption is currently enabled by calling `esp_flash_encryption_enabled()`. Also, a device can identify the flash encryption mode by calling `esp_get_flash_encryption_mode()`.

Once flash encryption is enabled, be more careful with accessing flash contents from code.
Scope of Flash Encryption

Whenever the FLASH_CRYPT_CNT eFuse is set to a value with an odd number of bits, all flash content accessed via the MMU’s flash cache is transparently decrypted. It includes:

- Executable application code in flash (IROM).
- All read-only data stored in flash (DROM).
- Any data accessed via spi_flash_mmap().
- The firmware bootloader image when it is read by the ROM bootloader.

**Important:** The MMU flash cache unconditionally decrypts all existing data. Data which is stored unencrypted in flash memory will also be “transparently decrypted” via the flash cache and will appear to software as random garbage.

Reading from Encrypted Flash

To read data without using a flash cache MMU mapping, you can use the partition read function esp_partition_read(). This function will only decrypt data when it is read from an encrypted partition. Data read from unencrypted partitions will not be decrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also use the following SPI flash API functions:

- esp_flash_read() to read raw (encrypted) data which will not be decrypted
- esp_flash_read_encrypted() to read and decrypt data

The ROM function SPIRead() can read data without decryption, however, this function is not supported in esp-idf applications.

Data stored using the Non-Volatile Storage (NVS) API is always stored and read decrypted from the perspective of flash encryption. It is up to the library to provide encryption feature if required. Refer to NVS Encryption for more details.

Writing to Encrypted Flash

It is recommended to use the partition write function esp_partition_write(). This function will only encrypt data when it is written to an encrypted partition. Data written to unencrypted partitions will not be encrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also pre-encrypt and write data using the function esp_flash_write_encrypted()

Also, the following ROM function exist but not supported in esp-idf applications:

- esp_rom_spiflash_write_encrypted pre-encrypts and writes data to flash
- SPIWrite writes unencrypted data to flash

Since data is encrypted in blocks, the minimum write size for encrypted data is 16 bytes and the alignment is also 16 bytes.

4.15.8 Updating Encrypted Flash

OTA Updates

OTA updates to encrypted partitions will automatically write encrypted data if the function esp_partition_write() is used.

Before building the application image for OTA updating of an already encrypted device, enable the option Enable flash encryption on boot in project configuration menu.

For general information about ESP-IDF OTA updates, please refer to OTA
Chapter 4. API Guides

Updating Encrypted Flash via Serial

Flashing an encrypted device via serial bootloader requires that the serial bootloader download interface has not been permanently disabled via eFuse.

In Development Mode, the recommended method is *Re-flashing Updated Partitions*.

In Release Mode, if a copy of the same key stored in eFuse is available on the host then it’s possible to pre-encrypt files on the host and then flash them. See *Manually Encrypting Files*.

4.15.9 Disabling Flash Encryption

If flash encryption was enabled accidentally, flashing of plaintext data will soft-brick the ESP32. The device will reboot continuously, printing the error `flash read err, 1000 or invalid header: 0xFFFFXX`. 

For flash encryption in Development mode, encryption can be disabled by burning the `FLASH_CRYPT_CNT` eFuse. It can only be done three times per chip by taking the following steps:

1. In *Project Configuration Menu*, disable *Enable flash encryption on boot*, then save and exit.
2. Open project configuration menu again and **double-check** that you have disabled this option! If this option is left enabled, the bootloader will immediately re-enable encryption when it boots.
3. With flash encryption disabled, build and flash the new bootloader and application by running `idf.py flash`.
4. Use `espefuse.py` (in components/esptool_py/esptool) to disable the `FLASH_CRYPT_CNT` by running:

```
espefuse.py burn_efuse FLASH_CRYPT_CNT
```

Reset the ESP32. Flash encryption will be disabled, and the bootloader will boot as usual.

4.15.10 Key Points About Flash Encryption

- Flash memory contents is encrypted using AES-256. The flash encryption key is stored in the `flash_encryption` eFuse internal to the chip and, by default, is protected from software access.
- The flash encryption algorithm is AES-256, where the key is “tweaked” with the offset address of each 32 byte block of flash. This means that every 32-byte block (two consecutive 16 byte AES blocks) is encrypted with a unique key derived from the flash encryption key.
- Flash access is transparent via the flash cache mapping feature of ESP32 - any flash regions which are mapped to the address space will be transparently decrypted when read.
- Some data partitions might need to remain unencrypted for ease of access or might require the use of flash-friendly update algorithms which are ineffective if the data is encrypted. NVS partitions for non-volatile storage cannot be encrypted since the NVS library is not directly compatible with flash encryption. For details, refer to *NVS Encryption*.
- If flash encryption might be used in future, the programmer must keep it in mind and take certain precautions when writing code that uses encrypted flash.
- If secure boot is enabled, re-flashing the bootloader of an encrypted device requires a “Re-flashable” secure boot digest (see *Flash Encryption and Secure Boot*).  

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See *Bootloader Size*.

**Important:** Do not interrupt power to the ESP32 while the first boot encryption pass is running. If power is interrupted, the flash contents will be corrupted and will require flashing with unencrypted data again. In this case, re-flashing will not count towards the flashing limit.
4.15.11 Limitations of Flash Encryption

Flash encryption protects firmware against unauthorised readout and modification. It is important to understand the limitations of the flash encryption feature:

- Flash encryption is only as strong as the key. For this reason, we recommend keys are generated on the device during first boot (default behaviour). If generating keys off-device, ensure proper procedure is followed and don’t share the same key between all production devices.
- Not all data is stored encrypted. If storing data on flash, check if the method you are using (library, API, etc.) supports flash encryption.
- Flash encryption does not prevent an attacker from understanding the high-level layout of the flash. This is because the same AES key is used for every pair of adjacent 16 byte AES blocks. When these adjacent 16 byte blocks contain identical content (such as empty or padding areas), these blocks will encrypt to produce matching pairs of encrypted blocks. This may allow an attacker to make high-level comparisons between encrypted devices (i.e. to tell if two devices are probably running the same firmware version).
- For the same reason, an attacker can always tell when a pair of adjacent 16 byte blocks (32 byte aligned) contain two identical 16 byte sequences. Keep this in mind if storing sensitive data on the flash, design your flash storage so this doesn’t happen (using a counter byte or some other non-identical value every 16 bytes is sufficient). NVS Encryption deals with this and is suitable for many uses.
- Flash encryption alone may not prevent an attacker from modifying the firmware of the device. To prevent unauthorised firmware from running on the device, use flash encryption in combination with Secure Boot.

4.15.12 Flash Encryption and Secure Boot

It is recommended to use flash encryption in combination with Secure Boot. However, if Secure Boot is enabled, additional restrictions apply to device re-flashing:

- OTA Updates are not restricted, provided that the new app is signed correctly with the Secure Boot signing key.
- Plaintext serial flash updates are only possible if the Re-flashable Secure Boot mode is selected and a Secure Boot key was pre-generated and burned to the ESP32 (refer to Secure Boot). In such configuration, idf.py bootloader will produce a pre-digested bootloader and secure boot digest file for flashing at offset 0x0. When following the plaintext serial re-flashing steps it is necessary to re-flash this file before flashing other plaintext data.
- Re-flashing via Pregenerated Flash Encryption Key is still possible, provided the bootloader is not re-flashed. Re-flashing the bootloader requires the same Re-flashable option to be enabled in the Secure Boot config.

4.15.13 Advanced Features

The following section covers advanced features of flash encryption.

Encrypted Partition Flag

Some partitions are encrypted by default. Other partitions can be marked in the partition table description as requiring encryption by adding the flag encrypted to the partitions’ flag field. As a result, data in these marked partitions will be treated as encrypted in the same manner as an app partition.

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

For details on partition table description, see partition table.

Further information about encryption of partitions:

- Default partition tables do not include any encrypted data partitions.
• With flash encryption enabled, the app partition is always treated as encrypted and does not require marking.
• If flash encryption is not enabled, the flag “encrypted” has no effect.
• You can also consider protecting phy_init data from physical access, readout, or modification, by marking the optional phy partition with the flag encrypted.
• The nvs partition cannot be encrypted, because the NVS library is not directly compatible with flash encryption.

Enabling UART Bootloader Encryption/Decryption

On the first boot, the flash encryption process burns by default the following eFuses:

• DISABLE_DL_ENCRYPT which disables flash encryption operation when running in UART bootloader boot mode.
• DISABLE_DL_DECRYPT which disables transparent flash decryption when running in UART bootloader mode, even if the eFuse FLASH_CRYPT_CNT is set to enable it in normal operation.
• DISABLE_DL_CACHE which disables the entire MMU flash cache when running in UART bootloader mode.

However, before the first boot you can choose to keep any of these features enabled by burning only selected eFuses and write-protect the rest of eFuses with unset value 0. For example:

```
espefuse.py --port PORT burn_efuse DISABLE_DL_DECRYPT
espefuse.py --port PORT write_protect_efuse DISABLE_DL_ENCRYPT
```

Important: Leaving DISABLE_DL_DECRYPT unset (0) makes flash encryption useless.

An attacker with physical access to the chip can use UART bootloader mode with custom stub code to read out the flash contents.

Setting FLASH_CRYPT_CONFIG

The eFuse FLASH_CRYPT_CONFIG determines the number of bits in the flash encryption key which are “tweaked” with the block offset. For details, see Flash Encryption Algorithm.

On the first boot or the firmware bootloader, this value is set to the maximum 0xF.

It is possible to burn this eFuse manually and write protect it before the first boot in order to select different tweak values. However, this is not recommended.

It is strongly recommended to never write-protect FLASH_CRYPT_CONFIG when it is unset. Otherwise, its value will remain zero permanently, and no bits in the flash encryption key will be tweaked. As a result, the flash encryption algorithm will be equivalent to AES ECB mode.

JTAG Debugging

By default, when Flash Encryption is enabled (in either Development or Release mode) then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables flash encryption.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with Flash Encryption.

Manually Encrypting Files

Manually encrypting or decrypting files requires the flash encryption key to be pre-burned in eFuse (see Using Host Generated Key) and a copy to be kept on the host. If the flash encryption is configured in Development Mode then it’s not necessary to keep a copy of the key or follow these steps, the simpler Re-flashing Updated Partitions steps can be used.
Chapter 4. API Guides

The key file should be a single raw binary file (example: `key.bin`).

For example, these are the steps to encrypt the file `build/my-app.bin` to flash at offset 0x10000. Run `espsecure.py` as follows:

```
espsecure.py encrypt_flash_data --keyfile /path/to/key.bin --address 0x10000 --
--output my-app-ciphertext.bin build/my-app.bin
```

The file `my-app-ciphertext.bin` can then be flashed to offset 0x10000 using `esptool.py`. To see all of the command line options recommended for `esptool.py`, see the output printed when `idf.py build` succeeds.

**Note:** If the flashed ciphertext file is not recognized by the ESP32 when it boots, check that the keys match and that the command line arguments match exactly, including the correct offset.

If your ESP32 uses non-default `FLASH_CRYPT_CONFIG` value in eFuse then you will need to pass the `--flash_crypt_conf` argument to `espsecure.py` to set the matching value. This will not happen if the device configured flash encryption by itself, but may happen if burning EFuses manually to enable flash encryption.

The command `espsecure.py decrypt_flash_data` can be used with the same options (and different input/output files), to decrypt ciphertext flash contents or a previously encrypted file.

### 4.15.14 Technical Details

The following sections provide some reference information about the operation of flash encryption.

**Flash Encryption Algorithm**

- AES-256 operates on 16-byte blocks of data. The flash encryption engine encrypts and decrypts data in 32-byte blocks - two AES blocks in series.
- The main flash encryption key is stored in the `flash_encryption` eFuse and, by default, is protected from further writes or software readout.
- AES-256 key size is 256 bits (32 bytes) read from the `flash_encryption` eFuse. The hardware AES engine uses the key in reversed byte order as compared to the storage order in `flash_encryption`.
  - If the `CODING_SCHEME` eFuse is set to 0 (default, “None” Coding Scheme) then the eFuse key block is 256 bits and the key is stored as-is (in reversed byte order).
  - If the `CODING_SCHEME` eFuse is set to 1 (3/4 Encoding) then the eFuse key block is 192 bits (in reversed byte order), so overall entropy is reduced. The hardware flash encryption still operates on a 256-bit key, after being read (and un-reversed), the key is extended as `key = key[0:255] + key[64:127]`.
- AES algorithm is used inverted in flash encryption, so the flash encryption “encrypt” operation is AES decrypt and the “decrypt” operation is AES encrypt. This is for performance reasons and does not alter the efficiency of the algorithm.
- Each 32-byte block (two adjacent 16-byte AES blocks) is encrypted with a unique key. The key is derived from the main flash encryption key in `flash_encryption`, XORed with the offset of this block in the flash (a “key tweak”).
- The specific tweak depends on the `FLASH_CRYPT_CONFIG` eFuse setting. This is a 4-bit eFuse where each bit enables XORing of a particular range of the key bits:
  - Bit 1, bits 0-66 of the key are XORed.
  - Bit 2, bits 67-131 of the key are XORed.
  - Bit 3, bits 132-194 of the key are XORed.
  - Bit 4, bits 195-256 of the key are XORed.

It is recommended that `FLASH_CRYPT_CONFIG` is always left at the default value 0xF, so that all key bits are XORed with the block offset. For details, see Setting `FLASH_CRYPT_CONFIG`.

- The high 19 bits of the block offset (bit 5 to bit 23) are XORed with the main flash encryption key. This range is chosen for two reasons: the maximum flash size is 16MB (24 bits), and each block is 32 bytes so the least significant 5 bits are always zero.
There is a particular mapping from each of the 19 block offset bits to the 256 bits of the flash encryption key to determine which bit is XORed with which. See the variable `_FLASH_ENCRYPTION_TWEAK_PATTERN` in the `espsecure.py` source code for complete mapping.

To see the full flash encryption algorithm implemented in Python, refer to the `_flash_encryption_operation()` function in the `espsecure.py` source code.

### 4.16 ESP-IDF FreeRTOS SMP Changes

#### 4.16.1 Overview

The vanilla FreeRTOS is designed to run on a single core. However the ESP32 is dual core containing a Protocol CPU (known as CPU 0 or PRO_CPU) and an Application CPU (known as CPU 1 or APP_CPU). The two cores are identical in practice and share the same memory. This allows the two cores to run tasks interchangeably between them.

The ESP-IDF FreeRTOS is a modified version of vanilla FreeRTOS which supports symmetric multiprocessing (SMP). ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0. This guide outlines the major differences between vanilla FreeRTOS and ESP-IDF FreeRTOS. The API reference for vanilla FreeRTOS can be found via [https://www.freertos.org/a00106.html](https://www.freertos.org/a00106.html).

For information regarding features that are exclusive to ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS Additions.

**Tasks and Task Creation**: Use `xTaskCreatePinnedToCore()` or `xTaskCreateStaticPinnedToCore()` to create tasks in ESP-IDF FreeRTOS. The last parameter of the two functions is `xCoreID`. This parameter specifies which core the task is pinned to. Acceptable values are 0 for PRO_CPU, 1 for APP_CPU, or `tskNO_AFFINITY` which allows the task to run on both.

**Round Robin Scheduling**: The ESP-IDF FreeRTOS scheduler will skip tasks when implementing Round-Robin scheduling between multiple tasks in the Ready state that are of the same priority. To avoid this behavior, ensure that those tasks either enter a blocked state, or are distributed across a wider range of priorities.

**Scheduler Suspension**: Suspending the scheduler in ESP-IDF FreeRTOS will only affect the scheduler on the calling core. In other words, calling `vTaskSuspendAll()` on PRO_CPU will not prevent APP_CPU from scheduling, and vice versa. Use critical sections or semaphores instead for simultaneous access protection.

**Tick Interrupt Synchronicity**: Tick interrupts of PRO_CPU and APP_CPU are not synchronized. Do not expect to use `vTaskDelay()` or `vTaskDelayUntil()` as an accurate method of synchronizing task execution between the two cores. Use a counting semaphore instead as their context switches are not tied to tick interrupts due to preemption.

**Critical Sections & Disabling Interrupts**: In ESP-IDF FreeRTOS, critical sections are implemented using mutexes. Entering critical sections involve taking a mutex, then disabling the scheduler and interrupts of the calling core. However the other core is left unaffected. If the other core attempts to take same mutex, it will spin until the calling core has released the mutex by exiting the critical section.

**Floating Point Arithmetic**: The ESP32 supports hardware acceleration of single precision floating point arithmetic (`float`). However the use of hardware acceleration leads to some behavioral restrictions in ESP-IDF FreeRTOS. Therefore, tasks that utilize `float` will automatically be pinned to a core if not done so already. Furthermore, `float` cannot be used in interrupt service routines.

**Thread Local Storage Pointers & Deletion Callbacks**: Deletion callbacks are called automatically during task deletion and are used to free memory pointed to by TLSP. Call `vTaskSetThreadLocalStoragePointerAndDeleteCallback()` to set TLSP and Deletion Callbacks.

**Configuring ESP-IDF FreeRTOS**: Several aspects of ESP-IDF FreeRTOS can be set in the project configuration (`idf.py menuconfig`) such as running ESP-IDF in Uincore (single core) Mode, or configuring the number of Thread Local Storage Pointers each task will have.

It is not necessary to manually start the FreeRTOS scheduler by calling `vTaskStartScheduler()`. In ESP-IDF the scheduler is started by the Application Startup Flow and is already running when the `app_main` function is called (see Running the main task for details).
4.16.2 Tasks and Task Creation

Tasks in ESP-IDF FreeRTOS are designed to run on a particular core, therefore two new task creation functions have been added to ESP-IDF FreeRTOS by appending `PinnedToCore` to the names of the task creation functions in vanilla FreeRTOS. The vanilla FreeRTOS functions of `xTaskCreate()` and `xTaskCreateStatic()` have led to the addition of `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS.

For more details see `freertos/tasks.c`.

The ESP-IDF FreeRTOS task creation functions are nearly identical to their vanilla counterparts with the exception of the extra parameter known as `xCoreID`. This parameter specifies the core on which the task should run on and can be one of the following values:

- 0 pins the task to `PRO_CPU`
- 1 pins the task to `APP_CPU`
- `tskNO_AFFINITY` allows the task to be run on both CPUs

For example `xTaskCreatePinnedToCore(tsk_callback, "APP_CPU Task", 1000, NULL, 10, NULL, 1)` creates a task of priority 10 that is pinned to `APP_CPU` with a stack size of 1000 bytes. It should be noted that the `uxStackDepth` parameter in vanilla FreeRTOS specifies a task’s stack depth in terms of the number of words, whereas ESP-IDF FreeRTOS specifies the stack depth in terms of bytes.

Note that the vanilla FreeRTOS functions `xTaskCreate()` and `xTaskCreateStatic()` have been defined in ESP-IDF FreeRTOS as inline functions which call `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` respectively with `tskNO_AFFINITY` as the `xCoreID` value.

Each Task Control Block (TCB) in ESP-IDF stores the `xCoreID` as a member. Hence when each core calls the scheduler to select a task to run, the `xCoreID` member will allow the scheduler to determine if a given task is permitted to run on the core that called it.

4.16.3 Scheduling

The vanilla FreeRTOS implements scheduling in the `vTaskSwitchContext()` function. This function is responsible for selecting the highest priority task to run from a list of tasks in the Ready state known as the Ready Tasks List (described in the next section). In ESP-IDF FreeRTOS, each core will call `vTaskSwitchContext()` independently to select a task to run from the Ready Tasks List which is shared between both cores. There are several differences in scheduling behavior between vanilla and ESP-IDF FreeRTOS such as differences in Round Robin scheduling, scheduler suspension, and tick interrupt synchronicity.

**Round Robin Scheduling**

Given multiple tasks in the Ready state and of the same priority, vanilla FreeRTOS implements Round Robin scheduling between each task. This will result in running those tasks in turn each time the scheduler is called (e.g. every tick interrupt). On the other hand, the ESP-IDF FreeRTOS scheduler may skip tasks when Round Robin scheduling multiple Ready state tasks of the same priority.

The issue of skipping tasks during Round Robin scheduling arises from the way the Ready Tasks List is implemented in FreeRTOS. In vanilla FreeRTOS, `pxReadyTasksList` is used to store a list of tasks that are in the Ready state. The list is implemented as an array of length `configMAX_PRIORITIES` where each element of the array is a linked list. Each linked list is of type `List_t` and contains TCBs of tasks of the same priority that are in the Ready state. The following diagram illustrates the `pxReadyTasksList` structure.

Each linked list also contains a `pxIndex` which points to the last TCB returned when the list was queried. This index allows the `vTaskSwitchContext()` to start traversing the list at the TCB immediately after `pxIndex` hence implementing Round Robin scheduling between tasks of the same priority.

In ESP-IDF FreeRTOS, the Ready Tasks List is shared between cores hence `pxReadyTasksList` will contain tasks pinned to different cores. When a core calls the scheduler, it is able to look at the `xCoreID` member of each TCB in the list to determine if a task is allowed to run on calling the core. The ESP-IDF FreeRTOS `pxReadyTasksList` is illustrated below.
Fig. 33: Illustration of FreeRTOS Ready Task List Data Structure

Fig. 34: Illustration of FreeRTOS Ready Task List Data Structure in ESP-IDF
Therefore when **PRO_CPU** calls the scheduler, it will only consider the tasks in blue or purple. Whereas when **APP_CPU** calls the scheduler, it will only consider the tasks in orange or purple.

Although each TCB has an `xCoreID` in ESP-IDF FreeRTOS, the linked list of each priority only has a single `pxIndex`. Therefore when the scheduler is called from a particular core and traverses the linked list, it will skip all TCBs pinned to the other core and point the `pxIndex` at the selected task. If the other core then calls the scheduler, it will traverse the linked list starting at the TCB immediately after `pxIndex`. Therefore, TCBs skipped on the previous scheduler call from the other core would not be considered on the current scheduler call. This issue is demonstrated in the following illustration.

![Image](72x760 to 523x857)

**Fig. 35:** Illustration of `pxIndex` behavior in ESP-IDF FreeRTOS

Referring to the illustration above, assume that priority 9 is the highest priority, and none of the tasks in priority 9 will block hence will always be either in the running or Ready state.

1) **PRO_CPU** calls the scheduler and selects Task A to run, hence moves `pxIndex` to point to Task A

2) **APP_CPU** calls the scheduler and starts traversing from the task after `pxIndex` which is Task B. However Task B is not selected to run as it is not pinned to **APP_CPU** hence it is skipped and Task C is selected instead. `pxIndex` now points to Task C

3) **PRO_CPU** calls the scheduler and starts traversing from Task D. It skips Task D and selects Task E to run and points `pxIndex` to Task E. Notice that Task B isn’t traversed because it was skipped the last time **APP_CPU** called the scheduler to traverse the list.

4) The same situation with Task D will occur if **APP_CPU** calls the scheduler again as `pxIndex` now points to Task E

One solution to the issue of task skipping is to ensure that every task will enter a blocked state so that they are removed from the Ready Task List. Another solution is to distribute tasks across multiple priorities such that a given priority will not be assigned multiple tasks that are pinned to different cores.

**Scheduler Suspension**

In vanilla FreeRTOS, suspending the scheduler via `vTaskSuspendAll()` will prevent calls of `vTaskSwitchContext` from context switching until the scheduler has been resumed with `xTaskResumeAll()`. However servicing ISRs are still permitted. Therefore any changes in task states as a result from the current running task or ISRs will not be executed until the scheduler is resumed. Scheduler suspension in vanilla FreeRTOS is a common protection method against simultaneous access of data shared between tasks, whilst still allowing ISRs to be serviced.

In ESP-IDF FreeRTOS, `xTaskSuspendAll()` will only prevent calls of `vTaskSwitchContext()` from switching contexts on the core that called for the suspension. Hence if **PRO_CPU** calls `vTaskSuspendAll()`, **APP_CPU** will still be able to switch contexts. If data is shared between tasks that are pinned to different cores, scheduler suspension is **NOT** a valid method of protection against simultaneous access. Consider using critical sections (disables interrupts) or semaphores (does not disable interrupts) instead when protecting shared resources in ESP-IDF FreeRTOS.

In general, it’s better to use other RTOS primitives like mutex semaphores to protect against data shared between tasks, rather than `vTaskSuspendAll()`.

**Tick Interrupt Synchronicity**

In ESP-IDF FreeRTOS, tasks on different cores that unblock on the same tick count might not run at exactly the same time due to the scheduler calls from each core being independent, and the tick interrupts to each core being
unsynchronized.

In vanilla FreeRTOS the tick interrupt triggers a call to xTaskIncrementTick() which is responsible for incrementing the tick counter, checking if tasks which have called vTaskDelay() have fulfilled their delay period, and moving those tasks from the Delayed Task List to the Ready Task List. The tick interrupt will then call the scheduler if a context switch is necessary.

In ESP-IDF FreeRTOS, delayed tasks are unblocked with reference to the tick interrupt on PRO_CPU as PRO_CPU is responsible for incrementing the shared tick count. However tick interrupts to each core might not be synchronized (same frequency but out of phase) hence when PRO_CPU receives a tick interrupt, APP_CPU might not have received it yet. Therefore if multiple tasks of the same priority are unblocked on the same tick count, the task pinned to PRO_CPU will run immediately whereas the task pinned to APP_CPU must wait until APP_CPU receives its out of sync tick interrupt. Upon receiving the tick interrupt, APP_CPU will then call for a context switch and finally switches contexts to the newly unblocked task.

Therefore, task delays should NOT be used as a method of synchronization between tasks in ESP-IDF FreeRTOS. Instead, consider using a counting semaphore to unblock multiple tasks at the same time.

### 4.16.4 Critical Sections & Disabling Interrupts

Vanilla FreeRTOS implements critical sections with taskENTER_CRITICAL() which calls portDISABLE_INTERRUPTS(). This prevents preemptive context switches and servicing of ISRs during a critical section. Therefore, critical sections are used as a valid protection method against simultaneous access in vanilla FreeRTOS.

On the other hand, ESP32 has no hardware method for cores to disable each other’s interrupts. Calling portDISABLE_INTERRUPTS() will have no effect on the interrupts of the other core. Therefore, disabling interrupts is NOT a valid protection method against simultaneous access to shared data as it leaves the other core free to access the data even if the current core has disabled its own interrupts.

For this reason, ESP-IDF FreeRTOS implements critical sections using special mutexes, referred by portMUX_Type objects. These are implemented on top of a specific spinlock component. Calls to taskENTER_CRITICAL or taskEXIT_CRITICAL each provide a spinlock object as an argument. The spinlock is associated with a shared resource requiring access protection. When entering a critical section in ESP-IDF FreeRTOS, the calling core will disable interrupts similar to the vanilla FreeRTOS implementation, and will then take the spinlock and enter the critical section. The other core is unaffected at this point, unless it enters its own critical section and attempts to take the same spinlock. In that case it will spin until the lock is released. Therefore, the ESP-IDF FreeRTOS implementation of critical sections allows a core to have protected access to a shared resource without disabling the other core. The other core will only be affected if it tries to concurrently access the same resource.

The ESP-IDF FreeRTOS critical section functions have been modified as follows:

- taskENTER_CRITICAL(mux), taskENTER_CRITICAL_ISR(mux), portENTER_CRITICAL(mux), portENTER_CRITICAL_ISR(mux) are all macro defined to call internal function vPortEnterCritical()
- taskEXIT_CRITICAL(mux), taskEXIT_CRITICAL_ISR(mux), portEXIT_CRITICAL(mux), portEXIT_CRITICAL_ISR(mux) are all macro defined to call internal function vPortExitCritical()
- portENTER_CRITICAL_SAFE(mux), portEXIT_CRITICAL_SAFE(mux) macro identifies the context of execution, i.e ISR or Non-ISR, and calls appropriate critical section functions (port*_CRITICAL in Non-ISR and port*_CRITICAL_ISR in ISR) in order to be in compliance with Vanilla FreeRTOS.

For more details see esp_hw_support/include/soc/spinlock.h, freertos/include/freertos/task.h, and freertos/tasks.c

It should be noted that when modifying vanilla FreeRTOS code to be ESP-IDF FreeRTOS compatible, it is trivial to modify the type of critical section called as they are all defined to call the same function. As long as the same spinlock is provided upon entering and exiting, the exact macro or function used for the call should not matter.

### 4.16.5 Floating Point Arithmetic

ESP-IDF FreeRTOS implements Lazy Context Switching for FPUs. In other words, the state of a core’s FPU registers are not immediately saved when a context switch occurs. Therefore, tasks that utilize float must be
pinned to a particular core upon creation. If not, ESP-IDF FreeRTOS will automatically pin the task in question to whichever core the task was running on upon the task’s first use of float. Likewise due to Lazy Context Switching, only interrupt service routines of lowest priority (that is it the Level 1) can use float, higher priority interrupts do not support FPU usage.

ESP32 does not support hardware acceleration for double precision floating point arithmetic (double). Instead double is implemented via software hence the behavioral restrictions with regards to float do not apply to double. Note that due to the lack of hardware acceleration, double operations may consume significantly larger amount of CPU time in comparison to float.

4.16.6 Task Deletion

In FreeRTOS task deletion the freeing of task memory will occur immediately (within vTaskDelete()) if the task being deleted is not currently running or is not pinned to the other core (with respect to the core vTaskDelete() is called on). TLSP deletion callbacks will also run immediately if the same conditions are met. However, calling vTaskDelete() to delete a task that is either currently running or pinned to the other core will still result in the freeing of memory being delegated to the Idle Task.

4.16.7 Thread Local Storage Pointers & Deletion Callbacks

Thread Local Storage Pointers (TLSP) are pointers stored directly in the TCB. TLSP allow each task to have its own unique set of pointers to data structures. However task deletion behavior in vanilla FreeRTOS does not automatically free the memory pointed to by TLSP. Therefore if the memory pointed to by TLSP is not explicitly freed by the user before task deletion, memory leak will occur.

ESP-IDF FreeRTOS provides the added feature of Deletion Callbacks. Deletion Callbacks are called automatically during task delete to free memory pointed to by TLSP. Each TLSP can have its own Deletion Callback. Note that due to the to Task Deletion behavior, there can be instances where Deletion Callbacks are called in the context of the Idle Tasks. Therefore Deletion Callbacks should never attempt to block and critical sections should be kept as short as possible to minimize priority inversion.

Deletion callbacks are of type void (*TlsDeleteCallbackFunction_t)( int, void * ) where the first parameter is the index number of the associated TLSP, and the second parameter is the TLSP itself.

Deletion callbacks are set alongside TLSP by calling vTaskSetThreadLocalStoragePointerAndDeleteCallback(). Calling the vanilla FreeRTOS function vTaskSetThreadLocalStoragePointer() will simply set the TLSP’s associated Deletion Callback to NULL meaning that no callback will be called for that TLSP during task deletion. If a deletion callback is NULL, users should manually free the memory pointed to by the associated TLSP before task deletion in order to avoid memory leak.

For more details see FreeRTOS API reference.

4.16.8 Configuring ESP-IDF FreeRTOS

The ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see FreeRTOS

CONFIG_FREERTOS_UNICORE will run ESP-IDF FreeRTOS only on PRO_CPU. Note that this is not equivalent to running vanilla FreeRTOS. Note that this option may affect behavior of components other than freertos. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION will trigger a halt in particular functions in ESP-IDF FreeRTOS which have not been fully tested in an SMP context.

CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call vTaskDelete()), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:
4.17 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. Architecture
2. LL (Low Level) Layer
3. HAL (Hardware Abstraction Layer)

**Warning:** Hardware abstraction API (excluding the driver and xxx_types.h) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF's versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

**Note:** Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU's features are partially abstracted).

4.17.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the hal component. Each layer is dependent on the layer below it (i.e., driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral xxx, its hardware abstraction will generally consist of the header files described in the table below. Files that are **Target Specific** will have a separate implementation for each target (i.e., a separate copy for each chip). However, the #include directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.
### Table 22: Hardware Abstraction Header Files

<table>
<thead>
<tr>
<th>Include Directive</th>
<th>Target Specific</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>#include 'soc/xxx_caps.h&quot;</code></td>
<td>Y</td>
<td>This header contains a list of C macros specifying the various capabilities of the ESP32’s peripheral <code>xxx</code>. Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc.</td>
</tr>
</tbody>
</table>
| `#include "soc/xxx_struct.h"`  
`#include "soc/xxx_reg.h"` | Y | The two headers contain a representation of a peripheral’s registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files. |
| `#include "soc/xxx_pins.h"` | Y | If certain signals of a peripheral are mapped to a particular pin of the ESP32, their mappings are defined in this header as C macros. |
| `#include "soc/xxx_reg.h"` | N | This header is mainly used as a convenience header file to automatically include `xxx_caps.h`, `xxx_struct.h`, and `xxx_reg.h`. |
| `#include "hal/xxx_types.h"` | N | This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following:  
  - Protocol related types/macros such as a frames, modes, common bus speeds, etc.  
  - Features/characteristics of an `xxx` peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc. |
| `#include "hal/xxx_ll.h"` | Y | This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions. |
| `#include "hal/xxx_hal.h"` | Y | The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer. |
| `#include "driver/xxx.h"` | N | The driver layer is the highest level of ESP-IDF’s hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can used in a multi-threaded environment. |

### 4.17.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```c
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
    xxx_ll_clk_src_t clock_source,
    uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
    hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}
```

(continues on next page)
The code snippet above illustrates typical LL functions for a peripheral xxx. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral’s registers, thus the first argument is always a pointer to the starting address of the peripheral’s registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

### 4.17.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral’s register implementation (i.e., which registers need to be set/read) are hidden (abstractioned away) by the HAL. By modelling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT’s operation life cycle, thus illustrating how a HAL abstracts a peripheral’s operation into functional steps.

```c
// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler, _bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t _timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);
```

HAL functions will generally have the following characteristics:
• The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e., the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
  - The channel number of this instance
  - Pointer to the peripheral’s (or channel’s) registers (i.e., a `xxx_dev_t *` type)
  - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  - Some configuration values for the instance (e.g., channel configurations)
  - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)
• HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
• Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
• Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

4.18 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 8 levels, plus an assortment of exceptions. On the ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the interrupt allocator. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, allowing for very low interrupt latencies.

4.18.1 Interrupt Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Symbol</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>Exception and level 0 interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>2-3</td>
<td>N/A</td>
<td>Medium level interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>4</td>
<td>xt_highint4</td>
<td>Normally used by ESP-IDF debug logic</td>
</tr>
<tr>
<td>5</td>
<td>xt_highint5</td>
<td>Free to use</td>
</tr>
<tr>
<td>NMI</td>
<td>xt_nmi</td>
<td>Free to use</td>
</tr>
<tr>
<td>dbg</td>
<td>xt_debugexception</td>
<td>Debug exception. Called on e.g. a BREAK instruction.</td>
</tr>
</tbody>
</table>

Using these symbols is done by creating an assembly file (suffix `.S`) and defining the named symbols, like this:

```assembly
 .section .iram1,"ax"
 .global xt_highint5
 .type xt_highint5,@function
 .align 4
 xt_highint5:
    ... your code here
    rsr a0, EXCSAVE_5
    rfi 5
```

For a real-life example, see the `esp_system/port/soc/esp32/dport_panic_highint_hdl.S` file; the panic handler interrupt is implemented there.

4.18.2 Notes

• Do not call C code from a high-level interrupt; because these interrupts still run in critical sections, this can cause crashes. (The panic handler interrupt does call normal C code, but this is OK because there is no intention of returning to the normal code flow afterwards.)
• Make sure your assembly code gets linked in. If the interrupt handler symbol is the only symbol the rest of the code uses from this file, the linker will take the default ISR instead and not link the assembly file into the final project. To get around this, in the assembly file, define a symbol, like this:
The symbol is called `ld_include_my_isr_file` here but can have any arbitrary name not defined anywhere else.

Then, in the component CMakeLists.txt, add this file as an unresolved symbol to the ld command line arguments:

```make
target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")
```

If using the legacy Make build system, add the following to component.mk, instead:

```make
COMPONENT_ADD_LDFLAGS := -u ld_include_my_isr_file
```

This should cause the linker to always include a file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using `esp_intr_alloc` and associated functions. The handler and handler arguments to `esp_intr_alloc` must be NULL, however.
- In theory, medium priority interrupts could also be handled in this way. For now, ESP-IDF does not support this.

## 4.19 JTAG Debugging

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB. The document is structured as follows:

- **Introduction** Introduction to the purpose of this guide.
- **How it Works?** Description how ESP32, JTAG interface, OpenOCD and GDB are interconnected and working together to enable debugging of ESP32.
- **Selecting JTAG Adapter** What are the criteria and options to select JTAG adapter hardware.
- **Setup of OpenOCD** Procedure to install OpenOCD and verify that it is installed.
- **Configuring ESP32 Target** Configuration of OpenOCD software and setup JTAG adapter hardware that will make together a debugging target.
- **Launching Debugger** Steps to start up a debug session with GDB from Eclipse and from Command Line.
- **Debugging Examples** If you are not familiar with GDB, check this section for debugging examples provided from Eclipse as well as from Command Line.
- **Building OpenOCD from Sources** Procedure to build OpenOCD from sources for Windows, Linux and MacOS operating systems.
- **Tips and Quirks** This section provides collection of tips and quirks related JTAG debugging of ESP32 with OpenOCD and GDB.

### 4.19.1 Introduction

The ESP32 has two powerful Xtensa cores, allowing for a great deal of variety of program architectures. The FreeRTOS OS that comes with ESP-IDF is capable of multi-core preemptive multithreading, allowing for an intuitive way of writing software.

The downside of the ease of programming is that debugging without the right tools is harder: figuring out a bug that is caused by two threads, running even simultaneously on two different CPU cores, can take a long time when all you have are printf statements. A better and in many cases quicker way to debug such problems is by using a debugger, connected to the processors over a debug port.

Espressif has ported OpenOCD to support the ESP32 processor and the multicore FreeRTOS, which will be the foundation of most ESP32 apps, and has written some tools to help with features OpenOCD does not support natively.

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB under Linux, Windows and MacOS. Except for OS specific installation procedures, the s/w user interface and use procedures are the same across all supported operating systems.
Chapter 4. API Guides

Note: Screenshots presented in this document have been made for Eclipse Neon 3 running on Ubuntu 16.04 LTS. There may be some small differences in what a particular user interface looks like, depending on whether you are using Windows, MacOS or Linux and / or a different release of Eclipse.

4.19.2 How it Works?

The key software and hardware to perform debugging of ESP32 with OpenOCD over JTAG (Joint Test Action Group) interface is presented below and includes xtensa-esp32-elf-gdb debugger, OpenOCD on chip debugger and JTAG adapter connected to ESP32 target.

Under “Application Loading and Monitoring” there is another software and hardware to compile, build and flash application to ESP32, as well as to provide means to monitor diagnostic messages from ESP32.

Debugging using JTAG and application loading / monitoring is integrated under the Eclipse environment, to provide quick and easy transition from writing, compiling and loading the code to debugging, back to writing the code, and so on. All the software is available for Windows, Linux and MacOS platforms.

If the ESP-WROVER-KIT is used, then connection from PC to ESP32 is done effectively with a single USB cable. This is made possible by the FT2232H chip, which provides two USB channels, one for JTAG and the one for UART connection.

Depending on user preferences, both debugger and idf.py build can be operated directly from terminal/command line, instead from Eclipse.

4.19.3 Selecting JTAG Adapter

The quickest and most convenient way to start with JTAG debugging is by using ESP-WROVER-KIT. Each version of this development board has JTAG interface already built in. No need for an external JTAG adapter and extra wiring / cable to connect JTAG to ESP32. ESP-WROVER-KIT is using FT2232H JTAG interface operating at 20 MHz clock speed, which is difficult to achieve with an external adapter.

If you decide to use separate JTAG adapter, look for one that is compatible with both the voltage levels on the ESP32 as well as with the OpenOCD software. The JTAG port on the ESP32 is an industry-standard JTAG port which lacks (and does not need) the TRST pin. The JTAG I/O pins all are powered from the VDD_3P3_RTC pin (which
normally would be powered by a 3.3 V rail) so the JTAG adapter needs to be able to work with JTAG pins in that voltage range.

On the software side, OpenOCD supports a fair amount of JTAG adapters. See [http://openocd.org/doc/html/Debug-Adapter-Hardware.html](http://openocd.org/doc/html/Debug-Adapter-Hardware.html) for an (unfortunately slightly incomplete) list of the adapters OpenOCD works with. This page lists SWD-compatible adapters as well; take note that the ESP32 does not support SWD. JTAG adapters that are hardcoded to a specific product line, e.g. ST-LINK debugging adapters for STM32 families, will not work.

The minimal signalling to get a working JTAG connection are TDI, TDO, TCK, TMS and GND. Some JTAG debuggers also need a connection from the ESP32 power line to a line called e.g. Vtar to set the working voltage. SRST can optionally be connected to the CH_PD of the ESP32, although for now, support in OpenOCD for that line is pretty minimal.

ESP-Prog is an example for using an external board for debugging by connecting it to the JTAG pins of ESP32.

### 4.19.4 Setup of OpenOCD

If you have already set up ESP-IDF with CMake build system according to the [Getting Started Guide](https://docs.espressif.com/en/latest/zh/gets-started.html), then OpenOCD is already installed. After setting up the environment in your terminal, you should be able to run OpenOCD. Check this by executing the following command:

```
openocd --version
```

The output should be as follows (although the version may be more recent than listed here):

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
```

You may also verify that OpenOCD knows where its configuration scripts are located by printing the value of the `OPENOCD_SCRIPTS` environment variable, by typing `echo $OPENOCD_SCRIPTS` (for Linux and macOS) or `echo %OPENOCD_SCRIPTS%` (for Windows). If a valid path is printed, then OpenOCD is set up correctly.

If any of these steps do not work, please go back to the [setting up the tools](https://docs.espressif.com/en/latest/zh/gets-started.html) section of the Getting Started Guide.

---

**Note:** It is also possible to build OpenOCD from source. Please refer to the [Building OpenOCD from Sources](https://docs.espressif.com/en/latest/zh/developing/tools/openocd.html) section for details.

### 4.19.5 Configuring ESP32 Target

Once OpenOCD is installed, move to configuring ESP32 target (i.e ESP32 board with JTAG interface). You will do it in the following three steps:

- Configure and connect JTAG interface
- Run OpenOCD
- Upload application for debugging

**Configure and connect JTAG interface**

This step depends on JTAG and ESP32 board you are using - see the two cases described below.

**Configure ESP-WROVER-KIT JTAG Interface**  All versions of ESP-WROVER-KIT boards have built-in JTAG functionality. Putting it to work requires setting jumpers or DIP switches to enable JTAG functionality, and configuring USB drivers. Please refer to step by step instructions below.
Configure Hardware

- Enable on-board JTAG functionality by setting JP8 according to *ESP-WROVER-KIT V4.1 Getting Started Guide*, Section *Setup Options*.
- Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation:

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

Configure USB Drivers  Install and configure USB drivers, so OpenOCD is able to communicate with JTAG interface on ESP-WROVER-KIT board as well as with UART interface used to upload application for flash. Follow steps below specific to your operating system.

**Note:** ESP-WROVER-KIT uses an FT2232 adapter. The following instructions can also be used for other FT2232 based JTAG adapters.

**Windows**

2. Wait until USB ports of ESP-WROVER-KIT are recognized by Windows and drives are installed. If they do not install automatically, then download them from [https://www.ftdichip.com/Drivers/D2XX.htm](https://www.ftdichip.com/Drivers/D2XX.htm) and install manually.
3. Download Zadig tool (Zadig_X.X.exe) from [https://zadig.akeo.ie/](https://zadig.akeo.ie/) and run it.
4. In Zadig tool go to “Options” and check “List All Devices”.
5. Check the list of devices that should contain two ESP-WROVER-KIT specific USB entries: “Dual RS232-HS (Interface 0)” and “Dual RS232-HS (Interface 1)”. The driver name would be “FTDIBUS (vxxxx)” and USB ID: 0403 6010.

![Zadig tool](https://zadig.akeo.ie/)

**Fig. 37: Configuration of JTAG USB driver in Zadig tool**
Chapter 4. API Guides

6. The first device (Dual RS232-HS (Interface 0)) is connected to the JTAG port of the ESP32. Original FT-DIBUS (vxxxxx) driver of this device should be replaced with WinUSB (v6xxxxxx). To do so, select Dual RS232-HS (Interface 0) and reinstall attached driver to the WinUSB (v6xxxxxx), see picture above.

**Note:** Do not change the second device Dual RS232-HS (Interface 1). It is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section *Run OpenOCD*.

### Linux

2. Open a terminal, enter `ls -l /dev/ttyUSB*` command and check, if board’s USB ports are recognized by the OS. You are looking for similar result:

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
   ```
3. Following section “Permissions delegation” in OpenOCD’s README, set up the access permissions to both USB ports.
4. Log off and login, then cycle the power to the board to make the changes effective. In terminal enter again `ls -l /dev/ttyUSB*` command to verify, if group-owner has changed from dialout to plugdev:

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw-r-- 1 root plugdev 188, 0 Jul 10 19:07 /dev/ttyUSB0
crw-rw-r-- 1 root plugdev 188, 1 Jul 10 19:07 /dev/ttyUSB1
   ```
   If you see similar result and you are a member of plugdev group, then the set up is complete.

   The /dev/ttyUSBn interface with lower number is used for JTAG communication. The other interface is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section *Run OpenOCD*.

### MacOS

On macOS, using FT2232 for JTAG and serial port at the same time needs some additional steps. When the OS loads FTDI serial port driver, it does so for both channels of FT2232 chip. However only one of these channels is used as a serial port, while the other is used as JTAG. If the OS has loaded FTDI serial port driver for the channel used for JTAG, OpenOCD will not be able to connect to the chip. There are two ways around this:

1. Manually unload the FTDI serial port driver before starting OpenOCD, start OpenOCD, then load the serial port driver.
2. Modify FTDI driver configuration so that it doesn’t load itself for channel B of FT2232 chip, which is the channel used for JTAG on ESP-WROVER-KIT.

#### Manually unloading the driver

1. Install FTDI driver from [https://www.ftdichip.com/Drivers/VCP.htm](https://www.ftdichip.com/Drivers/VCP.htm)
2. Connect USB cable to the ESP-WROVER-KIT.
3. Unload the serial port driver:

   ```
   sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
   ```

   In some cases you may need to unload Apple’s FTDI driver as well:
   
   * macOS < 10.15:

---

Submit Document Feedback
Chapter 4. API Guides

```shell
sudo kextunload -b com.apple.driver.AppleUSBFTDI
```

* macOS 10.15:

```shell
sudo kextunload -b com.apple.DriverKit-AppleUSBFTDI
```

**Warning:** Attempting to use serial over the wrong channel with the FTDI driver will cause a kernel panic. The ESP-WROVER-KIT uses channel A for JTAG and channel B for serial.

4. Run OpenOCD:

```shell
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

5. In another terminal window, load FTDI serial port driver again:

```shell
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

**Note:** If you need to restart OpenOCD, there is no need to unload FTDI driver again — just stop OpenOCD and start it again. The driver only needs to be unloaded if ESP-WROVER-KIT was reconnected or power was toggled. This procedure can be wrapped into a shell script, if desired.

**Modifying FTDI driver** In a nutshell, this approach requires modification to FTDI driver configuration file, which prevents the driver from being loaded for channel B of FT2232H.

**Note:** Other boards may use channel A for JTAG, so use this option with caution.

**Warning:** This approach also needs signature verification of drivers to be disabled, so may not be acceptable for all users.

1. Open FTDI driver configuration file using a text editor (note `sudo`):

```shell
sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
```

2. Find and delete the following lines:

```xml
<key>FT2232H_B</key>
<dict>
  <key>CFBundleIdentifier</key>
  <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
  <key>IOClass</key>
  <string>FTDIUSBSerialDriver</string>
  <key>IOCProviderClass</key>
  <string>IOUSBInterface</string>
  <key>bConfigurationValue</key>
  <integer>1</integer>
  <key>bInterfaceNumber</key>
  <integer>1</integer>
  <key>bcdDevice</key>
  <integer>1792</integer>
  <key>idProduct</key>
  <integer>24592</integer>
  <key>idVendor</key>
  <integer>1027</integer>
</dict>
```

3. Save and close the file

Espressif Systems 1847 Release v4.4-dev-2313-gc69f0ec

Submit Document Feedback
4. Disable driver signature verification:
   1. Open Apple logo menu, choose “Restart…”
   2. When you hear the chime after reboot, press CMD+R immediately
   3. Once Recovery mode starts up, open Terminal
   4. Run the command:
   
   ```
csrutil enable --without kext
   ```
   5. Restart again

After these steps, serial port and JTAG can be used at the same time.

To carry on with debugging environment setup, proceed to section Run OpenOCD.

**Configure Other JTAG Interface** Refer to section Selecting JTAG Adapter for guidance what JTAG interface to select, so it is able to operate with OpenOCD and ESP32. Then follow three configuration steps below to get it working.

**Configure Hardware**

1. Identify all pins / signals on JTAG interface and ESP32 board, that should be connected to establish communication.

   Table 24: ESP32 JTAG pins

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

2. Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation.
3. Connect identified pin / signals of ESP32 and JTAG interface.

**Configure Drivers** You may need to install driver s/w to make JTAG work with computer. Refer to documentation of JTAG adapter, that should provide related details.

**Connect** Connect JTAG interface to the computer. Power on ESP32 and JTAG interface boards. Check if JTAG interface is visible by computer.

To carry on with debugging environment setup, proceed to section Run OpenOCD.

**Run OpenOCD**

Once target is configured and connected to computer, you are ready to launch OpenOCD.

Open a terminal and set it up for using the ESP-IDF as described in the setting up the environment section of the Getting Started Guide. Then run OpenOCD (this command works on Windows, Linux, and macOS):

```
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

**Note:** The files provided after `-f` above are specific for ESP-WROVER-KIT with ESP32-WROOM-32 module. You may need to provide different files depending on used hardware. For guidance see Configuration of OpenOCD for specific target.
For example, board/esp32c3-ftdi.cfg can be used for a custom board with an FT2232H or FT232H chip used for JTAG connection, or with ESP-Prog.

You should now see similar output (this log is for ESP-WROVER-KIT with ESP32-WROOM-32 module):

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32-wrover-kit-3.3v.cfg
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
http://openocd.org/doc/doxygen/bugs.html
none separate
adapter speed: 20000 kHz
force hard breakpoints
Info : ftdi: if you experience problems at higher adapter clocks, try the command
  "ftdi_tdo_sample_edge falling"
Info : clock speed 20000 kHz
Info : JTAG tap: esp32.cpu0 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
  part: 0x2003, ver: 0x1)
Info : JTAG tap: esp32.cpu1 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
  part: 0x2003, ver: 0x1)
Info : esp32: Debug controller was reset (pwrstat=0x5F, after clear 0x0F).
Info : esp32: Core was reset (pwrstat=0x5F, after clear 0x0F).
```

- If there is an error indicating permission problems, please see the “Permissions delegation” bit in the OpenOCD README file in ~/esp/openocd-esp32 directory.
- In case there is an error finding configuration files, e.g. Can’t find board/esp32-wrover-kit-3.3v.cfg, check OPENOCD_SCRIPTS environment variable is set correctly. This variable is used by OpenOCD to look for the files specified after -f. See Setup of OpenOCD section for details. Also check if the file is indeed under provided path.
- If you see JTAG errors (all ones/all zeroes) please check your connections, whether no other signals are connected to JTAG besides ESP32’s pins, and see if everything is powered on.

**Upload application for debugging**

Build and upload your application to ESP32 as usual, see *Step 8. Build the Project*.

Another option is to write application image to flash using OpenOCD via JTAG with commands like this:

```
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "program_esp filename.bin 0x10000 --verify exit"
```

OpenOCD flashing command `program_esp` has the following format:

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - Path to program image file.
- `offset` - Offset in flash bank to write image.
- `verify` - Optional. Verify flash contents after writing.
- `reset` - Optional. Reset target after programming.
- `exit` - Optional. Finally exit OpenOCD.

You are now ready to start application debugging. Follow steps described in section below.

**4.19.6 Launching Debugger**

The toolchain for ESP32 features GNU Debugger, in short GDB. It is available with other toolchain programs under filename: xtensa-esp32-elf-gdb. GDB can be called and operated directly from command line in a terminal. Another option is to call it from within IDE (like Eclipse, Visual Studio Code, etc.) and operate indirectly with help of GUI instead of typing commands in a terminal.

Both options of using debugger are discussed under links below.
It is recommended to first check if debugger works from Command Line and then move to using Eclipse.

### 4.19.7 Debugging Examples

This section is intended for users not familiar with GDB. It presents example debugging session from Eclipse using simple application available under get-started/blink and covers the following debugging actions:

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting the target manually
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Similar debugging actions are provided using GDB from Command Line.

Before proceeding to examples, set up your ESP32 target and load it with get-started/blink.

### 4.19.8 Building OpenOCD from Sources

Please refer to separate documents listed below, that describe build process.

#### Building OpenOCD from Sources for Windows

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

**Note:** Following instructions are assumed to be runned in MSYS2 environment with MINGW32 subsystem!

#### Install Dependencies

Install packages that are required to compile OpenOCD:

```
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winpthreads-git \
p7zip
```

#### Download Sources of OpenOCD

The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.
Chapter 4. API Guides

**Downloading libusb**  Build and export variables for a following OpenOCD compilation:

```bash
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"
export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
```

**Build OpenOCD**  Proceed with configuring and building OpenOCD:

```bash
cd ~/esp/openocd-esp32
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="$CFLAGS -Wno-error"
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build=i686-w64-mingw32 --host=i686-w64-mingw32
make
make
```

Optionally you can add `make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten. Also you could use `export DESTDIR="/custom/install/dir"; make install`.  

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.  
- If there is a submodule problem from OpenOCD, please cd to the `openocd-esp32` directory and input `git submodule update --init`.  
- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.  
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `./openocd-esp32/doc/INSTALL.txt`.  
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.Windows`.  
- Don’t forget to copy `libusb-1.0.dll` and `libwinpthread-1.dll` into `OOCD_INSTALLDIR/bin` from `~/esp/openocd-esp32/src`.  

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src` directory.  

**Full Listing**  A complete described previously process is provided below for the faster execution, e.g. as a shell script:

```bash
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-cross-winnethreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"; export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="$CFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build=i686-w64-mingw32 --host=i686-w64-mingw32
```

(continues on next page)
make
    cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
    cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="SPWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin

Next Steps To carry on with debugging environment setup, proceed to section Configuring ESP32 Target.

Building OpenOCD from Sources for Linux

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

Download Sources of OpenOCD The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

cd ~/esp
    git clone --recursive https://github.com/espressif/openocd-esp32.git

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

Install Dependencies Install packages that are required to compile OpenOCD.

Note: Install the following packages one by one, check if installation was successful and then proceed to the next package. Resolve reported problems before moving to the next step.

    sudo apt-get install make
    sudo apt-get install libtool
    sudo apt-get install pkg-config
    sudo apt-get install autoconf
    sudo apt-get install automake
    sudo apt-get install texinfo
    sudo apt-get install libusb-1.0

Note:
- Version of pkg-config should be 0.2.3 or above.
- Version of autoconf should be 2.6.4 or above.
- Version of automake should be 1.9 or above.
- When using USB-Blaster, ASIX Presto, OpenJTAG and FT2232 as adapters, drivers libFTDI and FTD2XX need to be downloaded and installed.
- When using CMSIS-DAP, HIDAPI is needed.

Build OpenOCD Proceed with configuring and building OpenOCD:
Optionaly you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please cd to the openocd-esp32 directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/openocd-esp32/bin` directory.

**Next Steps** To carry on with debugging environment setup, proceed to section *Configuring ESP32 Target*. 

**Building OpenOCD from Sources for MacOS**

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section *Setup of OpenOCD*.

**Download Sources of OpenOCD** The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in `~/esp/openocd-esp32` directory.

**Install Dependencies** Install packages that are required to compile OpenOCD using Homebrew:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

**Build OpenOCD** Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

**Note:**
Chapter 4. API Guides

• Should an error occur, resolve it and try again until the command `make` works.
• If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
• If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
• If the information of your device is not shown in the log, use `./configure` to enable it as described in `./openocd-esp32/doc/INSTALL.txt`.
• For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.OSX`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src/openocd` directory.

Next Steps To carry on with debugging environment setup, proceed to section Configuring ESP32 Target.

The examples of invoking OpenOCD in this document assume using pre-built binary distribution described in section Setup of OpenOCD.

To use binaries build locally from sources, change the path to OpenOCD executable to `src/openocd` and set the `OPENOCD_SCRIPTS` environment variable so that OpenOCD can find the configuration files. For Linux and macOS:

```
$ cd ~/esp/openocd-esp32
$ export OPENOCD_SCRIPTS=$PWD/tcl
```

For Windows:

```
$ cd %USERPROFILE%\esp\openocd-esp32
$ set "OPENOCD_SCRIPTS=%CD%\tcl"
```

Example of invoking OpenOCD build locally from sources, for Linux and macOS:

```
$ src/openocd -f board/esp32-wrover-kit-3.3v.cfg
```

and Windows:

```
$ src\openocd -f board\esp32-wrover-kit-3.3v.cfg
```

4.19.9 Tips and Quirks

This section provides collection of links to all tips and quirks referred to from various parts of this guide.

Tips and Quirks

This section provides collection of all tips and quirks referred to from various parts of this guide.

Breakpoints and watchpoints available ESP32 debugger supports 2 hardware implemented breakpoints and 64 software ones. Hardware breakpoints are implemented by ESP32 chip’s logic and can be set anywhere in the code: either in flash or IRAM program’s regions. Additionally there are 2 types of software breakpoints implemented by OpenOCD: flash (up to 32) and IRAM (up to 32) breakpoints. Currently GDB can not set software breakpoints in flash. So until this limitation is removed those breakpoints have to be emulated by OpenOCD as hardware ones (see below for details). ESP32 also supports two watchpoints, so two variables can be watched for change or read by the GDB command `watch myVariable`. Note that menuconfig option CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK uses the 2nd watchpoint and will not provide expected results, if you also try to use it within OpenOCD / GDB. See menuconfig’s help for detailed description.
Chapter 4. API Guides

What else should I know about breakpoints? Emulating part of hardware breakpoints using software flash ones means that the GDB command `hb myFunction` which is invoked for function in flash will use pure hardware breakpoint if it is available otherwise one of the 32 software flash breakpoints is used. The same rule applies to the `b myFunction`-like commands. In this case GDB will decide what type of breakpoint to set itself. If `myFunction` is resided in writable region (IRAM) software IRAM breakpoint will be used otherwise hardware or software flash breakpoint is used as it is done for `hb` command.

Flash Mappings vs SW Flash Breakpoints In order to set/clear software breakpoints in flash, OpenOCD needs to know their flash addresses. To accomplish conversion from the ESP32 address space to the flash one, OpenOCD uses mappings of program’s code regions resided in flash. Those mappings are kept in the image header which is prepended to program binary data (code and data segments) and is specific to every application image written to the flash. So to support software flash breakpoints OpenOCD should know where application image under debugging is resided in the flash. By default OpenOCD reads partition table at 0x8000 and uses mappings from the first found application image, but there can be the cases when it will not work, e.g. partition table is not at standard flash location or even there can be multiple images: one factory and two OTA and you may want to debug any of them. To cover all possible debugging scenarios OpenOCD supports special command which can be used to set arbitrary location of application image to debug. The command has the following format:

`esp appimage_offset <offset>`

Offset should be in hex format. To reset to the default behaviour you can specify `-1` as offset.

**Note:** Since GDB requests memory map from OpenOCD only once when connecting to it, this command should be specified in one of the TCL configuration files, or passed to OpenOCD via its command line. In the latter case command line should look like below:

```bash
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "init; halt; esp appimage_offset=-0x210000"
```

Another option is to execute that command via OpenOCD telnet session and then connect GDB, but it seems to be less handy.

Why stepping with “next” does not bypass subroutine calls? When stepping through the code with `next` command, GDB is internally setting a breakpoint (one out of two available) ahead in the code to bypass the subroutine calls. This functionality will not work, if the two available breakpoints are already set elsewhere in the code. If this is the case, delete breakpoints to have one “spare”. With both breakpoints already used, stepping through the code with `next` command will work as like with `step` command and debugger will step inside subroutine calls.

Support options for OpenOCD at compile time ESP-IDF has some support options for OpenOCD debugging which can be set at compile time:

- `CONFIG_ESP32_DEBUG_OCDAWARE` is enabled by default. If a panic or unhandled exception is thrown and a JTAG debugger is connected (ie OpenOCD is running), ESP-IDF will break into the debugger.
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` (disabled by default) sets watchpoint index 1 (the second of two) at the end of any task stack. This is the most accurate way to debug task stack overflows. Click the link for more details.

Please see the project configuration menu menu for more details on setting compile-time options.

FreeRTOS support OpenOCD has explicit support for the ESP-IDF FreeRTOS. GDB can see FreeRTOS tasks as threads. Viewing them all can be done using the GDB `i threads` command, changing to a certain task is done with `thread n`, with `n` being the number of the thread. FreeRTOS detection can be disabled in target’s configuration. For more details see Configuration of OpenOCD for specific target.
Why to set SPI flash voltage in OpenOCD configuration? The MTDI pin of ESP32, being among four pins used for JTAG communication, is also one of ESP32’s bootstrapping pins. On power up ESP32 is sampling binary level on MTDI to set its internal voltage regulator used to supply power to external SPI flash chip. If binary level on MTDI pin on power up is low, the voltage regulator is set to deliver 3.3 V. If it is high, then the voltage is set to 1.8 V. The MTDI pin should have a pull-up or may rely on internal weak pull down resistor (see ESP32 Series Datasheet for details), depending on the type of SPI chip used. Once JTAG is connected, it overrides the pull-up or pull-down resistor that is supposed to do the bootstrapping.

To handle this issue OpenOCD’s board configuration file (e.g. board\esp32-wrover-kit-3.3v.cfg for ESP-WROVER-KIT board) provides ESP32_FLASH_VOLTAGE parameter to set the idle state of the TDO line to a specified binary level, therefore reducing the chance of a bad bootup of application due to incorrect flash voltage.

Check specification of ESP32 module connected to JTAG, what is the power supply voltage of SPI flash chip. Then set ESP32_FLASH_VOLTAGE accordingly. Most WROOM modules use 3.3 V flash. WROVER earlier than ESP32-WROVER-B use 1.8 V flash, while ESP32-WROVER-B and -E modules use 3.3 V flash.

Optimize JTAG speed In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG. To do so use the following tips.

1. The upper limit of JTAG clock frequency is 20 MHz if CPU runs at 80 MHz, or 26 MHz if CPU runs at 160 MHz or 240 MHz.
2. Depending on particular JTAG adapter and the length of connecting cables, you may need to reduce JTAG frequency below 20 / 26 MHz.
3. In particular reduce frequency, if you get DSR/DIR errors (and they do not relate to OpenOCD trying to read from a memory range without physical memory being present there).
4. ESP-WROVER-KIT operates stable at 20 / 26 MHz.

What is the meaning of debugger’s startup commands? On startup, debugger is issuing sequence of commands to reset the chip and halt it at specific line of code. This sequence (shown below) is user defined to pick up at most convenient / appropriate line and start debugging.

- set remote hardware-watchpoint-limit 2 — Restrict GDB to using two hardware watchpoints supported by the chip, 2 for ESP32. For more information see https://sourceware.org/gdb/onlinedocs/gdb/Remote-Configuration.html.
- mon reset halt — reset the chip and keep the CPUs halted
- flushregs — monitor (mon) command can not inform GDB that the target state has changed. GDB will assume that whatever stack the target had before mon reset halt will still be valid. In fact, after reset the target state will change, and executing flushregs is a way to force GDB to get new state from the target.
- thb app_main — insert a temporary hardware breakpoint at app_main, put here another function name if required
- c — resume the program. It will then stop at breakpoint inserted at app_main.

Configuration of OpenOCD for specific target There are several kinds of OpenOCD configuration files (*.cfg). All configuration files are located in subdirectories of share/openocd/scripts directory of OpenOCD distribution (or tcl/scripts directory of the source repository). For the purposes of this guide, the most important ones are board, interface and target.

- interface configuration files describe the JTAG adapter. Examples of JTAG adapters are ESP-Prog and J-Link.
- target configuration files describe specific chips, or in some cases, modules.
- board configuration files are provided for development boards with a built-in JTAG adapter. Such files include an interface configuration file to choose the adapter, and target configuration file to choose the chip/module.

The following configuration files are available for ESP32:
Table 25: OpenOCD configuration files for ESP32

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>board/esp32-wrover-kit-3.3v.cfg</code></td>
<td>Board configuration file for ESP-WROVER-KIT with a 3.3 V ESP32-WROOM-32 module or ESP32-WROVER-B / ESP32-WROVER-E module.</td>
</tr>
<tr>
<td><code>board/esp32-wrover-kit-1.8v.cfg</code></td>
<td>Board configuration file for ESP-WROVER-KIT with an 1.8 V ESP32-WROVER module.</td>
</tr>
<tr>
<td><code>board/esp32-ethernet-kit-3.3v.cfg</code></td>
<td>Board configuration file for ESP-Ethernet-KIT with a 3.3 V ESP32-WROVER-B / ESP32-WROVER-E module.</td>
</tr>
<tr>
<td><code>target/esp32.cfg</code></td>
<td>ESP32 target configuration file. Can be used together with one of the interface/configuration files.</td>
</tr>
<tr>
<td><code>target/esp32-solo-1.cfg</code></td>
<td>Target configuration file for ESP32-SOLO-1 module. Different from <code>esp32.cfg</code> in that it only configures one CPU.</td>
</tr>
<tr>
<td><code>interface/ftdi/esp32_devkitj_v1.cfg</code></td>
<td>JTAG adapter configuration file for ESP-WROVER-KIT and ESP-Prog boards.</td>
</tr>
</tbody>
</table>

If you are using one of the boards which have a pre-defined configuration file, you only need to pass one `-f` argument to OpenOCD, specifying that file.

If you are using a board not listed here, you need to specify both the interface configuration file and target configuration file.

**Custom configuration files** OpenOCD configuration files are written in TCL, and include a variety of choices for customization and scripting. This can be useful for non-standard debugging situations. Please refer to [OpenOCD Manual](#) for the TCL scripting reference.

**OpenOCD configuration variables** The following variables can be optionally set before including the ESP-specific target configuration file. This can be done either in a custom configuration file, or from the command line.

The syntax for setting a variable in TCL is:

```
set VARIABLE_NAME value
```

To set a variable from the command line (replace the name of .cfg file with the correct file for your board):

```
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

It is important to set the variable before including the ESP-specific configuration file, otherwise the variable will not have effect. You can set multiple variables by repeating the `-c` option.

Table 26: Common ESP-related OpenOCD variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESPRTOS</code></td>
<td>Set to <code>none</code> to disable RTOS support. In this case, thread list will not be available in GDB. Can be useful when debugging FreeRTOS itself, and stepping through the scheduler code.</td>
</tr>
<tr>
<td><code>ESP_FLASH_SIZE</code></td>
<td>Set to 0 to disable Flash breakpoints support.</td>
</tr>
<tr>
<td><code>ESP_SEMIHOST_BASED</code></td>
<td>Set to the path (on the host) which will be the default directory for semihosting functions.</td>
</tr>
</tbody>
</table>
### Table 27: ESP32-specific OpenOCD variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32_FLASH_VOLTAGE</td>
<td>When using 1.8 V flash ESP32 based modules, set this variable to 1.8. Refer to Why to set SPI flash voltage in OpenOCD configuration?</td>
</tr>
<tr>
<td>ESP32_ONLYCPU</td>
<td>For multi-core targets, can be set to 1 to only enable single core debugging.</td>
</tr>
</tbody>
</table>

**How debugger resets ESP32?** The board can be reset by entering `mon reset` or `mon reset halt` into GDB.

**Do not use JTAG pins for something else** Operation of JTAG may be disturbed, if some other h/w is connected to JTAG pins besides ESP32 module and JTAG adapter. ESP32 JTAG is using the following pins:

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

JTAG communication will likely fail, if configuration of JTAG pins is changed by user application. If OpenOCD initializes correctly (detects the two Tensilica cores), but loses sync and spews out a lot of DTR/DIR errors when the program is ran, it is likely that the application reconfigures the JTAG pins to something else, or the user forgot to connect Vtar to a JTAG adapter that needed it.

Below is an excerpt from series of errors reported by GDB after the application stepped into the code that reconfigured MTDO pin to be an input:

```plaintext
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_, an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_, an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_, an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated_, an overrun!
```

**JTAG with Flash Encryption or Secure Boot** By default, enabling Flash Encryption and/or Secure Boot will disable JTAG debugging. On first boot, the bootloader will burn an eFuse bit to permanently disable JTAG at the same time it enables the other features.

The project configuration option `CONFIG_SECURE_BOOT_ALLOW_JTAG` will keep JTAG enabled at this time, removing all physical security but allowing debugging. (Although the name suggests Secure Boot, this option can be applied even when only Flash Encryption is enabled).

However, OpenOCD may attempt to automatically read and write the flash in order to set software breakpoints. This has two problems:

- Software breakpoints are incompatible with Flash Encryption, OpenOCD currently has no support for encrypting or decrypting flash contents.
- If Secure Boot is enabled, setting a software breakpoint will change the digest of a signed app and make the signature invalid. This means if a software breakpoint is set and then a reset occurs, the signature verification will fail on boot.
To disable software breakpoints while using JTAG, add an extra argument `-c 'set ESP_FLASH_SIZE 0'` to the start of the OpenOCD command line, see *OpenOCD configuration variables*.

**Note:** For the same reason, the ESP-IDF app may fail bootloader verification of app signatures, when this option is enabled and a software breakpoint is set.

**JTAG and ESP32-WROOM-32 AT firmware Compatibility Issue** The ESP32-WROOM series of modules come pre-flashed with AT firmware. This firmware configures the pins GPIO12 to GPIO15 as SPI slave interface, which makes using JTAG impossible.

To make JTAG available, build new firmware that is not using pins GPIO12 to GPIO15 dedicated to JTAG communication. After that, flash the firmware onto your module. See also *Do not use JTAG pins for something else*.

**Reporting issues with OpenOCD / GDB** In case you encounter a problem with OpenOCD or GDB programs itself and do not find a solution searching available resources on the web, open an issue in the OpenOCD issue tracker under https://github.com/espressif/openocd-esp32/issues.

1. In issue report provide details of your configuration:
   a. JTAG adapter type, and the chip/module being debugged.
   b. Release of ESP-IDF used to compile and load application that is being debugged.
   c. Details of OS used for debugging.
   d. Is OS running natively on a PC or on a virtual machine?
2. Create a simple example that is representative to observed issue. Describe steps how to reproduce it. In such an example debugging should not be affected by non-deterministic behaviour introduced by the Wi-Fi stack, so problems will likely be easier to reproduce, if encountered once.
3. Prepare logs from debugging session by adding additional parameters to start up commands.
   **OpenOCD:**
   ```
   openocd -l openocd_log.txt -d3 -f board/esp32-wrover-kit-3.3v.cfg
   ```
   Logging to a file this way will prevent information displayed on the terminal. This may be a good thing taken amount of information provided, when increased debug level `-d3` is set. If you still like to see the log on the screen, then use another command instead:
   ```
   openocd -d3 -f board/esp32-wrover-kit-3.3v.cfg 2>&1 | tee openocd.log
   ```
   **Debugger:**
   ```
   xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
   ```
   Optionally add command remotelogfile gdb_log.txt to the gdbinit file.
4. Attach both openocd_log.txt and gdb_log.txt files to your issue report.

**4.19.10 Related Documents**

**Using Debugger**

This section covers configuration and running debugger using several methods:

- from *Eclipse*
- from *Command Line*
- using *idf.py debug targets*

**Eclipse**

**Note:** It is recommended to first check if debugger works using *idf.py debug targets* or from *Command Line* and then move to using Eclipse.
Debugging functionality is provided out of box in standard Eclipse installation. Another option is to use plugins like “GDB Hardware Debugging” plugin. We have found this plugin quite convenient and decided to use throughout this guide.

To begin with, install “GDB Hardware Debugging” plugin by opening Eclipse and going to Help > Install New Software.

Once installation is complete, configure debugging session following steps below. Please note that some of configuration parameters are generic and some are project specific. This will be shown below by configuring debugging for “blink” example project. If not done already, add this project to Eclipse workspace following guidance in section Build and Flash with Eclipse IDE. The source of get-started/blink application is available in examples directory of ESP-IDF repository.

1. In Eclipse go to Run > Debug Configuration. A new window will open. In the window’s left pane double click “GDB Hardware Debugging” (or select “GDB Hardware Debugging” and press the “New” button) to create a new configuration.
2. In a form that will show up on the right, enter the “Name:” of this configuration, e.g. “Blink checking”.  
3. On the “Main” tab below, under “Project:” , press “Browse” button and select the “blink” project.  
4. In next line “C/C++ Application:” press “Browse” button and select “blink.elf” file. If “blink.elf” is not there, then likely this project has not been build yet. See Build and Flash with Eclipse IDE how to do it.  
5. Finally, under “Build (if required) before launching” click “Disable auto build”.  
A sample window with settings entered in points 1 - 5 is shown below.

![Configuration of GDB Hardware Debugging - Main tab](image)

7. Change default configuration of “Remote host” by entering 3333 under the “Port number”.  
Configuration entered in points 6 and 7 is shown on the following picture.  
8. The last tab to that requires changing of default configuration is “Startup”. Under “Initialization Commands” uncheck “Reset and Delay (seconds)” and “Halt”. Then, in entry field below, enter the following lines:
Fig. 39: Configuration of GDB Hardware Debugging - Debugger tab
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2

Note: If you want to update image in the flash automatically before starting new debug session add the following lines of commands at the beginning of “Initialization Commands” textbox:

mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify

For description of program_esp command see Upload application for debugging.

10. Further down on the same tab, establish an initial breakpoint to halt CPUs after they are reset by debugger. The plugin will set this breakpoint at the beginning of the function entered under “Set break point at:”. Checkout this option and enter app_main in provided field.
11. Checkout “Resume” option. This will make the program to resume after mon reset halt is invoked per point 8. The program will then stop at breakpoint inserted at app_main.

Configuration described in points 8 - 11 is shown below.

Fig. 40: Configuration of GDB Hardware Debugging - Startup tab

If the “Startup” sequence looks convoluted and respective “Initialization Commands” are not clear to you, check What is the meaning of debugger’s startup commands? for additional explanation.

12. If you previously completed Configuring ESP32 Target steps described above, so the target is running and ready to talk to debugger, go right to debugging by pressing “Debug” button. Otherwise press “Apply” to save changes, go back to Configuring ESP32 Target and return here to start debugging.
Once all 1 - 12 configuration steps are satisfied, the new Eclipse perspective called “Debug” will open as shown on example picture below.

![Debug Perspective in Eclipse](image)

Fig. 41: Debug Perspective in Eclipse

If you are not quite sure how to use GDB, check Eclipse example debugging session in section Debugging Examples.

**Command Line**

1. Begin with completing steps described under Configuring ESP32 Target. This is prerequisite to start a debugging session.

2. Open a new terminal session and go to directory that contains project for debugging, e.g.

   ```
   cd ~/esp/blink
   ```

3. When launching a debugger, you will need to provide couple of configuration parameters and commands. Instead of entering them one by one in command line, create a configuration file and name it `gdbinit`:

   ```
   target remote :3333
   set remote hardware-watchpoint-limit 2
   mon reset halt
   flushregs
   thb app_main
   c
   ```

   Save this file in current directory.

   For more details what’s inside `gdbinit` file, see What is the meaning of debugger’s startup commands?

4. Now you are ready to launch GDB. Type the following in terminal:
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf

5. If previous steps have been done correctly, you will see a similar log concluded with (gdb) prompt:

```
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
GNU gdb (crosstool-NG crosstool-ng-1.22.0-61-gab8375a) 7.10

```

Note the third line from bottom that shows debugger halting at breakpoint established in gdbinit file at function app_main(). Since the processor is halted, the LED should not be blinking. If this is what you see as well, you are ready to start debugging.

If you are not quite sure how to use GDB, check Command Line example debugging session in section Debugging Examples.
**idf.py debug targets** It is also possible to execute the described debugging tools conveniently from `idf.py`. These commands are supported:

1. `idf.py openocd`
   Runs OpenOCD in a console with configuration defined in the environment or via command line. It uses default script directory defined as `OPENOCD_SCRIPTS` environmental variable, which is automatically added from an Export script (export.sh or export.bat). It is possible to override the script location using command line argument `--openocd-scripts`.
   As for the JTAG configuration of the current board, please use the environmental variable `OPENOCD_COMMANDS` or `--openocd-commands` command line argument. If none of the above is defined, OpenOCD is started with `-f board/esp32-wrover-kit-3.3v.cfg` board definition.

2. `idf.py gdb`
   Starts the gdb the same way as the **Command Line**, but generates the initial gdb scripts referring to the current project elf file.

3. `idf.py gdbtui`
   The same as 2, but starts the gdb with `tui` argument allowing very simple source code view.

4. `idf.py gdbgui`
   Starts `gdbgui` debugger frontend enabling out-of-the-box debugging in a browser window.
   It is possible to combine these debugging actions on a single command line allowing convenient setup of blocking and non-blocking actions in one step. `idf.py` implements a simple logic to move the background actions (such as openocd) to the beginning and the interactive ones (such as gdb, monitor) to the end of the action list.
   An example of a very useful combination is:

   ```
   idf.py openocd gdbgui monitor
   ```

   The above command runs OpenOCD in the background, starts `gdbgui` to open a browser window with active debugger frontend and opens a serial monitor in the active console.

**Debugging Examples**

This section describes debugging with GDB from **Eclipse** as well as from **Command Line**.

**Eclipse** Verify if your target is ready and loaded with `get-started/blink` example. Configure and start debugger following steps in section **Eclipse**. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`.

**Examples in this section**

1. **Navigating through the code, call stack and threads**
2. **Setting and clearing breakpoints**
3. **Halting the target manually**
4. **Stepping through the code**
5. **Checking and setting memory**
6. **Watching and setting program variables**
7. **Setting conditional breakpoints**

**Navigating through the code, call stack and threads** When the target is halted, debugger shows the list of threads in “Debug” window. The line of code where program halted is highlighted in another window below, as shown on the following picture. The LED stops blinking.

Specific thread where the program halted is expanded showing the call stack. It represents function calls that lead up to the highlighted line of code, where the target halted. The first line of call stack under Thread #1 contains the last called function `app_main()`, that in turn was called from function `main_task()` shown in a line below. Each line of the stack also contains the file name and line number where the function was called. By clicking / highlighting the stack entries, in window below, you will see contents of this file.
Fig. 42: Debug Perspective in Eclipse
Fig. 43: Target halted during debugging
By expanding threads you can navigate throughout the application. Expand Thread #5 that contains much longer call stack. You will see there, besides function calls, numbers like 0x4000000c. They represent addresses of binary code not provided in source form.

![call stack diagram]

Fig. 44: Navigate through the call stack

In another window on right, you can see the disassembled machine code no matter if your project provides it in source or only the binary form.

Go back to the app_main() in Thread #1 to familiar code of blink.c file that will be examined in more details in the following examples. Debugger makes it easy to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

**Setting and clearing breakpoints**  
When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let’s establish two breakpoints when the state of LED changes. Basing on code listing above, this happens at lines 33 and 36. To do so, hold the “Control” on the keyboard and double clink on number 33 in file blink.c file. A dialog will open where you can confirm your selection by pressing “OK” button. If you do not like to see the dialog just double click the line number. Set another breakpoint in line 36.

Information how many breakpoints are set and where is shown in window “Breakpoints” on top right. Click “Show Breakpoints Supported by Selected Target” to refresh this list. Besides the two just set breakpoints the list may contain temporary breakpoint at function app_main() established at debugger start. As maximum two breakpoints are allowed (see Breakpoints and watchpoints available), you need to delete it, or debugging will fail.

If you now click “Resume” (click blink_task() under “Thread #8”, if “Resume” button is grayed out), the processor will run and halt at a breakpoint. Clicking “Resume” another time will make it run again, halt on second breakpoint, and so on.
Fig. 45: Setting a breakpoint
Fig. 46: Three breakpoints are set / maximum two are allowed.
You will also be able to see that LED is changing the state after each click to “Resume” program execution.

Read more about breakpoints under Breakpoints and watchpoints available and What else should I know about breakpoints?

**Halting the target manually** When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by pressing “Suspend” button.

To check it, delete all breakpoints and click “Resume”. Then click “Suspend”. Application will be halted at some random point and LED will stop blinking. Debugger will expand thread and highlight the line of code where application halted.

![Image of Debugger Interface with Resume and Suspend buttons]

In particular case above, the application has been halted in line 52 of code in file freertos_hooks.c Now you can resume it again by pressing “Resume” button or do some debugging as discussed below.

**Stepping through the code** It is also possible to step through the code using “Step Into (F5)” and “Step Over (F6)” commands. The difference is that “Step Into (F5)” is entering inside subroutines calls, while “Step Over (F6)” steps over the call, treating it as a single source line.

Before being able to demonstrate this functionality, using information discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of blink.c.

Resume program by entering pressing F8 and let it halt. Now press “Step Over (F6)”, one by one couple of times, to see how debugger is stepping one program line at a time.

If you press “Step Into (F5)” instead, then debugger will step inside subroutine calls.

In this particular case debugger stepped inside gpio_set_level(BLINK_GPIO, 0) and effectively moved to gpio.c driver code.
Fig. 48: Stepping through the code with “Step Over (F6)”
Fig. 49: Stepping through the code with “Step Into (F5)”
See Why stepping with “next” does not bypass subroutine calls? for potential limitation of using next command.

**Checking and setting memory**

To display or set contents of memory use “Memory” tab at the bottom of “Debug” perspective.

With the “Memory” tab, we will read from and write to the memory location 0x3FF44004 labeled as GPIO_OUT_REG used to set and clear individual GPIO’s.

For more information, see ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

Being in the same blink.c project as before, set two breakpoints right after gpio_set_level instruction. Click “Memory” tab and then “Add Memory Monitor” button. Enter 0x3FF44004 in provided dialog.

Now resume program by pressing F8 and observe “Monitor” tab.

![Fig. 50: Observing memory location 0x3FF44004 changing one bit to “ON”](image)

You should see one bit being flipped over at memory location 0x3FF44004 (and LED changing the state) each time F8 is pressed.

![Fig. 51: Observing memory location 0x3FF44004 changing one bit to “OFF”](image)

To set memory use the same “Monitor” tab and the same memory location. Type in alternate bit pattern as previously observed. Immediately after pressing enter you will see LED changing the state.

**Watching and setting program variables**

A common debugging tasks is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file blink.c by adding a declaration of

---

Espressif Systems 1874 Release v4.4-dev-2313-gc69f0ec

Submit Document Feedback
Chapter 4. API Guides

a global variable int i above definition of function blink_task. Then add i++ inside while(1) of this function to get i incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter a breakpoint in the line where you put i++.

In next step, in the window with “Breakpoints” , click the “Expressions” tab. If this tab is not visible, then add it by going to the top menu Window > Show View > Expressions. Then click “Add new expression” and enter i.

Resume program execution by pressing F8. Each time the program is halted you will see i value being incremented.

Fig. 52: Watching program variable “i”

To modify i enter a new number in “Value” column. After pressing “Resume (F8)” the program will keep incrementing i starting from the new entered number.

Setting conditional breakpoints Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Right click on the breakpoint to open a context menu and select “Breakpoint Properties”. Change the selection under “Type:” to “Hardware” and enter a “Condition:” like i == 2.

If current value of i is less than 2 (change it if required) and program is resumed, it will blink LED in a loop until condition i == 2 gets true and then finally halt.

Command Line Verify if your target is ready and loaded with get-started/blink example. Configure and start debugger following steps in section Command Line. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at app_main();
Fig. 53: Setting a conditional breakpoint
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/.blink.c:43
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, _\n  _\n(NULL);
(gdb)

Examples in this section
1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting and resuming the application
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Navigating through the code, call stack and threads
When you see the (gdb) prompt, the application is halted. LED should not be blinking.

To find out where exactly the code is halted, enter l or list, and debugger will show couple of lines of code around the halt point (line 43 of code in file blink.c)

(gdb) l
38 }
39 }
40
t void app_main()
42 {
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, _\n  _\n(NULL);
44 }
(gdb)

Check how code listing works by entering, e.g. l 30, 40 to see particular range of lines of code.
You can use bt or backtrace to see what function calls lead up to this code:

(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/.blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp-idf/components/_\n  esp32/.cpu_start.c:339
(gdb)

Line #0 of output provides the last function call before the application halted, i.e. app_main () we have listed
previously. The app_main () was in turn called by function main_task from line 339 of code located in file
cpu_start.c.

To get to the context of main_task in file cpu_start.c, enter frame N, where N = 1, because the
main_task is listed under #1):

(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp-idf/components/_\n  esp32/.cpu_start.c:339
339 app_main();
(gdb)

Enter l and this will reveal the piece of code that called app_main() (in line 339):

(gdb) l
334 ;
335 }
(continues on next page)
Chapter 4. API Guides

(continued from previous page)

336 #endif
337 // Enable allocation in region where the startup stacks were located.
338 heap_caps_enable_nonos_stack_heaps();
339 app_main();
340 vTaskDelete(NULL);
341 }
342
(gdb)

By listing some lines before, you will see the function name main_task we have been looking for:

(gdb) l 326, 341
326 static void main_task(void* args)
327 {
328 // Now that the application is about to start, disable boot watchdogs
329 REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330 REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331 #if !CONFIG_FREERTOS_UNICORE
332 // Wait for FreeRTOS initialization to finish on APP CPU, before replacing...
333 while (port_xSchedulerRunning[1] == 0) {
334        
335     }
336 #endif
337 // Enable allocation in region where the startup stacks were located.
338 heap_caps_enable_nonos_stack_heaps();
339 app_main();
340 vTaskDelete(NULL);
341 }
(gdb)

To see the other code, enter i threads. This will show the list of threads running on target:

(gdb) i threads
   Id   Target Id   Frame
  8   Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=...
      at /home/user-name/esp/esp-idf/components/esp32/../dport_access.c:170
  7   Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
      pvBuffer=0x0, xTicksToWait=1644638200,
      xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.c:1452
  6   Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
  5   Thread 1073410208 (ipc1 : Running) 0x4000bf4a in ?? ()
  4   Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
      at /home/user-name/esp/esp-idf/components/esp32/../dport_access.c:150
  3   Thread 107341516 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
  2   Thread 107341512 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
   * 1   Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
      ..main/../blink.c:43
(gdb)

The thread list shows the last function calls per each thread together with the name of C source file if available.

You can navigate to specific thread by entering thread N, where N is the thread Id. To see how it works go to thread 5:

(gdb) thread 5
(continues on next page)
Then check the backtrace:

```
(gdb) bt
#0  0x4000bfea in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
    esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
    freertos/./tasks.c:2846
#3  0x4008532b in _frxt_dispatch ()
#4  0x4008532b in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/ 
    freertos/./port.c:222
#5  0x4000000c in ?? ()
#6  0x4000000c in ?? ()
#7  0x4000000c in ?? ()
#8  0x4000000c in ?? ()
(gdb)
```

As you see, the backtrace may contain several entries. This will let you check what exact sequence of function calls lead to the code where the target halted. Question marks ?? instead of a function name indicate that application is available only in binary format, without any source file in C language. The value like 0x4000bfea is the memory address of the function call.

Using `bt`, `i threads`, `thread N` and `list` commands we are now able to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

### Setting and clearing breakpoints

When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let’s establish two breakpoints when the state of LED changes. Basing on code listing above this happens at lines 33 and 36. Breakpoints may be established using command `break M` where M is the code line number:

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

If you new enter `c`, the processor will run and halt at a breakpoint. Entering `c` another time will make it run again, halt on second breakpoint, and so on:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)     APP_CPU: PC=0x400D10D8
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
    blink.c:33
  33  gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active)     APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active)     APP_CPU: PC=0x400D10D8
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
    blink.c:36
  36  gpio_set_level(BLINK_GPIO, 1);
```

(continues on next page)
You will be also able to see that LED is changing the state only if you resume program execution by entering \texttt{c}.

To examine how many breakpoints are set and where, use command \texttt{info break}:

\begin{verbatim}
(gdb) info break
Num Type Disp Enb Address What
2 breakpoint keep y 0x400db6f6 in blink_task at /home/user-name/esp/blink/main/./blink.c:33
  breakpoint already hit 1 time
3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/blink/main/./blink.c:36
  breakpoint already hit 1 time
(gdb)
\end{verbatim}

Please note that breakpoint numbers (listed under \texttt{Num}) start with \texttt{2}. This is because first breakpoint has been already established at function \texttt{app_main()} by running command \texttt{thb app_main} on debugger launch. As it was a temporary breakpoint, it has been automatically deleted and now is not listed anymore.

To remove breakpoints enter \texttt{delete N} command (in short \texttt{d N}), where \texttt{N} is the breakpoint number:

\begin{verbatim}
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
\end{verbatim}

Read more about breakpoints under \textit{Breakpoints and watchpoints available} and \textit{What else should I know about breakpoints?}

\textbf{Halting and resuming the application} When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any breakpoints defined. In such case, to go back to debugging mode, you can break program execution manually by entering \texttt{Ctrl+C}.

To check it delete all breakpoints and enter \texttt{c} to resume application. Then enter \texttt{Ctrl+C}. Application will be halted at some random point and LED will stop blinking. Debugger will print the following:

\begin{verbatim}
(gdb) c
Continuing.
^C Target halted. PRO_CPU: PC=0x400D0C00 APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/components/esp32/./freertos_hooks.c:52
  asm("waiti 0");
(gdb)
\end{verbatim}

In particular case above, the application has been halted in line \texttt{52} of code in file \texttt{freertos_hooks.c}. Now you can resume it again by enter \texttt{c} or do some debugging as discussed below.

\textbf{Note:} In MSYS2 shell \texttt{Ctrl+C} does not halt the target but exists debugger. To resolve this issue consider debugging with \textit{Eclipse} or check a workaround under \url{http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt}.

\textbf{Stepping through the code} It is also possible to step through the code using \texttt{step} and \texttt{next} commands (in short \texttt{s} and \texttt{n}). The difference is that \texttt{step} is entering inside subroutines calls, while \texttt{next} steps over the call, treating it as a single source line.
To demonstrate this functionality, using command `break` and `delete` discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`:

```plaintext
(gdb) info break
Num Type Disp Enb Address What
3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/
  → blink/main/.blink.c:36
      breakpoint already hit 1 time
(gdb)
```

Resume program by entering `c` and let it halt:

```plaintext
(gdb) c
Continuing.
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
  → blink.c:36
36 gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

Then enter `n` couple of times to see how debugger is stepping one program line at a time:

```plaintext
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
37 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
33 gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

If you enter `s` instead, then debugger will step inside subroutine calls:

```plaintext
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D1128 (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
  → components/driver/.gpio.c:183
183  GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
      → ", ESP_ERR_INVALID_ARG);
(gdb)
```

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

See Why stepping with “next” does not bypass subroutine calls? for potential limitation of using `next` command.

Checking and setting memory  Displaying the contents of memory is done with command `x`. With additional parameters you may vary the format and count of memory locations displayed. Run `help x` to see more details. Companion command to `x` is `set` that let you write values to the memory.

We will demonstrate how `x` and `set` work by reading from and writing to the memory location 0x3FF44004 labeled as `GPIO_OUT_REG` used to set and clear individual GPIO’ s.

For more information, see ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].
Being in the same `blink.c` project as before, set two breakpoints right after `gpio_set_level` instruction. Enter two times `c` to get to the break point followed by `x /1wx 0x3FF44004` to display contents of GPIO_OUT_REG memory location:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active)   APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
  → blink.c:34
  34   vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)   APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
  → blink.c:37
  37   vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```

If you are blinking LED connected to GPIO4, then you should see fourth bit being flipped each time the LED changes the state:

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

Now, when the LED is off, that corresponds to `0x3ff44004: 0x00000000` being displayed, try using `set` command to set this bit by writing `0x00000010` to the same memory location:

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

You should see the LED to turn on immediately after entering `set {unsigned int}0x3FF44004=0x000010` command.

**Watching and setting program variables** A common debugging tasks is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file `blink.c` by adding a declaration of a global variable `int i` above definition of function `blink_task`. Then add `i++` inside `while(1)` of this function to get `i` incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter the command `watch i`:

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

This will insert so called “watchpoint” in each place of code where variable `i` is being modified. Now enter `continue` to resume the application and observe it being halted:
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)   APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
    → blink.c:33
33    i++;
(gdb)

Resume application couple more times so i gets incremented. Now you can enter \texttt{print i} (in short \texttt{p i}) to check the current value of \(i\):

(gdb) p i
$1 = 3
(gdb)

To modify the value of \(i\) use \texttt{set} command as below (you can then print it out to check if it has been indeed changed):

(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)

You may have up to two watchpoints, see \textit{Breakpoints and watchpoints available}.

\textbf{Setting conditional breakpoints} \quad Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Delete existing breakpoints and try this:

(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)

Above command sets conditional breakpoint to halt program execution in line 34 of \texttt{blink.c} if \(i == 2\).

If current value of \(i\) is less than 2 and program is resumed, it will blink LED in a loop until condition \(i == 2\) gets true and then finally halt:

(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)   APP_CPU: PC=0x400D112C
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
    → blink.c:34
34    gpio_set_level(BLINK_GPIO, 0);
(gdb)

\textbf{Obtaining help on commands} \quad Commands presented so far should provide are very basis and intended to let you quickly get started with JTAG debugging. Check help what are the other commands at you disposal. To obtain help on syntax and functionality of particular command, being at (gdb) prompt type \texttt{help} and command name:
Chapter 4. API Guides

(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)

By typing just help, you will get top level list of command classes, to aid you drilling down to more details. Optionally refer to available GDB cheat sheets, for instance https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf. Good to have as a reference (even if not all commands are applicable in an embedded environment).

Ending debugger session To quit debugger enter q:

(gdb) q
A debugging session is active.

Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.

4.20 Linker Script Generation

4.20.1 Overview

There are several memory regions where code and data can be placed. Code and read-only data are placed by default in flash, writable data in RAM, etc. However, it is sometimes necessary to change these default placements.

For example, it may be necessary to place critical code in RAM for performance reasons or to place code in RTC memory for use in a wake stub or the ULP coprocessor.

With the linker script generation mechanism, it is possible to specify these placements at the component level within ESP-IDF. The component presents information on how it would like to place its symbols, objects or the entire archive. During build, the information presented by the components are collected, parsed and processed; and the placement rules generated is used to link the app.

4.20.2 Quick Start

This section presents a guide for quickly placing code/data to RAM and RTC memory - placements ESP-IDF provides out-of-the-box.

For this guide, suppose we have the following:

- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig

(continues on next page)
Creating and Specifying a Linker Fragment File

Before anything else, a linker fragment file needs to be created. A linker fragment file is simply a text file with a .lf extension upon which the desired placements will be written. After creating the file, it is then necessary to present it to the build system. The instructions for the build systems supported by ESP-IDF are as follows:

**Make** In the component’s component.mk file, set the variable COMPONENT_ADD_LDFRAGMENTS to the path of the created linker fragment file. The path can either be an absolute path or a relative path from the component directory.

```make
COMPONENT_ADD_LDFRAGMENTS += my_linker_fragment_file.lf
```

**CMake** In the component’s CMakeLists.txt file, specify argument LDFRAGMENTS in the `idf_component_register` call. The value of LDFRAGMENTS can either be an absolute path or a relative path from the component directory to the created linker fragment file.

```cmake
# file paths relative to CMakeLists.txt
idf_component_register(...

    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
    another_linker_fragment_file.lf"

    ...
)
```

Specifying placements

It is possible to specify placements at the following levels of granularity:

- object file (.obj or .o files)
- symbol (function/variable)
- archive (.a files)

**Placing object files** Suppose the entirety of `my_src1.o` is performance-critical, so it is desirable to place it in RAM. On the other hand, the entirety of `my_src2.o` contains symbols needed coming out of deep sleep, so it needs to be put under RTC memory. In the the linker fragment file, we can write:

```plaintext
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (nolash) # places all my_src1 code/read-only data under IRAM/DRAM
    my_src2 (rtc)    # places all my_src2 code/ data and read-only data under...
    RTC fast memory/RTC slow memory
```

- a component named `my_component` that is archived as library `libmy_component.a` during build
- three source files archived under the library, `my_src1.c`, `my_src2.c` and `my_src3.c` which are compiled as `my_src1.o`, `my_src2.o` and `my_src3.o`, respectively
- under `my_src1.o`, the function `my_function1` is defined; under `my_src2.o`, the function `my_function2` is defined
- there is bool-type config `PERFORMANCE_MODE (y/n)` and int type config `PERFORMANCE_LEVEL (with range 0-3) in my_component’s Kconfig`
What happens to `my_src3.o`? Since it is not specified, default placements are used for `my_src3.o`. More on default placements here.

**Placing symbols** Continuing our example, suppose that among functions defined under `object1.o`, only `my_function1` is performance-critical; and under `object2.o`, only `my_function2` needs to execute after the chip comes out of deep sleep. This could be accomplished by writing:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1:my_function1 (noflash)
  my_src2:my_function2 (rtc)
```

The default placements are used for the rest of the functions in `my_src1.o` and `my_src2.o` and the entire `object3.o`. Something similar can be achieved for placing data by writing the variable name instead of the function name, like so:

```
my_src1:my_variable (noflash)
```

**Warning:** There are limitations in placing code/data at symbol granularity. In order to ensure proper placements, an alternative would be to group relevant code and data into source files, and use object-granularity placements.

**Placing entire archive** In this example, suppose that the entire component archive needs to be placed in RAM. This can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (noflash)
```

Similarly, this places the entire component in RTC memory:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (rtc)
```

**Configuration-dependent placements** Suppose that the entire component library should only have special placement when a certain condition is true; for example, when `CONFIG_PERFORMANCE_MODE == y`. This could be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_MODE == y:
    * (noflash)
  else:
    * (default)
```

For a more complex config-dependent placement, suppose the following requirements: when `CONFIG_PERFORMANCE_LEVEL == 1`, only `object1.o` is put in RAM; when `CONFIG_PERFORMANCE_LEVEL == 2`, `object1.o` and `object2.o`; and when `CONFIG_PERFORMANCE_LEVEL == 3` all object files under the archive are to be put into RAM. When these three are false however, put entire library in RTC memory. This scenario is a bit contrived, but, it can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_LEVEL == 1:
    * (noflash)
  elif PERFORMANCE_LEVEL == 2:
    my_src1 (noflash)
    my_src2 (rtc)
  else:
    * (default)
```
Nesting condition-checking is also possible. The following is equivalent to the snippet above:

```c
if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
    if PERFORMANCE_LEVEL >= 1:
        object1 (noflash)
    if PERFORMANCE_LEVEL >= 2:
        object2 (noflash)
    if PERFORMANCE_LEVEL >= 3:
        object2 (noflash)
else:
    * (rtc)
```

### The ‘default’ placements

Up until this point, the term ‘default placements’ has been mentioned as fallback placements when the placement rules `rtc` and `noflash` are not specified. It is important to note that the tokens `noflash` or `rtc` are not merely keywords, but are actually entities called fragments, specifically `schemes`.

In the same manner as `rtc` and `noflash` are schemes, there exists a `default` scheme which defines what the default placement rules should be. As the name suggests, it is where code and data are usually placed, i.e. code/constants is placed in flash, variables placed in RAM, etc. More on the default scheme here.

**Note:** For an example of an ESP-IDF component using the linker script generation mechanism, see `freertos/CMakeLists.txt`. `freertos` uses this to place its object files to the instruction RAM for performance reasons.

This marks the end of the quick start guide. The following text discusses the internals of the mechanism in a little bit more detail. The following sections should be helpful in creating custom placements or modifying default behavior.

### 4.20.3 Linker Script Generation Internals

Linking is the last step in the process of turning C/C++ source files into an executable. It is performed by the toolchain’s linker, and accepts linker scripts which specify code/data placements, among other things. With the linker script generation mechanism, this process is no different, except that the linker script passed to the linker is dynamically generated from: (1) the collected `linker fragment files` and (2) `linker script template`.

**Note:** The tool that implements the linker script generation mechanism lives under `tools/ldgen`. 

Chapter 4. API Guides

Linker Fragment Files

As mentioned in the quick start guide, fragment files are simple text files with the .lf extension containing the desired placements. This is a simplified description of what fragment files contain, however. What fragment files actually contain are ‘fragments’. Fragments are entities which contain pieces of information which, when put together, form placement rules that tell where to place sections of object files in the output binary. There are three types of fragments: sections, scheme and mapping.

Grammar  The three fragment types share a common grammar:

```
[type:name]
key: value
key:
  value
  value
  value...
```

- **type**: Corresponds to the fragment type, can either be sections, scheme or mapping.
- **name**: The name of the fragment, should be unique for the specified fragment type.
- **key, value**: Contents of the fragment; each fragment type may support different keys and different grammars for the key values.

**Note**: In cases where multiple fragments of the same type and name are encountered, an exception is thrown.

**Note**: The only valid characters for fragment names and keys are alphanumeric characters and underscore.

Condition Checking

Condition checking enable the linker script generation to be configuration-aware. Depending on whether expressions involving configuration values are true or not, a particular set of values for a key can be used. The evaluation uses eval_string from kconfiglib package and adheres to its required syntax and limitations. Supported operators are as follows:

- **comparison**
  - LessThan <
  - LessThanOrEqualTo <=
  - MoreThan >
  - MoreThanOrEqualTo >=
  - Equal =
  - NotEqual !=

- **logical**
  - Or ||
  - And &&
  - Negation !

- **grouping**
  - Parenthesis ()

Condition checking behaves as you would expect an if...elseif/elif...else block in other languages. Condition-checking is possible for both key values and entire fragments. The two sample fragments below are equivalent:

```
# Value for keys is dependent on config
[type:name]
key_1:
  if CONDITION = y:
    value_1
```
else:
    value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b

# Entire fragment definition is dependent on config
if CONDITION = y:
    [type:name]
    key_1:
    value_1
    key_2:
    value_b
else:
    [type:name]
    key_1:
    value_2
    key_2:
    value_b

Comments
Comment in linker fragment files begin with #. Like in other languages, comment are used to provide helpful descriptions and documentation and are ignored during processing.

Compatibility with ESP-IDF v3.x Linker Script Fragment Files
ESP-IDF v4.0 brings some changes to the linker script fragment file grammar:

- indentation is enforced and improperly indented fragment files generate a parse exception; this was not enforced in the old version but previous documentation and examples demonstrates properly indented grammar
- move to if...elif...else structure for conditionals, with the ability to nest checks and place entire fragments themselves inside conditionals
- mapping fragments now requires a name like other fragment types

Linker script generator should be able to parse ESP-IDF v3.x linker fragment files that are indented properly (as demonstrated by the ESP-IDF v3.x version of this document). Backward compatibility with the previous mapping fragment grammar (optional name and the old grammar for conditionals) has also been retained but with a deprecation warning. Users should switch to the newer grammar discussed in this document as support for the old grammar is planned to be removed in the future.

Note that linker fragment files using the new ESP-IDF v4.0 grammar is not supported on ESP-IDF v3.x, however.

Types
Sections
Sections fragments defines a list of object file sections that the GCC compiler emits. It may be a default section (e.g. .text, .data) or it may be user defined section through the __attribute__ keyword.

The use of an optional ‘+’ indicates the inclusion of the section in the list, as well as sections that start with it. This is the preferred method over listing both explicitly.

[sections:name]
entries:
    .section+
    .section
    ...

Example:
# Non-preferred
[sections:text]
entries:
  .text
  .text.*
  .literal
  .literal.*

# Preferred, equivalent to the one above
[sections:text]
entries:
  .text+       # means .text and .text.*
  .literal+    # means .literal and .literal.*

## Scheme

Scheme fragments define what target a sections fragment is assigned to.

```
[scheme:name]
entries:
  sections -> target
  sections -> target
  ...
```

Example:

```
[scheme:noflash]
entries:
  text -> iram0_text          # the entries under the sections fragment named...
  text will go to iram0_text
  rodata -> dram0_data        # the entries under the sections fragment named...
  rodata will go to dram0_data
```

The default scheme

There exists a special scheme with the name default. This scheme is special because catch-all placement rules are generated from its entries. This means that, if one of its entries is `text -> flash_text`, the placement rule will be generated for the target `flash_text`.

```
*(.literal .literal.* .text .text.*)
```

These catch-all rules then effectively serve as fallback rules for those whose mappings were not specified.

The default scheme is defined in `esp_system/app.lf`. The noflash and rtc scheme fragments which are built-in schemes referenced in the quick start guide are also defined in this file.

## Mapping

Mapping fragments define what scheme fragment to use for mappable entities, i.e. object files, function names, variable names, archives.

```
[mapping:name]
archive: archive      # output archive file name, as built (i.e. libxxx.
  a)
entries:
  object:symbol {scheme} # symbol granularity
  object {scheme}        # object granularity
  * {scheme}             # archive granularity
```

There are three levels of placement granularity:

- symbol: The object file name and symbol name are specified. The symbol name can be a function name or a variable name.
- object: Only the object file name is specified.
Chapter 4. API Guides

• archive: * is specified, which is a short-hand for all the object files under the archive.

To know what an entry means, let us expand a sample object-granularity placement:

```
object (scheme)
```

Then expanding the scheme fragment from its entries definitions, we have:

```
object (sections -> target,
       sections -> target,
       ...
)
```

Expanding the sections fragment with its entries definition:

```
object (.section, # given this object file
       .section, # put its sections listed here at this
       ...  -> target, # target
       .section,
       .section, # same should be done for these sections
       ...  -> target,
       ...
)  # and so on
```

Example:

```
[mapping:map]
archive: libfreertos.a
entries:
   * (noflash)
```

Aside from the entity and scheme, flags can also be specified in an entry. The following flags are supported (note: <> = argument name, [] = optional):

1. ALIGN(<alignment>[, pre, post])
   Align the placement by the amount specified in alignment. Generates

2. SORT([<sort_by_first>, <sort_by_second>])
   Emits SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY or SORT in
   the input section description.
   Possible values for sort_by_first and sort_by_second are: name, alignment, init_priority.
   If both sort_by_first and sort_by_second are not specified, the input sections are sorted
   by name. If both are specified, then the nested sorting follows the same rules discussed in
   https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html.

3. KEEP()
   Prevent the linker from discarding the placement by surrounding the input section description with
   KEEP command. See https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html for more
details.

4. SURROUND(<name>)
   Generate symbols before and after the placement. The generated symbols follow the naming
   _<name>_start and _<name>_end. For example, if name == sym1,

When adding flags, the specific section -> target in the scheme needs to be specified. For multiple section
-> target, use a comma as a separator. For example,

```
# Notes:
# A. semicolon after entity-scheme
# B. comma before section2 -> target2
# C. section1 -> target1 and section2 -> target2 should be defined in entries of_
    --scheme1
```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

```
entity1 (schema1);
  section1 -> target1 KEEP() ALIGN(4, pre, post),
  section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

Putting it all together, the following mapping fragment, for example,

```
[mapping:name]
archive: lib1.a
entries:
  obj1 (noflash);
    rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

generates an output on the linker script:

```
. = ALIGN(8)
  _my_sym_start = ABSOLUTE(.)
  KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
  _my_sym_end = ABSOLUTE(.)
```

Note that ALIGN and SURROUND, as mentioned in the flag descriptions, are order sensitive. Therefore, if for the same mapping fragment these two are switched, the following is generated instead:

```
  _my_sym_start = ABSOLUTE(.)
  . = ALIGN(8)
  KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
  _my_sym_end = ABSOLUTE(.)
```

On Symbol-Granularity Placements  Symbol granularity placements is possible due to compiler flags -ffunction-sections and -fdata-sections. ESP-IDF compiles with these flags by default. If the user opts to remove these flags, then the symbol-granularity placements will not work. Furthermore, even with the presence of these flags, there are still other limitations to keep in mind due to the dependence on the compiler’s emitted output sections.

For example, with -ffunction-sections, separate sections are emitted for each function; with section names predictably constructed i.e. .text.{func_name} and .literal.{func_name}. This is not the case for string literals within the function, as they go to pooled or generated section names.

With -fdata-sections, for global scope data the compiler predictably emits either .data.{var_name}, .rodata.{var_name} or .bss.{var_name}; and so Type I mapping entry works for these. However, this is not the case for static data declared in function scope, as the generated section name is a result of mangling the variable name with some other information.

Linker Script Template

The linker script template is the skeleton in which the generated placement rules are put into. It is an otherwise ordinary linker script, with a specific marker syntax that indicates where the generated placement rules are placed.

To reference the placement rules collected under a target token, the following syntax is used:

```
mapping[target]
```

Example:

The example below is an excerpt from a possible linker script template. It defines an output section .iram0.text, and inside is a marker referencing the target iram0_text.

```
.iram0.text :
  { /* Code marked as runnning out of IRAM */
```
Suppose the generator collected the fragment definitions below:

```plaintext
[section: text]
.text+
.literal+

[section: iram]
.iram1+

[scheme: default]
entries:
  text -> flash_text
  iram -> iram0_text

[scheme: noflash]
entries:
  text -> iram0_text

[mapping: freertos]
archive: libfreertos.a
entries:
  *(noflash)
```

Then the corresponding excerpt from the generated linker script will be as follows:

```plaintext
.iram0.text :
{
  /* Code marked as running out of IRAM */
  _iram_text_start = ABSOLUTE(.

  /* Placement rules generated from the processed fragments, placed where the
     marker was in the template */
  *(.iram1 .iram1."
   "libfreertos.a:(.literal .text .literal.* .text."
  _iram_text_end = ABSOLUTE(.
}
> iram0_0_seg

*libfreertos.a:(.literal .text .literal.* .text."

  Rule generated from the entry *(noflash) of the freertos mapping fragment. All text sections
  of all object files under the archive libfreertos.a will be collected under the target iram0_text
  (as per the noflash scheme) and placed wherever in the template iram0_text is referenced by a
  marker.

  *(.iram1 .iram1."

  Rule generated from the default scheme entry iram -> iram0_text. Since the default scheme
  specifies an iram -> iram0_text entry, it too is placed wherever iram0_text is referenced by a
  marker. Since it is a rule generated from the default scheme, it comes first among all other rules
  collected under the same target name.

  The linker script template currently used is esp_system/ld/esp32/sections.ld.in; the generated output
  script sections.ld is put under its build directory.
```
4.21 Memory Types

ESP32 chip has multiple memory types and flexible memory mapping features. This section describes how ESP-IDF uses these features by default.

ESP-IDF distinguishes between instruction memory bus (IRAM, IROM, RTC FAST memory) and data memory bus (DRAM, DROM). Instruction memory is executable, and can only be read or written via 4-byte aligned words. Data memory is not executable and can be accessed via individual byte operations. For more information about the different memory buses consult the ESP32 Technical Reference Manual* > System and Memory [PDF].

4.21.1 DRAM (Data RAM)

Non-constant static data (.data) and zero-initialized data (.bss) is placed by the linker into Internal SRAM as data memory. Remaining space in this region is used for the runtime heap.

The available size of the internal DRAM region is reduced by 64kB (by shifting start address to 0x3FFC0000) if Bluetooth stack is used. Length of this region is also reduced by 16 kB or 32kB if trace memory is used. Due to some memory fragmentation issues caused by ROM, it is also not possible to use all available DRAM for static allocations - however the remaining DRAM is still available as heap at runtime.

Constant data may also be placed into DRAM, for example if it is used in a non-flash-safe ISR (see explanation under How to place code in IRAM).

“noinit” DRAM

The macro __NOSTART_ATTR can be used as attribute to place data into .noinit section. The values placed into this section will not be initialized at startup and should keep its value after software restart.

Example:

```c
__NOSTART_ATTR uint32_t noinit_data;
```

4.21.2 IRAM (Instruction RAM)

ESP-IDF allocates part of Internal SRAM0 region for instruction RAM. The region is defined in ESP32 Technical Reference Manual > System and Memory > Embedded Memory [PDF]. Except for the first 64 kB block which is used for PRO and APP MMU caches, the rest of this memory range (i.e. from 0x40080000 to 0x400A0000) is used to store parts of the application which need to run from RAM.

Why place code in IRAM

Cases when parts of application should be placed into IRAM:

- Interrupt handlers must be placed into IRAM if ESP_INTR_FLAG_IRAM is used when registering the interrupt handler. For more information, see IRAM-Safe Interrupt Handlers.
- Some timing critical code may be placed into IRAM to reduce the penalty associated with loading the code from flash. ESP32 reads code and data from flash via the MMU cache. In some cases, placing a function into IRAM may reduce delays caused by a cache miss and significantly improve that function’s performance.

How to place code in IRAM

Some code is automatically placed into the IRAM region using the linker script.

If some specific application code needs to be placed into IRAM, it can be done by using the Linker Script Generation feature and adding a linker script fragment file to your component that targets entire source files or functions with the noflash placement. See the Linker Script Generation docs for more information.
Alternatively, it’s possible to specify IRAM placement in the source code using the `IRAM_ATTR` macro:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

There are some possible issues with placement in IRAM, that may cause problems with IRAM-safe interrupt handlers:

- Strings or constants inside an `IRAM_ATTR` function may not be placed in RAM automatically. It’s possible to use `DRAM_ATTR` attributes to mark these, or using the linker script method will cause these to be automatically placed correctly.

```c
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char MSG = DRAM_STR("I am a string stored in RAM");
}
```

Note that knowing which data should be marked with `DRAM_ATTR` can be hard, the compiler will sometimes recognize that a variable or expression is constant (even if it is not marked `const`) and optimize it into flash, unless it is marked with `DRAM_ATTR`.

- GCC optimizations that automatically generate jump tables or switch/case lookup tables place these tables in flash. IDF by default builds all files with `-fno-jump-tables -fno-tree-switch-conversion` flags to avoid this.

  Jump table optimizations can be re-enabled for individual source files that don’t need to be placed in IRAM. For instructions on how to add the `-fjump-tables -ftree-switch-conversion` options when compiling individual source files, see Controlling Component Compilation.

### 4.21.3 IROM (code executed from Flash)

If a function is not explicitly placed into `IRAM (Instruction RAM)` or RTC memory, it is placed into flash. The mechanism by which Flash MMU is used to allow code execution from flash is described in ESP32 Technical Reference Manual > Memory Management and Protection Units (MMU, MPU) [PDF]. As IRAM is limited, most of an application’s binary code must be placed into IROM instead.

During Application Startup Flow, the bootloader (which runs from IRAM) configures the MMU flash cache to map the app’s instruction code region to the instruction space. Flash accessed via the MMU is cached using some internal SRAM and accessing cached flash data is as fast as accessing other types of internal memory.

### 4.21.4 RTC fast memory

The same region of RTC fast memory can be accessed as both instruction and data memory. Code which has to run after wake-up from deep sleep mode has to be placed into RTC memory. Please check detailed description in deep sleep documentation.

RTC fast memory can only be accessed by the PRO CPU.

In single core mode, remaining RTC fast memory is added to the heap unless the option `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` is disabled. This memory can be used interchangeably with `DRAM (Data RAM)`, but is slightly slower to access and not DMA capable.

### 4.21.5 DROM (data stored in Flash)

By default, constant data is placed by the linker into a region mapped to the MMU flash cache. This is the same as the `IROM (code executed from Flash)` section, but is for read-only data not executable code.
The only constant data not placed into this memory type by default are literal constants which are embedded by the compiler into application code. These are placed as the surrounding function’s executable instructions.

The DRAM_ATTR attribute can be used to force constants from DROM into the DRAM (Data RAM) section (see above).

### 4.21.6 RTC slow memory

Global and static variables used by code which runs from RTC memory must be placed into RTC slow memory. For example deep sleep variables can be placed here instead of RTC fast memory, or code and variables accessed by the ULP Coprocessor programming.

The attribute macro named RTC_NOINIT_ATTR can be used to place data into this type of memory. The values placed into this section keep their value after waking from deep sleep.

Example:

```c
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

### 4.21.7 DMA Capable Requirement

Most peripheral DMA controllers (e.g. SPI, sdmmc, etc.) have requirements that sending/receiving buffers should be placed in DRAM and word-aligned. We suggest to place DMA buffers in static variables rather than in the stack.

Use macro DMA_ATTR to declare global/local static variables like:

```c
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

Or:

```c
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

It is also possible to allocate DMA-capable memory buffers dynamically by using the `MALLOC_CAP_DMA` capabilities flag.

### 4.21.8 DMA Buffer in the stack

Placing DMA buffers in the stack is possible but discouraged. If doing so, pay attention to the following:
• Placing DRAM buffers on the stack is not recommended if the stack may be in PSRAM. If the stack of a task is placed in the PSRAM, several steps have to be taken as described in **Support for external RAM**.
• Use macro **WORD_ALIGNED_ATTR** in functions before variables to place them in proper positions like:

```c
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something"; //or...
       the buffer will be placed right after stuff.
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

### 4.22 lwIP

ESP-IDF uses the open source **lwIP lightweight TCP/IP stack**. The ESP-IDF version of lwIP (esp-lwip) has some modifications and additions compared to the upstream project.

#### 4.22.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- **BSD Sockets API**
- **Netconn API** is enabled but not officially supported for ESP-IDF applications

**Adapted APIs**

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the **ESP-NETIF** functionality
- Simple Network Time Protocol (SNTP) is supported via the lwip/include/apps/sntp/sntp.h lwip/lwip/src/include/lwip/apps/sntp.h functions (see also **SNTP Time Synchronization**)
- ICMP Ping is supported using a variation on the lwIP ping API. See **ICMP Echo**.
- NetBIOS lookup is available using the standard lwIP API. protocols/http_server/restful_server has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see **mDNS Service**), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the **CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES** setting is enabled.

#### 4.22.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

**References**

A wide range of BSD Sockets reference material is available, including:
Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- protocols/sockets/tcp_server
- protocols/sockets/tcp_client
- protocols/sockets/udp_server
- protocols/sockets/udp_client
- protocols/sockets/udp_multicast
- protocols/http_request (Note: this is a simplified example of using a TCP socket to send an HTTP request. The ESP HTTP Client is a much better option for sending HTTP requests.)

Supported functions

The following BSD socket API functions are supported. For full details see lwip/lwip/src/include/lwip/sockets.h.

- socket()
- bind()
- accept()
- shutdown()
- getpeername()
- getsockopt() & setsockopt() (see Socket Options)
- close() (via Virtual filesystem component)
- read(), readv(), write(), writev() (via Virtual filesystem component)
- recv(), recvmsg(), recvfrom()
- send(), sendmsg(), sendto()
- select() (via Virtual filesystem component)
- poll() (Note: on ESP-IDF, poll() is implemented by calling select internally, so using select() directly is recommended if a choice of methods is available.)
- fcntl() (see fcntl)

Non-standard functions:

- ioctl() (see ioctls)

Note: Some lwIP application sample code uses prefixed versions of BSD APIs, for example lwip_socket() instead of the standard socket(). Both forms can be used with ESP-IDF, but using standard names is recommended.

Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see Socket API Errors.
- select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout) has exception descriptor indicating that the socket has an error. For more information, see select() Errors.
Socket API Errors

The error detection
- We can know that the socket API fails according to its return value.

Get the error reason code
- When socket API fails, the return value doesn’t contain the failure reason and the application can get the error reason code by accessing errno. Different values indicate different meanings. For more information, see <Socket Error Reason Code>.

Example:
```c
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}
```

select() Errors

The error detection
- Socket error when select() has exception descriptor

Get the error reason code
- If the select indicates that the socket fails, we can’t get the error reason code by accessing errno, instead we should call getsockopt() to get the failure reason code. Because select() has exception descriptor, the error code will not be given to errno.

Note: getsockopt function prototype int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen). Its function is to get the current value of the option of any type, any state socket, and store the result in optval. For example, when you get the error code on a socket, you can get it by getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen).

Example:
```c
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

Socket Error Reason Code Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see newlib errno.h <https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h> and the platform-specific extensions newlib/platform_include/errno.h
<table>
<thead>
<tr>
<th>Error code</th>

<td>EPROTO</td>
<td>Unknown protocol</td>
</tr>
</tbody>
</table>

**Socket Options**

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options. Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

**Common options** Used with level argument SOL_SOCKET.

- SO_REUSEADDR (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- SO_KEEPALIVE
- SO_BROADCAST
- SO_ACCEPTCONN
- SO_RCVBUF (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- SO_SNDBUF / SO_RCVTIMEO
- SO_ERROR (this option is only used with `select()`, see Socket Error Handling)
- SO_TYPE
- SO_NO_CHECK (for UDP sockets only)

**IP options** Used with level argument IPPROTO_IP.

- IP_TOS
- IP_TTL
- IP_PKTINFO (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:

- IP_MULTICAST_IF
- IP_MULTICAST_LOOP
- IP_MULTICAST_TTL
- IP_ADD_MEMBERSHIP
- IP_DROP_MEMBERSHIP

**TCP options** TCP sockets only. Used with level argument IPPROTO_TCP.

- TCP_NODELAY

Options relating to TCP keepalive probes:

- TCP_KEEPALIVE (int value, TCP keepalive period in milliseconds)
- TCP_KEEPIDLE (same as TCP_KEEPALIVE, but the value is in seconds)
- TCP_KEEPCNT (int value, interval between keepalive probes in seconds)
- TCP_KEEPINTVL (int value, number of keepalive probes before timing out)
IPv6 options  IPv6 sockets only. Used with level argument IPPROTO_IPV6

- IPV6_CHECKSUM
- IPV6_V6ONLY

For multicast IPv6 UDP sockets:

- IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP
- IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP
- IPV6_MULTICAST_IF
- IPV6_MULTICAST_HOPS
- IPV6_MULTICAST_LOOP

fcntl

The fcntl() function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the Virtual filesystem component layer is used to implement this function.

When the file descriptor is a socket, only the following fcntl() values are supported:

- O_NONBLOCK to set/clear non-blocking I/O mode. Also supports O_NDELAY, which is identical to O_NONBLOCK.
- O_RDONLY, O_WRONLY, O_RDWR flags for different read/write modes. These can read via F_GETFL only, they cannot be set using F_SETFL. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return O_RDWR.

ioctl

The ioctl() function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the Virtual filesystem component layer is used to implement this function.

When the file descriptor is a socket, only the following ioctl() values are supported:

- FIONREAD returns the number of bytes of pending data already received in the socket’s network buffer.
- FIONBIO is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to fcntl(fd, F_SETFL, O_NONBLOCK, ...).

4.22.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

Important: Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is enabled but not supported. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult lwip/lwip/src/include/lwip/api.h and this wiki page which is part of the unofficial lwIP Application Developers Manual.

4.22.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues (“mailboxes”) used to send data to/from the TCP/IP task:
4.22.5 esp-lwip custom modifications

Additions

The following code is added which is not present in the upstream lwIP release:

**Thread-safe sockets** It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

**On demand timers** lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. esp-lwip default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable `CONFIG_LWIP_TIMERS_ONDEMAND`.

**Abort TCP connections when IP changes** `CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES` is disabled by default. This disables the default lwIP behaviour of keeping TCP connections open if an interface IP changes, in case the interface IP changes back (for example, if an interface connection goes down and comes back up). Enable this option to keep TCP connections open in this case, until they time out normally. This may increase the number of sockets in use if a network interface goes down temporarily.

**Additional Socket Options**

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

**IP layer features**

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

**Limitations**

Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don’t wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the *Wi-Fi* or *Ethernet* project configuration (as applicable) may also help.
4.22.6 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the wifi/iperf example in an RF sealed enclosure.

The wifi/iperf/sdkconfig.defaults file for the iperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project sdkconfig.

Important: Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (CONFIG_LWIP_TCPIP_TASK_AFFINITY) and runs at fixed priority ESP_TASK_TCPIP_PRIO (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also Built-In Task Priorities.
- If using select() function with socket arguments only, setting CONFIG_LWIP_USE_ONLY_LWIP_SELECT will make select() calls faster.
- If there is enough free IRAM, select CONFIG_LWIP_IRAM_OPTIMIZATION to improve TX/RX throughput.

If using a Wi-Fi network interface, please also refer to Wi-Fi Buffer Usage.

Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard TCP_NODELAY flag to disable Nagle’s algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing CONFIG_LWIP_MAX_SOCKETS reduces the maximum number of sockets in the system. This will also cause TCP sockets in the WAIT_CLOSE state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing CONFIG_LWIP_TCPIP_RECVMBOX_SIZE, CONFIG_LWIP_TCP_RECVMBOX_SIZE and CONFIG_LWIP_UDP_RECVMBOX_SIZE reduce memory usage at the expense of throughput, depending on usage.
- Disable CONFIG_LWIP_IPV6 can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCP/IP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to Wi-Fi Buffer Usage.

Peak Buffer Usage The peak heap memory that lwIP consumes is the theoretically-maximum memory that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: lwip_udp_conn
- the memory required to create a TCP connection: lwip_tcp_conn
- the number of UDP connections that the application has: lwip_udp_con_num
- the number of TCP connections that the application has: lwip_tcp_con_num
- the TCP TX window size: lwip_tcp_tx_win_size
- the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

\[
\text{lwip_dynamic_peek_memory} = (\text{lwip_udp_con_num} \times \text{lwip_udp_conn}) + (\text{lwip_tcp_con_num} \times (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))
\]

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.23 Partition Tables

4.23.1 Overview

A single ESP32’s flash can contain multiple apps, as well as many different kinds of data (calibration data, filesystems, parameter storage, etc). For this reason a partition table is flashed to (default offset) 0x8000 in the flash.

Partition table length is 0xC00 bytes (maximum 95 partition table entries). An MD5 checksum, which is used for checking the integrity of the partition table, is appended after the table data.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to open the project configuration menu (idf.py menuconfig) and choose one of the simple predefined partition tables under CONFIG_PARTITION_TABLE_TYPE:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you execute idf.py partition_table then it will print a summary of the partition table.

4.23.2 Built-in Partition Tables

Here is the summary printed for the “Single factory app, no OTA” configuration:

```plaintext
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- At a 0x10000 (64KB) offset in the flash is the app labelled “factory”. The bootloader will run this app by default.
- There are also two data regions defined in the partition table for storing NVS library partition and PHY init data.

Here is the summary printed for the “Factory app, two OTA definitions” configuration:

```plaintext
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
ootadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- There are now three app partition definitions. The type of the factory app (at 0x10000) and the next two “OTA” apps are all set to “app”, but their subtypes are different.
There is also a new “otadata” slot, which holds the data for OTA updates. The bootloader consults this data in order to know which app to execute. If “otadata” is empty, it will execute the factory app.

### 4.23.3 Creating Custom Tables

If you choose “Custom partition table CSV” in menuconfig then you can also enter the name of a CSV file (in the project directory) to use for your partition table. The CSV file can describe any number of definitions for the table you need.

The CSV format is the same format as printed in the summaries shown above. However, not all fields are required in the CSV. For example, here is the “input” CSV for the OTA partition table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>
<td>0x4000</td>
<td></td>
</tr>
<tr>
<td>otadata</td>
<td>data</td>
<td>ota</td>
<td>0xd000</td>
<td>0x2000</td>
<td></td>
</tr>
<tr>
<td>phy_init</td>
<td>data</td>
<td>phy</td>
<td>0xf000</td>
<td>0x1000</td>
<td></td>
</tr>
<tr>
<td>factory</td>
<td>app</td>
<td>factory</td>
<td>0x10000</td>
<td></td>
<td>1M</td>
</tr>
<tr>
<td>ota_0</td>
<td>app</td>
<td>ota_0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ota_1</td>
<td>app</td>
<td>ota_1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>nvs_key</td>
<td>data</td>
<td>nvs_keys</td>
<td></td>
<td>0x1000</td>
<td></td>
</tr>
</tbody>
</table>

- Whitespace between fields is ignored, and so is any line starting with # (comments).
- Each non-comment line in the CSV file is a partition definition.
- The “Offset” field for each partition is empty. The gen_esp32part.py tool fills in each blank offset, starting after the partition table and making sure each partition is aligned correctly.

#### Name field

Name field can be any meaningful name. It is not significant to the ESP32. Names longer than 16 characters will be truncated.

#### Type field

Partition type field can be specified as app (0x00) or data (0x01). Or it can be a number 0-254 (or as hex 0x00-0xFE). Types 0x00-0x3F are reserved for ESP-IDF core functions.

If your app needs to store data in a format not already supported by ESP-IDF, then please add a custom partition type value in the range 0x40-0xFE.

See `esp_partition_type_t` for the enum definitions for app and data partitions.

If writing in C++ then specifying a application-defined partition type requires casting an integer to `esp_partition_type_t` in order to use it with the partition API. For example:

```c++
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

The ESP-IDF bootloader ignores any partition types other than app (0x00) and data (0x01).

#### SubType

The 8-bit subtype field is specific to a given partition type. ESP-IDF currently only specifies the meaning of the subtype field for app and data partition types.

See enum `esp_partition_subtype_t` for the full list of subtypes defined by ESP-IDF, including the following:

- When type is app, the subtype field can be specified as `factory` (0x00), `ota_0` (0x10) … `ota_15` (0x1F) or `test` (0x20).
– factory (0x00) is the default app partition. The bootloader will execute the factory app unless there it sees a partition of type data/ota, in which case it reads this partition to determine which OTA image to boot.
* OTA never updates the factory partition.
* If you want to conserve flash usage in an OTA project, you can remove the factory partition and use ota_0 instead.
– ota_0 (0x10) ... ota_15 (0x1F) are the OTA app slots. When OTA is in use, the OTA data partition configures which app slot the bootloader should boot. When using OTA, an application should have at least two OTA application slots (ota_0 & ota_1). Refer to the OTA documentation for more details.
– test (0x20) is a reserved subtype for factory test procedures. It will be used as the fallback boot partition if no other valid app partition is found. It is also possible to configure the bootloader to read a GPIO input during each boot, and boot this partition if the GPIO is held low, see Boot from Test Firmware.

* When type is data, the subtype field can be specified as ota (0x00), phy (0x01), nvs (0x02), nvs_keys (0x04), or a range of other component-specific subtypes (see subtype enum).
– ota (0) is the OTA data partition which stores information about the currently selected OTA app slot. This partition should be 0x2000 bytes in size. Refer to the OTA documentation for more details.
– phy (1) is for storing PHY initialisation data. This allows PHY to be configured per-device, instead of in firmware.
* In the default configuration, the phy partition is not used and PHY initialisation data is compiled into the app itself. As such, this partition can be removed from the partition table to save space.
* To load PHY data from this partition, open the project configuration menu (idf.py menuconfig) and enable CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION option. You will also need to flash your devices with phy init data as the esp-idf build system does not do this automatically.
– nvs (2) is for the Non-Volatile Storage (NVS) API.
* NVS is used to store per-device PHY calibration data (different to initialisation data).
* NVS is used to store WiFi data if the esp_wifi_set_storage(WIFI_STORAGE_FLASH) initialisation function is used.
* The NVS API can also be used for other application data.
* It is strongly recommended that you include an NVS partition of at least 0x3000 bytes in your project.
* If using NVS API to store a lot of data, increase the NVS partition size from the default 0x6000 bytes.
– nvs_keys (4) is for the NVS key partition. See Non-Volatile Storage (NVS) API for more details.
* It is used to store NVS encryption keys when NVS Encryption feature is enabled.
* The size of this partition should be 4096 bytes (minimum partition size).
– There are other predefined data subtypes for data storage supported by ESP-IDF. These include FAT filesystem (ESP_PARTITION_SUBTYPE_DATA_FAT), SPIFFS (ESP_PARTITION_SUBTYPE_DATA_SPIFFS), etc. Other subtypes of data type are reserved for future ESP-IDF uses.

* If the partition type is any application-defined value (range 0x40-0xFE), then subtype field can be any value chosen by the application (range 0x00-0xFE).

Offset & Size

Partitions with blank offsets in the CSV file will start after the previous partition, or after the partition table in the case of the first partition.

Partitions of type app have to be placed at offsets aligned to 0x10000 (64K). If you leave the offset field blank, gen_esp32part.py will automatically align the partition. If you specify an unaligned offset for an app partition, the tool will return an error.

Sizes and offsets can be specified as decimal numbers, hex numbers with the prefix 0x, or size multipliers K or M (1024 and 1024*1024 bytes).

If you want the partitions in the partition table to work relative to any placement (CONFIG_PARTITION_TABLE_OFFSET) of the table itself, leave the offset field (in CSV file) for all partitions blank. Similarly, if changing the partition table offset then be aware that all blank partition offsets may change to match, and that any fixed offsets may now collide with the partition table (causing an error).
Chapter 4. API Guides

Flags

Only one flag is currently supported, encrypted. If this field is set to encrypted, this partition will be encrypted if Flash Encryption is enabled.

Note: app type partitions will always be encrypted, regardless of whether this flag is set or not.

4.23.4 Generating Binary Partition Table

The partition table which is flashed to the ESP32 is in a binary format, not CSV. The tool partition_table/gen_esp32part.py is used to convert between CSV and binary formats.

If you configure the partition table CSV name in the project configuration (idf.py menuconfig) and then build the project or run idf.py partition_table, this conversion is done as part of the build process.

To convert CSV to Binary manually:

```python
gen_esp32part.py input_partitions.csv binary_partitions.bin
```

To convert binary format back to CSV manually:

```python
gen_esp32part.py binary_partitions.bin input_partitions.csv
```

To display the contents of a binary partition table on stdout (this is how the summaries displayed when running idf.py partition_table are generated):

```python
gen_esp32part.py binary_partitions.bin
```

4.23.5 Partition Size Checks

The ESP-IDF build system will automatically check if generated binaries fit in the available partition space, and will fail with an error if a binary is too large.

Currently these checks are performed for the following binaries:

- Bootloader binary must fit in space before partition table (see Bootloader Size)
- App binary should fit in at least one partition of type “app”. If the app binary doesn’t fit in any app partition, the build will fail. If it only fits in some of the app partitions, a warning is printed about this.

Note: Although the build process will fail if the size check returns an error, the binary files are still generated and can be flashed (although they may not work if they are too large for the available space.)

Note: Build system binary size checks are only performed when using the CMake build system. When using the legacy GNU Make build system, file sizes can be checked manually or an error will be logged during boot.

MD5 checksum

The binary format of the partition table contains an MD5 checksum computed based on the partition table. This checksum is used for checking the integrity of the partition table during the boot.

The MD5 checksum generation can be disabled by the --disable-md5sum option of gen_esp32part.py or by the CONFIG_PARTITION_TABLE_MD5 option. This is useful for example when one uses a bootloader from ESP-IDF before v3.1 which cannot process MD5 checksums and the boot fails with the error message invalid magic number 0xebeb.
4.23.6  Flashing the partition table

- `idf.py partition_table-flash`: will flash the partition table with `esptool.py`.
- `idf.py flash`: Will flash everything including the partition table.

A manual flashing command is also printed as part of `idf.py partition_table` output.

**Note:** Note that updating the partition table doesn’t erase data that may have been stored according to the old partition table. You can use `idf.py erase_flash` (or `esptool.py erase_flash`) to erase the entire flash contents.

4.23.7  Partition Tool (parttool.py)

The component `partition_table` provides a tool `parttool.py` for performing partition-related operations on a target device. The following operations can be performed using the tool:

- reading a partition and saving the contents to a file (read_partition)
- writing the contents of a file to a partition (write_partition)
- erasing a partition (erase_partition)
- retrieving info such as name, offset, size and flag (“encrypted”) of a given partition (get_partition_info)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

**Python API**

Before anything else, make sure that the `parttool` module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
parttool_dir = os.path.join(idf_path, "components", "partition_table")  # parttool.py lives in $IDF_PATH/components/partition_table
sys.path.append(parttool_dir)  # this enables Python to find parttool module
from parttool import *  # import all names inside parttool module
```

The starting point for using the tool’s Python API to do is create a `ParttoolTarget` object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase partition with name 'storage'
target.erase_partition(PartitionName("storage"))

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# Write to partition 'factory' the contents of a file named 'factory.bin'
target.write_partition(PartitionName("factory"), "factory.bin")

# Print the size of default boot partition
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```
The partition to operate on is specified using `PartitionName` or `PartitionType` or `PARTITION_BOOT_DEFAULT`. As the name implies, these can be used to refer to partitions of a particular name, type-subtype combination, or the default boot partition.

More information on the Python API is available in the docstrings for the tool.

**Command-line Interface**

The command-line interface of `parttool.py` has the following structure:

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args`: These are arguments that are needed for executing the main command (`parttool.py`), mostly pertaining to the target device.
- `subcommand`: This is the operation to be performed.
- `subcommand-args`: These are arguments that are specific to the chosen operation.

```bash
# Erase partition with name 'storage'
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-subtype=spiffs --output "spiffs.bin"

# Write to partition 'factory' the contents of a file named 'factory.bin'
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory "factory.bin"

# Print the size of default boot partition
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --info size
```

More information can be obtained by specifying `-help` as argument:

```bash
# Display possible subcommands and show main command argument descriptions
parttool.py --help

# Show descriptions for specific subcommand arguments
parttool.py [subcommand] --help
```

## 4.24 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

### 4.24.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.
Maximizing Execution Speed

Overview Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as Minimizing Binary Size.

Choose What To Optimize If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

Measuring Performance The first step to improving something is to measure it.

Basic Performance Measurements If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples wifi/iperf and ethernet/iperf for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```c
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();
    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // This is the thing you need to measure
    }
    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %ull milliseconds (%ull microseconds per invocation)\n", MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using `esp_timer_get_time()` generates “wall clock” timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It’s also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision. The CPU cycles are counted per-core, so only use this method from an interrupt handler, or a task that is pinned to a single core.
- If making “microbenchmarks” (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small...
function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see Targeted Optimizations).

**External Tracing**  The Application Level Tracing library allows measuring code execution with minimal impact on the code itself.

**Tasks**  If the option `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS` is enabled then the FreeRTOS API `vTaskGetRunTimeStats()` can be used to retrieve runtime information about the processor time used by each FreeRTOS task.

**SEGGER SystemView** is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

**Improving Overall Speed**  The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set `CONFIG_ESPTOOLPY_FLASHFREQ` to 80 MHz. This is double the 40 MHz default value and will double the speed at which code is loaded or executed from flash. You should verify that the board or module that connects the ESP32 to the flash chip is rated for 80 MHz operation at the relevant temperature ranges, before changing this setting. The hardware datasheet(s) will have this information.
- Set `CONFIG_ESPTOOLPY_FLASHMODE` to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32 and the flash chip must support quad I/O modes or the SoC will not work correctly.
- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for performance (-O2)”. This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.
- Avoid using floating point arithmetic (`float`). Even though ESP32 has a single precision hardware floating point unit, floating point calculations are always slower than integer calculations. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.
- Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

**Reduce Logging Overhead**  Although standard output is buffered, it’s possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

- Reduce the volume of log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL` (the equivalent bootloader setting is `CONFIG_BOOTLOADER_LOG_LEVEL`). This also reduces the binary size, and saves some CPU time spent on string formatting.
- Increase the speed of logging output by increasing the `CONFIG_ESP_CONSOLE_UART_BAUDRATE`

**Not Recommended**  The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

- Set `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

**Targeted Optimizations**  The following changes will increase the speed of a chosen part of the firmware application:
Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it’s possible for the CPU to have to wait on a “cache miss” while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.

IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See IRAM (Instruction RAM) for more information.

Jump table optimizations can be re-enabled for individual source files that don’t need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the -fjump-tables-free-switch-conversion options when compiling individual source files, see Controlling Component Compilation.

Improving Startup Time In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

- Minimizing the CONFIG_LOG_DEFAULT_LEVEL and CONFIG_BOOTLOADER_LOG_LEVEL has a large impact on startup time. To enable more logging after the app starts up, set the CONFIG_MAXIMUM_LEVEL as well and then call esp_log_set_level() to restore higher level logs. The system/startup_time main function shows how to do this.
- If using deep sleep, setting CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.
- Setting CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON will skip verifying the binary on every power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the config item for an explanation and recommendations if using this option.
- It’s possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set CONFIG_ESP32_RTC_CLK_CAL_CYCLES to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project system/startup_time is pre-configured to optimize startup time. The files system/startup_time/sdkconfig.defaults and system/startup_time/sdkconfig.defaults.esp32 contain all of these settings.

You can append these to the end of your project’s own sdkconfig file to merge the settings, but please read the documentation for each setting first.

Task Priorities As ESP-IDF FreeRTOS is a real-time operating system, it’s necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling xTaskCreate() or xTaskCreatePinnedToCore() and can be changed at runtime by calling vTaskPrioritySet().

It’s also necessary to ensure that tasks yield CPU (by calling vTaskDelay(), sleep(), or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The Task Watchdog Timer provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

Built-In Task Priorities ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header components/esp_system/include/esp_task.h contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:
- **Main task that executes app_main function** has minimum priority (1). This task is pinned to Core 0 by default (configurable).
• **High Resolution Timer** system task to manage high precision timer events and execute callbacks has high priority (22, ESP_TASK_TIMER_PRIO). This task is pinned to Core 0.
• FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, configurable). This task is pinned to Core 0.
• **Event Handling** system task to manage the default system event loop and execute callbacks has high priority (20, ESP_TASK_EVENT_PRIO) and pinned to Core 0. This configuration is only used if the application calls `esp_event_loop_create_default()`, it’s possible to call `esp_event_loop_create()` with a custom task configuration instead.
• **lwIP** TCP/IP task has high priority (18, ESP_TASK_TCPIP_PRIO) and is not pinned to any core (configurable).
• **Wi-Fi Driver** task has high priority (23) and is pinned to Core 0 by default (configurable).
• Wi-Fi wpa_supplicant component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2) and are not pinned to any core.
• **Bluetooth Controller** task has high priority (23, ESP_TASK_BT_CONTROLLER_PRIO) and is pinned to Core 0 by default (configurable). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task assigned to a single CPU.
• **NimBLE Bluetooth Host** host task has high priority (21) and is pinned to Core 0 by default (configurable).
• **Bluedroid Bluetooth Host** creates multiple tasks when used:
  – Stack event callback task (“BTC”) has high priority (19).
  – Stack BTU layer task has high priority (20).
  – Host HCI host task has high priority (22).
All Bluedroid Tasks are pinned to the same core, which is Core 0 by default (configurable).
• The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the priority is medium-high (15) and the task is not pinned to any core. These settings can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
• If using the **mDNS** component, it creates a task with default low priority 1 (configurable) and pinned to CPU0 (configurable).
• If using the **MQTT** component, it creates a task with default priority 5 (configurable, depends on `CONFIG_MQTT_USE_CUSTOM_CONFIG`) and not pinned to any core (configurable).

**Choosing application task priorities**  With a few exceptions (most importantly the lwIP TCP/IP task), in the default configuration most built-in tasks are pinned to Core 0. This makes it quite easy for the application to place high priority tasks on Core 1. Using priority 19 or higher will guarantee an application task can run on Core 1 without being preempted by any built-in task. To further isolate the tasks running on each CPU, configure the lwIP task to only run on Core 0 instead of either core (this may reduce total TCP/IP throughput depending on what other tasks are running).

In general, it’s not recommended to set task priorities on Core 0 higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. Choosing priority 19 and Core 0 will allow lower layer Wi-Fi/BT functionality to run without delays, but still pre-empts the lwIP TCP/IP stack and other less time-critical internal functionality - this is an option for time-critical tasks that don’t perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

**Note:** Setting a task to always run in preference to built-in ESP-IDF tasks does not require pinning to Core 1. The task can be left unpinned - at priority 17 or lower - to optionally run on Core 0 as well, if no higher priority built-in task is running there. Using unpinned tasks can improve the overall CPU utilization, however it makes reasoning about task scheduling more complex.

**Note:** Task execution is always completely suspended when writing to the built-in SPI flash chip. Only IRAM-Safe Interrupt Handlers will continue executing.
Improving Interrupt Performance  ESP-IDF supports dynamic Interrupt allocation with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones. Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it’s important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

- Assign more important interrupts a higher priority using a flag such as ESP_INTR_FLAG_LEVEL2 or ESP_INTR_FLAG_LEVEL3 when calling esp_intr_alloc().
- Assign the interrupt on a CPU where built-in Wi-Fi/BT tasks are not configured to run (this means assigning on Core 1 by default, see Built-In Task Priorities). Interrupts are assigned on the same CPU where the esp_intr_alloc() function call is made.
- If you’re sure the entire interrupt handler can run from IRAM (see IRAM-Safe Interrupt Handlers) then set the ESP_INTR_FLAG_IRAM flag when calling esp_intr_alloc() to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.
- Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see Targeted Optimizations). It’s possible to do this without adding the ESP_INTR_FLAG_IRAM flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

Improving Network Speed

- For Wi-Fi, see How to improve Wi-Fi performance and Wi-Fi Buffer Usage
- For lwIP TCP/IP (Wi-Fi and Ethernet), see Performance Optimization
- The wifi/iperf example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files wifi/iperf/sdkconfig.defaults, wifi/iperf/sdkconfig.defaults.esp32 and wifi/iperf/sdkconfig.ci.99 to your project sdkconfig file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

Measuring Static Sizes  To optimize both firmware binary size and memory usage it’s necessary to measure statically allocated RAM (“data”, “bss”), code (“text”) and read-only data (“rodata”) in your project.

Using the idf.py sub-commands size, size-components and size-files provides a summary of memory used by the project:

Size Summary (idf.py size)

```
$ idf.py size
[...]
  Total sizes:
  DRAM .data size:  14956 bytes
  DRAM .bss size:  15808 bytes
  Used static DRAM:  30764 bytes ( 149972 available, 17.0% used)
  Used static IRAM:  83918 bytes ( 47154 available, 64.0% used)
  Flash code:  559943 bytes
  Flash rodata:  176736 bytes
  Total image size:~ 835553 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:
• DRAM .data size is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
• DRAM .bss size is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn’t use any space in the binary file.
• Used static DRAM is the total DRAM used by .data + .bss. The available size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
• Used static IRAM is the total size of executable code executed from IRAM. This uses space in the binary file and also reduces IRAM and/or DRAM (depending on sizes) available as heap memory at runtime. See Optimizing IRAM Usage.
• Flash code is the total size of executable code executed from flash cache (IROM). This uses space in the binary file.
• Flash rodata is the total size of read-only data loaded from flash cache (DROM). This uses space in the binary file.
• Total image size is the estimated total binary file size, which is the total of all the used memory types except for .bss.

Component Usage Summary (idf.py size-components)  The summary output provided by idf.py size does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use idf.py size-components

```
$ idf.py size-components
[...]
Total sizes:
DRAM .data size: 14956 bytes

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see `Build System`), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- **DRAM .data & .bss & other**: .data and .bss are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but .bss doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- **IRAM**: is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces IRAM that can be dynamically allocated at runtime using `HEAP_CAP_32BIT`.
- **D/IRAM**: Shows IRAM space which, due to occupying D/IRAM space, is also reducing available DRAM available as heap at runtime.
- **Flash code & rodata**: these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

### Source File Usage Summary (idf.py size-files)

For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```
$ idf.py size-files
[...]
Total sizes:
  DRAM .data size: 14956 bytes
  DRAM .bss size: 15808 bytes
  Used static DRAM: 30764 bytes (149972 available, 17.0% used)
  Used static IRAM: 83918 bytes (47154 available, 64.0% used)
  Flash code: 559943 bytes
  Flash rodata: 176736 bytes
Total image size: 835553 bytes (.bin may be padded larger)
Per-file contributions to ELF file:
  Object File DRAM .data & .bss & other  IRAM  D/IRAM Flash code &...

(continues on next page)
After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed. The columns are the same as shown above for `idy.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509.crt_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the **ESP x509 Certificate Bundle** feature and not using this feature would save at least this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won’t find a corresponding source file. To locate which component a source file belongs to, it’s generally possible to search in the ESP-IDF source tree or look in the **Linker Map File** for the full path.

### Comparing Two Binaries

If making some changes that affect binary size, it’s possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn’t part of `idy.py`, it’s necessary to run the `idf-size.py` Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name `PROJECTNAME.map`. The `idf-size.py` tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding `.map` file saved from the build directory.

For example, to compare two builds: one with the default `CONFIG_COMPILER_OPTIMIZATION` setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)”: 

```
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_request.map
```

```
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means... that <CURRENT> is larger.

Total sizes of <CURRENT>:

<table>
<thead>
<tr>
<th>Component</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAM .data size</td>
<td>14516 bytes</td>
</tr>
<tr>
<td>-14956</td>
<td>-440</td>
</tr>
<tr>
<td>DRAM .bss size</td>
<td>15792 bytes</td>
</tr>
<tr>
<td>-15808</td>
<td>-16</td>
</tr>
<tr>
<td>Used static DRAM</td>
<td>30308 bytes</td>
</tr>
<tr>
<td>-30764</td>
<td>-456</td>
</tr>
<tr>
<td>Used static IRAM</td>
<td>78498 bytes</td>
</tr>
<tr>
<td>-83918</td>
<td>-5420</td>
</tr>
<tr>
<td>Flash code</td>
<td>509183 bytes</td>
</tr>
<tr>
<td>-559943</td>
<td>-50760</td>
</tr>
<tr>
<td>Flash rodata</td>
<td>170592 bytes</td>
</tr>
<tr>
<td>-176736</td>
<td>-6144</td>
</tr>
<tr>
<td>Total image size</td>
<td>772789 bytes</td>
</tr>
<tr>
<td>-835553</td>
<td>-62764</td>
</tr>
</tbody>
</table>
```

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It’s also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

```
$ $IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_Os/https_request.map
```

Also at the individual source file level:

```
$ $IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_Os/https_request.map
```
Other options (like writing the output to a file) are available, pass --help to see the full list.

**Showing Size When Linker Fails**  If too much static memory is used, then the linker will fail with an error such as `DRAM segment data does not fit, region `iram0_0_seg' overflowed by 44 bytes, or similar.

In these cases, `idf.py size` will not succeed either. However it is possible to run `idf_size.py` manually in order to view the **partial static memory usage** (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of **size-components** or **size-files** output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

**Linker Map File**  *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to :ref:`reducing-overall-size` and possibly come back to this later.*

The `idf.py` size analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created (‘linked’) the final firmware binary file.

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- **Archive member included to satisfy reference by file (symbol).** This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the Cross Reference Table at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the Discarded input sections list instead.

- **Allocating common symbols** - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.

- **Discarded input sections** - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections` `-fdata-sections` and linker option `--gc-sections`). Items mentioned in this list do not contribute to the final binary.

- **Memory Configuration, Linker script and memory map** These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the Build System. The linker script is partially generated from the ESP-IDF project using the Linker Script Generation feature.

As the output of the Linker script and memory map part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file).

Following all of the output sections that take up space in the final `.bin` file, the memory map also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don’t contribute to the final binary size. You’ll notice the address of these symbols is a very low number (starting from 0x0000000000000000 and counting up).

- **Cross Reference Table.** This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you’re wondering why a particular thing is included in the binary, this will help determine what included it.
Chapter 4. API Guides

**Note:** Unfortunately, the Cross Reference Table doesn’t only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn’t mean that it was included in the final binary - this needs to be checked separately.

**Note:** Linker map files are generated by the GNU binutils linker “ld”, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.

### Reducing Overall Size

The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for size (-Os)”. In some cases, “Optimize for performance (-O2)” will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don’t happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to “Silent”. This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It’s still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- If the binary needs to run on only certain revision(s) of ESP32, increasing `CONFIG_ESP32_REV_MIN` to match can result in a reduced binary size. This will make a large difference if setting ESP32 minimum revision 3, and PSRAM is enabled.
- Don’t enable `CONFIG_COMPILER_CXX_EXCEPTIONS, CONFIG_COMPILER_CXX_RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see Error Handling) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to “Silent reboot” will save a small amount of binary size, however this is only recommended if no one will use UART output to debug the device.

**Note:** In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is significant, this is usually noted in the configuration item help text.

### Targeted Optimizations

The following binary size optimizations apply to a particular component or a function:

**Wi-Fi**

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)

**ADC**
Chapter 4. API Guides

- Disabling ADC calibration features `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, `CONFIG_ADC_CAL_LUT_ENABLE` will save a small amount of binary size if ADC driver is used, at expense of accuracy.

**Bluetooth NimBLE** If using NimBLE Bluetooth Host then the following modifications can reduce binary size:

- Set `CONFIG_BTDM_CTRL_BLE_MAX_CONN` to 1 if only one BLE connection is needed.
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
- Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

**lwIP IPv6**

- Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

**Note:** IPv6 is required by some components such as `coap` and `ASIO port`. These components will not be available if IPv6 is disabled.

**Newlib nano formatting** By default, ESP-IDF uses newlib “full” formatting for I/O (printf, scanf, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32 ROM, so it doesn’t need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls printf() or another string formatting function, see *Reducing Stack Sizes*.

“Nano” formatting doesn’t support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the Newlib README file.

**mbedTLS features** Under Component Config -> mbedTLS there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_1`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SSL_ALPN`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_ECP_C` (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- Change `CONFIG_MBEDTLS_TLS_MODE` if both Server & Client are not needed
- Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`)
The help text for each option has some more information.

**Important:** It is strongly not recommended to disable all these mbedTLS options. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32 device may become inaccessible if support changes.

**Note:** Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

**FreeModBus** If using Modbus, enable or disable `CONFIG_FMB_COMM_MODE_TCP_EN`, `CONFIG_FMB_COMM_MODE_RTU_EN`, `CONFIG_FMB_COMM_MODE_ASCII_EN` as applicable for the necessary functionality.

**Bootloader Size** This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF Second stage bootloader.

For a discussion of ESP-IDF bootloader binary size, see [Bootloader Size](#).

**IRAM Binary Size** If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See [Optimizing IRAM Usage](#).

**Minimizing RAM Usage**

In some cases, a firmware application’s available RAM may run low or run out entirely. In these cases, it’s necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

**Background** Before optimizing ESP-IDF RAM usage, it’s necessary to understand the basics of ESP32 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in [Heap Memory Allocation](#).

**Measuring Static Memory Usage** The `idf.py` tool can be used to generate reports about the static memory usage of an application. Refer to the [Binary Size chapter](#) for more information.

**Measuring Dynamic Memory Usage** ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See [Heap Memory Debugging](#).

**Note:** In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the “largest free block”. Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.
Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the .data and .bss sizes. For tools to do this, see Measuring Static Sizes.
- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables const whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take const * arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using BlueBird, setting the option CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY will cause BlueBird to allocate memory on initialization and free it on deinitialization. This doesn’t necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

Reducing Stack Sizes

In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to xTaskCreate()). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
- Consolidate task functions. String formatting functions (like printf) are particularly heavy users of stack, so any task which doesn’t ever call these can usually have its stack size reduced.
- Enabling Newlib nano formatting will reduce the stack usage of any task that calls printf() or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don’t always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function uxTaskGetStackHighWaterMark() with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call uxTaskGetStackHighWaterMark(NULL) to get the current task’s high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call uxTaskGetStackHighWaterMark()). Often, it’s possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.
- Call uxTaskGetSystemState() at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.
- When debugger watchpoints are not being used, set the CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default CONFIG_FREERTOS_CHECK_STACKOVERFLOW option of “Checking using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it’s possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.
Internal Stack Sizes  ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

Important: If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

- Main task that executes app_main function has stack size CONFIG_ESP_MAIN_TASK_STACK_SIZE.
- High Resolution Timer system task which executes callbacks has stack size CONFIG_FREERTOS_TIMER_TASK_STACK_SIZE.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH.
- Event Handling system task to execute callbacks for the default system event loop has stack size CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE.
- lwIP TCP/IP task has stack size CONFIG_LWIP_TCP_TASK_STACK_SIZE.
- Bluez Bluetooth Host have task stack sizes CONFIG_BT_HOST_TASK_STACK_SIZE, CONFIG_BT_HCI_TASK_STACK_SIZE.
- NimBLE Bluetooth Host has task stack size CONFIG_BT_NIMBLE_TASK_STACK_SIZE.
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config ETH_MAC_DEFAULT_CONFIG then the task stack size is 4 KB. This setting can be changed by passing a custom eth_mac_config_t struct when initializing the Ethernet MAC.
- FreeRTOS idle task stack size is configured by CONFIG_FREERTOS_IDLE_TASK_STACKSIZE.
- If using the mDNS and/or MQTT components, they create tasks with stack sizes configured by CONFIG_MDNS_TASK_STACK_SIZE and CONFIG_MQTT_TASK_STACK_SIZE, respectively. MQTT stack size can also be configured using task_stack field of esp_mqtt_client_config_t.

Note: Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

Reducing Heap Usage  For functions that assist in analyzing heap usage at runtime, see Heap Memory Debugging.

Normally, optimizing heap usage consists of analyzing the usage and removing calls to malloc() that aren’t being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- lwIP documentation has a section to configure Minimum RAM usage.
- Wi-Fi Buffer Usage describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- The Ethernet driver allocates DMA buffers for the internal Ethernet MAC when it is initialized - configuration options are CONFIG_ETH_DMA_BUFFER_SIZE, CONFIG_ETH_DMA_RX_BUFFER_NUM, CONFIG_ETH_DMA_TX_BUFFER_NUM.
- mbedTLS TLS session memory usage can be minimized by enabling the ESP-IDF feature CONFIG_MBEDTLS_DYNAMIC_BUFFER.
- In single core mode only, it’s possible to use IRAM as byte accessible memory (added to the regular heap) by enabling CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY. Note that this option carries a per-
formance penalty and the risk of security issues caused by executable data. If this option is enabled then it’s possible to set other options to prefer certain buffers be allocated from this memory: *mbedTLS, NimBLE.*

- Reduce `CONFIG_BTDM_CTRL_BLE_MAX_CONN` if using BLE.
- Reduce `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN` if using Bluetooth Classic.

**Note:** There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

**Optimizing IRAM Usage** If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section `.iram0.text' will not fit in region `iram0_0_seg', IRAM0 segment data does not fit and region `iram0_0_seg' overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use *Measuring Static Sizes.* If the firmware failed to link, steps to analyze are shown at *Showing Size When Linker Fails.*

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Disable Wi-Fi options `CONFIG_ESP32_WIFI_IRAM_OPT` and/or `CONFIG_ESP32_WIFI_RX_IRAM_OPT`. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH` disabling this option will free some IRAM but is only available in some flash configurations (see the configuration item help text).
- Disabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` prevents posting `esp_event` events from IRAM-Safe Interrupt Handlers but will save some IRAM.
- Disabling `CONFIG_SPI_MASTER_ISR_IN_IRAM` prevents `spi_master` interrupts from being serviced while writing to flash, and may otherwise reduce `spi_master` performance, but will save some IRAM.
- Setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

When compiling for ESP32 revisions older than ECO3 (`CONFIG_ESP32_REV_MIN`), PSRAM cache bug workaround (`CONFIG_SPIRAM_CACHE_WORKAROUND`) option is enabled, and the C library functions normally located in ROM are recompiled with the workaround and placed into IRAM instead. For most applications, it is safe to move many of the C library functions into Flash, reclaiming some IRAM. Corresponding options include:

- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`: affects the functions `longjmp` and `setjmp`.
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`: affects the functions `abs`, `div`, `labs`, `ldiv`, `quorem`, `fclassify` and `nan`.
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`: affects the functions `utoa`, `itoa`, `atoi`, `atol`, `strtotime`, and `strtol`.
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`: affects the functions `wctomb`, `fwrite`, `wbuf`, `wsetup`, `fpwtwc`, `wctomb_r`, `ungetc`, `makebuf`, `fflush`, `refill`, and `scc1`.
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`: affects the functions `asctime`, `asctime_r`, `ctime`, `ftime`, `lcltime`, `lcltime_r`, `gmtime`, `gmtime_r`, `strftime`, `mktime`, `tztime_r`, `tzset`, `time`, `gettzinfo`, `systimes`, `month_lengths`, `timelocal`, `tzvars`, `tzlock`, `tzcalc_limits`, and `stroptime`.
- `CONFIG_SPIRAM_CACHE_LIBCHART_IN_IRAM`: affects the functions `ctype_r`, `toupper`, `tolower`, `toascii`, `strpr`, `bzero`, `isalnum`, `isalpha`, `isascii`, `isblank`, `iscntrl`, `isdigit`, `isgraph`, `islower`, `isprint`, `ispunct`, `isspace`, and `isupper`.
- `CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM`: affects the functions `memcpy`, `memchr`, `memmove`, and `memrchr`.
- `CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM`: affects the functions `strcasestr`, `strcasestr`, `strchr`, `stcrch`, `strcoll`, `strcp`, `strcsn`, `strdup`, `strdup_r`, `strlcat`, `strlcpy`, `strlwr`, `strncasecmp`, `strncat`, `strncpy`, `strndup`, `strndup_r`, `strchr`, `strsep`, `strspn`, `strstr`, `strtok_r`, and ``strpr`.
- `CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM`: affects the functions `srand`, `rand`, and `rand_r`. 
• **CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM**: affects the functions `environ`, `envlock`, and `getenv_r`.
• **CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**: affects the functions `lock`, `isatty`, `fclose`, `open`, `close`, `creat`, `read`, `rshift`, `sbrk`, `stdio`, `sysbrk`, `sysclose`, `sysopen`, `creat`, `sysread`, `syswrite`, `impure`, `fwalk`, and `findfp`.
• **CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**: affects the functions `raise` and `system`.

The exact amount of IRAM saved will depend on how much C library code is actually used by the application. In addition to these, the following options may be used to move more of the C library code into Flash, however note that this may result in reduced performance. Also take care to not use corresponding C library functions from interrupts which may be called while cache is disabled (allocated with `ESP_INTR_FLAG_IRAM` flag), refer to [IRAM-Safe Interrupt Handlers](#) for more details. For these reasons, the functions `itoa`, `memcmp`, `memcpy`, `memset`, `strcat`, `strcmp`, and `strlen` are always put in IRAM.

**Note:** Moving frequently-called functions from IRAM to flash may increase their execution time.

**Note:** Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

### 4.25 RF calibration

ESP32 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

#### 4.25.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to menuconfig and enable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`.

#### 4.25.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to menuconfig and disable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don’t mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.
4.25.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

4.25.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file components/esp_phy/esp32/include/phy_init_data.h. It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to menuconfig and disable CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: data, subtype: phy). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to menuconfig and enable CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION.

4.26 Secure Boot

Important: All references in this document are related to Secure Boot V1 (The AES based Secure Boot Scheme). ESP32 Revision 3 onwards, the preferred secure boot scheme is Secure Boot V2. Please refer to Secure Boot V2 document for ESP32 Revision 3 or ESP32-S2.

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each reset.

Secure Boot is separate from the Flash Encryption feature, and you can use secure boot without encrypting the flash contents. However, for a secure environment both should be used simultaneously. See Secure Boot & Flash Encryption for more details.

Important: Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document thoroughly and understand the implications of enabling secure boot.

4.26.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (ABS_DONE_0) is burned (written to 1) to permanently enable secure boot on the chip. For more details on Efuses, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF].
- To understand the secure boot process, first familiarise yourself with the standard ESP-IDF boot process.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.

4.26.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under How To Enable Secure Boot. Further in-depth details are supplied under Technical Details:
1. The options to enable secure boot are provided in the Project Configuration Menu, under “Secure Boot Configuration”.

2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.

3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.

4. On first boot, the software bootloader follows the following process to enable secure boot:
   - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
   - The secure digest is flashed at offset 0x0 in the flash.
   - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
   - Bootloader permanently enables secure boot by burning the ABS_DONE_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)

5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see Secure Boot Hardware Support.

6. When running in secure boot mode, the software bootloader uses the secure boot signing key (the public key of which is embedded in the bootloader itself, and therefore validated as part of the bootloader) to verify the signature appended to all subsequent partition tables and app images before they are booted.

### 4.26.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see Re-Flashable Software Bootloader). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
  - By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING_SCHEME efuse has value 1) and a 192 bit key must be stored in this block. For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) > System Parameter coding_scheme [PDF].

- The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits (details).

- “secure boot signing key” is a standard ECDSA public/private key pair (see Image Signing Algorithm) in PEM format.
  - The public key from this key pair (for signature verification but not signature creation) is compiled into the software bootloader and used to verify the second stage of booting (partition table, app image) before booting continues. The public key can be freely distributed, it does not need to be kept secret.
  - The private key from this key pair must be securely kept private, as anyone who has this key can authenticate to any bootloader that is configured with secure boot and the matching public key.

### 4.26.4 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See Bootloader Size.

### 4.26.5 How To Enable Secure Boot

1. Open the Project Configuration Menu, navigate to “Secure Boot Configuration” and select the option “One-time Flash”. (To understand the alternative “Reflashable” choice, see Re-Flashable Software Bootloader.)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.

3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.

4. The first time you run make, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See Generating Secure Boot Signing Key for more details.

5. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.

6. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by make) and then wait for flashing to complete. **Remember this is a one time flash, you can’t change the bootloader after this!**

7. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

**Note:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).

### 4.26.6 Re-Flashable Software Bootloader

Configuration “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode Secure Boot: Reflashable is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digestes for them.

In the esp-idf build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the Generating Secure Boot Signing Key step below). This private key’s SHA-256 digest is used as the secure bootloader key in efuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.
Chapter 4. API Guides

**Note:** Although it’s possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

To enable a reflashable bootloader:

1. In the Project Configuration Menu, select “Bootloader Config” -> CONFIG_SECURE_BOOT -> CONFIG_SECURE_BOOT_V1_ENABLED -> CONFIG_SECURE_BOOTLOADER_MODE -> Reflashing.
2. If necessary, set the CONFIG_SECURE_BOOTLOADER_KEY_ENCODING based on the coding scheme used by the device. The coding scheme is shown in the Features line when esptool.py connects to the chip, or in the espefuse.py summary output.
3. Follow the steps shown above to choose a signing key file, and generate the key file.
4. Run idf.py bootloader. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an espefuse.py burn_key secure_boot_v1 path_to/secure-bootloader-key-xxx.bin command which is used to write the bootloader key to eFuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).
4. Resume from Step 6 of the one-time flashing process, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

### 4.26.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via espsecure.py generate_signing_key. This uses the python-ecdsa library, which in turn uses Python’s os.urandom() as a random number source.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the openssl command line:

```bash
openssl ecparam -name prime256v1 -genkey -noout -out my_secure_boot_signing_key.pem
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

### 4.26.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates).

To extract the public key from the private key:

```bash
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_KEY
```

The path to the public signature verification key needs to be specified in the menuconfig under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```bash
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```
Chapter 4. API Guides

The above command appends the image signature to the existing binary. You can use the -output argument to write the signed binary to a separate file:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY --output SIGNED_BINARY_FILE --BINARY_FILE
```

### 4.26.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with *flash encryption* to prevent local readout of the flash contents.

### 4.26.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

**Secure Boot Hardware Support**

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32’s Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see *Secure Bootloader Digest Algorithm*. The digest can only be read back by software if Efuse ABS_DONE_0 is *not* burned (ie still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse ABS_DONE_0 is burned.

**Secure Bootloader Digest Algorithm**

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the `espsecure.py` tool in the components/esptool_py directory (specifically, the `digest_secure_bootloader` command).

Items marked with (*) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.

1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in *Flash Encryption Algorithm*.
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (*)
4. For each 16 byte plaintext block of the input image: - Reverse the byte order of the plaintext input block (*) - Apply AES256 in ECB mode to the plaintext block. - Reverse the byte order of the ciphertext output block. (*) - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (*)
6. Calculate SHA-512 of the ciphertext.

Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.
Image Signing Algorithm

Deterministic ECDSA as specified by RFC 6979.

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
- In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

Manual Commands

Secure boot is integrated into the esp-idf build system, so make will automatically sign an app image if secure boot is enabled. idf.py bootloader will produce a bootloader digest if menuconfig is configured for it.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
$ espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./image_signed.bin --image-un Signed.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```
$ espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./bootloader-digest.bin build/bootloader/bootloader.bin
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the espsecure.py digest_secure_bootloader command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:

```
$ esptool.py write_flash 0x0 bootloader-digest.bin
```

4.26.11 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.26.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See How To Enable Signed App Verification for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
• Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**How To Enable Signed App Verification**

1. Open Project Configuration Menu -> Security features -> Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you’ll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key” option. In this case, private signing key should be generated by following instructions in Generating Secure Boot Signing Key; public verification key and signed image should be generated by following instructions in Remote Signing of Images.

### 4.26.13 Advanced Features

**JTAG Debugging**

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

### 4.27 Secure Boot V2

**Important:** The references in this document are related to Secure Boot V2, the preferred scheme from ESP32 ECO3 onwards, in ESP32-S2, and from ESP32-C3 ECO3 onwards.

Refer also to Secure Boot for ESP32.

Secure Boot V2 uses RSA based app and bootloader verification. This document can also be referred for signing apps with the RSA scheme without signing the bootloader.

Secure Boot V2 and RSA scheme (App Signing Scheme) options are available for ESP32 from ECO3 onwards. To get these options visible in the menuconfig set CONFIG_ESP32_REV_MIN greater than or equal to Rev 3.

**4.27.1 Background**

Secure Boot protects a device from running unsigned code (verification at time of load). A new RSA based secure boot verification scheme (Secure Boot V2) has been introduced for ESP32-S2, ESP32-C3 ECO3 onwards, and ESP32 ECO3 onwards.

• The software bootloader’s RSA-PSS signature is verified by the Mask ROM and it is executed post successful verification.
• The verified software bootloader verifies the RSA-PSS signature of the application image before it is executed.
4.27.2 Advantages

- The RSA public key is stored on the device. The corresponding RSA private key is kept secret on a server and is never accessed by the device.
  - Only one public key can be generated and stored in ESP32 ECO3 during manufacturing.
- Same image format & signature verification is applied for applications & software bootloader.
- No secrets are stored on the device. Therefore immune to passive side-channel attacks (timing or power analysis, etc.)

4.27.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process, Step by step instructions are supplied under How To Enable Secure Boot V2.

1. Secure Boot V2 verifies the signature blocks appended to the bootloader and application binaries. The signature block contains the image binary signed by a RSA-3072 private key and its corresponding public key. More details on the Signature Block Format.
2. On startup, ROM code checks the Secure Boot V2 bit in eFuse.
3. If secure boot is enabled, ROM checks the SHA-256 of the public key in the signature block in the eFuse.
4. The ROM code validates the public key embedded in the software bootloader’s signature block by matching the SHA-256 of its public key to the SHA-256 in eFuse as per the earlier step. Boot process will be aborted if a valid hash of the public key isn’t found in the eFuse.
5. The ROM code verifies the signature of the bootloader with the pre-validated public key with the RSA-PSS Scheme. In depth information on Verifying the signature Block.
6. Software bootloader, reads the app partition and performs similar verification on the application. The application is verified on every boot up and OTA update. If selected OTA app partition fails verification, bootloader will fall back and look for another correctly signed partition.

4.27.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

Each signature block contains the following:

- Offset 0 (1 byte): Magic byte (0xe7)
- Offset 1 (1 byte): Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
- Offset 2 (2 bytes): Padding bytes, Reserved. Should be zero.
- Offset 4 (32 bytes): SHA-256 hash of only the image content, not including the signature block.
- Offset 36 (384 bytes): RSA Public Modulus used for signature verification. (value \( n \) in RFC8017).
- Offset 420 (4 bytes): RSA Public Exponent used for signature verification (value \( e \) in RFC8017).
- Offset 424 (384 bytes): Precalculated \( R \), derived from \( n \).
- Offset 808 (4 bytes): Precalculated \( M' \), derived from \( n' \)
- Offset 812 (384 bytes): RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC).
- Offset 1196: CRC32 of the preceding 1095 bytes.
- Offset 1200 (16 bytes): Zero padding to length 1216 bytes.

Note: \( R \) and \( M' \) are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

4.27.5 Verifying the signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196.
Only one signature block can be appended to the bootloader or application image in ESP32 ECO3.

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. The magic byte, signature block CRC is validated.
2. Public key digests are generated per signature block and compared with the digests from eFuse. If none of the digests match, the verification process is aborted.
3. The application image digest is generated and matched with the image digest in the signature blocks. The verification process is aborted if the digests don’t match.
4. The public key is used to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (3) for comparison.
   - The application signing scheme is set to RSA for Secure Boot V2 and to ECDSA for Secure Boot V1.

**Important:** It is recommended to use Secure Boot V2 on the chip versions supporting them.

### 4.27.6 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See *Bootloader Size*.

### 4.27.7 eFuse usage

ESP32-ECO3:

- ABS_DONE_1 - Enables secure boot protection on boot.
- BLK2 - Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M’ values (represented as 776 bytes – offsets 36 to 812 - as per the *Signature Block Format*) is written to an eFuse key block.

### 4.27.8 How To Enable Secure Boot V2

1. Open the *Project Configuration Menu*, in “Security Features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. For ESP32, Secure Boot V2 is available only ESP32 ECO3 onwards. To view the “Secure Boot V2” option the chip revision should be changed to revision 3 (ESP32-ECO3). To change the chip revision, set “Minimum Supported ESP32 Revision” to Rev 3 in “Component Config” -> “ESP32- Specific”.
3. Specify the secure boot signing key path. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
4. Select the UART ROM download mode in “Security features -> UART ROM download mode”. By default the UART ROM download mode has been kept enabled in order to prevent permanently disabling it in the development phase, this option is a potentially insecure option. It is recommended to disable the UART download mode for better security.
5. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.
6. The first time you run *make* or *idf.py build*, if the signing key is not found then an error message will be printed with a command to generate a signing key via *espsecure.py generate_signing_key*.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (/dev/urandom on OSX/Linux and *CryptGenRandom()* on Windows). If this random number source is weak, then the private key will be weak.
**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

7. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

10. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

**Note:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

11. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

### 4.27.9 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in efuse.
- After Secure Boot is enabled, no further efuses can be read protected. (If Flash Encryption is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behaviour can be disabled, but this is not recommended.

### 4.27.10 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the openssl command line:

```
`openssl genrsa -out my_secure_boot_signing_key.pem 3072`
```

Remember that the strength of the secure boot system depends on keeping the signing key private.
4.27.11 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the --output argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_ --BINARY_FILE BINARY_FILE
```

4.27.12 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

4.27.13 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

Manual Commands

Secure boot is integrated into the esp-idf build system, so make or idf.py build will sign an app image and idf.py bootloader will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_ --signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.27.14 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.
4.27.15 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware secure boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware secure boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn’t verified during the update process, it’s assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it’s essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn’t verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

**Note:** In general, it’s recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is RSA. For ESP32 ECO3 chip, select *CONFIG_ESP32_REV_MIN* to Rev 3 to get RSA option available
3. Enable *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

**Warning:** It is very important that all apps flashed have been signed, either during the build or after the build.

4.27.16 Advanced Features

**JTAG Debugging**

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG with Flash Encryption or Secure Boot* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.28 Thread Local Storage

4.28.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:
• **FreeRTOS Native API**: ESP-IDF FreeRTOS native API.
• **Pthread API**: ESP-IDF’s pthread API.
• **C11 Standard**: C11 standard introduces special keyword to declare variables as thread local.

### 4.28.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by \texttt{CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS} configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more then 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

### 4.28.3 Pthread API

The ESP-IDF provides the following *pthread API* to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

### 4.28.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with \texttt{__thread} keyword). For details on this GCC feature please see [https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local](https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local). Storage for that kind of variables is allocated on the task’s stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like \texttt{ipc}, \texttt{timer} tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

### 4.29 Tools

#### 4.29.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like apt, yum, brew, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.
However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as idf.py)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

**Note:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the *Getting Started Guide*.

**Tools metadata file**

The list of tools and tool versions required for each platform is located in `tools/tools.json`. The schema of this file is defined by `tools/tools_schema.json`. This file is used by `tools/idf_tools.py` script when installing the tools or setting up the environment variables.

**Tools installation directory**

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` — where the archives of the tools are downloaded.
- `tools` — where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

**GitHub Assets Mirror**

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it’s possible to configure a GitHub assets mirror.

To use Espressif’s download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

**Note:** The Espressif download server doesn’t currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.
idf_tools.py script

The `idf_tools.py` script bundled with ESP-IDF performs several functions:

- **install**: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`.
  
  The `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If all is given, all the tools (required and optional ones) are installed. If no argument or required is given, only the required tools are installed.

- **download**: Similar to `install` but doesn’t extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.

- **export**: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:
  - `shell` produces output suitable for evaluation in the shell. For example,
    
    ```bash
    export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
    ```
    
    on Linux and macOS, and

    ```cmd
    set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
    ```
    
    on Windows.

    **Note:** Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

    The output of this command may be used to update the environment variables, if the shell supports this. For example:

    ```bash
    eval $(/IDF_PATH/tools/idf_tools.py export)
    ```

  - `key-value` produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

    ```bash
    PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
    ```

    Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- **list**: Lists the known versions of the tools, and indicates which ones are installed.

- **check**: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
• export.sh for Bash

**Note:** To modify the shell environment in Bash, `export.sh` must be “sourced”: `. ./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the PATH.

**Other installation methods**

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- **IDF Tools installer for Windows** can download and install the tools. Internally the installer uses `idf_tools.py`.
- **Eclipse plugin for ESP-IDF** includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- **Visual Studio Code extension for ESP-IDF** includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

**Custom installation**

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

**List of IDF Tools**

**xtensa-esp32-elf** Toolchain for Xtensa (ESP32) based on GCC

**cmake**  
CMake build system

On Linux and macOS, it is recommended to install CMake using the OS-specific package manager (like apt, yum, brew, etc.). However, for convenience it is possible to install CMake using idf_tools.py along with the other tools.

### 4.29.2 IDF Docker Image

IDF Docker image (*espressif/idf*) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, make, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

**Tags**

Multiple tags of this image are maintained:

- `latest`: tracks `master` branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks release `vX.Y` branch of ESP-IDF

**Note:** Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at [https://hub.docker.com/r/espressif/idf/tags](https://hub.docker.com/r/espressif/idf/tags).

**Usage**

**Setting up Docker**  
Before using the `espressif/idf` Docker image locally, make sure you have Docker installed. Follow the instructions at [https://docs.docker.com/install/](https://docs.docker.com/install/), if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

**Building a project with CMake**  
In the project directory, run:

```shell
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
Chapter 4. API Guides

- `--v $PWD:/project`: mounts the current directory on the host ($PWD) as /project directory in the container
- `espressif/idf`: uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as `espressif/idf:TAG`, for example:

```
docker run --rm --v $PWD:/project -w /project espressif/idf:release-v4.0 idf.py --build
```

You can check the up-to-date list of available tags at [https://hub.docker.com/r/espressif/idf/tags](https://hub.docker.com/r/espressif/idf/tags).

**Building a project with GNU Make** Same as for CMake, except that the build command is different:

```
docker run --rm --v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

**Note:** If the `sdkconfig` file does not exist, the default behavior of GNU Make build system is to open the menuconfig UI. This may be not desired in automated build environments. To ensure that the `sdkconfig` file exists, `defconfig` target is added before `all`.

If you intend to build the same project repeatedly, you may bind the `tools/kconfig` directory of ESP-IDF to a named volume. This will prevent Kconfig tools, located in ESP-IDF directory, from being rebuilt, causing a rebuild of the rest of the project:

```
docker run --rm --v $PWD:/project -v kconfig:/opt/esp/idf/tools/kconfig -w /project espressif/idf make defconfig all -j4
```

If you need cleanup the `kconfig` volume, run `docker volume rm kconfig`.

Binding the `tools/kconfig` directory to a volume is not necessary when using the CMake build system.

**Using the image interactively** It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm --v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

**Note:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows ([https://github.com/docker/for-win/issues/1018](https://github.com/docker/for-win/issues/1018)) and Docker for Mac ([https://github.com/docker/for-mac/issues/900](https://github.com/docker/for-mac/issues/900)).

### 4.29.3 IDF Windows Installer

**Command-line parameters**

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

## 4.30 ULP Coprocessor programming

### 4.30.1 ESP32 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP coprocessor assembler.

ULP coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.
ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

Note about addressing

ESP32 ULP coprocessor’s JUMP, ST, LD instructions which take register as an argument (jump address, store/load base address) expect the argument to be expressed in 32-bit words.

Consider the following example program:

```assembly
entry:
   NOP
   NOP
   NOP
   NOP

loop:
   MOVE R1, loop
   JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However `JUMP` instruction expects the address stored in register to be expressed in 32-bit words. To account for this common use case, assembler will convert the address of label `loop` from bytes to words, when generating `MOVE` instruction, so the code generated code will be equivalent to:

```assembly
0000  NOP
0004  NOP
0008  NOP
000c  NOP
0010  MOVE R1, 4
0014  JUMP R1
```

The other case is when the argument of `MOVE` instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```assembly
.set   val, 0x10
MOVE   R1, val
```

In this case, value loaded into R1 will be 0x10.

Similar considerations apply to `LD` and `ST` instructions. Consider the following code:

```assembly
.globa1 array
array: .long 0
       .long 0
       .long 0
       .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0     // write value of R2 into the first array element,
                 // i.e. array[0]

ST R2, R1, 4     // write value of R2 into the second array element
                 // (4 byte offset), i.e. array[1]
```

(continues on next page)
ADD R1, R1, 2  // this increments address by 2 words (8 bytes)
ST R2, R1, 0  // write value of R2 into the third array element,
               // i.e. array[2]

Note about instruction execution time

ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time. Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

NOP - no operation

Syntax NOP
Operands None
Cycles 2 cycle to execute, 4 cycle to fetch next instruction
Description No operation is performed. Only the PC is incremented.
Example:

```
1: NOP
```

ADD - Add to register

Syntax ADD Rdst, Rsrl, Rsr2
      ADD Rdst, Rsrl, imm
Operands
- `Rdst` - Register R[0..3]
- `Rsrl` - Register R[0..3]
- `Rsr2` - Register R[0..3]
- `Imm` - 16-bit signed value
Cycles 2 cycles to execute, 4 cycles to fetch next instruction
Description The instruction adds source register to another source register or to a 16-bit signed value and stores result to the destination register.
Examples:

```
1: ADD R1, R2, R3  // R1 = R2 + R3
2: Add R1, R2, 0x1234 // R1 = R2 + 0x1234
```

Chapter 4. API Guides

(continued from previous page)

3: .set value1, 0x03  //constant value1=0x03
    Add R1, R2, value1  //R1 = R2 + value1

4: .global label  //declaration of variable label
    Add R1, R2, label  //R1 = R2 + label
    ...  
    label: nop  //definition of variable label

SUB - Subtract from register

Syntax  SUB Rdst, Rsrc1, Rsrc2
       SUB Rdst, Rsrc1, imm

Operands
• Rdst  - Register R[0..3]
• Rsrc1  - Register R[0..3]
• Rsrc2  - Register R[0..3]
• Imm  - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction subtracts the source register from another source register or subtracts 16-bit signed value from a source register, and stores result to the destination register.

Examples:

1: SUB R1, R2, R3  //R1 = R2 - R3
2: sub R1, R2, 0x1234  //R1 = R2 - 0x1234
3: .set value1, 0x03  //constant value1=0x03
    SUB R1, R2, value1  //R1 = R2 - value1
4: .global label  //declaration of variable label
    SUB R1, R2, label  //R1 = R2 - label
    ...  
    label: nop  //definition of variable label

AND - Logical AND of two operands

Syntax  AND Rdst, Rsrc1, Rsrc2
       AND Rdst, Rsrc1, imm

Operands
• Rdst  - Register R[0..3]
• Rsrc1  - Register R[0..3]
• Rsrc2  - Register R[0..3]
• Imm  - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does logical AND of a source register and another source register or 16-bit signed value and stores result to the destination register.

Examples:

1: AND R1, R2, R3  //R1 = R2 \& R3
2: AND R1, R2, 0x1234  //R1 = R2 \& 0x1234
3: .set value1, 0x03  //constant value1=0x03
    AND R1, R2, value1  //R1 = R2 \& value1

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

4:   `.global` label  //declaration of variable label
     AND R1, R2, label  //R1 = R2 & label
     ...
label: nop  //definition of variable label

OR - Logical OR of two operands

Syntax  OR Rdst, Rscl, Rsr2
       OR Rdst, Rscl, imm
Operands
- Rdst - Register R[0..3]
- Rscl - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical OR of a source register and another source register or 16-bit signed value and stores result to the destination register.

Examples:

1:   OR R1, R2, R3  //R1 = R2 || R3
2:   OR R1, R2, 0x1234  //R1 = R2 || 0x1234
3:   .set value1, 0x03  //constant value1=0x03
     OR R1, R2, value1  //R1 = R2 || value1
4:   `.global` label  //declaration of variable label
     OR R1, R2, label  //R1 = R2 || label
     ...
label: nop  //definition of variable label

LSH - Logical Shift Left

Syntax  LSH Rdst, Rscl, Rsr2
        LSH Rdst, Rscl, imm
Operands
- Rdst - Register R[0..3]
- Rscl - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical shift to left of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

Examples:

1:   LSH R1, R2, R3  //R1 = R2 << R3
2:   LSH R1, R2, 0x03  //R1 = R2 << 0x03
3:   .set value1, 0x03  //constant value1=0x03
     LSH R1, R2, value1  //R1 = R2 << value1
4:   `.global` label  //declaration of variable label
     LSH R1, R2, label  //R1 = R2 << label

(continues on next page)
RSH - Logical Shift Right

Syntax  \texttt{RSH Rdst, Rsrc1, Rsrc2}  
\texttt{RSH Rdst, Rsrc1, imm}

Operands  \texttt{Rdst} - Register R[0..3]  \texttt{Rsrc1} - Register R[0..3]  \texttt{Rsrc2} - Register R[0..3]  \texttt{Imm} - 16-bit signed value  
Cycles  2 cycles to execute, 4 cycles to fetch next instruction  
Description  The instruction does logical shift to right of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.  

Examples:

1:  \texttt{RSH R1, R2, R3}  //R1 = R2 >> R3  
2:  \texttt{RSH R1, R2, 0x03}  //R1 = R2 >> 0x03  
3:  \texttt{.set value1, 0x03}  //constant value1=0x03  
\texttt{RSH R1, R2, value1}  //R1 = R2 >> value1  
4:  \texttt{.global label}  //declaration of variable label  
\texttt{RSH R1, R2, label}  //R1 = R2 >> label  
label: nop  //definition of variable label  

MOVE – Move to register

Syntax  \texttt{MOVE Rdst, Rsrc}  
\texttt{MOVE Rdst, imm}

Operands  \texttt{Rdst} - Register R[0..3]  
\texttt{Rsrc} - Register R[0..3]  
\texttt{Imm} - 16-bit signed value  
Cycles  2 cycles to execute, 4 cycles to fetch next instruction  
Description  The instruction move to destination register value from source register or 16-bit signed value.  
Note that when a label is used as an immediate, the address of the label will be converted from bytes to words.  
This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. To avoid using an extra instruction  

Examples:

1:  \texttt{MOVE R1, R2}  //R1 = R2  
2:  \texttt{MOVE R1, 0x03}  //R1 = 0x03  
3:  \texttt{.set value1, 0x03}  //constant value1=0x03  
\texttt{MOVE R1, value1}  //R1 = value1  
4:  \texttt{.global label}  //declaration of label  
\texttt{MOVE R1, label}  //R1 = address_of(label) / 4  
label: nop  //definition of label  

ST – Store data to the memory

Syntax  \texttt{ST Rsrc, Rdst, offset}
Operands
- \( R_{src} \) – Register R[0..3], holds the 16-bit value to store
- \( R_{dst} \) – Register R[0..3], address of the destination, in 32-bit words
- \( \text{Offset} \) – 13-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction stores the 16-bit value of \( R_{src} \) to the lower half-word of memory with address \( R_{dst} + \text{offset} \). The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with \( R_{dst} (0..3) \):

\[
\text{Mem}[R_{dst} + \text{offset} / 4][31:0] = (PC[10:0], 3'b0, R_{dst}, R_{src}[15:0])
\]

The application can use higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

Examples:

1: \[ \text{ST} \ R1, \ R2, \ 0x12 \quad // \text{MEM}[R2+0x12] = R1 \]

2: \[ .\text{data} \quad // \text{Data section definition} \]
\[ \text{Addr1}: \ .\text{word} \ 123 \quad // \text{Define label Addr1 16 bit} \]
\[ .\text{set} \ \text{offs, 0x00} \quad // \text{Define constant offs} \]
\[ .\text{text} \quad // \text{Text section definition} \]
\[ \text{MOVE} \ R1, 1 \quad // R1 = 1 \]
\[ \text{MOVE} \ R2, \text{Addr1} \quad // R2 = \text{Addr1} \]
\[ \text{ST} \ R1, \ R2, \text{offs} \quad // \text{MEM}[R2 + 0] = R1 \]
\[ // \text{MEM}[\text{Addr1} + 0] \text{ will be 32'h600001} \]

LD – Load data from the memory

Syntax \( \text{LD} \ \ R_{dst}, \ R_{src}, \text{offset} \)

Operands \( R_{dst} \) – Register R[0..3], destination
\( R_{src} \) – Register R[0..3], holds address of destination, in 32-bit words
\( \text{Offset} \) – 13-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction loads lower 16-bit half-word from memory with address \( R_{src} + \text{offset} \) into the destination register \( R_{dst} \):

\[ R_{dst}[15:0] = \text{Mem}[R_{src} + \text{offset} / 4][15:0] \]

Examples:

1: \[ \text{LD} \ R1, \ R2, \ 0x12 \quad // R1 = \text{MEM}[R2+0x12] \]

2: \[ .\text{data} \quad // \text{Data section definition} \]
\[ \text{Addr1}: \ .\text{word} \ 123 \quad // \text{Define label Addr1 16 bit} \]
\[ .\text{set} \ \text{offs, 0x00} \quad // \text{Define constant offs} \]
\[ .\text{text} \quad // \text{Text section definition} \]
\[ \text{MOVE} \ R1, 1 \quad // R1 = 1 \]
\[ \text{MOVE} \ R2, \text{Addr1} \quad // R2 = \text{Addr1} / 4 \text{ (address of label \text{is...}} \]
\[ \text{LD} \ R1, \ R2, \text{offs} \quad // R1 = \text{MEM}[R2 + 0] \]
\[ // R1 \text{ will be 123} \]

JUMP – Jump to an absolute address

Syntax \( \text{JUMP} \ \ R_{dst} \)
\( \text{JUMP} \ \text{ImmAddr} \)
\( \text{JUMP} \ \ R_{dst}, \text{Condition} \)
\( \text{JUMP} \ \text{ImmAddr}, \text{Condition} \)
Chapter 4. API Guides

Operands

- **Rdst** - Register R[0..3] containing address to jump to (expressed in 32-bit words)
- **ImmAddr** - 13 bits address (expressed in bytes), aligned to 4 bytes
- **Condition**:
  - **EQ** - jump if last ALU operation result was zero
  - **OV** - jump if last ALU has set overflow flag

Cycles

2 cycles to execute, 2 cycles to fetch next instruction

Description

The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

Examples:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>// Definition of label</td>
</tr>
</tbody>
</table>

**JUMPR** - Jump to a relative offset (condition based on R0)

Syntax

**JUMPR** Step, Threshold, Condition

Operands

- **Step** - relative shift from current position, in bytes
- **Threshold** - threshold value for branch condition
- **Condition**:
  - **EQ** (equal) - jump if value in R0 == threshold
  - **LT** (less than) - jump if value in R0 < threshold
  - **LE** (less or equal) - jump if value in R0 <= threshold
  - **GT** (greater than) - jump if value in R0 > threshold
  - **GE** (greater or equal) - jump if value in R0 >= threshold

Cycles

Conditions **LT**, **GE**, **LE** and **GT**: 2 cycles to execute, 2 cycles to fetch next instruction

Conditions **LE** and **GT** are implemented in the assembler using one **JUMPR** instructions:

```assembly
// JUMPR target, threshold, GT is implemented as:
JUMPR target, threshold+1, GE

// JUMPR target, threshold, LE is implemented as:
JUMPR target, threshold + 1, LT
```

Conditions **EQ** is implemented in the assembler using two **JUMPR** instructions:

```assembly
// JUMPR target, threshold, EQ is implemented as:
JUMPR next, threshold + 1, GE
JUMPR target, threshold, GE
next:
```
Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples:**

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if...

2: // Down counting loop using R0 register

<table>
<thead>
<tr>
<th>Mov</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUB</td>
<td>R0, R0, 1</td>
</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
<tr>
<td>JUMPR</td>
<td>label, 1, GE // jump to label if R0 &gt;= 1</td>
</tr>
</tbody>
</table>

**JUMPS** –Jump to a relative address (condition based on stage count)

**Syntax** JUMPS Step, Threshold, Condition

**Operands**
- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition:**
  - *EQ* (equal) – jump if value in stage_cnt == threshold
  - *LT* (less than) – jump if value in stage_cnt < threshold
  - *LE* (less or equal) – jump if value in stage_cnt <= threshold
  - *GT* (greater than) – jump if value in stage_cnt > threshold
  - *GE* (greater or equal) – jump if value in stage_cnt >= threshold

**Cycles** Conditions *LE, LT, GE*: 2 cycles to execute, 2 cycles to fetch next instruction

Conditions *EQ, GT* are implemented in the assembler using two JUMPS instructions:

```
// JUMPS target, threshold, EQ is implemented as:
JUMPS next, threshold, LT
JUMPS target, threshold, LE

next:
// JUMPS target, threshold, GT is implemented as:
JUMPS next, threshold, LE
JUMPS target, threshold, GE

next:
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt...

2: // Up counting loop using stage count register

<table>
<thead>
<tr>
<th>Mov</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAGE_RST</td>
<td>// set stage_cnt to 0</td>
</tr>
<tr>
<td>STAGE_INC</td>
<td>1       // stage_cnt++</td>
</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
<tr>
<td>JUMPS</td>
<td>label, 16, LT // jump to label if stage_cnt &lt; 16</td>
</tr>
</tbody>
</table>
**STAGE_RST – Reset stage count register**

**Syntax** `STAGE_RST`

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

```
1: STAGE_RST  // Reset stage count register
```

**STAGE_INC – Increment stage count register**

**Syntax** `STAGE_INC Value`

**Operands**
- `Value` – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments stage count register by given value.

**Examples:**

```
1: STAGE_INC 10  // stage_cnt += 10
2: // Up counting loop example:
STAGE_RST  // set stage_cnt to 0
label: STAGE_INC 1  // stage_cnt++
NOP  // do something
JUMPS label, 16, LT  // jump to label if stage_cnt < 16
```

**STAGE_DEC – Decrement stage count register**

**Syntax** `STAGE_DEC Value`

**Operands**
- `Value` – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements stage count register by given value.

**Examples:**

```
1: STAGE_DEC 10  // stage_cnt -= 10;
2: // Down counting loop example
STAGE_RST  // set stage_cnt to 0
STAGE_INC 16  // increment stage_cnt to 16
label: STAGE_DEC 1  // stage_cnt--;
NOP  // do something
JUMPS label, 0, GT  // jump to label if stage_cnt > 0
```

**HALT – End the program**

**Syntax** `HALT`

**Operands** No operands

**Cycles** 2 cycles to execute

**Description** The instruction halts the ULP coprocessor and restarts ULP wakeup timer, if it is enabled.

**Examples:**
WAKE –Wake up the chip

Syntax WAKE

Operands No operands

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction sends an interrupt from ULP to RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

Examples:

```
1: is_rdy_for_wakeup:
    // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOWPOWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq
    // Retry until the bit is set
    WAKE
    // Trigger wake up
    REG_WR 0x006, 24, 24, 0
    // Stop ULP timer (clear RTC_CNTL_ULP_CP_SLP_TIMER_EN)
    HALT
    // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.
```

SLEEP –set ULP wakeup timer period

Syntax SLEEP sleep_reg

Operands

- sleep_reg –0..4, selects one of SENS_ULP_CP_SLEEP_CYC\(x\) REG registers.

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction selects which of the SENS_ULP_CP_SLEEP_CYC\(x\) REG (\(x = 0..4\)) register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

Examples:

```
1: SLEEP 1
    // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG
2: .set sleep_reg, 4
    // Set constant
    SLEEP sleep_reg
    // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG
```

WAIT –wait some number of cycles

Syntax WAIT Cycles

Operands

- Cycles –number of cycles for wait

Cycles 2 + Cycles cycles to execute, 4 cycles to fetch next instruction

Description The instruction delays for given number of cycles.

Examples:
API Guides

1:    WAIT 10  // Do nothing for 10 cycles
2:    .set wait_cnt, 10 // Set a constant
      WAIT wait_cnt  // wait for 10 cycles

TSENS – do measurement with temperature sensor

Syntax
  • TSENS Rdst, Wait_Delay

Operands
  • Rdst - Destination Register R[0..3], result will be stored to this register
  • Wait_Delay - number of cycles used to perform the measurement

Cycles 2 + Wait_Delay + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction

Description The instruction performs measurement using TSENS and stores the result into a general purpose register.

Examples:
1: TSENS R1, 1000 // Measure temperature sensor for 1000 cycles, and store result to R1

ADC – do measurement with ADC

Syntax
  • ADC Rdst, Sar_sel, Mux
  • ADC Rdst, Sar_sel, Mux, 0 — deprecated form

Operands
  • Rdst - Destination Register R[0..3], result will be stored to this register
  • Sar_sel - Select ADC: 0 = SARADC1, 1 = SARADC2
  • Mux - selected PAD, SARADC Pad[Mux-1] is enabled. If the user passes Mux value 1, then ADC pad 0 gets used.

Cycles 23 + max(1, SAR_AMP_WAIT1) + max(1, SAR_AMP_WAIT2) + max(1, SAR_AMP_WAIT3) + SARx_SAMPLE_CYCLE + SARx_SAMPLE_BIT cycles to execute, 4 cycles to fetch next instruction

Description The instruction makes measurements from ADC.

Examples:
1: ADC R1, 0, 1 // Measure value using ADC1 pad 2 and store...
1:    I2C_RD  0x10, 7, 0, 0 // Read byte from sub-address 0x10 of slave with address set in SENS_I2C_SLAVE_ADDR0

I2C_WR - write single byte to I2C slave

**Syntax**

```
I2C_WR Sub_addr, Value, High, Low, Slave_sel
```

**Operands**

- **Sub_addr** – Address within the I2C slave to write.
- **Value** – 8-bit value to be written.
- **High, Low** — Define range of bits to write. Bits outside of [High, Low] range are masked.
- **Slave_sel** - Index of I2C slave address to use.

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** I2C_WR instruction writes one byte to I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == Slave_sel.

**Examples:**

1:    I2C_WR 0x20, 0x33, 7, 0, 1 // Write byte 0x33 to sub-address 0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.

REG_RD – read from peripheral register

**Syntax** REG_RD Addr, High, Low

**Operands**

- **Addr** – Register address, in 32-bit words
- **High** – Register end bit number
- **Low** – Register start bit number

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction reads up to 16 bits from a peripheral register into a general purpose register: 

```
R0 = REG[Addr][High:Low].
```

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

1:    REG_RD 0x120, 7, 4 // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}

REG_WR – write to peripheral register

**Syntax** REG_WR Addr, High, Low, Data

**Operands**

- **Addr** – Register address, in 32-bit words.
- **High** – Register end bit number
- **Low** – Register start bit number
- **Data** – Value to write, 8 bits

**Cycles** 8 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction writes up to 8 bits from an immediate data value into a peripheral register:

```
REG[Addr][High:Low] = data.
```

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:
addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4

Examples:

| REG_WR       | 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10 |

Convenience macros for peripheral registers access

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ_RTC_REG(rtc_reg, low_bit, bit_width)** Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"
/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**READ_RTC_FIELD(rtc_reg, field)** Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"
/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value)** Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"
/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**WRITE_RTC_FIELD(rtc_reg, field, value)** Write immediate value into a field in rtc_reg, up to 8 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"
/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

### 4.30.2 Programming ULP coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
  I_MOVI(R3, 16), // R3 <- 16
  I_LD(R0, R3, 0), // R0 <- RTC_SLOW_MEM[R3 + 0]
  I_LD(R1, R3, 1), // R1 <- RTC_SLOW_MEM[R3 + 1]
};
```

(continues on next page)
The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 — R3) and literal constants. See ULP coprocessor instruction defines section for descriptions of instructions and arguments they take.

Note: Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

Load and store instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM (which is address 0x50000000 as seen by the main CPUs).

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
  I_MOVI(R0, 34), // R0 <- 34
  M_LABEL(1), // label_1
  I_MOVI(R1, 32), // R1 <- 32
  I_LD(R1, R1, 0), // R1 <- RTC_SLOW_MEM[R1]
  I_MOVI(R2, 33), // R2 <- 33
  I_LD(R2, R2, 0), // R2 <- RTC_SLOW_MEM[R2]
  I_SUBR(R3, R1, R2), // R3 <- R1 - R2
  I_ST(R3, R0, 0), // R3 -> RTC_SLOW_MEM[R0 + 0]
  I_ADDI(R0, R0, 1), // R0++
  M_BL(1, 64), // if (R0 < 64) goto label_1
  I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

Application Example

Demonstration of entering into deep sleep mode and waking up using several wake up sources: system/deep_sleep.

API Reference
Chapter 4. API Guides

Header File
- ulp/include/esp32/ulp.h

Functions

```c
esp_err_t ulp_process_macros_and_load(uint32_t load_addr, const ulp_insn_t *program, size_t *psize)
```
Resolve all macro references in a program and load it into RTC memory.

Return
- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or can not be loaded

Parameters
- `load_addr`: address where the program should be loaded, expressed in 32-bit words
- `program`: ulp_insn_t array with the program
- `psize`: size of the program, expressed in 32-bit words

```c
esp_err_t ulp_run(uint32_t entry_point)
```
Run the program loaded into RTC memory.

Return
- ESP_OK on success

Parameters
- `entry_point`: entry point, expressed in 32-bit words

Error codes

- **ESP_ERR_ULP_BASE**
  Offset for ULP-related error codes
- **ESP_ERR_ULP_SIZE_TOO_BIG**
  Program doesn’t fit into RTC memory reserved for the ULP
- **ESP_ERR_ULP_INVALID_LOAD_ADDR**
  Load address is outside of RTC memory reserved for the ULP
- **ESP_ERR_ULP_DUPLICATE_LABEL**
  More than one label with the same number was defined
- **ESP_ERR_ULP_DEFINED_LABEL**
  Branch instructions references an undefined label
- **ESP_ERR_ULP_BRANCH_OUT_OF_RANGE**
  Branch target is out of range of B instruction (try replacing with BX)

ULP coprocessor registers

ULP co-processor has 4 16-bit general purpose registers. All registers have same functionality, with one exception. R0 register is used by some of the compare-and-branch instructions as a source register.

These definitions can be used for all instructions which require a register.

- **R0**
  general purpose register 0
- **R1**
  general purpose register 1
- **R2**
  general purpose register 2
- **R3**
  general purpose register 3
**ULP coprocessor instruction defines**

**I_DELAY (cycles_)**  
Delay (nop) for a given number of cycles

**I_HALT ()**  
Halt the coprocessor.
This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

**I_END ()**  
Stop ULP program timer.  
This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

**I_ST (reg_val, reg_addr, offset_)**  
Store value from register reg_val into RTC memory.
The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:
- bits [31:21] hold the PC of current instruction, expressed in 32-bit words
- bits [20:18] = 3’b0
- bits [17:16] reg_addr (0..3)
- bits [15:0] are assigned the contents of reg_val

RTC_SLOW_MEM[addr + offset_] = { insn_PC[10:0], 3’b0, reg_addr, reg_val[15:0] }

**I_LD (reg_dest, reg_addr, offset_)**  
Load value from RTC memory into reg_dest register.
Loads 16 LSBs from RTC memory word given by the sum of value in reg_addr and value of offset_.

**I_WR_REG (reg, low_bit, high_bit, val)**  
Write literal value to a peripheral register
reg[high_bit : low_bit] = val This instruction can access RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripheral registers.

**I_RD_REG (reg, low_bit, high_bit)**  
Read from peripheral register into R0
R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripheral registers.

**I_BL (pc_offset, imm_value)**  
Branch relative if R0 less than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BGE (pc_offset, imm_value)**  
Branch relative if R0 greater or equal than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

**I_BXR (reg_pc)**  
Unconditional branch to absolute PC, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I_BXI (imm_pc)**  
Unconditional branch to absolute PC, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXZR (reg_pc)
Branch to absolute PC if ALU result is zero, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXZI (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)
Branch to absolute PC if ALU overflow, address in register
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXFI (imm_pc)
Branch to absolute PC if ALU overflow, immediate address
Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)
Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)
Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)
Logical OR: dest = src1 | src2

I_MOVR (reg_dest, reg_src)
Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)
Logical shift left: dest = src << shift

I_RSHR (reg_dest, reg_src, reg_shift)
Logical shift right: dest = src >> shift

I_ADDI (reg_dest, reg_src, imm_)
Add register and an immediate value: dest = src1 + imm

I_SUBI (reg_dest, reg_src, imm_)
Subtract register and an immediate value: dest = src - imm

I_ANDI (reg_dest, reg_src, imm_)
Logical AND register and an immediate value: dest = src & imm

I_ORI (reg_dest, reg_src, imm_)
Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)
Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)
Logical shift left register value by an immediate: dest = src << imm

I_RSHI (reg_dest, reg_src, imm_)
Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
Define a label with number label_num.
This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.
Chapter 4. API Guides

M_BL (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BGE (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)
Macro: unconditional branch to label.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)
Macro: branch to label if ALU result is zero.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)
Macro: branch to label if ALU overflow.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

Defines
RTC_SLOW_MEM
RTC slow memory, 8k size
The ULP (Ultra Low Power) coprocessor is a simple FSM (Finite State Machine) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers.

4.30.3 Installing the Toolchain
The ULP coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain.
If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then the ULP toolchain will already be installed.
If you are using ESP-IDF with the legacy GNU Make based build system, refer to the instructions on this page: The ULP Coprocessor (Legacy GNU Make).

4.30.4 Compiling the ULP Code
To compile the ULP code as part of the component, the following steps must be taken:

1. The ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance ulp/.
2. Call ulp_embed_binary from the component CMakeLists.txt after registration. For example:
... 
idf_component_register()
set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")
ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")

The first argument to ulp_embed_binary specifies the ULP binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g. idf.py app)
   Inside, the build system will take the following steps to build ULP program:
   1. **Run each assembly file (foo.S) through the C preprocessor**. This step generates the preprocessed assembly files (foo.ulp.S) in the component build directory. This step also generates dependency files (foo.ulp.d).
   2. **Run preprocessed assembly sources through the assembler**. This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
   3. **Run the linker script template through the C preprocessor**. The template is located in components/ulp/ld directory.
   4. **Link the object files into an output ELF file** (ulp_app_name.elf). The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.
   5. **Dump the contents of the ELF file into a binary** (ulp_app_name.bin) which can then be embedded into the application.
   6. **Generate a list of global symbols** (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.
   7. **Create an LD export script and header file** (ulp_app_name.1d and ulp_app_name.h) containing the symbols from ulp_app_name.sym. This is done using the esp32ulp_mapgen.py utility.
   8. **Add the generated binary to the list of binary files** to be embedded into the application.

4.30.5 Accessing the ULP Program Variables

Global symbols defined in the ULP program may be used inside the main program.

For example, the ULP program may define a variable measurement_count which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:

```assembly
.globl measurement_count
measurement_count:
    .long 0

/* later, use measurement_count */
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the ${ULP_APP_NAME}.h and ${ULP_APP_NAME}.1d files which define the global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with ulp_.

The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```
Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```c
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `#include` statement. This will allow the ULP program variables to be accessed as regular variables:

```c
#include "ulp_app_name.h"
```

```c
// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note that the ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word.

Likewise, the ULP store instruction writes register value into the lower 16 bits part of the 32-bit word. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP, the main application needs to mask the upper 16 bits, e.g.:

```c
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.30.6 Starting the ULP Program

To run a ULP program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary` function, and then start it using the `ulp_run` function.

Note that “Enable Ultra Low Power (ULP) Coprocessor” option must be enabled in menuconfig to reserve memory for the ULP. “RTC slow memory reserved for coprocessor” option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to `ulp_app_name`):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

```c
esp_err_t ulp_load_binary(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)
```

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

Parameters
- load_addr: address where the program should be loaded, expressed in 32-bit words
- program_binary: pointer to program binary
- program_size: size of the program binary

Once the program is loaded into RTC memory, the application can start it, passing the address of the entry point to the ulp_run function:

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

der_t ulp_run (uint32_t entry_point)

Run the program loaded into RTC memory.

Return ESP_OK on success

Parameters
- entry_point: entry point, expressed in 32-bit words

Declaration of the entry point symbol comes from the generated header file mentioned above, ${ULP_APP_NAME}.h. In the assembly source of the ULP application, this symbol must be marked as .global:

```assembly
.globl entry
entry: /* code starts here */
```

4.30.7 ESP32 ULP program flow

ESP32 ULP coprocessor is started by a timer. The timer is started once ulp_run is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of ticks is set using SENS_ULP_CP_SLEEP_CYCx_REG registers (x = 0..4). When starting the ULP for the first time, SENS_ULP_CP_SLEEP_CYC0_REG will be used to set the number of timer ticks. Later the ULP program can select another SENS_ULP_CP_SLEEP_CYCx_REG register using sleep instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) for ESP32, and only one period value which can be programmed into RTC_CNTL_ULP_CP_TIMER_1_REG register for ESP32-S2. By default, for ESP32, the wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2 the SLEEP instruction not exist. Instead a WAKE instruction will be used.
**Chapter 4. API Guides**

**Note**: The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

**Parameters**
- period_index: wakeup period setting number (0 - 4)
- period_us: wakeup period, us

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCLEx_REG register, ULP coprocessor powers up and starts running the program from the entry point set in the call to ulp_run.

The program runs until it encounters a **halt** instruction or an illegal instruction. Once the program halts, ULP coprocessor powers down, and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the RTC_CNTL_ULP_CP_SLP_TIMER_EN bit in the RTC_CNTL_STATE0_REG register. This can be done both from ULP code and from the main program.

### 4.31 The ULP Coprocessor (Legacy GNU Make)

**Note**: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

The ULP (Ultra Low Power) coprocessor is a simple FSM (Finite State Machine) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers.

#### 4.31.1 Installing the Toolchain

The ULP coprocessor code is written in assembly and compiled using the **binutils-esp32ulp toolchain**.

2. Extract the toolchain into a directory, and add the path to the **bin/** directory of the toolchain to the **PATH** environment variable.

#### 4.31.2 Compiling the ULP Code

To compile the ULP code as part of the component, the following steps must be taken:

1. The ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance **ulp/**.
2. Modify the component makefile, adding the following:

   ```
   ULP_APP_NAME ?= ulp_$ (COMPONENT_NAME)
   ULP_S_SOURCES = $(COMPONENT_PATH)/ulp/ulp_source_file.S
   ULP_EXP_DEP_OBJECTS := main.o
   include $(IDF_PATH)/components/ulp/component_ulp_common.mk
   ```

   Here is each line explained:

---

Submit Document Feedback

Espressif Systems 1971 Release v4.4-dev-2313-gc69f0ec
**ULP_APP_NAME** Name of the generated ULP application, without an extension. This name is used for build products of the ULP application: ELF file, map file, binary file, generated header file, and generated linker export file.

**ULP_S_SOURCES** List of assembly files to be passed to the ULP assembler. These must be absolute paths, i.e. start with $(COMPONENT_PATH). Consider using $(addprefix) function if more than one file needs to be listed. Paths are relative to component build directory, so prefixing them is not necessary.

**ULP_EXP_DEP_OBJECTS** List of object files names within the component which include the generated header file. This list is needed to build the dependencies correctly and ensure that the generated header file is created before any of these files are compiled. See section below explaining the concept of generated header files for ULP applications.

include $(IDF_PATH)/components/ulp/component_ulp_common.mk

3. Build the application as usual (e.g. `idf.py build` or `idf.py app`)

Inside, the build system will take the following steps to build ULP program:

1. **Run each assembly file** (foo.S) **through the C preprocessor.** This step generates the preprocessed assembly files (foo.ulp.pS) in the component build directory. This step also generates dependency files (foo.ulp.d).

2. **Run the preprocessed assembly sources through the assembler.** This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.

3. **Run the linker script template through the C preprocessor.** The template is located in components/ulp/ld directory.

4. **Link the object files into an output ELF file** (ulp_app_name.elf). The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.

5. **Dump the contents of the ELF file into a binary** (ulp_app_name.bin) which can then be embedded into the application.

6. **Generate a list of global symbols** (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm. The symbols from ulp_app_name.sym are included in these files and are prefixed with `ulp_`. The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

**4.31.3 Accessing the ULP Program Variables**

Global symbols defined in the ULP program may be used inside the main program.

For example, the ULP program may define a variable `measurement_count` which will define the number of the ADC measurements the program needs to make before waking up the chip from deep sleep:

```c
.global measurement_count
measurement_count: .long 0

/* later, use measurement_count */
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating `$(ULP_APP_NAME).h` and `$(ULP_APP_NAME).ld` files which define global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with `ulp_`.

The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```
The generated linker script file defines locations of symbols in RTC_SLOW_MEM:

```plaintext
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `include` statement. This will allow the ULP program variables to be accessed as regular variables:

```plaintext
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note that the ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word.

Likewise, the ULP store instruction writes register value into the lower 16 bits part of the 32-bit word. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP, the main application needs to mask the upper 16 bits, e.g.:

```plaintext
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.3.1.4 Starting the ULP Program

To run a ULP program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary` function, and then start it using the `ulp_run` function.

Note that “Enable Ultra Low Power (ULP) Coprocessor” option must be enabled in menuconfig to reserve memory for the ULP. “RTC slow memory reserved for coprocessor” option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to `ulp_app_name`):

```plaintext
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

```plaintext
esp_err_t ulp_load_binary(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)
Load ULP program binary into RTC memory.
ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section
```
Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

Parameters

- load_addr: address where the program should be loaded, expressed in 32-bit words
- program_binary: pointer to program binary
- program_size: size of the program binary

Once the program is loaded into RTC memory, the application can start it, passing the address of the entry point to the `ulp_run` function:

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

```c
esp_err_t ulp_run (uint32_t entry_point)
{
    Run the program loaded into RTC memory.
    Return ESP_OK on success
    Parameters
    • entry_point: entry point, expressed in 32-bit words
}
```

Declaration of the entry point symbol comes from the generated header file mentioned above, $(ULP_APP_NAME).h. In the assembly source of the ULP application, this symbol must be marked as .global:

```assembly
.entry
    /* code starts here */
```

### 4.31.5 ULP Program Flow

The ULP coprocessor is started by a timer. The timer is started once `ulp_run` is called. The timer counts the number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of ticks is set using `SENS_ULP_CP_SLEEP_CYCx_REG` registers (x = 0..4). When starting the ULP for the first time, `SENS_ULP_CP_SLEEP_CYC0_REG` will be used to set the number of timer ticks. Later the ULP program can select another `SENS_ULP_CP_SLEEP_CYCx_REG` register using the `sleep` instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) using the `ulp_set_wakeup_period` function.

```c
esp_err_t ulp_set_wakeup_period (size_t period_index, uint32_t period_us)
{
    Set one of ULP wakeup period values.
    ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into `SENS_ULP_CP_SLEEP_CYCx_REG` registers, x = 0..4 for ESP32, and one period value which can be programmed into `RTC_CNTL_ULP_CP_TIMER_1_REG` register for ESP32-S2. By default, for ESP32, wake-up timer will use the period set into `SENS_ULP_CP_SLEEP_CYC0_REG`, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the `SENS_ULP_CP_SLEEP_CYCx_REG` should be used for subsequent wakeups.
    However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.
    For ESP32-s2 the SLEEP instruction not exist. Instead a WAKE instruction will be used.
    Note The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more
clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

Parameters

- **period_index**: wakeup period setting number (0 - 4)
- **period_us**: wakeup period, us

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCx_REG register, the ULP coprocessor will power up and start running the program from the entry point set in the call to ulp_run.

The program runs until it encounters a halt instruction or an illegal instruction. Once the program halts, ULP coprocessor will power down, and the timer will be started again.

To disable the timer (effectively preventing the ULP program from running again), please clear the RTC_CNTL_ULP_CP_SLP_TIMER_EN bit in the RTC_CNTL_STATE0_REG register. This can be done both from the ULP code and from the main program.

### 4.32 Unit Testing in ESP32

ESP-IDF comes with two possibilities to test software.

- A unit test application which runs on the target and that is based on the Unity - unit test framework. These unit tests are integrated in the ESP-IDF repository and are placed in the test subdirectories of each component respectively. Target-based unit tests are covered in this document.
- Linux-host based unit tests in which all the hardware is abstracted via mocks. Linux-host based tests are still under development and only a small fraction of IDF components supports them currently. They are covered here: target based unit testing.

#### 4.32.1 Normal Test Cases

Unit tests are located in the test subdirectory of a component. Tests are written in C, and a single C source file can contain multiple test cases. Test files start with the word “test”.

Each test file should include the unity.h header and the header for the C module to be tested.

Tests are added in a function in the C file as follows:

```c
TEST_CASE("test name", "[module name]"
{
    // Add test here
}
```

- The first argument is a descriptive name for the test.
- The second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

**Note:** There is no need to add a main function with UNITY_BEGIN() and UNITY_END() in each test case. unity_platform.c will run UNITY_BEGIN() autonomously, and run the test cases, then call UNITY_END().

The test subdirectory should contain a component CMakeLists.txt, since they are themselves, components. ESP-IDF uses the unity test framework and should be specified as a requirement for the component. Normally, components should list their sources manually; for component tests however, this requirement is relaxed and the use of the SRC_DIRS argument in idf_component_register is advised.

Overall, the minimal test subdirectory CMakeLists.txt file should contain the following:
### 4.32.2 Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). However, components that require some form of communication (e.g., GPIO, SPI) require another device to communicate with, thus cannot be tested normal test cases. Multi-device test cases involve writing multiple test functions, and running them on multiple DUTs.

The following is an example of a multi-device test case:

```c
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    }
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    }
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare a multi-device test case.

- The first argument is test case name.
- The second argument is test case description.
- From the third argument, up to 5 test functions can be defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt and user interaction is required:

DUT1 (master) console:

```
Waiting for signal: [output high level]!
Please press "Enter" key to once any board send this signal.
```

DUT2 (slave) console:

```
Send signal: [output high level]!
```

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from `unity_wait_for_signal` and starts to change GPIO level.

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.
Chapter 4. API Guides

4.32.3 Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we expect to run some specific tests after certain kinds of reset. For example, we expect to test if the reset reason is correct after a wakeup from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support this, we can define multi-stage test cases, to group a set of test functions:

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_deepsleep, check_deepsleep_reset_reason);
```

Multi-stage test cases present a group of test functions to users. It needs user interactions (select cases and select different stages) to run the case.

4.32.4 Tests For Different Targets

Some tests (especially those related to hardware) cannot run on all targets. Below is a guide how to make your unit tests run on only specified targets.

1. Wrap your test code by `! (TEMPORARY_)DISABLED_FOR_TARGETS()` macros and place them either in the original test file, or separate the code into files grouped by functions, but make sure all these files will be processed by the compiler. E.g.:

```c
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[]")
{
}
#endif !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

Once you need one of the tests to be compiled on a specified target, just modify the targets in the disabled list. It’s more encouraged to use some general conception that can be described in `soc_caps.h` to control the disabling of tests. If this is done but some of the tests are not ready yet, use both of them (and remove `! (TEMPORARY_)DISABLED_FOR_TARGETS()` later). E.g.:

```c
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. For test code that you are 100% for sure that will not be supported (e.g. no peripheral at all), use `DISABLED_FOR_TARGETS`; for test code that should be disabled temporarily, or due to lack of runners, etc., use `TEMPORARY_DISABLED_FOR_TARGETS`.

Some old ways of disabling unit tests for targets, that have obvious disadvantages, are deprecated:

- DON’T put the test code under `test/target` folder and use `CMakeLists.txt` to choose one of the target folder. This is prevented because test code is more likely to be reused than the implementations. If you put
something into test/esp32 just to avoid building it on esp32s2, it’s hard to make the code tidy if you want to enable the test again on esp32s3.

- DON’T use CONFIG_IDF_TARGET_xxx macros to disable the test items any more. This makes it harder to track disabled tests and enable them again. Also, a black-list style #if !disabled is preferred to white-list style #if CONFIG_IDF_TARGET_xxx, since you will not silently disable cases when new targets are added in the future. But for test implementations, it’s allowed to use #if CONFIG_IDF_TARGET_xxx to pick one of the implementation code.

  - Test item: some items that will be performed on some targets, but skipped on others. E.g. There are three test items SD 1-bit, SD 4-bit and SDSPI. For ESP32-S2, which doesn’t have SD host, among the tests only SDSPI is enabled on ESP32-S2.

  - Test implementation: some code will always happen, but in different ways. E.g. There is no SDIO PKT_LEN register on ESP8266. If you want to get the length from the slave as a step in the test process, you can have different implementation code protected by #if CONFIG_IDF_TARGET_xxx reading in different ways.

  But please avoid using #else macro. When new target is added, the test case will fail at building stage, so that the maintainer will be aware of this, and choose one of the implementations explicitly.

### 4.32.5 Building Unit Test App

Follow the setup instructions in the top-level esp-idf README. Make sure that IDF_PATH environment variable is set to point to the path of esp-idf top-level directory.

Change into tools/unit-test-app directory to configure and build it:

- idf.py menuconfig - configure unit test app.
- idf.py -T all build - build unit test app with tests for each component having tests in the test subdirectory.
- idf.py -T "xxx yyy" build - build unit test app with tests for some space-separated specific components (For instance: idf.py -T heap build - build unit tests only for heap component directory).
- idf.py -T all -E "xxx yyy" build - build unit test app with all unit tests, except for unit tests of some components (For instance: idf.py -T all -E "ulp mbedtls" build - build all unit tests excludes ulp and mbedtls components).

**Note:** Due to inherent limitations of Windows command prompt, following syntax has to be used in order to build unit-test-app with multiple components: idf.py -T xxx -T yyy build or with escaped quotas: idf.py -T "xxx yyy" build in PowerShell or idf.py -T "\"ssd1306 hts221\"" build in Windows command prompt.

When the build finishes, it will print instructions for flashing the chip. You can simply run idf.py flash to flash all build output.

You can also run idf.py -T all flash or idf.py -T xxx flash to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

### 4.32.6 Running Unit Tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:

Here’s the test menu, pick your combo:

1. "esp_ota_begin() verifies arguments" [ota]
2. "esp_ota_get_next_update_partition logic" [ota]
3. "Verify bootloader image in flash" [bootloader_support]
4. "Verify unit test app image" [bootloader_support]
5. "can use new and delete" [cxx]

(continues on next page)
"can call virtual functions" [cxx]
"can use static initializers for non-POD types" [cxx]
"can use std::vector" [cxx]
"static initialization guards work as expected" [cxx]
"global initializers run in the correct order" [cxx]
"before scheduler has started, static initializers work correctly" [cxx]
"adc2 work with wifi" [adc]
"gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_device]
    (1)  "gpio_master_test"
    (2)  "gpio_slave_test"
"SPI Master clockdiv calculation routines" [spi]
"SPI Master test" [spi][ignore]
"SPI Master test, interaction of multiple devs" [spi][ignore]
"SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" [spi]
"SPI Master DMA test, TX and RX in different regions" [spi]
"SPI Master DMA test: length, start, not aligned" [spi]
"reset reason check for deepsleep" [esp32][test_env=UT_T2_1][multi_stage]
    (1)  "trigger_deepsleep"
    (2)  "check_deepsleep_reset_reason"

The normal case will print the case name and description. Master-slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks to run a single test case
- Test case index to run a single test case
- Module name in square brackets to run all test cases for a specific module
- An asterisk to run all test cases

[multi_device] and [multi_stage] tags tell the test runner whether a test case is a multiple devices or multiple stages of test case. These tags are automatically added by `TEST_CASE_MULTIPLE_STAGES and TEST_CASE_MULTIPLE_DEVICES macros.

After you select a multi-device test case, it will print sub-menu:

Running gpio master/slave test example...
gpio master/slave test example
    (1)  "gpio_master_test"
    (2)  "gpio_slave_test"

You need to input a number to select the test running on the DUT.

Similar to multi-device test cases, multi-stage test cases will also print sub-menu:

Running reset reason check for deepsleep...
reset reason check for deepsleep
    (1)  "trigger_deepsleep"
    (2)  "check_deepsleep_reset_reason"

First time you execute this case, input 1 to run first stage (trigger deepsleep). After DUT is rebooted and able to run test cases, select this case again and input 2 to run the second stage. The case only passes if the last stage passes and all previous stages trigger reset.

### 4.32.7 Timing Code with Cache Compensated Timer

Instructions and data stored in external memory (e.g. SPI Flash and SPI RAM) are accessed through the CPU’s unified instruction and data cache. When code or data is in cache, access is very fast (i.e., a cache hit).
However, if the instruction or data is not in cache, it needs to be fetched from external memory (i.e., a cache miss). Access to external memory is significantly slower, as the CPU must execute stall cycles whilst waiting for the instruction or data to be retrieved from external memory. This can cause the overall code execution speed to vary depending on the number of cache hits or misses.

Code and data placements can vary between builds, and some arrangements may be more favorable with regards to cache access (i.e., minimizing cache misses). This can technically affect execution speed, however these factors are usually irrelevant as their effect ‘average out’ over the device’s operation.

The effect of the cache on execution speed, however, can be relevant in benchmarking scenarios (especially microbenchmarks). There might be some variability in measured time between runs and between different builds. A technique for eliminating some of the variability is to place code and data in instruction or data RAM (IRAM/DRAM), respectively. The CPU can access IRAM and DRAM directly, eliminating the cache out of the equation. However, this might not always be viable as the size of IRAM and DRAM is limited.

The cache compensated timer is an alternative to placing the code/data to be benchmarked in IRAM/DRAM. This timer uses the processor’s internal event counters in order to determine the amount of time spent on waiting for code/data in case of a cache miss, then subtract that from the recorded wall time.

```c
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

One limitation of the cache compensated timer is that the task that benchmarked functions should be pinned to a core. This is due to each core having its own event counters that are independent of each other. For example, if `ccomp_timer_start` gets called on one core, put to sleep by the scheduler, wakes up, and gets rescheduled on the other core, then the corresponding `ccomp_timer_stop` will be invalid.

## 4.32.8 Mocks

One of the biggest problems for unit testing in embedded systems are the strong hardware dependencies. This is why ESP-IDF has a component which integrates the CMock mocking framework. Ideally, all components other than the one which should be tested (component under test) are mocked. This way, the test environment has complete control over all the interaction with the component under test. However, if mocking becomes problematic due to the tests becoming too specific, more “real” IDF code can always be included into the tests.

Besides the usual IDF requirements, ruby is necessary to generate the mocks. Refer to cmock/CMock/docs/CMock_Summary.md for more details on how CMock works and how to create and use mocks.

In IDF, adjustments are necessary inside the component(s) that should be mocked as well as inside the unit test, compared to writing normal components or unit tests without mocking.

### Adjustments in Mock Component

The component that should be mocked requires a separate mock directory containing all additional files needed specifically for the mocking. Most importantly, it contains `mock_config.yaml` which configures CMock. For more details on what the options inside that configuration file mean and how to write your own, please take a look at the [CMock documentation](https://github.com/espressif/CMock). It may be necessary to have some more files related to mocking which should also be placed inside the `mock` directory.

Furthermore, the component’s `CMakeLists.txt` needs a switch to build mocks instead of the actual code. This is usually done by checking the component property `USE_MOCK` for the particular component. E.g., the `spi_flash` component execute the following code in its `CMakeLists.txt` to check whether mocks should be built:
An example CMake build command to create mocks of a component inside its CMakeLists.txt may look like this:

```cmake
add_custom_command(
  OUTPUT ${MOCK_OUTPUT}
  COMMAND ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_ -config.yaml ${MOCK_HEADERS}
  COMMAND ${CMAKE_COMMAND} -E env "UNITY_DIR=${IDF_PATH}/components/unity/unity"_ -ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_config._ -yaml ${MOCK_HEADERS}
)
```

${MOCK_OUTPUT} contains all CMock generated output files, ${MOCK_HEADERS} contains all headers to be mocked and ${CMOCK_DIR} needs to be set to the CMock directory inside IDF. ${CMAKE_COMMAND} is automatically set by the IDF build system.

One aspect of CMock’s usage is special here: CMock usually uses Unity as a submodule, but due to some Espressif-internal limitations with CI, IDF still uses Unity as an ordinary module in ESP-IDF. To use the IDF-supplied Unity component, which isn’t a submodule, the build system needs to pass an environment variable UNITY_IDR to CMock. This variable simply contains the path to the Unity directory in IDF, e.g. export "UNITY_DIR=${IDF_PATH}/components/unity/unity". Refer to cmock/CMock/lib/cmock_generator.rb to see how the Unity directory is determined in CMock.

An example CMakeLists.txt which enables mocking exists in spi_flash

### Adjustments in Unit Test

The unit test needs to set the component property USE_MOCK for the component that should be mocked. This lets the dependent component build the mocks instead of the actual component. E.g., in the nvs host test’s CMakeLists.txt, spi_flash mocks are enabled by the following line:

```cmake
idf_component_set_property(spi_flash USE_MOCK 1)
```

Refer to the NVS host unit test for more information on how to use and control CMock inside a unit test.

# 4.33 Unit Testing on Linux

**Note:** Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can’t guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to target based unit testing.

## 4.33.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with CMock are introduced. Linux host-based tests are more efficient than unit tests on the target since they:
Compile the necessary code only
Don’t need time to upload to a target
Run much faster on a host-computer, compared to an ESP

Using the CMock framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to target based unit testing for more information on target tests (the second kind of tests).

4.33.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component’s dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

• An example hello-world application
• A unit test for NVS.

Inside the component which should be tested, there is a separate directory host_test, besides the “traditional” test directory or the test_apps directory. It has one or more subdirectories:

- host_test/
  - fixtures/
    - contains test fixtures (structs/functions to do test case set-up-
      and tear-down). If there are no fixtures, this can be ommitted.
  - <test_name>/
    - IDF applications which run the tests
  - <test_name2>/
    - Further tests are possible.

The IDF applications inside host_test set the mocking configuration as described in the IDF unit test documentation.

The NVS page unit test provides some illustration of how to control the mocks.

Requirements

Besides the usual IDF requirements and CMock requirements, only the host’s GCC/g++ is required.

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

4.34 Unit Testing (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.
ESP-IDF comes with a unit test application that is based on the Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in the test subdirectories of each component respectively.

### 4.34.1 Normal Test Cases

Unit tests are located in the test subdirectory of a component. Tests are added in C files, a single C file can include multiple test cases. Test files start with the word “test”.

Each test file should include the unity.h header and the header for the C module to be tested.

Tests are added in a function in the C file as follows:

```c
TEST_CASE("test name", "[module name]"
{
   // Add test here
}
```

The first argument is a descriptive name for the test, the second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

**Note:** There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()` autonomously, and run the test cases, then call `UNITY_END()`.

Each test subdirectory needs to include a component.mk file with the following line of code:

```makefile
COMPONENT_ADD_LDFLAGS = -Wl,--whole-archive -l$(COMPONENT_NAME) -Wl,--no-whole-archive
```

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.

### 4.34.2 Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). However, components that require some form of communication (e.g., GPIO, SPI) require another device to communicate with, thus cannot be tested normal test cases. Multi-device test cases involve writing multiple test functions, and running them on multiple DUTs.

The following is an example of a Multi-device test case:

```c
void gpio_master_test()
{
   gpio_config_t slave_config = {
      .pin_bit_mask = 1 << MASTER_GPIO_PIN,
      .mode = GPIO_MODE_INPUT,
   };
   gpio_config(&slave_config);
   unity_wait_for_signal("output high level");
   TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
   gpio_config_t master_config = {
      .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
      .mode = GPIO_MODE_OUTPUT,
   };
   gpio_config(&master_config);
   gpio_set_level(SLAVE_GPIO_PIN, 1);
   unity_send_signal("output high level");
}
```

(continues on next page)
The macro TEST_CASE_MULTIPLE_DEVICES is used to declare a multi-device test case. The first argument is
test case name, the second argument is test case description. From the third argument, up to 5 test functions can be
declared, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide
unity_wait_for_signal and unity_send_signal to support synchronizing with UART. As the sce-
nario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt
and requires user interaction:

DUT1 (master) console:

Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.

DUT2 (slave) console:

Send signal: [output high level]!

Once the signal is sent from DUT2, you need to press "Enter" on DUT1, then DUT1 unblocks from
unity_wait_for_signal and starts to change GPIO level.

Signals can also be used to pass parameters between multiple devices. For example, DUT1 want to know the
MAC address of DUT2, so it can connect to DUT2. In this case, unity_wait_for_signal_param and
unity_send_signal_param can be used:

DUT1 console:

Waiting for signal: [dut2 mac address]!
Please input parameter value from any board send this signal and press "Enter" key.

DUT2 console:

Send signal: [dut2 mac address][10:20:30:40:50:60]!

Once the signal is sent from DUT2, you need to input 10:20:30:40:50:60 on DUT1 and press "Enter". Then
DUT1 will get the MAC address string of DUT2 and unblock from unity_wait_for_signal_param, then
start to connect to DUT2.

4.34.3 Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we
expect to run some specific tests after certain kinds of reset. For example, we expect to test if reset reason is correct
after a wakeup from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support
this, we can define multi-stage test cases, to group a set of test functions:

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}
```
Multi-stage test cases present a group of test functions to users. It need user interactions (select cases and select different stages) to run the case.

### 4.3.4.4 Building Unit Test App

Follow the setup instructions in the top-level esp-idf README. Make sure that IDF_PATH environment variable is set to point to the path of esp-idf top-level directory.

Change into `tools/unit-test-app` directory to configure and build it:

- make menuconfig - configure unit test app.
- make TESTS_ALL=1 - build unit test app with tests for each component having tests in the test subdirectory.
- make TEST_COMPONENTS='xxx' - build unit test app with tests for specific components.
- make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='xxx' - build unit test app with all unit tests, except for unit tests of some components. (For instance: make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='ulp mbedtls' - build all unit tests excludes ulp and mbedtls components).

When the build finishes, it will print instructions for flashing the chip. You can simply run `make flash` to flash all build output.

You can also run `make flash TESTS_ALL=1` or `make TEST_COMPONENTS='xxx'` to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

### 4.3.4.5 Running Unit Tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:

Here's the test menu, pick your combo:

1. "esp_ota_begin() verifies arguments" [ota]
2. "esp_ota_get_next_update_partition logic" [ota]
3. "Verify bootloader image in flash" [bootloader_support]
4. "Verify unit test app image" [bootloader_support]
5. "can use new and delete" [cxx]
6. "can call virtual functions" [cxx]
7. "can use static initializers for non-POD types" [cxx]
8. "can use std::vector" [cxx]
9. "static initialization guards work as expected" [cxx]
10. "global initializers run in the correct order" [cxx]
11. "before scheduler has started, static initializers work correctly" [cxx]
12. "adc2 work with wifi" [adc]

3.5 Wi-Fi Driver

3.5.1 ESP32 Wi-Fi Feature List

- Support Station-only mode, AP-only mode, Station/AP-coexistence mode
- Support IEEE 802.11B, IEEE 802.11G, IEEE 802.11N and APIs to configure the protocol mode
- Support WPA/WPA2/WPA2-Enterprise and WPS
- Support AMPDU, HT40, QoS and other key features
- Support Modem-sleep
- Support an Espressif-specific protocol which, in turn, supports up to 1 km of data traffic
- Up to 20 Mbit/s TCP throughput and 30 Mbit/s UDP throughput over the air
- Support Sniffer
- Support both fast scan and all-channel scan
- Support multiple antennas
- Support channel state information
4.35.2 How To Write a Wi-Fi Application

Preparation

Generally, the most effective way to begin your own Wi-Fi application is to select an example which is similar to your own application, and port the useful part into your project. It is not a MUST but it is strongly recommended that you take some time to read this article first, especially if you want to program a robust Wi-Fi application. This article is supplementary to the Wi-Fi APIs/Examples. It describes the principles of using the Wi-Fi APIs, the limitations of the current Wi-Fi API implementation, and the most common pitfalls in using Wi-Fi. This article also reveals some design details of the Wi-Fi driver. We recommend you to select an example.

Setting Wi-Fi Compile-time Options

Refer to Wi-Fi Menuconfig.

Init Wi-Fi

Refer to ESP32 Wi-Fi Station General Scenario, ESP32 Wi-Fi AP General Scenario.

Start/Connect Wi-Fi

Refer to ESP32 Wi-Fi Station General Scenario, ESP32 Wi-Fi AP General Scenario.

Event-Handling

Generally, it is easy to write code in “sunny-day” scenarios, such as WIFI_EVENT_STA_START, WIFI_EVENT_STA_CONNECTED etc. The hard part is to write routines in “rainy-day” scenarios, such as WIFI_EVENT_STA_DISCONNECTED etc. Good handling of “rainy-day” scenarios is fundamental to robust Wi-Fi applications. Refer to ESP32 Wi-Fi Event Description, ESP32 Wi-Fi Station General Scenario, ESP32 Wi-Fi AP General Scenario. See also an overview of event handling in ESP-IDF.

Write Error-Recovery Routines Correctly at All Times

Just like the handling of “rainy-day” scenarios, a good error-recovery routine is also fundamental to robust Wi-Fi applications. Refer to ESP32 Wi-Fi API Error Code.

4.35.3 ESP32 Wi-Fi API Error Code

All of the ESP32 Wi-Fi APIs have well-defined return values, namely, the error code. The error code can be categorized into:

- No errors, e.g. ESP_OK means that the API returns successfully.
- Recoverable errors, such as ESP_ERR_NO_MEM, etc.
- Non-recoverable, non-critical errors.
- Non-recoverable, critical errors.

Whether the error is critical or not depends on the API and the application scenario, and it is defined by the API user. The primary principle to write a robust application with Wi-Fi API is to always check the error code and write the error-handling code. Generally, the error-handling code can be used:

- for recoverable errors, in which case you can write a recoverable-error code. For example, when esp_wifi_start() returns ESP_ERR_NO_MEM, the recoverable-error code vTaskDelay can be called, in order to get a microseconds’ delay for another try.
for non-recoverable, yet non-critical, errors, in which case printing the error code is a good method for error handling.
- for non-recoverable, critical errors, in which case “assert” may be a good method for error handling. For example, if `esp_wifi_set_mode()` returns ESP_ERR_WIFI_NOT_INIT, it means that the Wi-Fi driver is not initialized by `esp_wifi_init()` successfully. You can detect this kind of error very quickly in the application development phase.

In esp_err.h, ESP_ERROR_CHECK checks the return values. It is a rather commonplace error-handling code and can be used as the default error-handling code in the application development phase. However, we strongly recommend that API users write their own error-handling code.

4.35.4 ESP32 Wi-Fi API Parameter Initialization

When initializing struct parameters for the API, one of two approaches should be followed:
- explicitly set all fields of the parameter
- use get API to get current configuration first, then set application specific fields

Initializing or getting the entire structure is very important because most of the time the value 0 indicates the default value is used. More fields may be added to the struct in the future and initializing these to zero ensures the application will still work correctly after IDF is updated to a new release.

4.35.5 ESP32 Wi-Fi Programming Model

The ESP32 Wi-Fi programming model is depicted as follows:

![Wi-Fi Programming Model](image)

The Wi-Fi driver can be considered a black box that knows nothing about high-layer code, such as the TCP/IP stack, application task, event task, etc. The application task (code) generally calls Wi-Fi driver APIs to initialize Wi-Fi and handles Wi-Fi events when necessary. Wi-Fi driver receives API calls, handles them, and post events to the application.

Wi-Fi event handling is based on the esp_event library. Events are sent by the Wi-Fi driver to the default event loop. Application may handle these events in callbacks registered using esp_event_handler_register(). Wi-Fi events are also handled by esp_netif component to provide a set of default behaviors. For example, when Wi-Fi station connects to an AP, esp_netif will automatically start the DHCP client (by default).

4.35.6 ESP32 Wi-Fi Event Description
**WIFI_EVENT_WIFI_READY**

The Wi-Fi driver will never generate this event, which, as a result, can be ignored by the application event callback. This event may be removed in future releases.

**WIFI_EVENT_SCAN_DONE**

The scan-done event is triggered by `esp_wifi_scan_start()` and will arise in the following scenarios:

- The scan is completed, e.g., the target AP is found successfully, or all channels have been scanned.
- The scan is stopped by `esp_wifi_scan_stop()`.
- The `esp_wifi_scan_start()` is called before the scan is completed. A new scan will override the current scan and a scan-done event will be generated.

The scan-done event will not arise in the following scenarios:

- It is a blocked scan.
- The scan is caused by `esp_wifi_connect()`.

Upon receiving this event, the event task does nothing. The application event callback needs to call `esp_wifi_scan_get_ap_num()` and `esp_wifi_scan_get_ap_records()` to fetch the scanned AP list and trigger the Wi-Fi driver to free the internal memory which is allocated during the scan (do not forget to do this!). Refer to ESP32 Wi-Fi Scan for a more detailed description.

**WIFI_EVENT_STA_START**

If `esp_wifi_start()` returns ESP_OK and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will initialize the LwIP network interface (netif). Generally, the application event callback needs to call `esp_wifi_connect()` to connect to the configured AP.

**WIFI_EVENT_STA_STOP**

If `esp_wifi_stop()` returns ESP_OK and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will release the station’s IP address, stop the DHCP client, remove TCP/UDP-related connections and clear the LwIP station netif, etc. The application event callback generally does not need to do anything.

**WIFI_EVENT_STA_CONNECTED**

If `esp_wifi_connect()` returns ESP_OK and the station successfully connects to the target AP, the connection event will arise. Upon receiving this event, the event task starts the DHCP client and begins the DHCP process of getting the IP address. Then, the Wi-Fi driver is ready for sending and receiving data. This moment is good for beginning the application work, provided that the application does not depend on LwIP, namely the IP address. However, if the application is LwIP-based, then you need to wait until the got ip event comes in.

**WIFI_EVENT_STA_DISCONNECTED**

This event can be generated in the following scenarios:

- When `esp_wifi_disconnect()`, or `esp_wifi_stop()`, or `esp_wifi_deinit()` is called and the station is already connected to the AP.
- When `esp_wifi_connect()` is called, but the Wi-Fi driver fails to set up a connection with the AP due to certain reasons, e.g. the scan fails to find the target AP, authentication times out, etc. If there are more than one AP with the same SSID, the disconnected event is raised after the station fails to connect all of the found APs.
- When the Wi-Fi connection is disrupted because of specific reasons, e.g., the station continuously loses N beacons, the AP kicks off the station, the AP’s authentication mode is changed, etc.
Chapter 4. API Guides

Upon receiving this event, the default behavior of the event task is:

- Shuts down the station’s LwIP netif.
- Notifies the LwIP task to clear the UDP/TCP connections which cause the wrong status to all sockets. For socket-based applications, the application callback can choose to close all sockets and re-create them, if necessary, upon receiving this event.

The most common event handle code for this event in application is to call `esp_wifi_connect()` to reconnect the Wi-Fi. However, if the event is raised because `esp_wifi_disconnect()` is called, the application should not call `esp_wifi_connect()` to reconnect. It’s application’s responsibility to distinguish whether the event is caused by `esp_wifi_disconnect()` or other reasons. Sometimes a better reconnect strategy is required, refer to Wi-Fi Reconnect and Scan When Wi-Fi Is Connecting.

Another thing deserves our attention is that the default behavior of LwIP is to abort all TCP socket connections on receiving the disconnect. Most of time it is not a problem. However, for some special application, this may not be what they want, consider following scenarios:

- The application creates a TCP connection to maintain the application-level keep-alive data that is sent out every 60 seconds.
- Due to certain reasons, the Wi-Fi connection is cut off, and the WIFI_EVENT_STA_DISCONNECTED is raised. According to the current implementation, all TCP connections will be removed and the keep-alive socket will be in a wrong status. However, since the application designer believes that the network layer should NOT care about this error at the Wi-Fi layer, the application does not close the socket.
- Five seconds later, the Wi-Fi connection is restored because `esp_wifi_connect()` is called in the application event callback function. Moreover, the station connects to the same AP and gets the same IPv4 address as before.
- Sixty seconds later, when the application sends out data with the keep-alive socket, the socket returns an error and the application closes the socket and re-creates it when necessary.

In above scenarios, ideally, the application sockets and the network layer should not be affected, since the Wi-Fi connection only fails temporarily and recovers very quickly. The application can enable “Keep TCP connections when IP changed” via LwIP menuconfig.

**IP_EVENT_STA_GOT_IP**

This event arises when the DHCP client successfully gets the IPv4 address from the DHCP server, or when the IPv4 address is changed. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

The IPv4 may be changed because of the following reasons:

- The DHCP client fails to renew/rebind the IPv4 address, and the station’s IPv4 is reset to 0.
- The DHCP client rebinds to a different address.
- The static-configured IPv4 address is changed.

Whether the IPv4 address is changed or NOT is indicated by field `ip_change` of `ip_event_got_ip_t`. The socket is based on the IPv4 address, which means that, if the IPv4 changes, all sockets relating to this IPv4 will become abnormal. Upon receiving this event, the application needs to close all sockets and recreate the application when the IPv4 changes to a valid one.

**IP_EVENT_GOT_IP6**

This event arises when the IPv6 SLAAC support auto-configures an address for the ESP32, or when this address changes. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

**IP_STA_LOST_IP**

This event arises when the IPv4 address become invalid.
IP_STA_LOST_IP doesn’t arise immediately after the Wi-Fi disconnects, instead it starts an IPV4 address lost timer, if the IPV4 address is got before ip lost timer expires, IP_EVENT_STA_LOST_IP doesn’t happen. Otherwise, the event arises when IPV4 address lost timer expires.

Generally the application don’t need to care about this event, it is just a debug event to let the application know that the IPV4 address is lost.

**WIFI_EVENT_AP_START**

Similar to **WIFI_EVENT_STA_START**.

**WIFI_EVENT_AP_STOP**

Similar to **WIFI_EVENT_STA_STOP**.

**WIFI_EVENT_AP_STACONNECTED**

Every time a station is connected to ESP32 AP, the WIFI_EVENT_AP_STACONNECTED will arise. Upon receiving this event, the event task will do nothing, and the application callback can also ignore it. However, you may want to do something, for example, to get the info of the connected STA, etc.

**WIFI_EVENT_AP_STADISCONNECTED**

This event can happen in the following scenarios:

- The application calls `esp_wifi_disconnect()` or `esp_wifi_deauth_sta()`, to manually disconnect the station.
- The Wi-Fi driver kicks off the station, e.g. because the AP has not received any packets in the past five minutes, etc. The time can be modified by `esp_wifi_set_inactive_time()`.
- The station kicks off the AP.

When this event happens, the event task will do nothing, but the application event callback needs to do something, e.g., close the socket which is related to this station, etc.

**WIFI_EVENT_AP_PROBEREQRECVED**

This event is disabled by default. The application can enable it via API `esp_wifi_set_event_mask()`. When this event is enabled, it will be raised each time the AP receives a probe request.

### 4.35.7 ESP32 Wi-Fi Station General Scenario

Below is a “big scenario” which describes some small scenarios in Station mode:

**1. Wi-Fi/LwIP Init Phase**

- s1.1: The main task calls `esp_netif_init()` to create an LwIP core task and initialize LwIP-related work.
- s1.2: The main task calls `esp_event_loop_create()` to create a system Event task and initialize an application event’s callback function. In the scenario above, the application event’s callback function does nothing but relaying the event to the application task.
- s1.3: The main task calls `esp_netif_create_default_wifi_ap()` or `esp_netif_create_default_wifi_sta()` to create default network interface instance binding station or AP with TCP/IP stack.
- s1.4: The main task calls `esp_wifi_init()` to create the Wi-Fi driver task and initialize the Wi-Fi driver.
Fig. 55: Sample Wi-Fi Event Scenarios in Station Mode
• s1.5: The main task calls OS API to create the application task.

Step 1.1 ~ 1.5 is a recommended sequence that initializes a Wi-Fi-/LwIP-based application. However, it is NOT a must-follow sequence, which means that you can create the application task in step 1.1 and put all other initializations in the application task. Moreover, you may not want to create the application task in the initialization phase if the application task depends on the sockets. Rather, you can defer the task creation until the IP is obtained.

2. Wi-Fi Configuration Phase

Once the Wi-Fi driver is initialized, you can start configuring the Wi-Fi driver. In this scenario, the mode is Station, so you may need to call `esp_wifi_set_mode()` (WIFI_MODE_STA) to configure the Wi-Fi mode as Station. You can call other esp_wifi_set_xxx APIs to configure more settings, such as the protocol mode, country code, bandwidth, etc. Refer to [ESP32 Wi-Fi Configuration](#).

Generally, we configure the Wi-Fi driver before setting up the Wi-Fi connection, but this is NOT mandatory, which means that you can configure the Wi-Fi connection anytime, provided that the Wi-Fi driver is initialized successfully. However, if the configuration does not need to change after the Wi-Fi connection is set up, you should configure the Wi-Fi driver at this stage, because the configuration APIs (such as `esp_wifi_set_protocol()`) will cause the Wi-Fi to reconnect, which may not be desirable.

If the Wi-Fi NVS flash is enabled by menuconfig, all Wi-Fi configuration in this phase, or later phases, will be stored into flash. When the board powers on/reboots, you do not need to configure the Wi-Fi driver from scratch. You only need to call esp_wifi_get_xxx APIs to fetch the configuration stored in flash previously. You can also configure the Wi-Fi driver if the previous configuration is not what you want.

3. Wi-Fi Start Phase

• s3.1: Call `esp_wifi_start()` to start the Wi-Fi driver.
• s3.2: The Wi-Fi driver posts WIFI_EVENT_STA_START to the event task; then, the event task will do some common things and will call the application event callback function.
• s3.3: The application event callback function relays the WIFI_EVENT_STA_START to the application task. We recommend that you call `esp_wifi_connect()`. However, you can also call `esp_wifi_connect()` in other phrases after the WIFI_EVENT_STA_START arises.

4. Wi-Fi Connect Phase

• s4.1: Once `esp_wifi_connect()` is called, the Wi-Fi driver will start the internal scan/connection process.
• s4.2: If the internal scan/connection process is successful, the WIFI_EVENT_STA_CONNECTED will be generated. In the event task, it starts the DHCP client, which will finally trigger the DHCP process.
• s4.3: In the above-mentioned scenario, the application event callback will relay the event to the application task. Generally, the application needs to do nothing, and you can do whatever you want, e.g., print a log, etc.

In step 4.2, the Wi-Fi connection may fail because, for example, the password is wrong, the AP is not found, etc. In a case like this, WIFI_EVENT_STA_DISCONNECTED will arise and the reason for such a failure will be provided. For handling events that disrupt Wi-Fi connection, please refer to phase 6.

5. Wi-Fi ‘Got IP’ Phase

• s5.1: Once the DHCP client is initialized in step 4.2, the got IP phase will begin.
• s5.2: If the IP address is successfully received from the DHCP server, then IP_EVENT_STA_GOT_IP will arise and the event task will perform common handling.
• s5.3: In the application event callback, IP_EVENT_STA_GOT_IP is relayed to the application task. For LwIP-based applications, this event is very special and means that everything is ready for the application to begin its tasks, e.g. creating the TCP/UDP socket, etc. A very common mistake is to initialize the socket before IP_EVENT_STA_GOT_IP is received. DO NOT start the socket-related work before the IP is received.
6. Wi-Fi Disconnect Phase

- s6.1: When the Wi-Fi connection is disrupted, e.g. because the AP is powered off, the RSSI is poor, etc., `WIFI_EVENT_STA_DISCONNECTED` will arise. This event may also arise in phase 3. Here, the event task will notify the LwIP task to clear/remove all UDP/TCP connections. Then, all application sockets will be in a wrong status. In other words, no socket can work properly when this event happens.
- s6.2: In the scenario described above, the application event callback function relays `WIFI_EVENT_STA_DISCONNECTED` to the application task. We recommend that `esp_wifi_connect()` be called to reconnect the Wi-Fi, close all sockets and re-create them if necessary. Refer to `WIFI_EVENT_STA_DISCONNECTED`.

7. Wi-Fi IP Change Phase

- s7.1: If the IP address is changed, the `IP_EVENT_STA_GOT_IP` will arise with “ip_change” set to true.
- s7.2: This event is important to the application. When it occurs, the timing is good for closing all created sockets and recreating them.

8. Wi-Fi Deinit Phase

- s8.1: Call `esp_wifi_disconnect()` to disconnect the Wi-Fi connectivity.
- s8.2: Call `esp_wifi_stop()` to stop the Wi-Fi driver.
- s8.3: Call `esp_wifi_deinit()` to unload the Wi-Fi driver.

4.35.8 ESP32 Wi-Fi AP General Scenario

Below is a “big scenario” which describes some small scenarios in AP mode:

4.35.9 ESP32 Wi-Fi Scan

Currently, the `esp_wifi_scan_start()` API is supported only in Station or Station+AP mode.
Fig. 56: Sample Wi-Fi Event Scenarios in AP Mode
### Scan Type

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Scan</td>
<td>Scan by sending a probe request. The default scan is an active scan.</td>
</tr>
<tr>
<td>Passive Scan</td>
<td>No probe request is sent out. Just switch to the specific channel and wait for a beacon. Application can enable it via the scan_type field of wifi_scan_config_t.</td>
</tr>
<tr>
<td>Foreground Scan</td>
<td>This scan is applicable when there is no Wi-Fi connection in Station mode. Foreground or background scanning is controlled by the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>Background Scan</td>
<td>This scan is applicable when there is a Wi-Fi connection in Station mode or in Station+AP mode. Whether it is a foreground scan or background scan depends on the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>All-Channel Scan</td>
<td>It scans all of the channels. If the channel field of wifi_scan_config_t is set to 0, it is an all-channel scan.</td>
</tr>
<tr>
<td>Specific Channel Scan</td>
<td>It scans specific channels only. If the channel field of wifi_scan_config_t is set to 1, it is a specific-channel scan.</td>
</tr>
</tbody>
</table>

The scan modes in above table can be combined arbitrarily, so we totally have 8 different scans:

- All-Channel Background Active Scan
- All-Channel Background Passive Scan
- All-Channel Foreground Active Scan
- All-Channel Foreground Passive Scan
- Specific-Channel Background Active Scan
- Specific-Channel Background Passive Scan
- Specific-Channel Foreground Active Scan
- Specific-Channel Foreground Passive Scan

### Scan Configuration

The scan type and other per-scan attributes are configured by `esp_wifi_scan_start()`. The table below provides a detailed description of `wifi_scan_config_t`. 
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>If the SSID is not NULL, it is only the AP with the same SSID that can be scanned.</td>
</tr>
<tr>
<td>bssid</td>
<td>If the BSSID is not NULL, it is only the AP with the same BSSID that can be scanned.</td>
</tr>
<tr>
<td>channel</td>
<td>If “channel” is 0, there will be an all-channel scan; otherwise, there will be a specific-channel scan.</td>
</tr>
<tr>
<td>show_hidden</td>
<td>If “show_hidden” is 0, the scan ignores the AP with a hidden SSID; otherwise, the scan considers the hidden AP a normal one.</td>
</tr>
<tr>
<td>scan_type</td>
<td>If “scan_type” is WIFI_SCAN_TYPE_ACTIVE, the scan is “active”; otherwise, it is a “passive” one.</td>
</tr>
</tbody>
</table>
| scan_time  | This field is used to control how long the scan dwells on each channel. For passive scans, scan_time.passive designates the dwell time for each channel. For active scans, dwell times for each channel are listed in the table below. Here, min is short for scan_time.active.min and max is short for scan_time.active.max.  
• min=0, max=0: scan dwells on each channel for 120 ms.  
• min>0, max=0: scan dwells on each channel for 120 ms.  
• min=0, max>0: scan dwells on each channel for max ms.  
• min>0, max>0: the minimum time the scan dwells on each channel is min ms. If no AP is found during this time frame, the scan switches to the next channel. Otherwise, the scan dwells on the channel for max ms.  
If you want to improve the performance of the the scan, you can try to modify these two parameters. |

There are also some global scan attributes which are configured by API esp_wifi_set_config(), refer to Station Basic Configuration.

Scan All APs on All Channels (Foreground)

Scenario:
The scenario above describes an all-channel, foreground scan. The foreground scan can only occur in Station mode where the station does not connect to any AP. Whether it is a foreground or background scan is totally determined by the Wi-Fi driver, and cannot be configured by the application.

Detailed scenario description:

Scan Configuration Phase

• s1.1: Call esp_wifi_set_country() to set the country info if the default country info is not what you want, refer to Wi-Fi Country Code.
• s1.2: Call esp_wifi_scan_start() to configure the scan. To do so, you can refer to Scan Configuration. Since this is an all-channel scan, just set the SSID/BSSID/channel to 0.

Wi-Fi Driver’s Internal Scan Phase
Fig. 57: Foreground Scan of all Wi-Fi Channels
Chapter 4. API Guides

- s2.1: The Wi-Fi driver switches to channel 1, in case the scan type is WIFI_SCAN_TYPE_ACTIVE, and broadcasts a probe request. Otherwise, the Wi-Fi will wait for a beacon from the APs. The Wi-Fi driver will stay in channel 1 for some time. The dwell time is configured in min/max time, with default value being 120 ms.
- s2.2: The Wi-Fi driver switches to channel 2 and performs the same operation as in step 2.1.
- s2.3: The Wi-Fi driver scans the last channel N, where N is determined by the country code which is configured in step 1.1.

Scan-Done Event Handling Phase

- s3.1: When all channels are scanned, WIFI_EVENT_SCAN_DONE will arise.
- s3.2: The application’s event callback function notifies the application task that WIFI_EVENT_SCAN_DONE is received. esp_wifi_scan_get_ap_num() is called to get the number of APs that have been found in this scan. Then, it allocates enough entries and calls esp_wifi_scan_get_ap_records() to get the AP records. Please note that the AP records in the Wi-Fi driver will be freed, once esp_wifi_scan_get_ap_records() is called. Do not call esp_wifi_scan_get_ap_records() twice for a single scan-done event. If esp_wifi_scan_get_ap_records() is not called when the scan-done event occurs, the AP records allocated by the Wi-Fi driver will not be freed. So, make sure you call esp_wifi_scan_get_ap_records(), yet only once.

Scan All APs on All Channels (Background)

Scenario:
The scenario above is an all-channel background scan. Compared to Scan All APs on All Channels (Foreground), the difference in the all-channel background scan is that the Wi-Fi driver will scan the back-to-home channel for 30 ms before it switches to the next channel to give the Wi-Fi connection a chance to transmit/receive data.

Scan for Specific AP on All Channels

Scenario:
This scan is similar to Scan All APs on All Channels (Foreground). The differences are:

- s1.1: In step 1.2, the target AP will be configured to SSID/BSSID.
- s2.1~s2.N: Each time the Wi-Fi driver scans an AP, it will check whether it is a target AP or not. If the scan is WIFI_FAST_SCAN scan and the target AP is found, then the scan-done event will arise and scanning will end; otherwise, the scan will continue. Please note that the first scanned channel may not be channel 1, because the Wi-Fi driver optimizes the scanning sequence.

If there are multiple APs which match the target AP info, for example, if we happen to scan two APs whose SSID is “ap”. If the scan is WIFI_FAST_SCAN, then only the first scanned “ap” will be found, if the scan is WIFI_ALL_CHANNEL_SCAN, both “ap” will be found and the station will connect the “ap” according to the configured strategy, refer to Station Basic Configuration.

You can scan a specific AP, or all of them, in any given channel. These two scenarios are very similar.

Scan in Wi-Fi Connect

When esp_wifi_connect() is called, the Wi-Fi driver will try to scan the configured AP first. The scan in “Wi-Fi Connect” is the same as Scan for Specific AP On All Channels, except that no scan-done event will be generated when the scan is completed. If the target AP is found, the Wi-Fi driver will start the Wi-Fi connection; otherwise, WIFI_EVENT_STA_DISCONNECTED will be generated. Refer to Scan for Specific AP On All Channels.
Fig. 58: Background Scan of all Wi-Fi Channels
Fig. 59: Scan of specific Wi-Fi Channels
Scan In Blocked Mode

If the block parameter of \texttt{esp\_wifi\_scan\_start()} is true, then the scan is a blocked one, and the application task will be blocked until the scan is done. The blocked scan is similar to an unblocked one, except that no scan-done event will arise when the blocked scan is completed.

Parallel Scan

Two application tasks may call \texttt{esp\_wifi\_scan\_start()} at the same time, or the same application task calls \texttt{esp\_wifi\_scan\_start()} before it gets a scan-done event. Both scenarios can happen. However, the WiFi driver does not support multiple concurrent scans adequately. As a result, concurrent scans should be avoided. Support for concurrent scan will be enhanced in future releases, as the ESP32’s Wi-Fi functionality improves continuously.

Scan When Wi-Fi is Connecting

The \texttt{esp\_wifi\_scan\_start()} fails immediately if the Wi-Fi is in connecting process because the connecting has higher priority than the scan. If scan fails because of connecting, the recommended strategy is to delay sometime and retry scan again, the scan will succeed once the connecting is completed.

However, the retry/delay strategy may not work all the time. Considering following scenario:

- The station is connecting a non-existent AP or if the station connects the existed AP with a wrong password, it always raises the event \texttt{WIFI\_EVENT\_STA\_DISCONNECTED}.
- The application call \texttt{esp\_wifi\_connect()} to do reconnection on receiving the disconnect event.
- Another application task, e.g. the console task, call \texttt{esp\_wifi\_scan\_start()} to do scan, the scan always fails immediately because the station is keeping connecting.
- When scan fails, the application simply delay sometime and retry the scan.

In above scenario the scan will never succeed because the connecting is in process. So if the application supports similar scenario, it needs to implement a better reconnect strategy. E.g.

- The application can choose to define a maximum continuous reconnect counter, stop reconnect once the reconnect reaches the max counter.
- The application can choose to do reconnect immediately in the first N continuous reconnect, then give a delay sometime and reconnect again.

The application can define its own reconnect strategy to avoid the scan starve to death. Refer to \texttt{<Wi-Fi Reconnect>}

4.35.10 ESP32 Wi-Fi Station Connecting Scenario

This scenario only depicts the case when there is only one target AP are found in scan phase, for the scenario that more than one AP with the same SSID are found, refer to \texttt{ESP32 Wi-Fi Station Connecting When Multiple APs Are Found}.

Generally, the application does not need to care about the connecting process. Below is a brief introduction to the process for those who are really interested.

Scenario:

Scan Phase

- s1.1, The Wi-Fi driver begins scanning in “Wi-Fi Connect” . Refer to \texttt{Scan in Wi-Fi Connect} for more details.
- s1.2, If the scan fails to find the target AP, \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} will arise and the reason-code will be \texttt{WIFI\_REASON\_NO\_AP\_FOUND}. Refer to \texttt{Wi-Fi Reason Code}. 
Fig. 60: Wi-Fi Station Connecting Process

1. Scan Phase

1.1 > Scan

1.2 > WIFI_EVENT_STA_DISCONNECTED

2. Auth Phase

2.1 > Auth request

2.2 > WIFI_EVENT_STA_DISCONNECTED

2.3 > Auth response

2.4 > WIFI_EVENT_STA_DISCONNECTED

3. Assoc Phase

3.1 > Assoc request

3.2 > WIFI_EVENT_STA_DISCONNECTED

3.3 > Assoc response

3.4 > WIFI_EVENT_STA_DISCONNECTED

4. 4-way Handshake Phase

4.1 > WIFI_EVENT_STA_DISCONNECTED

4.2 > 1/4 EAPOL

4.3 > 2/4 EAPOL

4.4 > WIFI_EVENT_STA_DISCONNECTED

4.5 > 3/4 EAPOL

4.6 > 4/4 EAPOL

4.7 > WIFI_EVENT_STA_CONNECTED
Auth Phase

- s2.1. The authentication request packet is sent and the auth timer is enabled.
- s2.2. If the authentication response packet is not received before the authentication timer times out, \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} will arise and the reason-code will be \texttt{WIFI\_REASON\_AUTH\_EXPIRE}. Refer to \textit{Wi-Fi Reason Code}.
- s2.3. The auth-response packet is received and the auth-timer is stopped.
- s2.4. The AP rejects authentication in the response and \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} arises, while the reason-code is \texttt{WIFI\_REASON\_AUTH\_FAIL} or the reasons specified by the AP. Refer to \textit{Wi-Fi Reason Code}.

Association Phase

- s3.1. The association request is sent and the association timer is enabled.
- s3.2. If the association response is not received before the association timer times out, \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} will arise and the reason-code will be \texttt{WIFI\_REASON\_ASSOC\_EXPIRE}. Refer to \textit{Wi-Fi Reason Code}.
- s3.3. The association response is received and the association timer is stopped.
- s3.4. The AP rejects the association in the response and \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} arises, while the reason-code is the one specified in the association response. Refer to \textit{Wi-Fi Reason Code}.

Four-way Handshake Phase

- s4.1. The handshake timer is enabled, the 1/4 EAPOL is not received before the handshake timer expires, \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} will arise and the reason-code will be \texttt{WIFI\_REASON\_HANDSHAKE\_TIMEOUT}. Refer to \textit{Wi-Fi Reason Code}.
- s4.2. The 1/4 EAPOL is received.
- s4.3. The STA replies 2/4 EAPOL.
- s4.4. If the 3/4 EAPOL is not received before the handshake timer expires, \texttt{WIFI\_EVENT\_STA\_DISCONNECTED} will arise and the reason-code will be \texttt{WIFI\_REASON\_HANDSHAKE\_TIMEOUT}. Refer to \textit{Wi-Fi Reason Code}.
- s4.5. The 3/4 EAPOL is received.
- s4.6. The STA replies 4/4 EAPOL.
- s4.7. The STA raises \texttt{WIFI\_EVENT\_STA\_CONNECTED}.

Wi-Fi Reason Code

The table below shows the reason-code defined in ESP32. The first column is the macro name defined in \texttt{esp\_wifi\_types.h}. The common prefix \texttt{WIFI\_REASON} is removed, which means that \textit{UNSPECIFIED} actually stands for \texttt{WIFI\_REASON\_UNSPECIFIED} and so on. The second column is the value of the reason. The third column is the standard value to which this reason is mapped in section 8.4.1.7 of IEEE 802.11-2012. (For more information, refer to the standard mentioned above.) The last column is a description of the reason.
<table>
<thead>
<tr>
<th>Reason code</th>
<th>Value</th>
<th>Mapped To</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNSPECIFIED</td>
<td>1</td>
<td>1</td>
<td>Generally, it means an internal failure, e.g., the memory runs out, the internal TX fails, or the reason is received from the remote side, etc.</td>
</tr>
</tbody>
</table>
| AUTH_EXPIRE       | 2     | 2         | The previous authentication is no longer valid. For the ESP Station, this reason is reported when:  
|                   |       |           | • auth is timed out.  
|                   |       |           | • the reason is received from the AP. For the ESP AP, this reason is reported when:  
|                   |       |           | • the AP has not received any packets from the station in the past five minutes.  
|                   |       |           | • the AP is stopped by calling esp_wifi_stop().  
|                   |       |           | • the station is de-authed by calling esp_wifi_deauth_sta(). |
| AUTH_LEAVE        | 3     | 3         | De-authenticated, because the sending STA is leaving (or has left). For the ESP Station, this reason is reported when:  
|                   |       |           | • it is received from the AP. |
| ASSOC_EXPIRE      | 4     | 4         | Disassociated due to inactivity. For the ESP Station, this reason is reported when:  
|                   |       |           | • it is received from the AP. For the ESP AP, this reason is reported when:  
|                   |       |           | • the AP has not received any packets from the station in the past five minutes.  
|                   |       |           | • the AP is stopped by calling esp_wifi_stop().  
|                   |       |           | • the station is de-authed by calling esp_wifi_deauth_sta(). |
| ASSOC_TOOMANY     | 5     | 5         | Disassociated, because the AP is unable to handle all currently associated STAs at the same time. For the ESP Station, this reason is reported when:  
|                   |       |           | • it is received from the AP.  
|                   |       |           | • the AP has not received any packets from the station in the past five minutes.  
|                   |       |           | • the AP is stopped by calling esp_wifi_stop().  
|                   |       |           | • the station is de-authed by calling esp_wifi_deauth_sta(). |
4.35.11 ESP32 Wi-Fi Station Connecting When Multiple APs Are Found

This scenario is similar as ESP32 Wi-Fi Station Connecting Scenario, the difference is the station will not raise the event WIFI_EVENT_STA_DISCONNECTED unless it fails to connect all of the found APs.

4.35.12 Wi-Fi Reconnect

The station may disconnect due to many reasons, e.g. the connected AP is restarted etc. It’s the application’s responsibility to do the reconnect. The recommended reconnect strategy is to call esp_wifi_connect() on receiving event WIFI_EVENT_STA_DISCONNECTED.

Sometimes the application needs more complex reconnect strategy:

- If the disconnect event is raised because the esp_wifi_disconnect() is called, the application may not want to do reconnect.
- If the esp_wifi_scan_start() may be called at anytime, a better reconnect strategy is necessary, refer to Scan When Wi-Fi is Connecting.

Another thing we need to consider is the reconnect may not connect the same AP if there are more than one APs with the same SSID. The reconnect always select current best APs to connect.

4.35.13 Wi-Fi Beacon Timeout

The beacon timeout mechanism is used by ESP32 station to detect whether the AP is alive or not. If the station continuously loses 60 beacons of the connected AP, the beacon timeout happens.

After the beacon timeout happens, the station sends 5 probe requests to AP, it disconnects the AP and raises the event WIFI_EVENT_STA_DISCONNECTED if still no probe response or beacon is received from AP.

4.35.14 ESP32 Wi-Fi Configuration

All configurations will be stored into flash when the Wi-Fi NVS is enabled; otherwise, refer to Wi-Fi NVS Flash.

**Wi-Fi Mode**

Call esp_wifi_set_mode() to set the Wi-Fi mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIFI_MODE_NULL</td>
<td>In this mode, the internal data struct is not allocated to the station and the AP, while both the station and AP interfaces are not initialized for RX/TX Wi-Fi data. Generally, this mode is used for Sniffer, or when you only want to stop both the STA and the AP without calling esp_wifi_deinit() to unload the whole Wi-Fi driver.</td>
</tr>
<tr>
<td>WIFI_MODE_STA</td>
<td>In this mode, esp_wifi_start() will init the internal station data, while the station’s interface is ready for the RX and TX Wi-Fi data. After esp_wifi_connect() is called, the STA will connect to the target target AP.</td>
</tr>
<tr>
<td>WIFI_MODE_AP</td>
<td>In this mode, esp_wifi_start() will init the internal AP data, while the AP’s interface is ready for RX/TX Wi-Fi data. Then, the Wi-Fi driver starts broad-casting beacons, and the AP is ready to get connected to other stations.</td>
</tr>
<tr>
<td>WIFI_MODE_APSTA</td>
<td>In this mode, esp_wifi_start() will simultaneously init both the station and the AP. This is done in station mode and AP mode. Please note that the channel of the external AP, which the ESP Station is connected to, has higher priority over the ESP AP channel.</td>
</tr>
</tbody>
</table>
Chapter 4. API Guides

Station Basic Configuration

API `esp_wifi_set_config()` can be used to configure the station. The table below describes the fields in detail.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>This is the SSID of the target AP, to which the station wants to connect to.</td>
</tr>
<tr>
<td>password</td>
<td>Password of the target AP.</td>
</tr>
<tr>
<td>scan_method</td>
<td>WIFI_FAST_SCAN scan, the scan ends when the first matched AP is found, for WIFI_ALL_CHANNEL_SCAN, the scan finds all matched APs on all channels. The default scan is WIFI_FAST_SCAN.</td>
</tr>
<tr>
<td>bssid_set</td>
<td>If bssid_set is 0, the station connects to the AP whose SSID is the same as the field “ssid”, while the field “bssid” is ignored. In all other cases, the station connects to the AP whose SSID is the same as the “ssid” field, while its BSSID is the same the “bssid” field.</td>
</tr>
<tr>
<td>bssid</td>
<td>This is valid only when bssid_set is 1; see field “bssid_set”.</td>
</tr>
<tr>
<td>channel</td>
<td>If the channel is 0, the station scans the channel 1 ~ N to search for the target AP; otherwise, the station starts by scanning the channel whose value is the same as that of the “channel” field, and then scans others to find the target AP. If you do not know which channel the target AP is running on, set it to 0.</td>
</tr>
<tr>
<td>sort_method</td>
<td>If the sort_method is WIFI_CONNECT_AP_BY_SIGNAL, all matched APs are sorted by signal, for AP with best signal will be connected firstly. E.g. if the station want to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid equals to “apxx”, the first AP’s signal is -90 dBm, the second AP’s signal is -30 dBm, the station connects the second AP firstly, it doesn’t connect the first one unless it fails to connect the second one. If the sort_method is WIFI_CONNECT_AP_BY_SECURITY, all matched APs are sorted by security. E.g. if the station wants to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid is “apxx”, the security of the first found AP is open while the second one is WPA2, the stations connects to the second AP firstly, it doesn’t connect the second one unless it fails to connect the first one.</td>
</tr>
<tr>
<td>threshold</td>
<td>The threshold is used to filter the found AP, if the RSSI or security mode is less than the configured threshold, the AP will be discard.</td>
</tr>
</tbody>
</table>

**Attention:** WEP/WPA security modes are deprecated in IEEE 802.11-2016 specifications and are recommended not to be used. These modes can be rejected using authmode threshold by setting threshold as WPA2 by `threshold.authmode` as WIFI_AUTH_WPA2_PSK.

AP Basic Configuration

API `esp_wifi_set_config()` can be used to configure the AP. The table below describes the fields in detail.
### Field | Description
--- | ---
ssid | SSID of AP; if the ssid[0] is 0xFF and ssid[1] is 0xFF, the AP defaults the SSID to ESP_aabbcc, where “aabbcc” is the last three bytes of the AP MAC.
password | Password of AP; if the auth mode is WIFI_AUTH_OPEN, this field will be ignored.
ssid_len | Length of SSID; if ssid_len is 0, check the SSID until there is a termination character. If ssid_len > 32, change it to 32; otherwise, set the SSID length according to ssid_len.
channel | Channel of AP; if the channel is out of range, the Wi-Fi driver defaults the channel to channel 1. So, please make sure the channel is within the required range. For more details, refer to Wi-Fi Country Code.
auth_mode | Auth mode of ESP AP; currently, ESP Wi-Fi does not support AUTH_WEP. If the auth_mode is an invalid value, AP defaults the value to WIFI_AUTH_OPEN.
ssid_hidden | If ssid_hidden is 1, AP does not broadcast the SSID; otherwise, it does broadcast the SSID.
max_connection | Currently, ESP Wi-Fi supports up to 10 Wi-Fi connections. If max_connection > 10, AP defaults the value to 10.
beacon_interval | Beacon interval; the value is 100 ~ 60000 ms, with default value being 100 ms. If the value is out of range, AP defaults it to 100 ms.

### Wi-Fi Protocol Mode

Currently, the IDF supports the following protocol modes:

<table>
<thead>
<tr>
<th>Protocol Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11 B</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B) to set the station/AP to 802.11B-only mode.</td>
</tr>
<tr>
<td>802.11 BG</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGN</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGNL</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 LR</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR) to set the station/AP only to the Espressif-specific mode. <strong>This mode is an Espressif-patented mode which can achieve a one-kilometer line of sight range. Please, make sure both the station and the AP are connected to an ESP device</strong></td>
</tr>
</tbody>
</table>

### Long Range (LR)

Long Range (LR) mode is an Espressif-patented Wi-Fi mode which can achieve a one-kilometer line of sight range. It has better reception sensitivity, stronger anti-interference ability and longer transmission distance than the traditional 802.11B mode.

**LR Compatibility**  Since LR is Espressif unique Wi-Fi mode, only ESP32 devices can transmit and receive the LR data. In other words, the ESP32 device should NOT transmit the data in LR data rate if the connected device doesn’t support LR. The application can achieve this by configuring suitable Wi-Fi mode. If the negotiated mode supports LR, the ESP32 may transmit data in LR rate, otherwise, ESP32 will transmit all data in traditional Wi-Fi data rate. Following table depicts the Wi-Fi mode negotiation:
In above table, the row is the Wi-Fi mode of AP and the column is the Wi-Fi mode of station. The “-” indicates Wi-Fi mode of the AP and station are not compatible.

According to the table, we can conclude that:

- For LR enabled in ESP32 AP, it’s incompatible with traditional 802.11 mode because the beacon is sent in LR mode.
- For LR enabled in ESP32 station and the mode is NOT LR only mode, it’s compatible with traditional 802.11 mode.
- If both station and AP are ESP32 devices and both of them enable LR mode, the negotiated mode supports LR.

If the negotiated Wi-Fi mode supports both traditional 802.11 mode and LR mode, it’s the Wi-Fi driver’s responsibility to automatically select the best data rate in different Wi-Fi mode and the application don’t need to care about it.

**LR Impacts to Traditional Wi-Fi device**  The data transmission in LR rate has no impacts on the traditional Wi-Fi device because:

- The CCA and backoff process in LR mode are consistent with 802.11 specification.
- The traditional Wi-Fi device can detect the LR signal via CCA and do backoff.

In other words, the impact transmission in LR mode is similar as the impact in 802.11B mode.

**LR Transmission Distance**  The reception sensitivity of LR has about 4 dB gain than the traditional 802.11B mode, theoretically the transmission distance is about 2 to 2.5 times the distance of 11B.

**LR Throughput**  The LR rate has very limited throughput because the raw PHY data rate LR is 1/2 Mbits and 1/4 Mbits.

**When to Use LR**  The general conditions for using LR are:

- Both the AP and station are devices.
- Long distance Wi-Fi connection and data transmission is required.
- Data throughput requirements are very small, such as remote device control, etc.
Wi-Fi Country Code

Call `esp_wifi_set_country()` to set the country info. The table below describes the fields in detail, please consult local 2.4 GHz RF operating regulations before configuring these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| cc[3]  | Country code string, this attributes identify the country or noncountry entity in which the station/AP is operating. If it’s a country, the first two octets of this string is the two character country info as described in document ISO/IEC3166-1. The third octect is one of the following:  
• an ASCII space character, if the regulations under which the station/AP is operating encompass all environments for the current frequency band in the country.  
• an ASCII ‘O’ character if the regulations under which the station/AP is operating are for an outdoor environment only.  
• an ASCII ‘I’ character if the regulations under which the station/AP is operating are for an indoor environment only.  
• an ASCII ‘X’ character if the station/AP is operating under a noncountry entity. The first two octets of the noncountry entity is two ASCII ‘XX’ characters.  
• the binary representation of the Operating Class table number currently in use. Refer to Annex E, IEEE Std 802.11-2012. |
| schan  | Start channel, it’s the minimum channel number of the regulations under which the station/AP can operate. |
| nchan  | Total number of channels as per the regulations, e.g. if the schan=1, nchan=13, it means the station/AP can send data from channel 1 to 13. |
| policy | Country policy, this field control which country info will be used if the configured country info is conflict with the connected AP’s. More description about policy is provided in following section. |

The default country info is `{.cc=”CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}`, if the Wi-Fi Mode is station/AP coexist mode, they share the same configured country info. Sometimes, the country info of AP, to which the station is connected, is different from the country info of configured. For example, the configured station has country info `{.cc=”JP”, .schan=1, .nchan=14, policy=WIFI_COUNTRY_POLICY_AUTO}`, but the connected AP has country info `{.cc=”CN”, .schan=1, .nchan=13}`, then country info of connected AP’s is used. Following table depicts which country info is used in different Wi-Fi Mode and different country policy, also describe the impact to active scan.
WiFi Mode | Policy | Description
---|---|---
Station | WIFI_COUNTRY_POLICY_AUTO | If the connected AP has country IE in its beacon, the country info equals to the country info in beacon, otherwise, use default country info. For scan:
- If chann+nchan-1 > 11 :
  Use active scan from chann to 11 and use passive scan from 12 to chann+nchan-1.
- If chann+nchan-1 <= 11 :
  Use active scan from chann to chann+nchan-1.
Always keep in mind that if an AP with hidden SSID is set to a passive scan channel, the passive scan will not find it. In other words, if the application hopes to find the AP with hidden SSID in every channel, the policy of country info should be configured to WIFI_COUNTRY_POLICY_MANUAL.

Station | WIFI_COUNTRY_POLICY_MANUAL | Always use the configured country info. For scan, scans channel chann to chann+nchan-1 with active scan.

AP | WIFI_COUNTRY_POLICY_AUTO | Always use the configured country info.

AP | WIFI_COUNTRY_POLICY_MANUAL | Always use the configured country info.

Station/AP-coexistence | WIFI_COUNTRY_POLICY_AUTO | If the station doesn’t connect to any AP, the AP use the configured country info. If the station connects to an AP, the AP has the same country info as the station. Same as station mode with policy WIFI_COUNTRY_POLICY_MANUAL.

**Home Channel**  In AP mode, the home channel is defined as the AP channel. In Station mode, home channel is defined as the channel of AP which the station is connected to. In Station/AP-coexistence mode, the home channel of AP and station must be the same, if they are different, the station’s home channel is always in priority. Take the following as an example: the AP is on channel 6, and the station connects to an AP whose channel is 9. Since the station’s home channel has higher priority, the AP needs to switch its channel from 6 to make sure that it has the same home channel as the station. While switching channel, the ESP32 in SoftAP mode will notify the connected stations about the channel migration using a Channel Switch Announcement (CSA). Station that supports channel switching will transit without disconnecting and reconnecting to the SoftAP.

**Wi-Fi Vendor IE Configuration**

By default, all Wi-Fi management frames are processed by the Wi-Fi driver, and the application does not need to care about them. Some applications, however, may have to handle the beacon, probe request, probe response and other management frames. For example, if you insert some vendor-specific IE into the management
frames, it is only the management frames which contain this vendor-specific IE that will be processed. In ESP32, `esp_wifi_set_vendor_ie()` and `esp_wifi_set_vendor_ie_cbf()` are responsible for this kind of tasks.

### 4.35.15 Wi-Fi Security

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi now supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks in traditional modes.

**Protected Management Frames (PMF)**

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

ESP32 supports the following three modes of operation with respect to PMF.

- **PMF not supported**: In this mode, ESP32 indicates to AP that it is not capable of supporting management protection during association. In effect, security in this mode will be equivalent to that in traditional mode.
- **PMF capable, but not required**: In this mode, ESP32 indicates to AP that it is capable of supporting PMF. The management protection will be used if AP mandates PMF or is at least capable of supporting PMF.
- **PMF capable and required**: In this mode, ESP32 will only connect to AP, if AP supports PMF. If not, ESP32 will refuse to connect to the AP.

`esp_wifi_set_config()` can be used to configure PMF mode by setting appropriate flags in `pmf_cfg` parameter. Currently, PMF is supported only in Station mode.

**WPA3-Personal**

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. In order to provide more robust authentication, WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction. WPA3 also provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission. Please refer to Security section of Wi-Fi Alliance’s official website for further details.

In order to enable WPA3-Personal, “Enable WPA3-Personal” should be selected in menuconfig. If enabled, ESP32 uses SAE for authentication if supported by the AP. Since PMF is a mandatory requirement for WPA3, PMF capability should be at least set to “PMF capable, but not required” for ESP32 to use WPA3 mode. Application developers need not worry about the underlying security mode as highest available is chosen from security standpoint. Note that Wi-Fi stack size requirement will increase approximately by 3k when WPA3 is used. Currently, WPA3 is supported only in Station mode.
**WPA2-Enterprise**

WPA2-Enterprise is the secure authentication mechanism for enterprise wireless networks. It uses RADIUS server for authentication of network users before connecting to the Access Point. The authentication process is based on 802.1X policy and comes with different Extended Authentication Protocol (EAP) methods like TLS, TTLS, PEAP etc. RADIUS server authenticates the users based on their credentials (username and password), digital certificates or both. When ESP32 in Station mode tries to connect to an AP in enterprise mode, it sends authentication request to AP which is sent to RADIUS server by AP for authenticating the Station. Based on different EAP methods, the parameters can be set in configuration which can be opened using `idf.py menuconfig`. WPA2_Enterprise is supported by ESP32 only in Station mode.

For establishing a secure connection, AP and Station negotiate and agree on the best possible cipher suite to be used. ESP32 supports 802.1X/EAP (WPA) method of AKM and Advanced encryption standard with Counter Mode Cipher Block Chaining Message Authentication protocol (AES-CCM) cipher suite. It also supports the cipher suites supported by mbedtls if `USE_MBEDTLS_CRYPTO` flag is set.

**ESP32 currently supports the following EAP methods:**

- **EAP-TLS:** This is certificate based method and only requires SSID and EAP-IDF.
- **PEAP:** This is Protected EAP method. Username and Password are mandatory.
- **EAP-TTLS:** This is credentials based method. Only server authentication is mandatory while user authentication is optional. Username and Password are mandatory. It supports different Phase2 methods like,
  - MSCHAP and MSCHAP-V2.

Detailed information on creating certificates and how to run wpa2Enterprise example on ESP32 can be found in `wifi/wpa2_enterprise`.

### 4.35.16 ESP32 Wi-Fi Power-saving Mode

**Station Sleep**

Currently, ESP32 Wi-Fi supports the Modem-sleep mode which refers to the legacy power-saving mode in the IEEE 802.11 protocol. Modem-sleep mode works in Station-only mode and the station must connect to the AP first. If the Modem-sleep mode is enabled, station will switch between active and sleep state periodically. In sleep state, RF, PHY and BB are turned off in order to reduce power consumption. Station can keep connection with AP in modem-sleep mode.

Modem-sleep mode includes minimum and maximum power save modes. In minimum power save mode, station wakes up every DTIM to receive beacon. Broadcast data will not be lost because it is transmitted after DTIM. However, it can not save much more power if DTIM is short for DTIM is determined by AP.

In maximum power save mode, station wakes up every listen interval to receive beacon. This listen interval can be set longer than the AP DTIM period. Broadcast data may be lost because station may be in sleep state at DTIM time. If listen interval is longer, more power is saved but broadcast data is more easy to lose. Listen interval can be configured by calling API `esp_wifi_set_config()` before connecting to AP.

Call `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` to enable Modem-sleep minimum power save mode or `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` to enable Modem-sleep maximum power save mode after calling `esp_wifi_init()`. When station connects to AP, Modem-sleep will start. When station disconnects from AP, Modem-sleep will stop.

Call `esp_wifi_set_ps(WIFI_PS_NONE)` to disable modem sleep entirely. This has much higher power consumption, but provides minimum latency for receiving Wi-Fi data in real time. When modem sleep is enabled, received Wi-Fi data can be delayed for as long as the DTIM period (minimum power save mode) or the listen interval (maximum power save mode). Disabling modem sleep entirely is not possible for Wi-Fi and Bluetooth coexist mode.

The default Modem-sleep mode is WIFI_PS_MIN_MODEM.
AP Sleep

Currently ESP32 AP doesn’t support all of the power save feature defined in Wi-Fi specification. To be specific, the AP only caches unicast data for the stations connect to this AP, but doesn’t cache the multicast data for the stations. If stations connected to the ESP32 AP are power save enabled, they may experience multicast packet loss.

In the future, all power save features will be supported on ESP32 AP.

4.35.17 ESP32 Wi-Fi Throughput

The table below shows the best throughput results we got in Espressif’s lab and in a shield box.

<table>
<thead>
<tr>
<th>Type/Throughput</th>
<th>Air In Lab</th>
<th>Shield-box</th>
<th>Test Tool</th>
<th>IDF Version (commit ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Raw 802.11 Packet RX</td>
<td>N/A</td>
<td>130 MBit/s</td>
<td>Internal tool</td>
<td>NA</td>
</tr>
<tr>
<td>Raw 802.11 Packet TX</td>
<td>N/A</td>
<td>130 MBit/s</td>
<td>Internal tool</td>
<td>NA</td>
</tr>
<tr>
<td>UDP RX</td>
<td>30 MBit/s</td>
<td>85 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
<tr>
<td>UDP TX</td>
<td>30 MBit/s</td>
<td>75 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
<tr>
<td>TCP RX</td>
<td>20 MBit/s</td>
<td>65 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
<tr>
<td>TCP TX</td>
<td>20 MBit/s</td>
<td>75 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
</tbody>
</table>

When the throughput is tested by iperf example, the sdkconfig is examples/wifi/iperf/sdkconfig.defaults.esp32.

4.35.18 Wi-Fi 80211 Packet Send

The esp_wifi_80211_tx() API can be used to:

• Send the beacon, probe request, probe response, action frame.
• Send the non-QoS data frame.

It cannot be used for sending encrypted or QoS frames.

Preconditions of Using esp_wifi_80211_tx()

• The Wi-Fi mode is Station, or AP, or Station+AP.
• Either esp_wifi_set_promiscuous(true), or esp_wifi_start(), or both of these APIs return ESP_OK.
  This is because we need to make sure that Wi-Fi hardware is initialized before esp_wifi_80211_tx() is called. In ESP32, both esp_wifi_set_promiscuous(true) and esp_wifi_start() can trigger the initialization of Wi-Fi hardware.
• The parameters of esp_wifi_80211_tx() are hereby correctly provided.

Data rate

• If there is no Wi-Fi connection, the data rate is 1 Mbps.
• If there is Wi-Fi connection and the packet is from station to AP or from AP to station, the data rate is same as the Wi-Fi connection. Otherwise the data rate is 1 Mbps.

Side-Effects to Avoid in Different Scenarios

Theoretically, if we do not consider the side-effects the API imposes on the Wi-Fi driver or other stations/APs, we can send a raw 802.11 packet over the air, with any destination MAC, any source MAC, any BSSID, or any other type of packet. However, robust/useful applications should avoid such side-effects. The table below provides some tips/recommendations on how to avoid the side-effects of esp_wifi_80211_tx() in different scenarios.
### No WiFi connection

In this scenario, no Wi-Fi connection is set up, so there are no side-effects on the Wi-Fi driver. If `en_sys_seq=true`, the Wi-Fi driver is responsible for the sequence control. If `en_sys_seq=false`, the application needs to ensure that the buffer has the correct sequence. Theoretically, the MAC address can be any address. However, this may impact other stations/APs with the same MAC/BSSID.

**Side-effect example#1** The application calls `esp_wifi_80211_tx` to send a beacon with BSSID == mac_x in AP mode, but the mac_x is not the MAC of the AP interface. Moreover, there is another AP, say “other-AP”, whose bssid is mac_x. If this happens, an “unexpected behavior” may occur, because the stations which connect to the “other-AP” cannot figure out whether the beacon is from the “other-AP” or the `esp_wifi_80211_tx`. To avoid the above-mentioned side-effects, we recommend that:

- If `esp_wifi_80211_tx` is called in Station mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the station interface.
- If `esp_wifi_80211_tx` is called in AP mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the AP interface.

The recommendations above are only for avoiding side-effects and can be ignored when there are good reasons for doing this.

### Have WiFi connection

When the Wi-Fi connection is already set up, and the sequence is controlled by the application, the latter may impact the sequence control of the Wi-Fi connection, as a whole. So, the `en_sys_seq` need to be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

The MAC-address recommendations in the “No WiFi connection” scenario also apply to this scenario. If the WiFi mode is station mode and the MAC address1 is the MAC of AP to which the station is connected, the MAC address2 is the MAC of station interface, we say the packets is from the station to AP. On the other hand, if the WiFi mode is AP mode and the MAC address1 is the MAC of the station who connects to this AP, the MAC address2 is the MAC of AP interface, we say the packet is from the AP to station. To avoid conflicting with WiFi connections, the following checks are applied:

- If the packet type is data and is from the station to AP, the ToDS bit in IEEE 80211 frame control should be 1, the FromDS bit should be 0, otherwise the packet will be discarded by WiFi driver.
- If the packet type is data and is from the AP to station, the ToDS bit in IEEE 80211 frame control should be 0, the FromDS bit should be 1, otherwise the packet will be discarded by WiFi driver.
- If the packet is from station to AP or from AP to station, the Power Management, More Data, Re-Transmission bits should be 0, otherwise the packet will be discarded by WiFi driver. `ESP_ERR_WIFI_ARG` is returned if any check fails.
### 4.35.19 Wi-Fi Sniffer Mode

The Wi-Fi sniffer mode can be enabled by `esp_wifi_set_promiscuous()`. If the sniffer mode is enabled, the following packets can be dumped to the application:

- 802.11 Management frame.
- 802.11 Data frame, including MPDU, AMPDU, AMSDU, etc.
- 802.11 MIMO frame, for MIMO frame, the sniffer only dumps the length of the frame.
- 802.11 Control frame.

The following packets will NOT be dumped to the application:

- 802.11 error frame, such as the frame with a CRC error, etc.

For frames that the sniffer can dump, the application can additionally decide which specific type of packets can be filtered to the application by using `esp_wifi_set_promiscuous_filter()` and `esp_wifi_set_promiscuous_ctrl_filter()`. By default, it will filter all 802.11 data and management frames to the application.

The Wi-Fi sniffer mode can be enabled in the Wi-Fi mode of WIFI_MODE_NULL, or WIFI_MODE_STA, or WIFI_MODE_AP, or WIFI_MODE_APSTA. In other words, the sniffer mode is active when the station is connected to the AP, or when the AP has a Wi-Fi connection. Please note that the sniffer has a great impact on the throughput of the station or AP Wi-Fi connection. Generally, we should NOT enable the sniffer, when the station/AP Wi-Fi connection experiences heavy traffic unless we have special reasons.

Another noteworthy issue about the sniffer is the callback `wifi_promiscuous_cb_t`. The callback will be called directly in the Wi-Fi driver task, so if the application has a lot of work to do for each filtered packet, the recommendation is to post an event to the application task in the callback and defer the real work to the application task.

### 4.35.20 Wi-Fi Multiple Antennas

The Wi-Fi multiple antennas selecting can be depicted as following picture:

![Antenna switch diagram](image)

ESP32 supports up to sixteen antennas through external antenna switch. The antenna switch can be controlled by up to four address pins - antenna_select[0:3]. Different input value of antenna_select[0:3] means selecting different antenna. E.g. the value 0b1011 means the antenna 11 is selected. The default value of antenna_select[3:0] is 0b0000, it means the antenna 0 is selected by default.

Up to four GPIOs are connected to the four active high antenna_select pins. ESP32 can select the antenna by control the GPIO[0:3]. The API `esp_wifi_set_ant_gpio()` is used to configure which GPIOs are connected to antenna_selects. If GPIO[x] is connected to antenna_select[x], then gpio_config->gpio_cfg[x].gpio_num should be provided.

Although up to sixteen antenas are supported, only one or two antennas can be simultaneously enabled for RX/TX. The API `esp_wifi_set_ant()` is used to configure which antennas are enabled.

The enabled antennas selecting algorithm is also configured by `esp_wifi_set_ant()`. The RX/TX antenna mode can be WIFI_ANT_MODE_ANT0, WIFI_ANT_MODE_ANT1 or WIFI_ANT_MODE_AUTO. If the an-
tenna mode is WIFI_ANT_MODE_ANT0, the enabled antenna 0 is selected for RX/TX data. If the antenna mode is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is selected for RX/TX data. Otherwise, Wi-Fi automatically selects the antenna that has better signal from the enabled antennas.

If the RX antenna mode is WIFI_ANT_MODE_AUTO, the default antenna mode also needs to be set. Because the RX antenna switching only happens when some conditions are met, e.g. the RX antenna starts to switch if the RSSI is lower than -65 dBm and if another antenna has better signal etc, RX uses the default antenna if the conditions are not met. If the default antenna mode is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is used as the default RX antenna, otherwise the enabled antenna 0 is used as the default RX antenna.

Some limitations need to be considered:

- The TX antenna can be set to WIFI_ANT_MODE_AUTO only if the RX antenna mode is WIFI_ANT_MODE_AUTO because TX antenna selecting algorithm is based on RX antenna in WIFI_ANT_MODE_AUTO type.
- Currently Bluetooth® doesn’t support the multiple antennas feature, please don’t use multiple antennas related APIs.

Following is the recommended scenarios to use the multiple antennas:

- In Wi-Fi mode WIFI_MODE_STA, both RX/TX antenna modes are configured to WIFI_ANT_MODE_AUTO. The Wi-Fi driver selects the better RX/TX antenna automatically.
- The RX antenna mode is configured to WIFI_ANT_MODE_AUTO. The TX antenna mode is configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1. The applications can choose to always select a specified antenna for TX, or implement their own TX antenna selecting algorithm, e.g. selecting the TX antenna mode based on the channel switch information etc.
- Both RX/TX antenna modes are configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1.

### Wi-Fi Multiple Antennas Configuration

Generally, following steps can be taken to configure the multiple antennas:

- Configure which GPIOs are connected to the antenna_selects, for example, if four antennas are supported and GPIO20/GPIO21 are connected to antenna_select[0]/antenna_select[1], the configurations look like:

```c
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- Configure which antennas are enabled and how RX/TX use the enabled antennas, for example, if antenna1 and antenna3 are enabled, the RX needs to select the better antenna automatically and uses antenna1 as its default antenna, the TX always selects the antenna3. The configuration looks like:

```c
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.35.21 Wi-Fi Channel State Information

Channel state information (CSI) refers to the channel information of a Wi-Fi connection. In ESP32, this information consists of channel frequency responses of sub-carriers and is estimated when packets are received from the transmitter. Each channel frequency response of sub-carrier is recorded by two bytes of signed characters. The first one is imaginary part and the second one is real part. There are up to three fields of channel frequency responses according to the type of received packet. They are legacy long training field (LLTF), high throughput LTF (HT-LTF) and space time block code HT-LTF (STBC-HT-LTF). For different types of packets which are received on channels with different state, the sub-carrier index and total bytes of signed characters of CSI is shown in the following table.
<table>
<thead>
<tr>
<th>channel</th>
<th>secondary channel</th>
<th>below</th>
<th>above</th>
</tr>
</thead>
<tbody>
<tr>
<td>packet information</td>
<td>non HT</td>
<td>HT 20 MHz</td>
<td>20 MHz</td>
</tr>
<tr>
<td></td>
<td>non HT</td>
<td>HT 40 MHz</td>
<td>40 MHz</td>
</tr>
<tr>
<td>channel bandwidth</td>
<td>20 MHz</td>
<td>20 MHz</td>
<td>20 MHz</td>
</tr>
<tr>
<td>STBC</td>
<td>non STBC</td>
<td>STBC</td>
<td>non STBC</td>
</tr>
<tr>
<td>sub-carrier index</td>
<td>LLTF 0<del>31, 32</del>1</td>
<td>0<del>31, 32</del>1</td>
<td>0~63</td>
</tr>
<tr>
<td></td>
<td>HT-LTF 0~63</td>
<td>0~63</td>
<td>64~1</td>
</tr>
<tr>
<td></td>
<td>STBC-HT-LTF 0~63</td>
<td>0~63</td>
<td>64~1</td>
</tr>
<tr>
<td>total bytes</td>
<td>128</td>
<td>256</td>
<td>384</td>
</tr>
</tbody>
</table>

All of the information in the table can be found in the structure wifi_csi_info_t.

- Secondary channel refers to secondary_channel field of rx_ctrl field.
- Signal mode of packet refers to sig_mode field of rx_ctrl field.
- Channel bandwidth refers to cwb field of rx_ctrl field.
- STBC refers to stbc field of rx_ctrl field.
- Total bytes refers to len field.
- The CSI data corresponding to each Long Training Field (LTF) type is stored in a buffer starting from the buffer. Each item is stored as two bytes: imaginary part followed by real part. The order of each item is the same as the sub-carrier in the table. The order of LTF is: LLTF, HT-LTF, STBC-HT-LTF. However, all 3 LTFs may not be present, depending on the channel and packet information (see above).
- If first_word_invalid field of wifi_csi_info_t is true, it means that the first four bytes of CSI data is invalid due to a hardware limitation in ESP32.
- More information like RSSI, noise floor of RF, receiving time and antenna is in the rx_ctrl field.

**Note:**

- For STBC packet, CSI is provided for every space-time stream without CSD (cyclic shift delay). As each cyclic shift on the additional chains shall be -200 ns, only the CSD angle of first space-time stream is recorded in sub-carrier 0 of HT-LTF and STBC-HT-LTF for there is no channel frequency response in sub-carrier 0. CSD[10:0] is 11 bits, ranging from -pi to pi.
- If LLTF, HT-LTF or STBC-HT-LTF is not enabled by calling API esp_wifi_set_csi_config(), the total bytes of CSI data will be fewer than that in the table. For example, if LLTF and HT-LTF is not enabled and STBC-HT-LTF is enabled, when a packet is received with the condition above/HT/40MHz/STBC, the total bytes of CSI data is 244 ((61 + 60) * 2 + 2 = 244, the result is aligned to four bytes and the last two bytes is invalid).

### 4.35.22 Wi-Fi Channel State Information Configure

To use Wi-Fi CSI, the following steps need to be done.
• Select Wi-Fi CSI in menuconfig. It is “Menuconfig -> Components config -> Wi-Fi -> WiFi CSI(Channel State Information)”.
• Set CSI receiving callback function by calling API `esp_wifi_set_csi_rx_cb()`.
• Configure CSI by calling API `esp_wifi_set_csi_config()`.
• Enable CSI by calling API `esp_wifi_set_csi()`.

The CSI receiving callback function runs from Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task. Because station does not receive any packet when it is disconnected and only receives packets from AP when it is connected, it is suggested to enable sniffer mode to receive more CSI data by calling `esp_wifi_set_promiscuous()`.

4.35.23 Wi-Fi HT20/40

ESP32 supports Wi-Fi bandwidth HT20 or HT40, it doesn’t support HT20/40 coexist. `esp_wifi_set_bandwidth()` can be used to change the default bandwidth of station or AP. The default bandwidth for ESP32 station and AP is HT40.

In station mode, the actual bandwidth is firstly negotiated during the Wi-Fi connection. It is HT40 only if both the station and the connected AP support HT40, otherwise it’s HT20. If the bandwidth of connected AP is changes, the actual bandwidth is negotiated again without Wi-Fi disconnecting.

Similarly, in AP mode, the actual bandwidth is negotiated between AP and the stations that connect to the AP. It’s HT40 if the AP and one of the stations support HT40, otherwise it’s HT20.

In station/AP coexist mode, the station/AP can configure HT20/40 seperately. If both station and AP are negotiated to HT40, the HT40 channel should be the channel of station because the station always has higher priority than AP in ESP32. E.g. the configured bandwidth of AP is HT40, the configured primary channel is 6 and the configured secondary channel is 10. The station is connected to an router whose primary channel is 6 and secondary channel is 2, then the actual channel of AP is changed to primary 6 and secondary 2 automatically.

Theoretically the HT40 can gain better throughput because the maximum raw physical (PHY) data rate for HT40 is 150Mbps while it’s 72Mbps for HT20. However, if the device is used in some special environment, e.g. there are too many other Wi-Fi devices around the ESP32 device, the performance of HT40 may be degraded. So if the applications need to support same or similar scenarios, it’s recommended that the bandwidth is always configured to HT20.

4.35.24 Wi-Fi QoS

ESP32 supports all the mandatory features required in WFA Wi-Fi QoS Certification.

Four ACs (Access Category) are defined in Wi-Fi specification, each AC has its own priority to access the Wi-Fi channel. Moreover a map rule is defined to map the QoS priority of other protocol, such as 802.11D or TCP/IP precedence to Wi-Fi AC.

Below is a table describes how the IP Precedences are mapped to Wi-Fi ACs in ESP32, it also indicates whether the AMPDU is supported for this AC. The table is sorted with priority descending order, namely, the AC_VO has highest priority.

<table>
<thead>
<tr>
<th>IP Precedence</th>
<th>Wi-Fi AC</th>
<th>Support AMPDU?</th>
</tr>
</thead>
<tbody>
<tr>
<td>6, 7</td>
<td>AC_VO (Voice)</td>
<td>No</td>
</tr>
<tr>
<td>4, 5</td>
<td>AC_VI (Video)</td>
<td>Yes</td>
</tr>
<tr>
<td>3, 0</td>
<td>AC_BE (Best Effort)</td>
<td>Yes</td>
</tr>
<tr>
<td>1, 2</td>
<td>AC_BK (Background)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The application can make use of the QoS feature by configuring the IP precedence via socket option `IP_TOS`. Here is an example to make the socket to use VI queue:
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));

Theoretically the higher priority AC has better performance than the low priority AC, however, it’s not always be true, here are some suggestions about how to use the Wi-Fi QoS:

- For some really important application traffic, can put it into AC_VO queue. Avoid sending big traffic via AC_VO queue. On one hand, the AC_VO queue doesn’t support AMPDU and it can’t get better performance than other queue if the traffic is big, on the other hand, it may impact the the management frames that also use AC_VO queue.
- Avoid using more than two different AMPDU supported precedences, e.g. socket A uses precedence 0, socket B uses precedence 1, socket C uses precedence 2, this is a bad design because it may need much more memory. To be detailed, the Wi-Fi driver may generate a Block Ack session for each precedence and it needs more memory if the Block Ack session is setup.

### 4.35.25 Wi-Fi AMSDU

ESP32 supports receiving and transmitting AMSDU.

### 4.35.26 Wi-Fi Fragment

supports Wi-Fi receiving fragment, but doesn’t support Wi-Fi transmitting fragment.

### 4.35.27 WPS Enrollee

ESP32 supports WPS enrollee feature in Wi-Fi mode WIFI_MODE_STA or WIFI_MODE_APSTA. Currently ESP32 supports WPS enrollee type PBC and PIN.

### 4.35.28 Wi-Fi Buffer Usage

This section is only about the dynamic buffer configuration.

**Why Buffer Configuration Is Important**

In order to get a high-performance system, we need to consider the memory usage/configuration very carefully, because:

- the available memory in ESP32 is limited.
- currently, the default type of buffer in LwIP and Wi-Fi drivers is “dynamic”, which means that both the LwIP and Wi-Fi share memory with the application. Programmers should always keep this in mind; otherwise, they will face a memory issue, such as “running out of heap memory”.
- it is very dangerous to run out of heap memory, as this will cause ESP32 an “undefined behavior”. Thus, enough heap memory should be reserved for the application, so that it never runs out of it.
- the Wi-Fi throughput heavily depends on memory-related configurations, such as the TCP window size, Wi-Fi RX/TX dynamic buffer number, etc.
- the peak heap memory that the ESP32 LwIP/Wi-Fi may consume depends on a number of factors, such as the maximum TCP/UDP connections that the application may have, etc.
- the total memory that the application requires is also an important factor when considering memory configuration.

Due to these reasons, there is not a good-for-all application configuration. Rather, we have to consider memory configurations separately for every different application.
Dynamic vs. Static Buffer

The default type of buffer in Wi-Fi drivers is “dynamic”. Most of the time the dynamic buffer can significantly save memory. However, it makes the application programming a little more difficult, because in this case the application needs to consider memory usage in Wi-Fi.

lwIP also allocates buffers at the TCP/IP layer, and this buffer allocation is also dynamic. See lwIP documentation section about memory use and performance.

Peak Wi-Fi Dynamic Buffer

The Wi-Fi driver supports several types of buffer (refer to Wi-Fi Buffer Configure). However, this section is about the usage of the dynamic Wi-Fi buffer only. The peak heap memory that Wi-Fi consumes is the theoretically-maximum memory that the Wi-Fi driver consumes. Generally, the peak memory depends on:

- the number of dynamic rx buffers that are configured: wifi_rx_dynamic_buf_num
- the number of dynamic tx buffers that are configured: wifi_tx_dynamic_buf_num
- the maximum packet size that the Wi-Fi driver can receive: wifi_rx_pkt_size_max
- the maximum packet size that the Wi-Fi driver can send: wifi_tx_pkt_size_max

So, the peak memory that the Wi-Fi driver consumes can be calculated with the following formula:

\[
\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} \times \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} \times \text{wifi\_tx\_pkt\_size\_max})
\]

Generally, we do not need to care about the dynamic tx long buffers and dynamic tx long long buffers, because they are management frames which only have a small impact on the system.

4.35.29 How to improve Wi-Fi performance

The performance of ESP32 Wi-Fi is affected by many parameters, and there are mutual constraints between each parameter. A proper configuration can not only improve performance but also increase available memory for applications and improve stability.

In this section, we will briefly explain the operating mode of the Wi-Fi/LWIP protocol stack and explain the role of each parameter. We will give several recommended configuration ranks, user can choose the appropriate rank according to the usage scenario.

Protocol stack operation mode

![Fig. 61: ESP32 datapath](image)
The ESP32 protocol stack is divided into four layers: Application, LWIP, Wi-Fi, and Hardware.

- During receiving, hardware puts the received packet into DMA buffer, and then transfers it into the RX buffer of Wi-Fi, LWIP in turn for related protocol processing, and finally to the application layer. The Wi-Fi RX buffer and the LWIP RX buffer shares the same buffer by default. In other words, the Wi-Fi forwards the packet to LWIP by reference by default.
- During sending, the application copies the messages to be sent into the TX buffer of the LWIP layer for TCP/IP encapsulation. The messages will then be passed to the TX buffer of the Wi-Fi layer for MAC encapsulation and wait to be sent.

**Parameters**

Increasing the size or number of the buffers mentioned above properly can improve Wi-Fi performance. Meanwhile, it will reduce available memory to the application. The following is an introduction to the parameters that users need to configure:

**RX direction:**

- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` This parameter indicates the number of DMA buffer at the hardware layer. Increasing this parameter will increase the sender’s one-time receiving throughput, thereby improving the Wi-Fi protocol stack ability to handle burst traffic.
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM` This parameter indicates the number of RX buffer in the Wi-Fi layer. Increasing this parameter will improve the performance of packet reception. This parameter needs to match the RX buffer size of the LWIP layer.
- `CONFIG_ESP32_WIFI_RX_BA_WIN` This parameter indicates the size of the AMPDU BA Window at the receiving end. This parameter should be configured to the smaller value between twice of `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` and `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`.
- `CONFIG_LWIP_TCP_WND_DEFAULT` This parameter represents the RX buffer size of the LWIP layer for each TCP stream. Its value should be configured to the value of `WIFI_DYNAMIC_RX_BUFFER_NUM(KB)` to reach a high and stable performance. Meanwhile, in case of multiple streams, this value needs to be reduced proportionally.

**TX direction:**

- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` This parameter indicates the type of TX buffer, it is recommended to configure it as a dynamic buffer, which can make full use of memory.
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM` This parameter indicates the number of TX buffer on the Wi-Fi layer. Increasing this parameter will improve the performance of packet sending. The parameter value needs to match the TX buffer size of the LWIP layer.
- `CONFIG_LWIP_TCP_SND_BUF_DEFAULT` This parameter represents the TX buffer size of the LWIP layer for each TCP stream. Its value should be configured to the value of `WIFI_DYNAMIC_TX_BUFFER_NUM(KB)` to reach a high and stable performance. In case of multiple streams, this value needs to be reduced proportionally.

**Throughput optimization by placing code in IRAM:**

- `CONFIG_ESP32_WIFI_IRAM_OPT` If this option is enabled, some Wi-Fi functions are moved to IRAM, improving throughput. This increases IRAM usage by 15 kB.
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT` If this option is enabled, some Wi-Fi RX functions are moved to IRAM, improving throughput. This increases IRAM usage by 16 kB.
- `CONFIG_LWIP_IRAM_OPTIMIZATION` If this option is enabled, some LWIP functions are moved to IRAM, improving throughput. This increases IRAM usage by 13 kB.

**Note:** The buffer size mentioned above is fixed as 1.6 KB.
Chapter 4. API Guides

How to configure parameters

ESP32’s memory is shared by protocol stack and applications.

Here, we have given several configuration ranks. In most cases, the user should select a suitable rank for parameter configuration according to the size of the memory occupied by the application.

The parameters not mentioned in the following table should be set to the default.

<table>
<thead>
<tr>
<th>Rank</th>
<th>Iperf prior</th>
<th>TX prior</th>
<th>High-performance</th>
<th>RX prior</th>
<th>Default</th>
<th>Memory saving</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available memory(KB)</td>
<td>37.1</td>
<td>113.8</td>
<td>123.3</td>
<td>145.5</td>
<td>144.5</td>
<td>170.2</td>
<td>185.2</td>
</tr>
<tr>
<td>WIFI_STATIC_RX_BUFFER_NUM</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>4</td>
</tr>
<tr>
<td>WIFI_DYNAMIC_RX_BUFFER_NUM</td>
<td>24</td>
<td>34</td>
<td>20</td>
<td>12</td>
<td>8</td>
<td>8</td>
<td>8</td>
</tr>
<tr>
<td>WIFI_DYNAMIC_TX_BUFFER_NUM</td>
<td>24</td>
<td>18</td>
<td>20</td>
<td>12</td>
<td>8</td>
<td>8</td>
<td>8</td>
</tr>
<tr>
<td>WIFI_RX_BA_WIN</td>
<td>32</td>
<td>8</td>
<td>12</td>
<td>12</td>

<td>8</td>
<td>8</td>
</tr>
<tr>
<td>WIFI_IRAM_OPT</td>
<td>15</td>
<td>15</td>
<td>15</td>
<td>15</td>
<td>15</td>
<td>15</td>
<td>15</td>
</tr>
<tr>
<td>WIFI_RX_IRAM_OPT</td>
<td>16</td>
<td>16</td>
<td>16</td>
<td>16</td>
<td>16</td>
<td>16</td>
<td>16</td>
</tr>
<tr>
<td>LWIP_IRAM_OPTIMIZATION</td>
<td>13</td>
<td>13</td>
<td>13</td>
<td>13</td>
<td>13</td>
<td>13</td>
<td>13</td>
</tr>
<tr>
<td>TCP TX throughput (Mbit/s)</td>
<td>74.6</td>
<td>50.8</td>
<td>46.5</td>
<td>39.9</td>
<td>44.2</td>
<td>33.8</td>
<td>25.6</td>
</tr>
<tr>
<td>TCP RX throughput (Mbit/s)</td>
<td>63.6</td>
<td>35.5</td>
<td>42.3</td>
<td>48.5</td>
<td>40.5</td>
<td>30.1</td>
<td>27.8</td>
</tr>
<tr>
<td>UDP TX throughput (Mbit/s)</td>
<td>76.2</td>
<td>75.1</td>
<td>74.1</td>
<td>72.4</td>
<td>69.6</td>
<td>64.1</td>
<td>36.5</td>
</tr>
<tr>
<td>UDP RX throughput (Mbit/s)</td>
<td>83.1</td>
<td>66.3</td>
<td>75.1</td>
<td>75.6</td>
<td>73.1</td>
<td>65.3</td>
<td>54.7</td>
</tr>
</tbody>
</table>

**Note:** The result is tested with a single stream in a shielded box using an ASUS RT-N66U router. ESP32’s CPU is dual core with 240 MHz, ESP32’s flash is in QIO mode with 80 MHz.

**Ranks:**

- **Iperf rank** ESP32 extreme performance rank used to test extreme performance.
- **High-performance rank** The ESP32’s high-performance configuration rank, suitable for scenarios that the application occupies less memory and has high-performance requirements. In this rank, users can choose to use the RX prior rank or the TX prior rank according to the usage scenario.
- **Default rank** ESP32’s default configuration rank, the available memory, and performance are in balance.
- **Memory saving rank** This rank is suitable for scenarios where the application requires a large amount of memory, and the transceiver performance will be reduced in this rank.
- **Minimum rank** This is the minimum configuration rank of ESP32. The protocol stack only uses the necessary memory for running. It is suitable for scenarios that have no requirement for performance and the application requires lots of space.

**Using PSRAM**

PSRAM is generally used when the application takes up a lot of memory. In this mode, the `CONFIG_ESP32_WIFI_TX_BUFFER_NUM` is forced to be static. `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` indicates the number of DMA buffers at the hardware layer, increase this parameter can improve performance. The following are the recommended ranks for using PSRAM:
### 4.35.30 Wi-Fi Menuconfig

**Wi-Fi Buffer Configure**

If you are going to modify the default number or type of buffer, it would be helpful to also have an overview of how the buffer is allocated/freed in the data path. The following diagram shows this process in the TX direction:

![TX Buffer Allocation Diagram](image)

**Description:**
- The application allocates the data which needs to be sent out.
- The application calls TCP/IP-/Socket-related APIs to send the user data. These APIs will allocate a PBUF used in LwIP, and make a copy of the user data.
- When LwIP calls a Wi-Fi API to send the PBUF, the Wi-Fi API will allocate a "Dynamic Tx Buffer" or "Static Tx Buffer", make a copy of the LwIP PBUF, and finally send the data.

The following diagram shows how buffer is allocated/freed in the RX direction:

**Description:**
- The Wi-Fi hardware receives a packet over the air and puts the packet content to the "Static Rx Buffer", which is also called "RX DMA Buffer".
- The Wi-Fi driver allocates a "Dynamic Rx Buffer", makes a copy of the "Static Rx Buffer", and returns the "Static Rx Buffer" to hardware.
- The Wi-Fi driver delivers the packet to the upper-layer (LwIP), and allocates a PBUF for holding the "Dynamic Rx Buffer".
- The application receives data from LwIP.

The diagram shows the configuration of the Wi-Fi internal buffer.
# Chapter 4. API Guides

## Fig. 63: RX Buffer Allocation

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Alloc Type</th>
<th>Default</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static RX Buffer (Hardware RX Buffer)</td>
<td>Static</td>
<td>10 * 1600 Bytes</td>
<td>Yes</td>
<td>This is a kind of DMA memory. It is initialized in <code>esp_wifi_init()</code> and freed in <code>esp_wifi_deinit()</code>. The ‘Static Rx Buffer’ forms the hardware receiving list. Upon receiving a frame over the air, hardware writes the frame into the buffer and raises an interrupt to the CPU. Then, the Wi-Fi driver reads the content from the buffer and returns the buffer back to the list. If the application want to reduce the the memory statically allocated by Wi-Fi, they can reduce this value from 10 to 6 to save 6400 Bytes memory. It’s not recommended to reduce the configuration to a value less than 6 unless the AMPDU feature is disabled.</td>
</tr>
<tr>
<td>Dynamic RX Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>Yes</td>
<td>The buffer length is variable and it depends on the received frames’ length. When the Wi-Fi driver receives a frame from the ‘Hardware Rx Buffer’, the ‘Dynamic RX Buffer’ allocated from the heap. The number of the Dynamic Rx Buffer is configured in the menuconfig, which is used to limit the total unfreed Dynamic Rx Buffer number.</td>
</tr>

Release v4.4-dev-2313-gc69f0ec
Wi-Fi NVS Flash

If the Wi-Fi NVS flash is enabled, all Wi-Fi configurations set via the Wi-Fi APIs will be stored into flash, and the Wi-Fi driver will start up with these configurations next time it powers on/reboots. However, the application can choose to disable the Wi-Fi NVS flash if it does not need to store the configurations into persistent memory, or has its own persistent storage, or simply due to debugging reasons, etc.

Wi-Fi AMPDU

ESP32 supports both receiving and transmitting AMPDU, the AMPDU can greatly improve the Wi-Fi throughput. Generally, the AMPDU should be enabled. Disabling AMPDU is usually for debugging purposes.

4.35.31 Troubleshooting

Please refer to a separate document with Espressif Wireshark User Guide.

Espressif Wireshark User Guide

1. Overview

1.1 What is Wireshark?  
Wireshark (originally named “Ethereal”) is a network packet analyzer that captures network packets and displays the packet data as detailed as possible. It uses WinPcap as its interface to directly capture network traffic going through a network interface controller (NIC).

You could think of a network packet analyzer as a measuring device used to examine what is going on inside a network cable, just like a voltmeter is used by an electrician to examine what is going on inside an electric cable.

In the past, such tools were either very expensive, proprietary, or both. However, with the advent of Wireshark, all that has changed.

Wireshark is released under the terms of the GNU General Public License, which means you can use the software and the source code free of charge. It also allows you to modify and customize the source code.

Wireshark is, perhaps, one of the best open source packet analyzers available today.

1.2 Some Intended Purposes  
Here are some examples of how Wireshark is typically used:

- Network administrators use it to troubleshoot network problems.
- Network security engineers use it to examine security problems.
- Developers use it to debug protocol implementations.
- People use it to learn more about network protocol internals.

Besides these examples, Wireshark can be used for many other purposes.

1.3 Features  
The main features of Wireshark are as follows:

- Available for UNIX and Windows
- Captures live packet data from a network interface
- Displays packets along with detailed protocol information
- Opens/saves the captured packet data
- Imports/exports packets into a number of file formats, supported by other capture programs
- Advanced packet filtering
- Searches for packets based on multiple criteria
- Colorizes packets according to display filters
- Calculates statistics
- …and a lot more!
1.4 Wireshark Can or Can’t Do

- **Live capture from different network media.**
  Wireshark can capture traffic from different network media, including wireless LAN.
- **Import files from many other capture programs.**
  Wireshark can import data from a large number of file formats, supported by other capture programs.
- **Export files for many other capture programs.**
  Wireshark can export data into a large number of file formats, supported by other capture programs.
- **Numerous protocol dissectors.**
  Wireshark can dissect, or decode, a large number of protocols.
- **Wireshark is not an intrusion detection system.**
  It will not warn you if there are any suspicious activities on your network. However, if strange things happen, Wireshark might help you figure out what is really going on.
- **Wireshark does not manipulate processes on the network, it can only perform “measurements” within it.**
  Wireshark does not send packets on the network or influence it in any other way, except for resolving names (converting numerical address values into a human readable format), but even that can be disabled.

2. Where to Get Wireshark

You can get Wireshark from the official website: [https://www.wireshark.org/download.html](https://www.wireshark.org/download.html)

Wireshark can run on various operating systems. Please download the correct version according to the operating system you are using.

- **This demonstration uses Wireshark 2.2.6 on Linux.**
- **a) Start Wireshark**

On Linux, you can run the shell script provided below. It starts Wireshark, then configures NIC and the channel for packet capture.

```bash
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

In the above script, the parameter $1 represents NIC and $2 represents channel. For example, wlan0 in `./xxx.sh wlan0 6`, specifies the NIC for packet capture, and 6 identifies the channel of an AP or Soft-AP.

- **b) Run the Shell Script to Open Wireshark and Display Capture Interface**

![Fig. 64: Wireshark Capture Interface](image)

```text
Welcome to Wireshark
Capture
... using this filter: [ ] Enter a capture filter ...

- en0
- wlan0
- eth0
- burly: bluefox
- nhf
- nhf
- udde
- udde
- uddc
- fco remote capture: cosco
- random packet generation: randpkt
- SSH remote capture: ssh
```

Espressif Systems 2027 Release v4.4-dev-2313-gc69f0ecc
c) Select the Interface to Start Packet Capture

As the red markup shows in the picture above, many interfaces are available. The first one is a local NIC and the second one is a wireless NIC.

Please select the NIC according to your requirements. This document will use the wireless NIC to demonstrate packet capture.

Double click wlan0 to start packet capture.

d) Set up Filters

Since all packets in the channel will be captured, and many of them are not needed, you have to set up filters to get the packets that you need.

Please find the picture below with the red markup, indicating where the filters should be set up.

![Fig. 65: Setting up Filters in Wireshark](image)

Click Filter, the top left blue button in the picture below. The *display filter* dialogue box will appear.

![Fig. 66: Display Filter Dialogue Box](image)

Click the Expression button to bring up the *Filter Expression* dialogue box and set the filter according to your requirements.

**The quickest way**: enter the filters directly in the toolbar.

Click on this area to enter or modify the filters. If you enter a wrong or unfinished filter, the built-in syntax check turns the background red. As soon as the correct expression is entered, the background becomes green.

The previously entered filters are automatically saved. You can access them anytime by opening the drop down list.

For example, as shown in the picture below, enter two MAC addresses as the filters and click Apply (the blue arrow). In this case, only the packet data transmitted between these two MAC addresses will be captured.

Release v4.4-dev-2313-gc69f0ec

Submit Document Feedback
e) Packet List

You can click any packet in the packet list and check the detailed information about it in the box below the list. For example, if you click the first packet, its details will appear in that box.

![Example of Packet List Details](image1)

f) Stop/Start Packet Capture

As shown in the picture below, click the red button to stop capturing the current packet.

![Stopping Packet Capture](image2)

Click the top left blue button to start or resume packet capture.

g) Save the Current Packet

On Linux, go to File -> Export Packet Dissections -> As Plain Text File to save the packet.

Please note that All packets, Displayed and All expanded must be selected.

By default, Wireshark saves the captured packet in a libpcap file. You can also save the file in other formats, e.g. txt, to analyze it in other tools.

Chapter 5

Libraries and Frameworks

5.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks’ agents and examples:

5.1.1 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32 based on Amazon Web Services’ aws-iot-device-sdk-embedded-C.

5.1.2 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32 based on Microsoft Azure’s azure-iot-sdk-c SDK.

5.1.3 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32 based on Google’s iot-device-sdk-embedded-c SDK.

5.1.4 Aliyun IoT

https://github.com/espressif/esp-aliyun is an open source repository for ESP32 based on Aliyun’s iotkit-embedded SDK.

5.1.5 Joylink IoT

https://github.com/espressif/esp-joylink is an open source repository for ESP32 based on Joylink’s joylink_dev_sdk SDK.

5.1.6 Tencent IoT

https://github.com/espressif/esp-welink is an open source repository for ESP32 based on Tencent’s welink SDK.
5.1.7 Tencentyun IoT

https://github.com/espressif/esp-qcloud is an open source repository for ESP32 based on Tencentyun’s qcloud-iot-sdk-embedded-c SDK.

5.1.8 Baidu IoT

https://github.com/espressif/esp-baidu-iot is an open source repository for ESP32 based on Baidu’s iot-sdk-c SDK.
Chapter 6

Contributions Guide

We welcome contributions to the esp-idf project!

6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

• Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
• Does any new code conform to the esp-idf Style Guide?
• Have you installed the pre-commit hook for esp-idf project?
• Does the code documentation follow requirements in Documenting Code?
• Is the code adequately commented for people to understand how it is structured?
• Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
• Are comments and documentation written in clear English, with no spelling or grammar errors?
• Example contributions are also welcome. Please check the Creating Examples guide for these.
• If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” squashed into previous commits?
• If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself. Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.
6.4 Legal Part

Before a contribution can be accepted, you will need to sign our Contributor Agreement. You will be prompted for this automatically as part of the Pull Request process.

6.5 Related Documents

6.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared static.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie esp_vfs_register() or esp_console_run(). Starting the prefix with esp_ for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with s_ for easy identification. For example, static bool s_invert.
- Avoid unnecessary abbreviations (ie shortening data to dat), unless the resulting name would otherwise be very long.

Indentation

Use 4 spaces for each indentation level. Don’t use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space

Place one empty line between functions. Don’t begin or end a function with an empty line.

```c
void function1()
{
    do_one_thing();
    do_another_thing();
    // INCORRECT, don't place empty line here
}

void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

(continues on next page)
The maximum line length is 120 characters as long as it doesn’t seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```c
if (condition) {    // correct
    // ...
}
switch (n) {        // correct
    case 0:
        // ...
}
for (int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```c
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct
const int y = y0 + (x - x0)* (y1 - y0)/(x1 - x0);    // also okay
int y_cur = -y;
++y_cur;
const int y = y0+(x-x0)* (y1-y0)/(x1-x0);    // INCORRECT
```

No space is necessary around . and -> operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```c
esp_rom_gpio_connect_in_signal(PIN_CAM_D6, I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7, I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. PIN_CAM_VSYNC), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

**Braces**

- Function definition should have a brace on a separate line:

```c
// This is correct:
void function(int arg)
{
}
```
• Within a function, place opening brace on the same line with conditional and loop statements:

```c
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

• Don’t use single comments to disable some functionality:

```c
void init_something()
{
    setup_dma();
    // load_resources(); // WHY is this thing commented, asks the reader? 
    start_timer();
}
```

• If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```c
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated yet. 
    // load_resources();
    start_timer();
}
```

• Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don’t use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.

• Don’t add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```c
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01 
    init_dma_list();
    fill_dma_item(0);
    // end XXX add 
    start_timer();
}
```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. [Github has a document about setting this option](https://github-line-endings). However
because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs --dos2unix &
& git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it’s possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code** You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don’t re-format the code you didn’t change. This will help others when they review your changes.

To re-format a file, run:

```
工具/format.sh components/my_component/file.c
```

**Type Definitions** Should be snake_case, ending with _t suffix:

```c
typedef int signed_32_bit_t;
```

**Enum** Enums should be defined through the `typedef` and be namespaced:

```c
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

**Assertions** The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns false or 0 will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it’s not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

**Note:** When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` macro instead of an `assert()`.

It’s possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It’s also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:
int res = do_something();
assert(res == 0);

Once the assert is optimized out, the res value is unused and the compiler will warn about this. However the function do_something() must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to void on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

int res = do_something();
assert(res == 0);
(void)res;

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute __attribute__((unused)). The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

int res __attribute__((unused));
res = do_something();
assert(res == 0);
res = do_something_else();
assert(res != 0);

Header file guards

All public facing header files should have preprocessor guards. A pragma is preferred:

#pragma once

over the following pattern:

#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H

In addition to guard macros, all C header files should have extern "C" guards to allow the header to be used from C++ code. Note that the following order should be used: pragma once, then any #include statements, then extern "C" guards:

#pragma once
#include <stdint.h>

#ifdef _cplusplus
extern "C" { 
#endif
/* declarations go here */
#endif /*_cplusplus */

Include statements

When writing #include statements, try to maintain the following order:
• C standard library headers.
• Other POSIX standard headers and common extensions to them (such as sys/queue.h.)
• Common IDF headers (esp_log.h, esp_system.h, esp_timer.h, esp_sleep.h, etc.)
• Headers of other components, such as FreeRTOS.
• Public headers of the current component.
• Private headers.

Use angle brackets for C standard library headers and other POSIX headers (#include <stdio.h>).
Use double quotes for all other headers (#include "esp_log.h").

**C++ Code Formatting**

The same rules as for C apply. Where they are not enough, apply the following rules.

**File Naming**  C++ Header files have the extension .hpp. C++ source files have the extension .cpp. The latter is important for the compiler to distinguish them from normal C source files.

**Naming**

• **Class and struct** names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake_case.
• **Namespaces** shall be in lower snake_case.
• **Templates** are specified in the line above the function declaration.
• Interfaces in terms of Object-Oriented Programming shall be named without the suffix ...Interface. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

**Member Order in Classes**  In order of precedence:

• First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
• First put constructors/destructors, then member functions, then member variables.

For example:

```c++
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```
Spacing

- Don’t indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```c++
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>
namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};
template<typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};
} // namespace spaceships
#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"
namespace spaceships {

    // Putting the curly braces in the same line for constructors is OK if it only...
    // initialises
    // values in the initializer list
    SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

    size_t SpaceShip::get_crew_size() const
    {
        return crew;
    }
    
    // (continues on next page)
```
SpaceShuttle::SpaceShuttle() : SpaceShip(?)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don’t put anything in the optional parentheses after endforeach(), endif(), etc.
- Use lowercase (with underscores) for command, function, and macro names.
- For locally scoped variables, use lowercase (with underscores).
- For globally scoped variables, use uppercase (WITH_UNDERSCORES).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Documenting Code

Please see the guide here: Documenting Code.

Structure

To be written.

Language Features

To be written.

6.5.2 Install pre-commit Hook for ESP-IDF Project

Required Dependency

Python 3.6.1 or above. This is our recommendation python version for IDF developers.

If you still have versions not compatible, please do not install pre-commit hook and update your python versions.
Chapter 6. Contributions Guide

Install pre-commit

Run `pip install pre-commit`

Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you’re running `git commit` command

Uninstall pre-commit

Run `pre-commit uninstall`

What’s More?

For detailed usage, Please refer to the documentation of `pre-commit`.

Common Problems For Windows Users

1. `/usr/bin/env: python: Permission denied.
   If you’re in Git Bash or MSYS terminal, please check the python executable location by run `which python`.
   If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it’s a link to Windows AppStore, not a real one.
   Please install python manually and update this in your `PATH` environment variable.

6.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in `espressif/esp-idf` repository and how to add new documentation.

Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.
Chapter 6. Contributions Guide

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.
4. If function has void input or does not return any value, then skip \texttt{@param} or \texttt{@return}.

5. When documenting a \texttt{define} as well as members of a \texttt{struct} or \texttt{enum}, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like \texttt{@return} in example below).

\begin{verbatim}
\* @return
\* - ESP_OK if erase operation was successful
\end{verbatim}
7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

   ```c
   /@
   /* Example of using nvs_get_i32:
   * int32_t max_buffer_size = 4096; // default value
   * esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
   * assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
   * // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
   * // have its default value.
   * @endcode
   */
   
   The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

   ```c
   @attention
   /* 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
   * 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to... 
   */
   `*
   
   Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /**@{*/ and /** @}*/ mark up commands:

   ```c
   /**@{*}
   /**
   * @brief common description of similar functions
   */
   void first_similar_function (void);
   void second_similar_function (void);
   /** @} />
   ```

   For practical example see nvs_flash/include/nvs.h.

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within /** @cond */ and /** @endcond */ commands. Example of such implementation is provided in driver/include/driver/gpio.h.

5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.
6. Prepare one or more complete code examples together with description. Place description to a separate file README.md in specific folder of examples directory.

**Standardize Document Format**

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don’t break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

   ![Fig. 1: Onelineforoneparagraph(clicktoenlarge)](image1)

   ![Fig. 2: Nolinebreakswithinthesameparagraph(clicktoenlarge)](image2)

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

**Linking Examples**

When linking to examples on GitHub, do not use absolute/hardcoded URLs. Instead, use docutils custom roles that will generate links for you. These auto-generated links point to the tree or blob for the git commit ID (or tag) of the
repository. This is needed to ensure that links do not get broken when files in master branch are moved around or deleted. The roles will transparently handle files that are located in submodules and will link to the submodule’s repository with the correct commit ID.

The following roles are provided:

- :idf:`path` - points to directory inside ESP-IDF
- :idf_file:`path` - points to file inside ESP-IDF
- :idf_raw:`path` - points to raw view of the file inside ESP-IDF
- :component:`path` - points to directory inside ESP-IDF components dir
- :component_file:`path` - points to file inside ESP-IDF components dir
- :component_raw:`path` - points to raw view of the file inside ESP-IDF components dir
- :example:`path` - points to directory inside ESP-IDF examples dir
- :example_file:`path` - points to file inside ESP-IDF examples dir
- :example_raw:`path` - points to raw view of the file inside ESP-IDF examples dir

Example implementation:

```rst
* :example:`get-started/hello_world`
* :example:`Hello World! <get-started/hello_world>`
```

How it renders:

- get-started/hello_world
- Hello World!

A check is added to the CI build script, which searches RST files for presence of hard-coded links (identified by tree/master, blob/master, or raw/master part of the URL). This check can be run manually: cd docs and then make gh-linkcheck.

### Linking Language Versions

Switching between documentation in different languages may be done using :link_to_translation: custom role. The role placed on a page of documentation provides a link to the same page in a language specified as a parameter. Examples below show how to enter links to Chinese and English versions of documentation:

```rst
:link_to_translation:`zh_CN: 中文版`
:link_to_translation:`en:English`
```

The language is specified using standard abbreviations like en or zh_CN. The text after last semicolon is not standardized and may be entered depending on the context where the link is placed, e.g.:
Add Illustrations

Consider adding diagrams and pictures to illustrate described concepts.

Sometimes it is better to add an illustration than writing a lengthy paragraph to describe a complex idea, a data structure or an algorithm. This repository is using blockdiag suite of tools to generate diagram images from simple text files.

The following types of diagrams are supported:

- Block diagram
- Sequence diagram
- Activity diagram
- Logical network diagram

With this suite of tools, it is possible to generate beautiful diagram images from simple text format (similar to graphviz’s DOT format). The diagram elements are laid out automatically. The diagram code is then converted into “.png” graphics and integrated “behind the scenes” into Sphinx documents.

For the diagram preparation, you can use an on-line interactive shell that instantly shows the rendered image.

Below are couple of diagram examples:

- Simple block diagram / blockdiag - Wi-Fi Buffer Configuration
- Slightly more complicated block diagram - Wi-Fi programming model
- Sequence diagram / seqdiag - Scan for a Specific AP in All Channels
- Packet diagram / packetdiag - NVS Page Structure

Try them out by modifying the source code and see the diagram instantly rendering below.

Note: There may be slight differences in rendering of font used by the interactive shell compared to the font used in the esp-idf documentation.

Add Notes

Working on a document, you might need to:

- Place some suggestions on what should be added or modified in future.
- Leave a reminder for yourself or somebody else to follow up.

In this case, add a todo note to your reST file using the directive .. todo::. For example:

```rst
.. todo::
   
   Add a package diagram.
```

If you add .. todolist:: to a reST file, the directive will be replaced by a list of all todo notes from the whole documentation.

By default, the directives .. todo:: and .. todolist:: are ignored by documentation builders. If you want the notes and the list of notes to be visible in your locally built documentation, do the following:

1. Open your local conf_common.py file.
2. Find the parameter todo_include_todos.
3. Change its value from False to True.

Before pushing your changes to origin, please set the value of todo_include_todos back to False.

For more details about the extension, see sphinx.ext.todo documentation.
Chapter 6. Contributions Guide

Writing generic documentation for multiple chips

The documentation for all of Espressif’s chips is built from the same files. To facilitate the writing of documents that can be re-used for multiple different chips (called below “targets”), we provide you with the following functionality:

Exclusion of content based on chip-target Occasionally there will be content that is only relevant for one of targets. When this is the case, you can exclude that content by using the ‘.. only:: TAG’ directive, where you replace ‘TAG’ with one of the following names:

Chip name:
- esp32
- esp32s2
- esp32c3

Define identifiers from ‘sdkconfig.h’, generated by the default menuconfig settings for the target, e.g:
- CONFIG_FREERTOS_UNICORE

Define identifiers from the soc ‘*_caps’ headers, e.g:
- SOC_BT_SUPPORTED
- SOC_CAN_SUPPORTED

Example:
```
.. only:: esp32

ESP32 specific content.
```

This directive also supports the boolean operators ‘and’, ‘or’ and ‘not’. Example:
```
.. only:: SOC_BT_SUPPORTED and CONFIG_FREERTOS_UNICORE

BT specific content only relevant for single-core targets.
```

This functionality is provided by the Sphinx selective exclude extension.

A weakness in this extension is that it does not correctly handle the case where you exclude a section, that is directly followed by a labeled new section. In these cases everything will render correctly, but the label will not correctly link to the section that follows. A temporary work-around for the cases where this can’t be avoided is the following:
```
.. only:: esp32

   .. _section_1_label:

   Section 1
   ^^^^^^^^^

   Section one content

   .. _section_2_label:

   .. only:: not esp32

   .. _section_2_label:

Section 2
^^^^^^^^

Section 2 content
```

The :TAG: role is used for excluding content from a table of content tree. For example:
When building the documents, Sphinx will use the above mentioned directive and role to include or exclude content based on the target tag it was called with.

**Note:** If excluding an entire document from the toctree based on targets, it’s necessary to also update the exclude_patterns list in docs/conf_common.py to exclude the file for other targets, or a Sphinx warning “WARNING: document isn’t included in any toctree” will be generated.

The recommended way of doing it is adding the document to one of the list that gets included in conditional_include_dict in docs/conf_common.py, e.g. a document which should only be shown for BT capable targets should be added to BT_DOCS, docs/idf_extensions/exclude_docs.py will then take care of adding it to exclude_patterns if the corresponding tag is not set.

If you need to exclude content inside a list or bullet points, then this should be done by using the `{TAG}` role inside the `.. list::` directive.

**Substitution macros** When you need to refer to the chip’s name, toolchain name, path or other common names that depend on the target type you can consider using the substitution macros supplied by docs/idf_extensions/format_idf_target.py.

For example, the following reStructuredText content:

```
This is a {IDF_TARGET_NAME}, with /{IDF_TARGET_PATH_NAME}/soc.c, compiled with
{IDF_TARGET_TOOLCHAIN_PREFIX}-gcc with CONFIG_{IDF_TARGET_CFG_PREFIX}_MULTI_DOC
```

Would render in the documentation as:

```
This is a ESP32, with /esp32/soc.c, compiled with xtensa-esp32-elf-gcc with
CONFIG_ESP32_MULTI_DOC.
```

This extension also supports markup for defining local (within a single source file) substitutions. Place a definition like the following into a single line of the RST file:

```
{IDF_TARGET_SUFFIX:default="DEFAULT_VALUE", esp32="ESP32_VALUE", esp32s2="ESP32S2_VALUE", esp32c3="ESP32C3_VALUE"}
```

This will define a target-dependent substitution of the tag {IDF_TARGET_SUFFIX} in the current RST file. For example:

```
{IDF_TARGET_TX_PIN:default="IO3", esp32="IO4", esp32s2="IO5", esp32c3="IO6"}
```

Will define a substitution for the tag {IDF_TARGET_TX_PIN}, which would be replaced by the text IO5 if sphinx was called with the tag esp32s2.

**Note:** These single-file definitions can be placed anywhere in the .rst file (on their own line), but the name of the directive must start with IDF_TARGET_.

---

Espressif Systems 2052
Submit Document Feedback

Release v4.4-dev-2313-gc69f0ec
Put it all together

Once documentation is ready, follow instruction in *API Documentation Template* and create a single file, that will merge all individual pieces of prepared documentation. Finally add a link to this file to respective .. toctree:: in index.rst file located in /docs folder or subfolders.

OK, but I am new to Sphinx!

1. No worries. All the software you need is well documented. It is also open source and free. Start by checking Sphinx documentation. If you are not clear how to write using rst markup language, see reStructuredText Primer. You can also use markdown (.md) files, and find out more about the specific markdown syntax that we use on Recommonmark parser’s documentation page.

2. Check the source files of this documentation to understand what is behind of what you see now on the screen. Sources are maintained on GitHub in espressif/esp-idf repository in docs folder. You can go directly to the source file of this page by scrolling up and clicking the link in the top right corner. When on GitHub, see what’s really inside, open source files by clicking Raw button.

3. You will likely want to see how documentation builds and looks like before posting it on the GitHub. There are two options to do so:
   - Install Sphinx, Breathe, Blockdiag and Doxygen to build it locally, see chapter below.
   - Set up an account on Read the Docs and build documentation in the cloud. Read the Docs provides document building and hosting for free and their service works really quick and great.

4. To preview documentation before building, use Sublime Text editor together with OmniMarkupPreviewer plugin.

Setup for building documentation locally

Install Dependencies You can setup environment to build documentation locally on your PC by installing:

1. Doxygen - http://doxygen.nl/

The package “sphinx_idf_theme” is added to have the same “look and feel” of ESP-IDF Programming Guide. Do not worry about being confronted with several packages to install. Besides Doxygen, all remaining packages are written in pure Python. Therefore installation of all of them is combined into one simple step.

**Important:** Docs building now supports Python 3 only. Python 2 installations will not work.

Doxygen Installation of Doxygen is OS dependent:

**Linux**

```bash
sudo apt-get install doxygen
```

**Windows** - install in MSYS2 console

```bash
pacman -S doxygen
```

**MacOS**

```bash
brew install doxygen
```
Chapter 6. Contributions Guide

**Note:** If you are installing on Windows MSYS2 system (Linux and MacOS users should skip this note, Windows users who don’t use MSYS2 will need to find other alternatives), **before** going further, execute two extra steps below. These steps are required to install dependencies of “blockdiag” discussed under *Add Illustrations*.

1. Update all the system packages:
   ```
   $ pacman -Syu
   ```
   This process will likely require restarting of the MSYS2 MINGW32 console and repeating above commands, until update is complete.

2. Install pillow, that is one of dependences of the blockdiag:
   ```
   $ pacman -S mingw32/mingw-w64-i686-python-pillow
   ```
   Check the log on the screen that mingw-w64-i686-python-pillow-4.3.0-1 or newer is installed. Previous versions of pillow will not work.

A downside of Windows installation is that fonts of the blockdiag pictures <add-illustrations> do not render correctly, you will see some random characters instead. Until this issue is fixed, you can use the interactive shell to see how the complete picture looks like.

### Remaining applications
All remaining applications are Python packages and you can install them in one step as follows:

```
cd ~/esp/esp-idf/docs
pip install --user -r requirements.txt
```

**Note:** Installation steps assume that ESP-IDF is placed in ~/esp/esp-idf directory, that is default location of ESP-IDF used in documentation.

### Building Documentation
```
cd ~/esp/esp-idf/docs

./build_docs.py build
```

This will build docs for all supported ESP-IDF languages & targets. This can take some time, although jobs will run in parallel up to the number of CPU cores you have (can modify this with the --sphinx-parallel-builds option, see ./build_docs.py --help for details).

To build for a single language and target combination only:
```
./build_docs.py -l en -t esp32 build
```

Choices for language (-l) are en and zh_CN. Choices for target (-t) are any supported ESP-IDF build system target (for example esp32 and esp32s2).

Build documentation will be placed in _build/<language>/<target>/html folder. To see it, open the index.html inside this directory in a web browser.

**Building a subset of the documentation** Since building the full documentation can be quite slow, it might be useful to just build just the subset of the documentation you are interested in.

This can be achieved by listing the document you want to build:
Chapter 6. Contributions Guide

Building multiple documents is also possible:

```
./build_docs.py -l en -t esp32 -i api-reference/peripherals/can.rst build
```

As well as wildcards:

```
./build_docs.py -l en -t esp32 -i api-reference/peripherals/* build
```

Note that this is a feature intended to simply testing and debugging during writing of documentation. The HTML output won’t be perfect, i.e. it will not build a proper index that lists all the documents, and any references to documents that are not built will result in warnings.

**Fast build** Another trick to speed up building is to skip including doxygen generated API documentation into the Sphinx build process, skipping this drastically reduces build time.

This can be achieved by adding the fast-build argument:

```
./build_docs.py build -f
```

or by setting the environment variable `DOCS_FAST_BUILD`. Note that the the `-f` argument is a subargument to `build` and thus must be listed after `build`.

**Building PDF** It is also possible to build latex files and a PDF of the documentation using `build_docs.py`. To do this the following Latex packages are required to be installed:

- latexmk
- texlive-latex-recommended
- texlive-fonts-recommended
- texlive-xetex

The following fonts are also required to be installed:

- Freefont Serif, Sans and Mono OpenType fonts, available as the package `fonts-freefont-otf` on Ubuntu
- Lmodern, available as the package `fonts-lmodern` on Ubuntu
- Fandol, can be downloaded from here

Now you can build the PDF for a target by invoking:

```
./build_docs.py -bs latex -l en -t esp32 build
```

Or alternatively build both html and PDF:

```
./build_docs.py -bs html latex -l en -t esp32 build
```

Latex files and the PDF will be placed in `_build/<language>/<target>/latex` folder.

**Wrap up**

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

6.5.4 Documentation Add-ons and Extensions Reference

This documentation is created using Sphinx application that renders text source files in reStructuredText (.rst) format located in docs directory. For some more details on that process, please refer to section Documenting Code.

Besides Sphinx, there are several other applications that help to provide nicely formatted and easy to navigate documentation. These applications are listed in section Setup for building documentation locally with the installed version numbers provided in file docs/requirements.txt.

We build ESP-IDF documentation for two languages (English, Simplified Chinese) and for multiple chips. Therefore we don’t run sphinx directly, there is a wrapper Python program build_docs.py that runs Sphinx.

On top of that, we have created a couple of custom add-ons and extensions to help integrate documentation with underlining ESP-IDF repository and further improve navigation as well as maintenance of documentation.

The purpose of this section is to provide a quick reference to the add-ons and the extensions.

Documentation Folder Structure

- The ESP-IDF repository contains a dedicated documentation folder docs in the root.
- The docs folder contains localized documentation in docs/en (English) and docs/zh_CN (simplified Chinese) subfolders.
- Graphics files and fonts common to localized documentation are contained in docs/_static subfolder.
- Remaining files in the root of docs as well as docs/en and docs/zh_CN provide configuration and scripts used to automate documentation processing including the add-ons and extensions.
- Sphinx extensions are provided in two directories, extensions and idf_extensions.
- A _build directory is created in the docs folder by build_docs.py. This directory is not added to the ESP-IDF repository.

Add-ons and Extensions Reference

Config Files

docs/conf_common.py This file contains configuration common to each localized documentation (e.g. English, Chinese). The contents of this file is imported to standard Sphinx configuration file conf.py located in respective language folders (e.g. docs/en, docs/zh_CN) during build for each language.

docs/sphinx-known-warnings.txt There are couple of spurious Sphinx warnings that cannot be resolved without doing update to the Sphinx source code itself. For such specific cases, respective warnings are documented in sphinx-known-warnings.txt file, that is checked during documentation build, to ignore the spurious warnings.

Scripts docs/build_docs.py

Top-level executable program which runs a Sphinx build for one or more language/target combinations. Run build_docs.py --help for full command line options.

When build_docs.py runs Sphinx it sets the idf_target configuration variable, sets a Sphinx tag with the same name as the configuration variable, and uses some environment variables to communicate paths to IDF-Specific Extensions.

docs/check_lang_folder_sync.sh To reduce potential discrepancies when maintaining concurrent language version, the structure and filenames of language folders docs/en and docs/zh_CN folders should be kept identical. The script check_lang_folder_sync.sh is run on each documentation build to verify if this condition is met.
**Non-Docs Scripts**  These scripts are used to build docs but also used for other purposes:

- **tools/gen_esp_err_to_name.py** This script is traversing the ESP-IDF directory structure looking for error codes and messages in source code header files to generate an .inc file to include in documentation under Error Codes Reference.

- **tools/kconfig_new/confgen.py** Options to configure ESP-IDF’s components are contained in Kconfig files located inside directories of individual components, e.g. components/bt/Kconfig. This script is traversing the component directories to collect configuration options and generate an .inc file to include in documentation under Configuration Options Reference.

**Generic Extensions**  These are Sphinx extensions developed for IDF that don’t rely on any IDF-docs-specific behaviour or configuration:

- **docs/extensions/toctree_filter.py** Sphinx extensions overrides the :toctree: directive to allow filtering entries based on whether a tag is set, as :tagname: toctree_entry. See the Python file for a more complete description.

- **docs/extensions/list_filter.py** Sphinx extensions that provides a .. list:: directive that allows filtering of entries in lists based on whether a tag is set, as :tagname: - list content. See the Python file for a more complete description.

- **docs/extensions/html_redirects.py** During documentation lifetime, some source files are moved between folders or renamed. This Sphinx extension adds a mechanism to redirect documentation pages that have changed URL by generating in the Sphinx output static HTML redirect pages. The script is used together with a redirection list html_redirect_pages.conf_common.py builds this list from docs/page_redirects.txt.

**Third Party Extensions**

- sphinxcontrib extensions for blockdiag, seqdiag, actdiag, nwdiag, rackdiag & packetdiag diagrams.
- Sphinx selective exclude eager_only extension.

**IDF-Specific Extensions**

**Build System Integration**

- **docs/idf_extensions/build_system/** Python package implementing a Sphinx extension to pull IDF build system information into the docs build.

  - Creates a dummy CMake IDF project and runs CMake to generate metadata.
  - Registers some new configuration variables and emits a new Sphinx event, both for use by other extensions.

**Configuration Variables**

- **docs_root** - The absolute path of the $IDF_PATH/docs directory
- **idf_path** - The value of IDF_PATH variable, or the absolute path of IDF_PATH if environment unset
- **build_dir** - The build directory passed in by build_docs.py, default will be like _build/<lang>/<target>
- **idf_target** - The IDF_TARGET value. Expected that build_docs.py set this on the Sphinx command line
New Event  idf-info event is emitted early in the build, after the dummy project CMake run is complete. Arguments are (app, project_description), where project_description is a dict containing the values parsed from project_description.json in the CMake build directory. Other IDF-specific extensions subscribe to this event and use it to set up some docs parameters based on build system info.

Other Extensions
docs/idf_extensions/include_build_file.py The include-build-file directive is like the built-in include-file directive, but file path is evaluated relative to build_dir.
docs/idf_extensions/kconfig_reference.py Subscribes to idf-info event and uses config to generate kconfig.inc from the components included in the default project build. This file is then included into Project Configuration.
docs/idf_extensions/link_roles.py This is an implementation of a custom Sphinx Roles to help linking from documentation to specific files and folders in ESP-IDF. For description of implemented roles, please see Linking Examples and Linking Language Versions.
docs/idf_extensions/esp_err_definitions.py Small wrapper extension that calls gen_esp_err_to_name.py and updates the included .rst file if it has changed.
docs/idf_extensions/gen_toolchain_links.py There couple of places in documentation that provide links to download the toolchain. To provide one source of this information and reduce effort to manually update several files, this script generates toolchain download links and toolchain unpacking code snippets based on information found in tools/toolchain_versions.mk.
docs/idf_extensions/gen_version_specific_includes.py Another extension to automatically generate reStructuredText .inc snippets with version-based content for this ESP-IDF version.
docs/idf_extensions/util.py A collection of utility functions useful primarily when building documentation locally (see Setup for building documentation locally) to reduce the time to generate documentation on a second and subsequent builds.
docs/idf_extensions/format_idf_target.py An extension for replacing generic target related names with the idf_target passed to the Sphinx command line. This is a {IDF_TARGET_NAME}, with {IDF_TARGET_PATH_NAME}/soc.c, compiled with {IDF_TARGET_TOOLCHAIN PREFIX}-gcc with CONFIG {IDF_TARGET_CFG PREFIX}_MULTI_DOC will, if the backspaces are removed, render as This is a ESP32, with esp32/soc.c, compiled with xtensa-esp32-elf-gcc with CONFIG_ESP32_MULTI_DOC. Also supports markup for defining local (single .rst-file) substitutions with the following syntax: {IDF_TARGET_TX_PIN:default=p IO3,p IO4,p IO5,p} This will define a replacement of the tag [IDF_TARGET_TX_PIN] in the current rst-file. The extension also overrides the default .. include:: directive in order to format any included content using the same rules. These replacements cannot be used inside markup that rely on alignment of characters, e.g. tables.
docs/idf_extensions/latex_builder.py An extension for adding ESP-IDF specific functionality to the latex builder. Overrides the default Sphinx latex builder. Creates and adds the espiff.sty latex package to the output directory, which contains some macros for run-time variables such as IDF-Target.
docs/idf_extensions/gen_defines.py Sphinx extension to integrate defines from IDF into the Sphinx build, runs after the IDF dummy project has been built. Parses defines and adds them as sphinx tags. Emits the new ‘idf-defines-generated’ event which has a dictionary of raw text define values that other extensions can use to generate relevant data.
docs/idf_extensions/exclude_docs.py Sphinx extension that updates the excluded documents according to the conditional include dict [tag:documents]. If the tag is set, then the list of documents will be included. Also responsible for excluding documents when building with the config value docs_to_build set. In these cases all documents not listed in docs_to_build will be excluded. Subscribes to idf-defines-generated as it relies on the sphinx tags to determine which documents to exclude.
docs/idf_extensions/run_doxygen.py Subscribes to idf-defines-generated event and runs Doxygen (docs/doxygen/Doxyfile_common) to generate XML files describing key headers, and then runs Breathe to convert these to .inc files which can be included directly into API reference pages.
Chapter 6. Contributions Guide

Pushes a number of target-specific custom environment variables into Doxygen, including all macros defined in the project’s default `sdkconfig.h` file and all macros defined in all `soc component xxx_caps.h` headers. This means that public API headers can depend on target-specific configuration options or `soc capabilities headers options` as `#ifdef` & `#if` preprocessors in the header.

This means we can generate different Doxygen files, depending on the target we are building docs for.

Please refer to Documenting Code and API Documentation Template, section API Reference for additional details on this process.

- Documenting Code

6.5.5 Creating Examples

Each ESP-IDF example is a complete project that someone else can copy and adapt the code to solve their own problem. Examples should demonstrate ESP-IDF functionality, while keeping this purpose in mind.

Structure

- The `main` directory should contain a source file named `(something)_example_main.c` with the main functionality.
- If the example has additional functionality, split it logically into separate C or C++ source files under `main` and place a corresponding header file in the same directory.
- If the example has a lot of additional functionality, consider adding a `components` directory to the example project and make some example-specific components with library functionality. Only do this if the components are specific to the example, if they’re generic or common functionality then they should be added to ESP-IDF itself.
- The example should have a `README.md` file. Use the template example README and adapt it for your particular example.
- Examples should have an `example_test.py` file for running an automated example test. If submitting a GitHub Pull Request which includes an example, it’s OK not to include this file initially. The details can be discussed as part of the Pull Request.

General Guidelines

Example code should follow the Espressif IoT Development Framework Style Guide.

Checklist

Checklist before submitting a new example:

- Example project name (in `Makefile` and `README.md`) uses the word “example”. Use “example” instead of “demo”, “test” or similar words.
- Example does one distinct thing. If the example does more than one thing at a time, split it into two or more examples.
- Example has a `README.md` file which is similar to the template example README.
- Functions and variables in the example are named according to naming section of the style guide. (For non-static names which are only specific to the example’s source files, you can use example or something similar as a prefix.)
- All code in the example is well structured and commented.
- Any unnecessary code (old debugging logs, commented-out code, etc.) is removed from the example.
- Options in the example (like network names, addresses, etc.) are not hard-coded. Use configuration items if possible, or otherwise declare macros or constants)
- Configuration items are provided in a `KConfig.projbuild` file with a menu named “Example Configuration”. See existing example projects to see how this is done.
• All original example code has a license header saying it is “in the public domain / CC0”, and a warranty disclaimer clause. Alternatively, the example is licensed under Apache License 2.0. See existing examples for headers to adapt from.
• Any adapted or third party example code has the original license header on it. This code must be licensed compatible with Apache License 2.0.

6.5.6 API Documentation Template

Note: INSTRUCTIONS
1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using ..include::
   • README.rst
   • example.rst
   • ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

Note: INSTRUCTIONS
1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.
3. To distinguish between sections, use the following heading levels:
   • # with overline, for parts
   • * with overline, for chapters
   • =, for sections
   • -, for subsections
   • ^, for subsubsections
   • ”, for paragraphs

Application Example

Note: INSTRUCTIONS
1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in esp-idf/examples/ folder.
3. Place example in this folder complete with README.md file.
4. Provide overview of demonstrated functionality in README.md.
5. With good overview reader should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in esp-idf/examples/.
API Reference

Note: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using code markup retrieved by Doxygen from header files.

1. Update is done on each documentation build by invoking Sphinx extension docs/idf_extensions/run_doxygen.py for all header files listed in the INPUT statement of docs/doxygen/Doxyfile_common.

1. Each line of the INPUT statement (other than a comment that begins with ##) contains a path to header file *.h that will be used to generate corresponding *.inc files:

```
## Wi-Fi - API Reference
../components/esp32/include/esp_wifi.h \\
../components/esp32/include/esp_smartconfig.h \\
```

1. When the headers are expanded, any macros defined by default in sdkconfig.h as well as any macros defined in SOC-specific include/soc/*_caps.h headers will be expanded. This allows the headers to include/exclude material based on the IDF_TARGET value.

1. The *.inc files contain formatted reference of API members generated automatically on each documentation build. All *.inc files are placed in Sphinx _build directory. To see directives generated for e.g. esp_wifi.h.run python gen-dxd.py esp32/include/esp_wifi.h.

1. To show contents of *.inc file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see docs/en/api-reference/network/esp_wifi.rst

1. Optionally, rather that using *.inc files, you may want to describe API in you own way. See docs/en/api-guides/ulp.rst for example.

Below is the list of common .. doxygen...:: directives:

- Functions- .. doxygenfunction:: name_of_function
- Unions- .. doxyguinion:: name_of_union
- Structures- .. doxygenstruct:: name_of_structure together with :members:
- Macros- .. doxygendiff:: name_of_define
- Type Definitions- .. doxygentypedef:: name_of_type
- Enumerations- .. doxygenenum:: name_of_enumeration

See Breathe documentation for additional information.

To provide a link to header file, use the link custom role as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file docs/doxygen/Doxyfile_common should be updated with paths to *.h headers that are being documented.

1. When changes are committed and documentation is build, check how this section has been rendered. Correct annotations in respective header files, if required.

6.5.7 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement
including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ( “We” or “Us” ).

The purpose of this contributor agreement ( “Agreement” ) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at CONTRIBUTING.rst

1. DEFINITIONS

“You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“Contribution” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at marius.vikhammer@espressif.com.

“Copyright” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“Material” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“Submit” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“Submit Date” means the date You Submit a Contribution to Us.

“Documentation” means any non-software portion of a Contribution.

2. LICENSE GRANT

2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENTS

3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License
You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER THE CONTRIBUTION IS PROVIDED “AS IS”. MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

Chapter 7

ESP-IDF Versions

The ESP-IDF GitHub repository is updated regularly, especially the master branch where new development takes place.

For production use, there are also stable releases available.

7.1 Releases

The documentation for the current stable release version can always be found at this URL:

Documentation for the latest version (master branch) can always be found at this URL:

The full history of releases can be found on the GitHub repository Releases page. There you can find release notes, links to each version of the documentation, and instructions for obtaining each version.

7.2 Which Version Should I Start With?

- For production purposes, use the current stable version. Stable versions have been manually tested, and are updated with “bugfix releases” which fix bugs without changing other functionality (see Versioning Scheme for more details). Every stable release version can be found on the Releases page.
- For prototyping, experimentation or for developing new ESP-IDF features, use the latest version (master branch in Git). The latest version in the master branch has all the latest features and has passed automated testing, but has not been completely manually tested (“bleeding edge”).
- If a required feature is not yet available in a stable release, but you do not want to use the master branch, it is possible to check out a pre-release version or a release branch. It is recommended to start from a stable version and then follow the instructions for Updating to a Pre-Release Version or Updating to a Release Branch.

See Updating ESP-IDF if you already have a local copy of ESP-IDF and wish to update it.

7.3 Versioning Scheme

ESP-IDF uses Semantic Versioning. This means that:

- Major Releases, like v3.0, add new functionality and may change functionality. This includes removing deprecated functionality.
If updating to a new major release (for example, from v2.1 to v3.0), some of your project’s code may need updating and functionality may need to be re-tested. The release notes on the Releases page include lists of Breaking Changes to refer to.

- **Minor Releases** like v3.1 add new functionality and fix bugs but will not change or remove documented functionality, or make incompatible changes to public APIs.

  If updating to a new minor release (for example, from v3.0 to v3.1), your project’s code does not require updating, but you should re-test your project. Pay particular attention to the items mentioned in the release notes on the Releases page.

- **Bugfix Releases** like v3.0.1 only fix bugs and do not add new functionality.

  If updating to a new bugfix release (for example, from v3.0 to v3.0.1), you do not need to change any code in your project, and you only need to re-test the functionality directly related to bugs listed in the release notes on the Releases page.

### 7.4 Support Periods

Each ESP-IDF major and minor release version has an associated support period. After this period, the release is End of Life and no longer supported.

The ESP-IDF Support Period Policy explains this in detail, and describes how the support periods for each release are determined.

Each release on the Releases page includes information about the support period for that particular release.

As a general guideline:

- If starting a new project, use the latest stable release.
- If you have a GitHub account, click the “Watch” button in the top-right of the Releases page and choose “Releases only”. GitHub will notify you whenever a new release is available. Whenever a bug fix release is available for the version you are using, plan to update to it.
- If possible, periodically update the project to a new major or minor ESP-IDF version (for example, once a year.) The update process should be straightforward for Minor updates, but may require some planning and checking of the release notes for Major updates.
- Always plan to update to a newer release before the release you are using becomes End of Life.

Each ESP-IDF major and minor release (V4.1, V4.2, etc) is supported for 30 months after the initial stable release date.

Supported means that the ESP-IDF team will continue to apply bug fixes, security fixes, etc to the release branch on GitHub, and periodically make new bugfix releases as needed.

Support period is divided into “Service” and “Maintenance” period:

<table>
<thead>
<tr>
<th>Period</th>
<th>Duration</th>
<th>Recommended for new projects?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service</td>
<td>12 months</td>
<td>Yes</td>
</tr>
<tr>
<td>Maintenance</td>
<td>18 months</td>
<td>No</td>
</tr>
</tbody>
</table>

During the Service period, bugfixes releases are more frequent. In some cases, support for new features may be added during the Service period (this is reserved for features which are needed to meet particular regulatory requirements or standards for new products, and which carry a very low risk of introducing regressions.)

During the Maintenance period, the version is still supported but only bugfixes for high severity issues or security issues will be applied.

Using an “In Service” version is recommended when starting a new project.

Users are encouraged to upgrade all projects to a newer ESP-IDF release before the support period finishes and the release becomes End of Life (EOL). It is our policy to not continue fixing bugs in End of Life releases.

Pre-release versions (betas, previews, -rc and -dev versions, etc) are not covered by any support period. Sometimes a particular feature is marked as “Preview” in a release, which means it is also not covered by the support period.
The ESP-IDF Programming Guide has information about the different versions of ESP-IDF (major, minor, bugfix, etc).

### 7.5 Checking the Current Version

The local ESP-IDF version can be checked by using `idf.py`:

```
idf.py --version
```

The ESP-IDF version is also compiled into the firmware and can be accessed (as a string) via the macro `IDF_VER`. The default ESP-IDF bootloader will print the version on boot (the version information is not always updated if the code in the GitHub repo is updated, it only changes if there is a clean build or if that particular source file is recompiled).

If writing code that needs to support multiple ESP-IDF versions, the version can be checked at compile time using `compile-time macros`.

Examples of ESP-IDF versions:
### Version String | Meaning
--- | ---
v3.2-dev-306-gbeb3611ca | Master branch pre-release. -v3.2-dev - in development for version 3.2. -306 - number of commits after v3.2 development started. -beb3611ca - commit identifier.
v3.0.2 | Stable release, tagged v3.0.2.
v3.1-beta1-75-g346d6b0ea | Beta version in development (on a release branch). -v3.1-beta1 - pre-release tag. -75 - number of commits after the pre-release beta tag was assigned. -346d6b0ea - commit identifier.
v3.0.1-dirty | Stable release, tagged v3.0.1. -dirty means that there are modifications in the local ESP-IDF directory.

### 7.6 Git Workflow

The development (Git) workflow of the Espressif ESP-IDF team is as follows:

- New work is always added on the master branch (latest version) first. The ESP-IDF version on master is always tagged with -dev (for “in development”), for example v3.1-dev.
- Changes are first added to an internal Git repository for code review and testing but are pushed to GitHub after automated testing passes.
- When a new version (developed on master) becomes feature complete and “beta” quality, a new branch is made for the release, for example release/v3.1. A pre-release tag is also created, for example v3.1-beta1. You can see a full list of branches and a list of tags on GitHub. Beta pre-releases have release notes which may include a significant number of Known Issues.
- As testing of the beta version progresses, bug fixes will be added to both the master branch and the release branch. New features for the next release may start being added to master at the same time.
- Once testing is nearly complete a new release candidate is tagged on the release branch, for example v3.1-rc1. This is still a pre-release version.
- If no more significant bugs are found or reported, then the final Major or Minor Version is tagged, for example v3.1. This version appears on the Releases page.
- As bugs are reported in released versions, the fixes will continue to be committed to the same release branch.
- Regular bugfix releases are made from the same release branch. After manual testing is complete, a bugfix release is tagged (i.e. v3.1.1) and appears on the Releases page.

### 7.7 Updating ESP-IDF

Updating ESP-IDF depends on which version(s) you wish to follow:

- *Updating to Stable Release* is recommended for production use.
Chapter 7. ESP-IDF Versions

- **Updating to Master Branch** is recommended for the latest features, development use, and testing.
- **Updating to a Release Branch** is a compromise between the first two.

**Note:** These guides assume that you already have a local copy of ESP-IDF cloned. To get one, check Step 2 in the *Getting Started* guide for any ESP-IDF version.

### 7.7.1 Updating to Stable Release

To update to a new ESP-IDF release (recommended for production use), this is the process to follow:

- Check the [Releases page](https://www.espressif.com/en/support/download/espidf) regularly for new releases.
- When a bugfix release for the version you are using is released (for example, if using v3.0.1 and v3.0.2 is released), check out the new bugfix version into the existing ESP-IDF directory:

```bash
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- When major or minor updates are released, check the Release Notes on the releases page and decide if you want to update or to stay with your current release. Updating is via the same Git commands shown above.

**Note:** If you installed the stable release via zip file instead of using git, it might not be possible to update versions using the commands. In this case, update by downloading a new zip file and replacing the entire IDF_PATH directory with its contents.

### 7.7.2 Updating to a Pre-Release Version

It is also possible to `git checkout` a tag corresponding to a pre-release version or release candidate, the process is the same as Updating to Stable Release.

Pre-release tags are not always found on the [Releases page](https://www.espressif.com/en/support/download/espidf). Consult the list of tags on GitHub for a full list. Caveats for using a pre-release are similar to Updating to a Release Branch.

### 7.7.3 Updating to Master Branch

**Note:** Using Master branch means living “on the bleeding edge” with the latest ESP-IDF code.

To use the latest version on the ESP-IDF master branch, this is the process to follow:

- Check out the master branch locally:

```bash
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- Periodically, re-run `git pull` to pull the latest version of master. Note that you may need to change your project or report bugs after updating your master branch.
- To switch from master to a release branch or stable version, run `git checkout` as shown in the other sections.
Important: It is strongly recommended to regularly run `git pull` and then `git submodule update --init --recursive` so a local copy of master does not get too old. Arbitrary old master branch revisions are effectively unsupportable “snapshots” that may have undocumented bugs. For a semi-stable version, try Updating to a Release Branch instead.

7.7.4 Updating to a Release Branch

In terms of stability, using a release branch is part-way between using the master branch and only using stable releases. A release branch is always beta quality or better, and receives bug fixes before they appear in each stable release.

You can find a list of branches on GitHub.

For example, to follow the branch for ESP-IDF v3.1, including any bugfixes for future releases like v3.1.1, etc:

```bash
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull

git submodule update --init --recursive
```

Each time you `git pull` this branch, ESP-IDF will be updated with fixes for this release.

Note: There is no dedicated documentation for release branches. It is recommended to use the documentation for the closest version to the branch which is currently checked out.
Chapter 8

Resources

8.1 PlatformIO

8.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

8.1.2 Installation

- **PlatformIO IDE** is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- **PlatformIO Core (CLI)** is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services
8.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

8.1.4 Tutorials

- ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

8.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation

8.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about integrations with other IDEs/Text Editors
- Get help from PlatformIO community

8.2 Useful Links

- The esp32.com forum is a place to ask questions and find community resources.
- Check the Issues section on GitHub if you find a bug or have a feature request. Please check existing Issues before opening a new one.
- A comprehensive collection of solutions, practical applications, components and drivers based on ESP-IDF is available in ESP IoT Solution repository. In most of cases descriptions are provided both in English and in 中文.
- To develop applications using Arduino platform, refer to Arduino core for ESP32 WiFi chip.
- Several books have been written about ESP32 and they are listed on Espressif web site.
- If you’re interested in contributing to ESP-IDF, please check the Contributions Guide.
- For additional ESP32 product related information, please refer to documentation section of Espressif site.
- Download latest and previous versions of this documentation in PDF and HTML format.
Chapter 9

Copyrights and Licenses

9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2021 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- **Newlib** is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensa header files** are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of **FreeRTOS** (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in license.txt.
- Original parts of **LWIP** (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.
- **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- **FreeBSD net80211** Copyright (c) 2004-2008 Sam Leffler, Erno Consulting and licensed under the BSD license.
- **JSMN** JSON Parser (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- **argtable3** argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license.
- **linenoise** line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- **libcoap** COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in LICENSE file and COPYING file.
- **libexpat** XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in COPYING file.
- **FatFS** library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license.
- **cJSON** library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file.
- **libsodium** library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in LICENSE file.
- **micro-ecc** library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
Chapter 9. Copyrights and Licenses

- **nghttp2 library**, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in `COPYING` file.  

- **Mbed TLS library**, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in `LICENSE` file.  

- **SPIFFS library**, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in `LICENSE` file.  

- **TinyCBOR library**, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in `LICENSE` file.  

- **SD/MMC driver** is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.  

- **Asio**, Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in `COPYING` file.  

- **ESP-MQTT** MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuannpm at live dot com> is licensed under Apache License 2.0 as described in `LICENSE` file.  

- **BLE Mesh** is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0  

- **mynewt-nimble** Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in `LICENSE` file.  

- **cryptoauthlib** Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in `LICENSE` file.  

- **TLSF allocator** Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.  

- **qrcode** QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.  

- **openthread**, Copyright (c) The OpenThread Authors, is licensed under Apache License 2.0 as described in `LICENSE` file.  

- **UBSAN runtime** —Copyright (c) 2016, Linaro Limited and Jiří Zárevúcky, licensed under the BSD 2-clause license.

9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- **esptool.py** is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in `LICENSE` file.  

- **KConfig** is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

9.1.3 Documentation

- HTML version of the **ESP-IDF Programming Guide** uses the Sphinx theme `sphinx_idf_theme`, which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on `sphinx_rtd_theme`. Both are licensed under MIT license.

9.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- **Newlib** , licensed under the BSD License and is Copyright of various parties, as described in `COPYING.NEWLIB`.  

- **Xtensa libhal**, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).  

- **TinyBasic Plus**, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).  

- **miniz**, by Rich Geldreich - placed into the public domain.  

- **wpa_supplicant**, Copyright (c) 2003–2005 Jouni Malinen and licensed under the BSD license.  

- **TJpgDec**, Copyright (C) 2011, ChaN, all right reserved. See below for license.

9.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

9.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

• The TJpgDec module is a free software and there is NO WARRANTY.
• No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
• Redistributions of source code must retain the above copyright notice.
Chapter 10

About

This is documentation of ESP-IDF, the framework to develop applications for ESP32 chip by Espressif.
The ESP32 is 2.4 GHz Wi-Fi and Bluetooth combo, which integrates one or two Xtensa® 32-bit LX6 CPU, with up to 600 DMIPS processing power.

![Diagram of ESP-IDF development process]

Fig. 1: Espressif IoT Integrated Development Framework

The ESP-IDF, Espressif IoT Development Framework, provides toolchain, API, components and workflows to develop applications for ESP32 using Windows, Linux and Mac OS operating systems.
Chapter 11

Switch Between Languages

The ESP-IDF Programming Guide is now available in two languages. Please refer to the English version if there is any discrepancy.

- English
- Chinese

You can easily change from one language to another by clicking the language link you can find at the top of every document that has a translation.

Fatal Errors

Overview

In certain situations, execution of the program cannot be continued in a well defined way. In ESP-IDF, these situations include:

- genindex
Index
