### 2 API Reference

#### 2.1 Bluetooth API

- 2.1.1 Controller && VHCI | 125 |
- 2.1.2 BT COMMON | 125 |
- 2.1.3 BT LE | 132 |
- 2.1.4 CLASSIC BT | 137 |
- 2.1.5 NimBLE-based host APIs | 229 |
- 2.1.6 ESP-BLE-MESH | 305 |

#### 2.2 Networking APIs

- 2.2.1 Wi-Fi | 602 |
- 2.2.2 Ethernet | 627 |
- 2.2.3 Thread | 632 |
- 2.2.4 ESP-NETIF | 649 |
- 2.2.5 IP Network Layer | 652 |
- 2.2.6 Application Layer | 652 |

#### 2.3 Peripherals API

- 2.3.1 Analog to Digital Converter (ADC) | 653 |
- 2.3.2 Digital To Analog Converter (DAC) | 672 |
- 2.3.3 GPIO & RTC GPIO | 675 |
- 2.3.4 General Purpose Timer (GPTimer) | 693 |
- 2.3.5 Inter-Integrated Circuit (I2C) | 701 |
- 2.3.6 Inter-IC Sound (I2S) | 717 |
- 2.3.7 LCD | 732 |
- 2.3.8 LED Control (LED C) | 741 |
- 2.3.9 Motor Control Pulse Width Modulator (MCPWM) | 755 |
- 2.3.10 Pulse Counter (PCNT) | 779 |
- 2.3.11 Remote Control (RMT) | 788 |
- 2.3.12 SD Pull-up Requirements | 807 |
- 2.3.13 SDMMC Host Driver | 810 |
- 2.3.14 SD SPI Host Driver | 815 |
- 2.3.15 SDIO Card Slave Driver | 820 |
- 2.3.16 Sigma-delta Modulation | 829 |
- 2.3.17 SPI Master Driver | 832 |
- 2.3.18 SPI Slave Driver | 853 |
- 2.3.19 ESP32-WROOM-32SE (Secure Element) | 860 |
- 2.3.20 Touch Sensor | 860 |
- 2.3.21 Two-Wire Automotive Interface (TWAI) | 874 |
- 2.3.22 Universal Asynchronous Receiver/Transmitter (UART) | 889 |

#### 2.4 Application Protocols

- 2.4.1 ASIO port | 912 |
- 2.4.2 ESP-MQTT | 913 |
- 2.4.3 ESP-TLS | 924 |
- 2.4.4 OpenSSL-APIs | 935 |
- 2.4.5 ESP HTTP Client | 962 |
- 2.4.6 HTTP Server | 975 |
- 2.4.7 HTTPS server | 997 |
- 2.4.8 ICMP Echo | 999 |
- 2.4.9 ESP Local Control | 1004 |
- 2.4.10 mDNS Service | 1012 |
- 2.4.11 ESP-Modbus | 1026 |
- 2.4.12 ESP WebSocket Client | 1048 |
- 2.4.13 ESP Serial Slave Link | 1055 |
2.14 ESP x509 Certificate Bundle ........................................ 1070
2.15 IP Network Layer ......................................................... 1072
2.5 Provisioning API .......................................................... 1072
  2.5.1 Protocol Communication ............................................... 1072
  2.5.2 Unified Provisioning .................................................. 1082
  2.5.3 Wi-Fi Provisioning .................................................... 1086
2.6 Storage API ............................................................... 1103
  2.6.1 FAT Filesystem Support .............................................. 1103
  2.6.2 Manufacturing Utility ............................................... 1109
  2.6.3 Non-volatile storage library ....................................... 1113
  2.6.4 NVS Partition Generator Utility ................................... 1132
  2.6.5 SD/SDIO/MMC Driver ............................................... 1139
  2.6.6 SPI Flash API ....................................................... 1148
  2.6.7 SPIFFS Filesystem .................................................. 1173
  2.6.8 Virtual filesystem component ..................................... 1176
  2.6.9 Wear Levelling API ................................................ 1189
2.7 System API ............................................................... 1193
  2.7.1 App Image Format .................................................. 1193
  2.7.2 Application Level Tracing ......................................... 1198
  2.7.3 Console ............................................................. 1202
  2.7.4 eFuse Manager ..................................................... 1210
  2.7.5 Error Codes and Helper Functions ................................ 1226
  2.7.6 ESP HTTPS OTA .................................................... 1228
  2.7.7 POSIX Threads Support ............................................. 1232
  2.7.8 Event Loop Library ................................................. 1236
  2.7.9 FreeRTOS ............................................................ 1252
  2.7.10 FreeRTOS Additions ............................................... 1356
  2.7.11 Heap Memory Allocation ......................................... 1373
  2.7.12 Heap Memory Debugging ......................................... 1384
  2.7.13 High Resolution Timer ............................................ 1395
  2.7.14 The himem allocation API ........................................ 1400
  2.7.15 Inter-Processor Call .............................................. 1403
  2.7.16 Call function with external stack ............................... 1407
  2.7.17 Interrupt allocation .............................................. 1409
  2.7.18 Logging library ..................................................... 1414
  2.7.19 Miscellaneous System APIs ...................................... 1420
  2.7.20 Over The Air Updates (OTA) ...................................... 1426
  2.7.21 Performance Monitor .............................................. 1436
  2.7.22 Power Management ................................................ 1440
  2.7.23 Random Number Generation ..................................... 1446
  2.7.24 Sleep Modes ........................................................ 1447
  2.7.25 Watchdogs .......................................................... 1457
  2.7.26 System Time ........................................................ 1460
  2.7.27 Internal and Unstable APIs ...................................... 1464
2.8 API Conventions ........................................................ 1465
  2.8.1 Error handling ..................................................... 1465
  2.8.2 Configuration structures .......................................... 1465
  2.8.3 Private APIs ....................................................... 1466
  2.8.4 Components in example projects .................................. 1466
  2.8.5 API Stability ....................................................... 1466
2.9 Project Configuration .................................................. 1467
  2.9.1 Introduction ........................................................ 1467
  2.9.2 Project Configuration Menu ...................................... 1468
  2.9.3 Using sdkconfig.defaults ........................................ 1468
  2.9.4 Kconfig Formatting Rules ........................................ 1468
  2.9.5 Backward Compatibility of Kconfig Options ................. 1468
  2.9.6 Configuration Options Reference ................................ 1469
2.10 Error Codes Reference ............................................... 1720

4 API Guides

4.1 Application Level Tracing library ..................................... 1731
4.1.1 Overview ............................................................ 1731
4.1.2 Modes of Operation .................................................. 1731
4.1.3 Configuration Options and Dependencies ....................... 1732
4.1.4 How to use this library ............................................. 1733

4.2 Application Startup Flow ................................................. 1741
4.2.1 First stage bootloader ............................................... 1741
4.2.2 Second stage bootloader ............................................ 1742
4.2.3 Application startup .................................................. 1742

4.3 BluFi ........................................................................... 1744
4.3.1 Overview ............................................................ 1744
4.3.2 The BluFi Flow ...................................................... 1744
4.3.3 The Flow Chart of BluFi ............................................ 1745
4.3.4 The Frame Formats Defined in BluFi ......................... 1745
4.3.5 The Security Implementation of ESP32 ....................... 1751
4.3.6 GATT Related Instructions ......................................... 1752

4.4 Bootloader ................................................................. 1752
4.4.1 Bootloader compatibility .......................................... 1753
4.4.2 Log Level ............................................................ 1753
4.4.3 Factory reset ........................................................ 1754
4.4.4 Boot from Test Firmware ......................................... 1754
4.4.5 Rollback ............................................................. 1755
4.4.6 Watchdog ............................................................ 1755
4.4.7 Bootloader Size ...................................................... 1755
4.4.8 Fast boot from Deep Sleep ....................................... 1755
4.4.9 Custom bootloader .................................................. 1755

4.5 Build System ............................................................... 1756
4.5.1 Overview ............................................................ 1756
4.5.2 Using the Build System .......................................... 1757
4.5.3 Example Project .................................................... 1760
4.5.4 Project CMakeLists File ........................................ 1761
4.5.5 Component CMakeLists Files .................................. 1762
4.5.6 Component Configuration ......................................... 1765
4.5.7 Preprocessor Definitions ......................................... 1765
4.5.8 Component Requirements ........................................ 1765
4.5.9 Overriding Parts of the Project ................................ 1769
4.5.10 Configuration-Only Components ............................... 1769
4.5.11 Debugging CMake ................................................ 1770
4.5.12 Example Component CMakeLists .............................. 1770
4.5.13 Custom sdkconfig defaults ...................................... 1774
4.5.14 Flash arguments ................................................... 1774
4.5.15 Building the Bootloader ......................................... 1775
4.5.16 Selecting the Target .............................................. 1775
4.5.17 Writing Pure CMake Components .............................. 1776
4.5.18 Using Third-Party CMake Projects with Components .... 1776
4.5.19 Using Prebuilt Libraries with Components .................. 1777
4.5.20 Using ESP-IDF in Custom CMake Projects ................. 1777
4.5.21 ESP-IDF CMake Build System API ............................ 1778
4.5.22 File Globbing & Incremental Builds ......................... 1782
4.5.23 Build System Metadata .......................................... 1782
4.5.24 Build System Internals ........................................... 1783
4.5.25 Migrating from ESP-IDF GNU Make System ............... 1784

4.6 Deep Sleep Wake Stubs .................................................. 1786
4.13.5  Guru Meditation Errors .................................................. 1863
4.13.6  Other Fatal Errors ......................................................... 1865
4.14  Flash Encryption ............................................................. 1867
  4.14.1  Introduction .............................................................. 1867
  4.14.2  Relevant eFuses ......................................................... 1868
  4.14.3  Flash Encryption Process ................................................ 1868
  4.14.4  Flash Encryption Configuration ......................................... 1869
  4.14.5  Possible Failures ........................................................ 1875
  4.14.6  ESP32 Flash Encryption Status ........................................ 1876
  4.14.7  Reading and Writing Data in Encrypted Flash .......................... 1876
  4.14.8  Updating Encrypted Flash ............................................... 1877
  4.14.9  Disabling Flash Encryption ............................................ 1878
  4.14.10  Key Points About Flash Encryption .................................. 1878
  4.14.11  Limitations of Flash Encryption ....................................... 1879
  4.14.12  Flash Encryption and Secure Boot .................................... 1879

This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP8684, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

Hardware:

- An ESP32 board
- USB cable - USB A / micro USB B
- Computer running Windows, Linux, or macOS

Software:

You have a choice to either download and install the following software manually

- Toolchain to compile code for ESP32
- Build tools - CMake and Ninja to build a full Application for ESP32
- ESP-IDF that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
or get through the onboarding process using the following official plugins for integrated development environments (IDE) described in separate documents

- Eclipse Plugin (installation link)
- VS Code Extension (setup)

Fig. 1: Development of applications for ESP32

1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-DevKitC V4 Getting Started Guide

This guide shows how to start using the ESP32-DevKitC V4 development board.

What You Need

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-DA
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROVER-E
  - ESP32-WROVER-IE
- male or female pin headers.

For details please refer to ESP Product Selector.

Functional Description

The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

![ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered](image)

Fig. 2: ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered
Chapter 1. Get Started

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROOM-32</td>
<td>A module with ESP32 at its core. For more information, see ESP32-WROOM-32 Datasheet.</td>
</tr>
<tr>
<td>EN</td>
<td>Reset button.</td>
</tr>
<tr>
<td>Boot</td>
<td>Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates of up to 3 Mbps.</td>
</tr>
<tr>
<td>Micro USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-WROOM-32 module.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>Turns on when the USB or an external 5V power supply is connected to the board. For details see the schematics in Related Documents.</td>
</tr>
<tr>
<td>I/O</td>
<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>

**Note:** The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

**Note:** The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

**Power Supply Options**

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

**Header Block**

The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, as shown in ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered. The numbering and names are the same as in the ESP32-DevKitC V4 schematics (PDF).

**Pin Layout**

**Note on C15**

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal
In case these issues occur, please remove the component. The figure below shows the location of C15 highlighted in yellow.

**Start Application Development**

Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

1.3.2 ESP-WROOM-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROOM-KIT V4.1 development board and also provides information about its functionality and configuration options.

What You Need

- **ESP-WROOM-KIT V4.1 board**
- USB 2.0 cable (A to Micro-B)
You can skip the introduction sections and go directly to Section *Start Application Development.*

**Overview**

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-E module
- LCD screen
- MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

**Functionality Overview**

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

![Fig. 7: ESP-WROVER-KIT block diagram](image)

**Functional Description**

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Chapter 1. Get Started

Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1  The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>

</tbody>
</table>

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.
**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup   Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the Power Switch to ON, the 5V Power On LED should light up.

Now to Development   Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.
Chapter 1. Get Started

The application examples that use some hardware specific to your ESP-WROVER-KIT can be found below.

- On-board LCD example: peripherals/spi_master/lcd
- SD card slot example: storage/sd_card
- Camera connector example: https://github.com/espressif/sp32-camera

ESP-WROVER-KIT V3 Getting Started Guide This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview	ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
### Key Component | Description
--- | ---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
0R | Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.
ESP32 Module | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
FT2232 | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V3 schematic.
UART | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
CTS/RTS | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
JTAG | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.
EN | Reset button.
Boot | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
USB | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Key | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.
Power Select | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).

**Fig. 10: ESP-WROVER-KIT block diagram**
Fig. 11: ESP-WROVER-KIT board layout - front
Fig. 12: ESP-WROVER-KIT board layout - back
**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.
<table>

</tr>
</tbody>
</table>
**Allocation of ESP32 Pins**  
Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1**  
The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

It’s another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture

### Chapter 1. Get Started

#### Key Component | Description
--- | ---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
ESP32 Module | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
CTS/RTS Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
UART | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
JTAG | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.
FT2232 | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.
EN | Reset button.
Boot | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
USB | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Select | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.
Power Key | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
LDO | NCP1117(1A). 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.
Camera | Camera interface, a standard OV7670 camera module.
RGB | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).
I/O | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, 12C, 12S, SPI, etc.
MicroSD Card | MicroSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the MicroSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.
LCD | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

**Start Application Development**  Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development**  Please proceed to Get Started, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.

**1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide**

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

**What You Need**

- **ESP32-PICO-KIT mini development board**
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section **Start Application Development.**
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.
2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.
Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

Fig. 17: ESP32-PICO-KIT board layout
**Key Component** | **Description**
--- | ---
ESP32-PICO-D4 | Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.
LDO | 5V-to-3.3V Low dropout voltage regulator (LDO).
USB-UART bridge | Single-chip USB-UART bridge: CP2102 in V4 provides up to 1 Mbps transfer rates and CP2102N in V4.1 offers up to 3 Mbps transfers rates.
Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
5V Power On LED | This red LED turns on when power is supplied to the board. For details, see the schematics in Related Documents.
I/O | All the pins on ESP32-PICO-D4 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section Pin Descriptions.
BOOT Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
EN Button | Reset button.

**Power Supply Options**

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**

The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see ESP32-PICO-KIT board layout. The pin numbering and header names are the same as in the schematic given in Related Documents.

Chapter 1. Get Started

The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions

The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

### 1.3.4 ESP32-Ethernet-Kit V1.2 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The **ESP32-Ethernet-Kit** is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**
- **ESP32-Ethernet-Kit V1.2 board**
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section **Start Application Development**.
Fig. 21: ESP32-Ethernet-Kit V1.2 Overview (click to enlarge)
Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.
Chapter 1. Get Started

Chapter 1. Get Started

Note: Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users don’t need to do any operation with BOOT button or EN button.

PoE Board (B)  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

RMII Clock Selection  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).
Note: For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

**RMII Clock Sourced Externally by PHY**  
By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 26: RMII Clock from IP101GRI PHY](image)

Fig. 26: RMII Clock from IP101GRI PHY

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-upsampling phase).

**RMII Clock Sourced Internally from ESP32’s APLL**  
Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.
Fig. 27: RMII Clock from ESP Internal APLL
Chapter 1. Get Started

GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit default to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO21</td>
<td>TX_EN</td>

<tr>
<th>No.</th>
<th>ESP32 Pin</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

**Note:** The allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IO MUX or GPIO Matrix. REF_CLK can only be selected from GPIO0, GPIO16 or GPIO17 and it cannot be changed through GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>

</table>
Chapter 1. Get Started

Note:

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.

Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also RMII Clock Sourced Externally by PHY. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the **Ethernet board (A)** to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

Now to Development

Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example

After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.2* (click to enlarge).

Summary of Changes from ESP32-Ethernet-Kit V1.1

- Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
- Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
- Replace ESP32-WROVER-B with ESP32-WROVER-E.

ESP32-Ethernet-Kit V1.0 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).
What You Need

- ***ESP32-Ethernet-Kit V1.0 board***
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development.*

Overview ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

![ESP32-Ethernet-Kit V1.0](image)

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.
Chapter 1. Get Started

Fig. 29: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 30: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
**Ethernet Board (A)** The table below provides description starting from the picture’s top right corner and going clockwise.
### Key Component | Description
--- | ---
**ESP32-WROVER-B** | This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
**GPIO Header 2** | Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see [GPIO Header 2](#).
**Flow Control** | A jumper header with access to the board signals. For details, see [Flow Control](#).
**Function Switch** | A DIP switch used to configure the functionality of selected GPIOs of ESP32. For details, see [Function Switch](#).
**Tx/Rx LEDs** | Two LEDs to show the status of UART transmission.
**GPIO Header 3** | Provides access to some GPIOs of ESP32 that can be used depending on the position of the [Function Switch](#).
**FT2232H** | The FT2232H chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232H also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232H chip enhances user-friendliness in terms of application development and debugging. See [ESP32-Ethernet-Kit V1.0 Ethernet board (A) schematic](#).
**USB Port** | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
**Power Switch** | Power On/Off Switch. Toggling toward the Boot button powers the board on, toggling away from Boot powers the board off.
**5V Input** | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
**5V Power On LED** | This red LED turns on when power is supplied to the board, either from USB or 5V Input.
**DC/DC Converter** | Provided DC 5 V to 3.3 V conversion, output current up to 2A.
**Board B Connectors** | A pair male header pins for mounting the PoE board (B).
**IP101GRI (PHY)** | The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GRI chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3 / 802.3u standard of 10/100Mbps.
**RJ45 Port** | Ethernet network data transmission port.
**Magnetics Module** | The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.
**Link/Activity LEDs** | (green and red) that respectively indicate the “Link” and “Activity” statuses of the PHY.
**BOOT Button** | Download button. Holding down BOOT and then pressing CH_PU initiates Firmware Download mode for downloading firmware through the serial port.
**CH_PU Button** | Reset button.
Chapter 1. Get Started

**PoE Board (B)**  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Fig. 31: ESP32-Ethernet-Kit - PoE board (B) layout](click to enlarge)

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RMII Interface</strong></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>GPIO21</td>
</tr>
<tr>

<td>GPIO18</td>
</tr>
<tr>
<td><strong>PHY Reset</strong></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>GPIO5</td>
</tr>
</tbody>
</table>

**Note:** Except for REF_CLK, the allocation of all pins under the RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 GPIO32</td>
</tr>
<tr>

<tr>
<td>3 GPIO34</td>
</tr>
<tr>
<td>4 GPIO35</td>
</tr>
<tr>
<td>5 GPIO36</td>
</tr>
<tr>
<td>6 GPIO39</td>
</tr>
</tbody>
</table>

**GPIO Header 2**  This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see *IP101GRI (PHY) Interface*. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development  Proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example  After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.0 board.

ESP32-Ethernet-Kit V1.1 Getting Started Guide  This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview  The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

</table>
**PoE Board (B)**  
This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE Board (B) layout](image)

**Fig. 35: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)**

**Table 2: Table PoE board (B)**

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options**  
This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  
When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection**  
The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APDL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.
**RMII Clock Sourced Externally by PHY**  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 36: RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMII Clock Sourced Internally from ESP32’s APLL**  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

**GPIO Allocation**  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Fig. 37: RMII Clock from ESP Internal APLL
**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>RMII Interface</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO21</td>

<td>3.3 V power supply</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the **Function Switch**.

</tbody>
</table>

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also [RMII Clock Sourced Externally by PHY](#). For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic](#).

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on *ESP32-Ethernet-Kit V1.1*.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY nsclock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- The Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can then be pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**1.3.5 ESP32-DevKitS(-R)**

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif. ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
The document consists of the following major sections:

- **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.
- **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**

This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section *How to Flash a Board* provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

**Overview**  ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

- **ESP32-DevKitS**:
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R**:
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

For information about above modules, please refer to ESP32 Series Modules.

### How to Flash a Board

Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Hardware Setup

Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:

- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

### Software Setup

**Preferred Method** The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

**Alternative Method** As an alternative, Windows users can flash binaries using the Flash Download Tool. Just download it, unzip it, and follow the instructions inside the doc folder.

### Note:

1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

### Board Dimensions

### Contents and Packaging
Fig. 40: ESP32-DevKitS board dimensions - back

Fig. 41: ESP32-DevKitS-R board dimensions - back
**Retail orders**  If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram**  A block diagram below shows the components of ESP32-DevKitS(-R) and their interconnections.

---

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

### 1.3.6 ESP32-PICO-KIT-1

**Overview**

ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-V3 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
Chapter 1. Get Started

- 4 MB flash
- Filter capacitors
- RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

**Note:** ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started:** Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
- **Contents and Packaging:** Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference:** Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
- **Hardware Revision Details:** Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
- **Related Documents:** Gives links to related documentation.

**Getting Started**

This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section **Start Application Development** provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

**Description of Components** The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 43: ESP32-PICO-KIT-1 Overview (click to enlarge)

### Start Application Development

Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

### Required Hardware

- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
• 1 x Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment.

**Contents and Packaging**

**Retail Orders**  If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram**  The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

![Fig. 45: ESP32-PICO-KIT-1 Block Diagram (click to enlarge)](image)

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:**  The power supply must be provided using *one and only one of the options above*, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**  The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

The following notes give more information about the items in the tables above.
1. This pin is connected to the pin of the USB bridge chip on the board.

2. 32.768 kHz crystal oscillator: a) input b) output

3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

1.3.7 ESP32-PICO-DevKitM-2

Overview

ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-MINI-02(02U) module with complete Wi-Fi and Bluetooth functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02(02U) are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.
Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

Getting Started

This section describes how to get started with the ESP32-PICO-DevKitM-2. It begins with a few introductory sections about the ESP32-PICO-DevKitM-2, then Section Start Application Development provides instructions on how to flash firmware onto the ESP32-PICO-DevKitM-2.

Description of Components  The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-DevKitM-2 board. We take the board with a ESP32-PICO-MINI-02 module as an example in the following sections.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
### Key Component | Description
---|---
ESP32-PICO-MINI-02 | Standard ESP32-PICO-MINI-02 module soldered to the ESP32-PICO-DevKitM-2 board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the module. Users can also select the board with ESP32-PICO-MINI-02U soldered.
LDO | 5V-to-3.3V Low dropout voltage regulator (LDO).
USB-to-UART bridge | CP2102N, single-chip USB-UART bridge that offers up to 3 Mbps transfers rates.
Micro-B USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
5V Power On LED | This red LED turns on when power is supplied to the board. For details, see the schematic in Related Documents.
I/O Connector | All the pins on ESP32-PICO-MINI-02 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section Pin Descriptions.
BOOT Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
EN Button | Reset button.

**Start Application Development** Before powering up your ESP32-PICO-DevKitM-2, please make sure that the board is in good condition with no obvious signs of damage.

**Required Hardware**
- 1 x ESP32-PICO-DevKitM-2
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS
Chapter 1. Get Started

**Software Setup** Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment.

**Contents and Packaging**

**Retail Orders** If you order one or several samples of the board, each ESP32-PICO-DevKitM-2 development board comes in an individual package.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram** The block diagram below shows the main components of ESP32-PICO-DevKitM-2 and their interconnections.

![ESP32-PICO-DevKitM-2 Block Diagram](image)

**Fig. 49: ESP32-PICO-DevKitM-2 Block Diagram (click to enlarge)**

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions** The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

1.3.8 ESP32-DevKitM-1

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-1(1U)-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.
The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentation.

**Getting Started**

This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.

**Overview**

This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

**Contents and Packaging**

**Retail orders**  If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Description of Components**  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.
**Key Component** | **Description**
--- | ---
On-board module | ESP32-MINI-1 module or ESP32-MINI-1U module. ESP32-MINI-1 comes with an on-board PCB antenna. ESP32-MINI-1U comes with an external antenna connector. The two modules both have a 4 MB flash in chip package. For details, please see [ESP32-MINI-1 & ESP32-MINI-1U Datasheet](#).  
5 V to 3.3 V LDO | Power regulator converts 5 V to 3.3 V.  
Boot Button | Download button. Holding down **Boot** and then pressing **Reset** initiates Firmware Download mode for downloading firmware through the serial port.  
Reset Button | Reset Button  
Micro-USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32 chip.  
USB-to-UART Bridge | Single USB-UART bridge chip provides transfer rates up to 3 Mbps.  
3.3 V Power On LED | Turns on when the USB is connected to the board. For details, please see the schematics in [Related Documents](#).  
I/O Connector | All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. Users can program ESP32 chip to enable multiple functions.

### Start Application Development
Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware
- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Software Setup
Please proceed to [Get Started](#), where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.
Chapter 1. Get Started

**Attention:** ESP32-DevKitM-1 is a board with a single core module, please enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing your applications.

**Hardware Reference**

**Block Diagram** A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

![ESP32-DevKitM-1 Block Diagram](image)

**Fig. 52: ESP32-DevKitM-1**

**Power Source Select** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

**Warning:**

- The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.

**Pin Descriptions** The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- Step 1. Install prerequisites for Windows, Linux, or macOS
- Step 2. Get ESP-IDF
- Step 3. Set up the tools
- Step 4. Set up the environment variables

1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support. System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers from this URL: https://dl.espressif.com/dl/esp-idf/?idf=4.4
Chapter 1. Get Started

What is the use case for Online and Offline Installer

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif.

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation

The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.

Launching ESP-IDF Environment

At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 53: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):
Chapter 1. Get Started

Fig. 54: ESP-IDF PowerShell

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\idf>
Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs export.bat script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat.
   Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Related Documents

For advanced users who want to customize the install process:

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

Add ESP-IDF tools to PATH using an export script ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.ps1:
Chapter 1. Get Started

```bash
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### 1.5.2 Standard Setup of Toolchain for Linux

#### Install Prerequisites

To compile with ESP-IDF you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- **Ubuntu and Debian:**
  ```bash
  sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb1.
  ```

- **CentOS 7 & 8:**
  ```bash
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb1.
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Arch:**
  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja-build ccache dfu-util libusb
  ```

**Note:**

- CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

#### Additional Tips

**Permission issues /dev/ttyUSB0**  With some Linux distributions you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

**Python compatibility**

ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as `pyenv`.

#### Next Steps

To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*. 

---

This content is from the official ESP-IDF documentation. Espressif Systems 98 Release v5.0-dev-1077-g397639d

Submit Document Feedback
1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:
  ```shell
sudo easy_install pip
  ```

- install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```shell
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```shell
    sudo port install cmake ninja dfu-util
    ```
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

**Note:** If an error like this is shown during any step:

```shell
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

## Installing Python 3

Basing on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```shell
python --version
```

If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```shell
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with HomeBrew can be done as follows:
  ```shell
  brew install python3
  ```

- If you have MacPorts, you can run:
  ```shell
  sudo port install python38
  ```

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.
1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository. To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

1.6.2 Windows

In addition to installing the tools, ESP-IDF Tools Installer for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these instructions.

1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.
Chapter 1. Get Started

1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat esp32
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32
```

1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example:
```
./install.sh esp32,esp32c3,esp32s3
```
To install tools for all supported targets, run the script without specifying targets
```
./install.sh or use ./install.sh all.
```

1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

**Windows**

To prefer the Espressif download server when running the ESP-IDF Tools Installer, mark the *Use Espressif download mirror instead of GitHub* in the screen *Select Components* section *Optimization*.

**Linux and macOS**

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```
1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux and macOS, %USERPROFILE%\espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

ESP-IDF Tools Installer for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
.$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
.$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

```
alias get_idf=' $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, source ~/.bashrc.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.
1.9  Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy the project get-started/hello_world to ~/esp directory:

1.9.1 Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10  Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

1.11  Step 7. Configure

Navigate to your hello_world directory from Step 5. Start a Project, set ESP32 chip as the target and run the project configuration utility menuconfig.

1.11.1 Linux and macOS

```bash
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```
1.11.2 Windows

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32` should be done once, after opening a new project. If the project contains some existing builds and configuration, they will be cleared and initialized. The target may be saved in environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Fig. 57: Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”. This example will run with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MINI-1(1U) module, enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option --style. Please run `idf.py menuconfig --help` for further information.

1.12 Step 8. Build the Project

Build the project by running:

```bash
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.
Chapter 1. Get Started

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
.../.../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'

If there are no errors, the build will finish by generating the firmware binary .bin files.

1.13 Step 9. Flash onto the Device

Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:

idf.py -p PORT [-b BAUD] flash

Replace PORT with your ESP32 board’s serial port name from Step 6. Connect Your Device.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see idf.py.

Note: The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

1.13.1 Encountered Issues While Flashing?

If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all
Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the **Boot** button (GPIO0) and press the **EN** button (CHIP PU).
- For other types of hardware, try pulling GPIO0 down.

### 1.13.2 Normal Operation

When flashing, you will see the output log similar to the following:

```plaintext
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
   --after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
   --0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
   --0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0

If there are no issues by the end of the flash process, the board will reboot and start up the **hello_world** application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out the [Eclipse guide](#) and the [VS Code guide](#).
Chapter 1. Get Started

1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
   _world/build/hello_world.elf"
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB...
external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+] .

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```
c600|Xn@y.!60(^Pw+)|60|Hn9a^-/90|0t566P8-6k60c6ea650jA
~zY66Y(10,160 c600)Xn@y.!Dr@zY(0 jpi9}@z5Ymp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to `menuconfig`.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- `idf.py` for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.
Chapter 1. Get Started

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

### 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in *Step 2. Get ESP-IDF*.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at *Step 3. Set up the tools.*

Once the new tools are installed, update the environment using the Export script. See instructions at *Step 4. Set up the environment variables.*

### 1.16 Related Documents

#### 1.16.1 Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.

**Connect ESP32 to PC**

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows**

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT
Fig. 58: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 59: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Check port on Linux and macOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*
```

**macOS**

```
ls /dev/cu.*
```

**Note:** macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux

The currently logged user should have read and write access to the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32.

**Windows and Linux** In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32, see Example Output.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.
Fig. 60: Setting Serial Communication in PuTTY on Windows
Fig. 61: Setting Serial Communication in PuTTY on Linux
macOS  To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

  ```bash
  ls /dev/cu.*
  ```

- You should see similar output:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART  /dev/cu.SLAB_USBtoUART
  ```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

  ```bash
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32, see Example Output. To exit the `screen` session type Ctrl-A + \\.

**Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

### Example Output

An example log by ESP32 is shown below. Reset the board if you do not see anything.

```plaintext
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of firmware to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

If you got here from Step 6. Connect Your Device when installing s/w for ESP32 development, then you can continue with Step 7. Configure.

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.
Chapter 1. Get Started

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to Espressif IDF Eclipse Plugins IDF for further instructions.

**Note:** In Espressif IDF Eclipse Plugins, though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

1.16.3 Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

**Quick Install Guide**

Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

**Supported Features**

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the .svdat files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

**Bugs & Feature Requests**

If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the forum, or open a github issue for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, raise your feature request on github.

1.16.4 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running idf.py monitor.
# Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+[</td>
<td>Exit program</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Send the menu character itself to remote.</td>
</tr>
<tr>
<td>* Ctrl+T</td>
<td>Send the exit character itself to remote.</td>
<td></td>
</tr>
<tr>
<td>* Ctrl+]</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>* Ctrl+P</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>* Ctrl+R</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>* Ctrl+F</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>* Ctrl+A (or A)</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>* Ctrl+Y</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>* Ctrl+L</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>* Ctrl+I (or I)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>* Ctrl+H (or H)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>Interrupt running application</td>
<td>Pauses IDF monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-[ and Ctrl-T, will be sent through the serial port.

## IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4________, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : ...
A2 : 0x3fffb136c A3 : 0x00000005 A4 : 0x00000000 A5 : ...
A6 : 0x00000000 A7 : 0x00000080 A8 : 0x00000000 A9 : ...
A10 : 0x00000003 A11 : 0x00060f23 A12 : 0x00060f20 A13 : ...
A14 : 0x40000047 A15 : 0x0000000f SAR : 0x00000019 EXCCAUSE: ...
EXCVADDR: 0x00000000 LBEG : 0x4000c46c LEND : 0x4000c477 LCOUNT : ...

Backtrace: 0x400f360d:0x3ffb7e00 0x400dbf56:0x3ffb7e20 0x400dbf5e:0x3ffb7e40 ...
0x400dbf82:0x3ffb7e60 0x400d071d:0x3ffb7e90

IDF Monitor adds more details to the dump:
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : ...
A2 : 0x3fffb136c A3 : 0x00000005 A4 : 0x00000000 A5 : ...
A6 : 0x00000000 A7 : 0x00000080 A8 : 0x00000000 A9 : ...
A10 : 0x00000003 A11 : 0x00060f23 A12 : 0x00060f20 A13 : ...
A14 : 0x40000047 A15 : 0x0000000f SAR : 0x00000019 EXCCAUSE: ...
EXCVADDR: 0x00000000 LBEG : 0x4000c46c LEND : 0x4000c477 LCOUNT : ...

Backtrace: 0x400f360d:0x3ffb7e00 0x400dbf56:0x3ffb7e20 0x400dbf5e:0x3ffb7e40 ...
0x400dbf82:0x3ffb7e60 0x400d071d:0x3ffb7e90

To decode each address, IDF Monitor runs the following command in the background:
```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line.
Chapter 1. Get Started

option: idf_monitor.py --disable-address-decoding to disable address decoding.

Launching GDB with GDBStub  By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP_SYSTEM_PANIC to GDBStub on panic or set CONFIG_ESP_SYSTEM_PANIC to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xpenta-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex_
--interrupt build/PROJECT.elf :idf_target: 'Hello NAME chip'
```

Output Filtering  IDF monitor can be invoked as idf.py monitor --print-filter="xyz", where --print-filter is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of <tag>:<log_level> items where <tag> is the tag string and <log_level> is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...). Not specifying a <log_level> or using * defaults to Verbose level.

Note: Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples Of Filtering Rules:

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means matching everything.
- "*:N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To avoid this, use *:E or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:" , "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
• Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.
• Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.
• tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_...
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I" is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

1.16.5 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

• if you want to customize toolchain build configuration
• if you want to use a different GCC version (such as 4.8.5)
• if you want to hack gcc or newlib or libstdc++
• if you are curious and/or have time to spare
• if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Get ESP-IDF

**Note:** Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

**Note:** This command will clone the master branch, which has the latest development (“bleeding edge”) version of ESP-IDF. It is fully functional and updated on weekly basis with the most recent features and bugfixes.

**Note:** GitHub’s “Download zip file” feature does not work with ESP-IDF, a git clone is required. As a fallback, Stable version can be installed without Git.

**Note:** Do not miss the --recursive option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

Tools

**CMake**  Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

**Ninja build**  

**Note:** Ninja currently only provides binaries for 64-bit Windows.

Download the Ninja latest stable Windows release from the (download page).

The Ninja for Windows download is a .zip file containing a single ninja.exe file which needs to be unzipped to a directory which is then added to your Path (or you can choose a directory which is already on your Path).
Chapter 1. Get Started

Python  Download the latest Python for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path”. Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

Toolchain Setup  Download the precompiled Windows toolchain:

Unzip the file to C:\Program Files (or some other location). The zip file contains a single directory xtensa-esp32-elf.

Next, the bin subdirectory of this directory must be added to your Path. For example, the directory to add may be C:\Program Files\xtensa-esp32-elf\bin.

Adding Directory to Path  To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ;<new value>.

Next Steps  To carry on with development environment setup, proceed to Step 3. Set up the tools.

Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section Standard Setup of Toolchain for Linux.

Note: The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).

Install Prerequisites  To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

  ```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf˓
  --python3 python3-pip cmake ninja-build ccache dfu-util libusbx
  
  CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

  ```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-˓
  --pip python3-setuptools python3-serial python3-cryptography python3-future˓
  --python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev˓
  --libssl-dev dfu-util libusb-1.0-0
  
- Arch:

  ```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial˓
  --python-cryptography python-future python-pyparsing python-pyelftools cmake˓
  --ninja ccache dfu-util libusb
  ```

Espressif Systems 121  Release v5.0-dev-1077-g397639d

Submit Document Feedback
Chapter 1. Get Started

Note: CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    ```bash
    sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel autowake bison flex texinfo help2man libtool make
    ```
  - Ubuntu pre-16.04:
    ```bash
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev, automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu 16.04 or newer:
    ```bash
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev, automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Debian 9:
    ```bash
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev, automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Arch:
    ```bash
    sudo pacman -Sy --needed python-pip
    ```

Create the working directory and go into it:

```bash
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Note: To create a toolchain with support for 64-bit time_t, you need to remove the `--enable-newlib-long-time_t` option from the crosstool-NG/samples/xtensa-esp32-elf/crosstool.config file in 33 and 43 lines.

Build the toolchain:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32-elf`.

Add Toolchain to PATH  The custom toolchain needs to be copied to a binary directory and added to the PATH. Choose a directory, for example `~/esp/xtensa-esp32-elf/`, and copy the build output to this directory.

To use it, you will need to update your PATH environment variable in `~/.profile` file. To make `xtensa-esp32-elf` available for all terminal sessions, add the following line to your `~/.profile` file:
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"

**Note:** If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead. In CentOS, alias should set in .bashrc.

Log off and log in back to make the .profile changes effective. Run the following command to verify if PATH is correctly set:

```
printenv PATH
```

You are looking for similar result containing toolchain’s path at the beginning of displayed string:

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
```

Instead of /home/user-name there should be a home path specific to your installation.

**Next Steps**  
To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*.

**Setup Toolchain for Mac OS from Scratch**

**Package Manager**  
To set up the toolchain from scratch, rather than downloading a pre-compiled toolchain, you will need to install either the MacPorts or Homebrew package manager.

MacPorts needs a full XCode installation, while Homebrew only needs XCode command line tools.

See *Customized Setup of Toolchain* section for some of the reasons why installing the toolchain from scratch may be necessary.

**Install Prerequisites**

- install pip:
  ```
sudo easy_install pip
  ```

- install pyserial:
  ```
  pip install --user pyserial
  ```

- install CMake & Ninja build:
  - If you have Homebrew, you can run:
    ```
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```
    sudo port install cmake ninja dfu-util
    ```

**Compile the Toolchain from Source**  
Install dependencies:

- with MacPorts:
  ```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf
      --automake make
  ```

- with Homebrew:
  ```
  ```
Chapter 1. Get Started

```bash
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
      --autoconf automake
```

Create a case-sensitive filesystem image:

```bash
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive..<HFS+"
```

Mount it:

```bash
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```bash
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```bash
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin to PATH environment variable.

**Next Steps** To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*.
Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller & VHCI

Overview

Instructions

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h

Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`

Set BLE TX power Connection Tx power should only be set after connection created.

Return ESP_OK - success, other - failed

Parameters

- `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

Return >= 0 - Power level, < 0 - Invalid

Parameters

- `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Return** ESP_OK - success, other - failed

**Parameters**
- min_power_level: The minimum power level
- max_power_level: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** ESP_OK - success, other - failed

**Parameters**
- min_power_level: The minimum power level
- max_power_level: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)
```

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP_OK - success, other - failed

**Parameters**
- data_path: SCO data path

```c
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** ESP_OK - success, other - failed

**Parameters**
- cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

```c
esp_err_t esp_bt_controller_deinit (void)
```

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- mode: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp bt controller init().

```c
esp_err_t esp_bt_controller_disable (void)
```

Disable BT controller.

**Return** ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_get_status (void)
```

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

```c
bool esp_vhci_host_check_send_available (void)
```

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.
Return  true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
  • data: the packet point
  • len: the packet length

esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return  ESP_OK - success, ESP_FAIL - failed

Parameters
  • callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return  ESP_OK - success, other - failed

Parameters
  • mode: the mode want to release memory

esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- mode: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable Bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**
- ESP_OK : success
- other : failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off
Structures

struct esp_bt_controller_config_t
Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

- uint16_t controller_task_stack_size
  Bluetooth controller task stack size
- uint8_t controller_task_prio
  Bluetooth controller task priority
- uint8_t hci_uart_no
  If use UART1/2 as HCI IO interface, indicate UART number
- uint32_t hci_uart_baudrate
  If use UART1/2 as HCI IO interface, indicate UART baudrate
- uint8_t scan_duplicate_mode
  Scan duplicate mode
- uint8_t scan_duplicate_type
  Scan duplicate type
- uint16_t normal_adv_size
  Normal adv size for scan duplicate
- uint16_t mesh_adv_size
  Mesh adv size for scan duplicate
- uint16_t send_adv_reserved_size
  Controller minimum memory value
- uint8_t controller_debug_flag
  Controller debug log flag
- uint8_t mode
  Controller mode: BR/EDR, BLE or Dual Mode
- uint8_t ble_max_conn
  BLE maximum connection numbers
- uint8_t bt_max_acl_conn
  BR/EDR maximum ACL connection numbers
- uint8_t bt_sco_datapath
  SCO data path, i.e. HCI or PCM module
- bool auto_latency
  BLE auto latency, used to enhance classic BT performance
- bool bt_legacy_auth_vs_evt
  BR/EDR Legacy auth complete event required to protect from BIAS attack
- uint8_t bt_max_sync_conn
  BR/EDR maximum ACL connection numbers. Effective in menuconfig
- uint8_t ble_sca
  BLE low power crystal accuracy index
- uint8_t pcm_role
  PCM role (master & slave)
- uint8_t pcm_polar
  PCM polar trig (falling clk edge & rising clk edge)
Chapter 2. API Reference

bool hli
Using high level interrupt or not

uint32_t magic
Magic number

struct esp_vhci_host_callback

\(\text{esp_vhci_host_callback}\) used for vhci call host function to notify what host need to do

Public Members

void (*\text{notify_host_send_available}) (void)
callback used to notify that the host can send packet to controller

int (*\text{notify_host_recv}) (uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
\(\text{esp_vhci_host_callback}\) used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t

Bluetooth mode for controller enable/disable.

Values:

ESP_BT_MODE_IDLE = 0x00
Bluetooth is not running

ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]

BLE sleep clock accuracy(SCA), values for ble_sca field in \text{esp_bt_controller_config_t}, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm
ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initialised/de-initialised status.
Values:

ESP_BT_CONTROLLER_STATUS_IDLE = 0
ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.
Values:

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
For connection handle 1
ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
For connection handle 2
ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
For connection handle 3

For connection handle 7
ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers
enum esp_power_level_t

Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
  Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
  Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
  Corresponding to -6dbm

ESP_PWR_LVL_N3 = 3
  Corresponding to -3dbm

ESP_PWR_LVL_N0 = 4
  Corresponding to 0dbm

ESP_PWR_LVL_P3 = 5
  Corresponding to +3dbm

ESP_PWR_LVL_P6 = 6
  Corresponding to +6dbm

ESP_PWR_LVL_P9 = 7
  Corresponding to +9dbm

ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
  Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
  Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
  Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
  Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
  Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
  Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
  Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
  Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t

Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
  data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
  data over PCM interface

2.1.2 BT COMMON

BT GENERIC DEFINES
Overview

Application Example

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_btDefs.h

Structures

```c
struct esp_bt_uuid_t
UUID type.
```

Public Members

```c
uint16_t len
    UUID length, 16bit, 32bit or 128bit
uint16_t uuid16
    16bit UUID
uint32_t uuid32
    32bit UUID
uint8_t uuid128[ESP_UUID_LEN_128]
    128bit UUID
```

Macros

```c
ESP_BLUEDROID_STATUS_CHECK(status)
ESP_BT_OCTET16_LEN
ESP_BT_OCTET8_LEN
ESP_DEFAULT_GATT_IF
    Default GATT interface id.
ESP_BLE_CONN_INT_MIN
    relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h
ESP_BLE_CONN_INT_MAX
    relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_LATENCY_MAX
    relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_SUP_TOUT_MIN
    relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h
ESP_BLE_CONN_SUP_TOUT_MAX
    relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_PARAM_UNDEF
ESP_BLE_SCAN_PARAM_UNDEF
ESP_BLE_IS_VALID_PARAM(x, min, max)
    Check the param is valid or not.
```
ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128
ESP_BD_ADDR_LEN
   Bluetooth address length.
ESP_BLE_ENC_KEY_MASK
   Used to exchange the encryption key in the init key & response key.
ESP_BLE_ID_KEY_MASK
   Used to exchange the IRK key in the init key & response key.
ESP_BLE_CSR_KEY_MASK
   Used to exchange the CSRK key in the init key & response key.
ESP_BLE_LINK_KEY_MASK
   Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.
ESP_APP_ID_MIN
   Minimum of the application id.
ESP_APP_ID_MAX
   Maximum of the application id.
ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

**Type Definitions**

enum esp_bt_dev_type_t
Bluetooth device type.
Values:
ESP_BT_DEVICE_TYPE_BREDR = 0x01
ESP_BT_DEVICE_TYPE_BLE = 0x02
ESP_BT_DEVICE_TYPE_DUMO = 0x03

enum esp_ble_addr_type_t
BLE device address type.
Values:
BLE_ADDR_TYPE_PUBLIC = 0x00
BLE_ADDR_TYPE_RANDOM = 0x01
BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
BLE_ADDR_TYPE_RPA_RANDOM = 0x03

enum esp_ble_wl_addr_type_t
white list address type
Values:
BLE_WL_ADDR_TYPE_PUBLIC = 0x00
BLE_WL_ADDR_TYPE_RANDOM = 0x01

BT MAIN API

Overview Instructions

Application Example Instructions

API Reference

Header File
• components/bt/host/bluedroid/api/include/api/esp_bt_main.h
Functions

**esp_bluedroid_status_t esp_bluedroid_get_status (void)**

Get bluetooth stack status.

**Return**

- Bluetooth stack status

**esp_err_t esp_bluedroid_enable (void)**

Enable bluetooth, must after esp_bluedroid_init().

**Return**

- ESP_OK : Succeed
- Other : Failed

**esp_err_t esp_bluedroid_disable (void)**

Disable bluetooth, must prior to esp_bluedroid_deinit().

**Return**

- ESP_OK : Succeed
- Other : Failed

**esp_err_t esp_bluedroid_init (void)**

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**

- ESP_OK : Succeed
- Other : Failed

**esp_err_t esp_bluedroid_deinit (void)**

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**

- ESP_OK : Succeed
- Other : Failed

Enumerations

**enum esp_bluedroid_status_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**

- **ESP_BLUEDROID_STATUS_UNINITIALIZED** = 0
  Bluetooth not initialized
- **ESP_BLUEDROID_STATUS_INITIALIZED**
  Bluetooth initialized but not enabled
- **ESP_BLUEDROID_STATUS_ENABLED**
  Bluetooth initialized and enabled

BT DEVICE APIs

**Overview**

Bluetooth device reference APIs.

**Instructions**

**Application Example**

**Instructions**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
Functions

const uint8_t *esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Return bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name (const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return
• ESP_OK : Succeed
• ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL : others

Parameters
• [in] name:: device name to be set

2.1.3 BT LE

GAP API

Overview Instructions

Application Example Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough
• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] callback: callback function

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

Return
• ESP_OK : success
• other : failed
Chapter 2. API Reference

Parameters

• [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

\[\text{esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)}\]

This function is called to set scan parameters.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

\[\text{esp_err_t esp_ble_gap_start_scanning(uint32_t duration)}\]

This procedure keep the device scanning the peer device which advertising on the air.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] duration: Keeping the scanning time, the unit is second.

\[\text{esp_err_t esp_ble_gap_stop_scanning(void)}\]

This function call to stop the device scanning the peer device which advertising on the air.

Return

• ESP_OK : success
• other : failed

\[\text{esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)}\]

This function is called to start advertising.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] adv_params: pointer to User defined adv_params data structure.

\[\text{esp_err_t esp_ble_gap_stop_advertising(void)}\]

This function is called to stop advertising.

Return

• ESP_OK : success
• other : failed

\[\text{esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)}\]

Update connection parameters, can only be used when connection is up.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] params: - connection update parameters

\[\text{esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)}\]

This function is to set maximum LE data packet size.

Return

• ESP_OK : success
• other : failed

\[\text{esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)}\]

This function sets the static Random Address and Non-Resolvable Private Address for the application.
Chapter 2. API Reference

Return

• ESP_OK: success
• other : failed

Parameters

• [in] rand_addr: the random address which should be setting

*esp_err_t* esp_ble_gap_clear_rand_addr (void)

This function clears the random address for the application.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] rand_addr: the random address which should be setting

*esp_err_t* esp_ble_gap_config_local_privacy (bool privacy_enable)

Enable/disable privacy on the local device.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] privacy_enable: enable/disable privacy on remote device.

*esp_err_t* esp_ble_gap_config_local_icon (uint16_t icon)

*set local gap appearance icon*

Return

• ESP_OK : success
• other : failed

Parameters

• [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

*esp_err_t* esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)

Add or remove device from white list.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
• [in] remote_bda: the remote device address add/remove from the white list.
• [in] wl_addr_type: whitelist address type

*esp_err_t* esp_ble_gap_clear_whitelist (void)

*Clear all white list.*

Return

• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_get_whitelist_size (uint16_t* length)

*Get the whitelist size in the controller.*

Return

• ESP_OK : success
• other : failed

Parameters

• [out] length: the white list length.
```c
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

```c
esp_err_t esp_ble_gap_set_device_name(const char *name)
```

Set device name to the local device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] name: device name.

```c
esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
```

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] local_used_addr: current local used ble address (six bytes)
- [in] addr_type: ble address type

```c
uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
```

This function is called to get ADV data for a specific type.

**Return**
pointer of ADV data

**Parameters**
- [in] adv_data: pointer of ADV data which to be resolved
- [in] type: finding ADV data type
- [out] length: return the length of ADV data not including type

```c
esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] raw_data: raw advertising data
- [in] raw_data_len: raw advertising data length, less than 31 bytes

```c
esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
Chapter 2. API Reference

- [in] raw_data: raw scan response data
- [in] raw_data_len: raw scan response data length, less than 31 bytes

**esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)**

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_addr: The remote connection device address.

**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)**

This function is called to add a device info into the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)**

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)**

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value, uint8_t len)**

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:
1. Set bit ESP_LE_AUTH_REQ_SC_ONLY (param_type is ESP_BLE_SM_AUTHEN_REQ_MODE), bit ESP_LE_AUTH_BOND and bit ESP_LE_AUTH_REQ_MITM is optional as required.
2. Set to ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE (param_type is ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH).

Return - ESP_OK : success
• other : failed

Parameters
• [in] param_type:: the type of the param which to be set
• [in] value:: the param value
• [in] len:: the length of the param value

esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)
Grant security request access.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr:: BD address of the peer
• [in] accept::: accept the security request or not

esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr:: the address of the peer device need to encryption
• [in] sec_act::: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr:: BD address of the peer
• [in] accept::: passkey entry successful or declined.
• [in] passkey::: passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)
Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr:: BD address of the peer device
• [in] accept::: numbers to compare are the same or different.

esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr:: BD address of the peer device

int esp_ble_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
• ESP_FAIL : failed
**esp_err_t** esp_ble_get_bond_device_list**(int* dev_num, esp_ble_bond_dev_t* dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**esp_err_t** esp_ble_oob_req_reply**(esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)**

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Return**
- ESP_OK : success
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device.
- [in] TK: TK value, the TK value shall be a 128-bit random number
- [in] len: length of tk, should always be 128-bit

**esp_err_t** esp_ble_gap_disconnect**(esp_bd_addr_t remote_device)**

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] remote_device: BD address of the peer device

**esp_err_t** esp_ble_get_current_conn_params**(esp_bd_addr_t bd_addr, esp_gap_conn_params_t* conn_params)**

This function is called to read the connection parameters information of the device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device.
- [out] conn_params: the connection parameters information

**esp_err_t** esp_gap_ble_set_channels**(esp_gap_ble_channels channels)**

BLE set channels.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
- [in] channels: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**esp_err_t** esp_gap_ble_set_authorization**(esp_bd_addr_t bd_addr, bool authorize)**

This function is called to authorized a link after Authentication(MITM protection)

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.
**esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)**

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Return**  
- ESP_OK : success  
- other : failed  

**Parameters**  
- [in] bd_addr : BD address of the peer device

**esp_err_t esp_ble_gap_set_preferred_default_phy (esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)**

This function is used to allow the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return**  
- ESP_OK : success  
- other : failed  

**Parameters**  
- [in] tx_phy_mask : indicates the transmitter PHYs that the Host prefers the Controller to use  
- [in] rx_phy_mask : indicates the receiver PHYs that the Host prefers the Controller to use

**esp_err_t esp_ble_gap_set_preferred_phy (esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)**

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return**  
- ESP_OK : success  
- other : failed  

**Parameters**  
- [in] bd_addr : remote address  
- [in] all_phys_mask : a bit field that allows the Host to specify  
- [in] tx_phy_mask : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use  
- [in] rx_phy_mask : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use  
- [in] phy_options : a bit field that allows the Host to specify options for PHYs

**esp_err_t esp_ble_gap_ext_adv_set_rand_addr (uint8_t instance, esp_bd_addr_t rand_addr)**

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return**  
- ESP_OK : success  
- other : failed  

**Parameters**  
- [in] instance : Used to identify an advertising set  
- [in] rand_addr : Random Device Address

**esp_err_t esp_ble_gap_ext_adv_set_params (uint8_t instance, esp_ble_gap_ext_adv_params_t *params)**

This function is used by the Host to set the advertising parameters.

**Return**  
- ESP_OK : success  
- other : failed  

**Parameters**  
- [in] instance : identifies the advertising set whose parameters are being configured.  
- [in] params : advertising parameters

**esp_err_t esp_ble_gap_config_ext_adv_data_raw (uint8_t instance, uint16_t length, const uint8_t *data)**

This function is used to set the data used in advertising PDUs that have a data field.

**Return**  
- ESP_OK : success
**Chapter 2. API Reference**

- other : failed

**Parameters**
- [in] instance:: identifies the advertising set whose data are being configured
- [in] length:: data length
- [in] data:: data information

```c
esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length,
                                                  const uint8_t* scan_rsp_data)
```

This function is used to provide scan response data used in scanning response PDUs.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance:: identifies the advertising set whose data are being configured.
- [in] length:: data length
- [in] data:: data information

```c
esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)
```

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] num_adv:: Number of advertising sets to enable or disable
- [in] ext_adv:: adv parameters

```c
esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t *ext_adv_inst)
```

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] num_adv:: Number of advertising sets to enable or disable
- [in] ext_adv_inst:: adv instance

```c
esp_err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)
```

This function is used to remove an advertising set from the Controller.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance:: Used to identify an advertising set

```c
esp_err_t esp_ble_gap_ext_adv_set_clear(void)
```

This function is used to remove all existing advertising sets from the Controller.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance:: Used to identify an advertising set

```c
esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)
```

This function is used by the Host to set the parameters for periodic advertising.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance:: identifies the advertising set whose periodic advertising parameters are being configured.
- [in] params:: periodic adv parameters
**esp_err_t esp_ble_gap_config_periodic_adv_data_raw**

```c
uint8_t instance, uint16_t length,
const uint8_t *data)
```

This function is used to set the data used in periodic advertising PDUs.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
- [in] length: the length of periodic data
- [in] data: periodic data information

**esp_err_t esp_ble_gap_periodic_adv_start**

```c
(uint8_t instance)
```

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_periodic_adv_stop**

```c
(uint8_t instance)
```

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_set_ext_scan_params**

```c
(const esp_ble_ext_scan_params_t *params)
```

This function is used to set the extended scan parameters to be used on the advertising channels.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] params: scan parameters

**esp_err_t esp_ble_gap_start_ext_scan**

```c
(uint32_t duration, uint16_t period)
```

This function is used to enable scanning.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] duration: Scan duration
- [in] period: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

**esp_err_t esp_ble_gap_stop_ext_scan**

```c
(void)
```

This function is used to disable scanning.

**Return**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync**

```c
(const esp_ble_gap_periodic_adv_sync_params_t *params)
```

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] params: sync parameters

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel**

```c
(void)
```

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Return**
- ESP_OK : success
• other : failed

\textit{esp_err_t esp_ble_gap_periodic_adv_sync_terminate} (uint16_t \textit{sync\_handle})

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

\textbf{Return} - ESP_OK : success
• other : failed

\textbf{Parameters}
• [in] \textit{sync\_handle} : : identify the periodic advertiser

\textit{esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list} (esp_ble_addr_type_t \textit{addr\_type},
esp_bd_addr_t \textit{addr}, uint8_t \textit{sid})

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

\textbf{Return} - ESP_OK : success
• other : failed

\textbf{Parameters}
• [in] \textit{addr\_type} : : address type
• [in] \textit{addr} : : Device Address
• [in] \textit{sid} : : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

\textit{esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list} (esp_ble_addr_type_t \textit{addr\_type},
esp_bd_addr_t \textit{addr}, uint8_t \textit{sid})

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

\textbf{Return} - ESP_OK : success
• other : failed

\textbf{Parameters}
• [in] \textit{addr\_type} : : address type
• [in] \textit{addr} : : Device Address
• [in] \textit{sid} : : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

\textit{esp_err_t esp_ble_gap_periodic_adv_clear_dev} (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

\textbf{Return} - ESP_OK : success
• other : failed

\textbf{Parameters}

\textit{esp_err_t esp_ble_gap_prefer_ext_connect_params_set} (esp_bd_addr_t \textit{addr},
esp_ble_gap_phy_mask_t \textit{phy\_mask},
const esp_ble_gap_conn_params_t *\textit{phy\_1m\_conn\_params},
const esp_ble_gap_conn_params_t *\textit{phy\_2m\_conn\_params},
const esp_ble_gap_conn_params_t *\textit{phy\_coded\_conn\_params})

This function is used to set aux connection parameters.

\textbf{Return} - ESP_OK : success
• other : failed

\textbf{Parameters}
• [in] \textit{addr} : : device address
• [in] \textit{phy\_mask} : : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
• [in] \textit{phy\_1m\_conn\_params} : : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
• [in] \textit{phy\_2m\_conn\_params} : : Connection parameters for the LE 2M PHY are provided.
• [in] \textit{phy\_coded\_conn\_params} : : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

esp_gap_search_evt_t search_evt
    Search event type

esp_bd_addr_t bda
    Bluetooth device address which has been searched

esp_bt_dev_type_t dev_type
    Device type

esp_ble_addr_type_t ble_addr_type
    Ble device address type

esp_ble_evt_type_t ble_evt_type
    Ble scan result event type

int rssi
    Searched device’s RSSI

uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]
    Received EIR

int flag
    Advertising data flag bit

int num_resps
    Scan result number

uint8_t adv_data_len
    Adv data length

uint8_t scan_rsp_len
    Scan response length

uint32_t num_dis
    The number of discard packets

struct ble_scan_rsp_data_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
    Indicate the set scan response data operation success status
struct ble_scan_rsp_data_raw_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the set raw advertising data operation success status

struct ble_scan_start_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate scan start operation success status

struct ble_scan_stop_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate scan stop operation success status

struct ble_set_channels_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.

Public Members

esp_bt_status_t stat
BLE set channel status

struct ble_set_ext_scan_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate extend advertising parameters set status

struct ble_set_perf_def_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate perf default phy set status

struct ble_set_perf_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
Public Members

\textit{esp\_bt\_status\_t status}
Indicate perf phy set status

\textbf{struct ble\_set\_rand\_cmpl\_evt\_param}

\textit{#include <esp\_gap\_ble\_api.h> ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT.}

Public Members

\textit{esp\_bt\_status\_t status}
Indicate set static rand address operation success status

\textbf{struct ble\_update\_conn\_params\_evt\_param}

\textit{#include <esp\_gap\_ble\_api.h> ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT.}

Public Members

\textit{esp\_bt\_status\_t status}
Indicate update connection parameters success status

\textit{esp\_bd\_addr\_t bda}
Bluetooth device address

uint16\_t \textbf{min\_int}
Min connection interval

uint16\_t \textbf{max\_int}
Max connection interval

uint16\_t \textbf{latency}
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t \textbf{conn\_int}
Current connection interval

uint16\_t \textbf{timeout}
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

\textbf{struct ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param}

\textit{#include <esp\_gap\_ble\_api.h> ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT.}

Public Members

\textit{esp\_bt\_status\_t status}
Indicate update duplicatescan exceptional list operation success status

uint8\_t \textbf{subcode}
Define in esp\_bt\_duplicate\_exceptional\_subcode\_type\_t

uint16\_t \textbf{length}
The length of device\_info

\textit{esp\_duplicate\_info\_t device\_info}
device information, when subcode is ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN, the value is invalid

\textbf{struct ble\_update\_whitelist\_cmpl\_evt\_param}

\textit{#include <esp\_gap\_ble\_api.h> ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT.}
Public Members

*esp_bt_status_t* status
Indicate the add or remove whitelist operation success status

*esp_ble_wl_operation_t* wl_operation
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success,
ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

struct esp_ble_adv_params_t
Advertising parameters.

Public Members

uint16_t adv_int_min
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t adv_int_max
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

*esp_ble_adv_type_t* adv_type
Advertising type

*esp_ble_addr_type_t* own_addr_type
Owner bluetooth device address type

*esp_bd_addr_t* peer_addr
Peer device bluetooth device address

*esp_ble_addr_type_t* peer_addr_type
Peer device bluetooth device address type, only support public address type and random address type

*esp_ble_adv_channel_t* channel_map
Advertising channel map

*esp_ble_adv_filter_t* adv_filter_policy
Advertising filter policy

struct esp_ble_adv_data_t
Advertising data content, according to "Supplement to the Bluetooth Core Specification".

Public Members

bool set_scan_rsp
Set this advertising data as scan response or not

bool include_name
Advertising data include device name or not

bool include_txpower
Advertising data include TX power

int min_interval
Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalMin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.
int max_interval
Advertising data show slave preferred connection max interval. The connection interval in the following manner: \( \text{connIntervalMax} = \text{Conn Interval Max} \times 1.25 \) ms \( \text{Conn Interval Max} \) range: 0x0006 to 0x0C80 \( \text{Conn Interval Max} \) shall be equal to or greater than the \( \text{Conn Interval Min} \). Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
External appearance of device

uint16_t manufacturer_len
Manufacturer data length

uint8_t *p_manufacturer_data
Manufacturer data point

uint16_t service_data_len
Service data length

uint8_t *p_service_data
Service data point

uint16_t service_uuid_len
Service uuid length

uint8_t *p_service_uuid
Service uuid array point

uint8_t flag
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

Public Members

exp_ble_scan_type_t scan_type
Scan type

exp_ble_addr_type_t own_addr_type
Owner address type

exp_ble_scan_filter_t scan_filter_policy
Scan filter policy

uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

exp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLESCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
connection parameters information
Public Members

uint16_t **interval**
connection interval

uint16_t **latency**
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

```c
struct esp_ble_conn_update_params_t
Connection update parameters.
```

Public Members

```c
struct esp_bd_addr_t bda
Bluetooth device address
```

uint16_t **min_int**
Min connection interval

uint16_t **max_int**
Max connection interval

uint16_t **latency**
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

```c
struct esp_ble_pkt_data_length_params_t
BLE pkt date length keys.
```

Public Members

uint16_t **rx_len**
pkt rx data length value

uint16_t **tx_len**
pkt tx data length value

```c
struct esp_ble_penc_keys_t
BLE encryption keys.
```

Public Members

```c
esp_bt_octet16_t ltk
The long term key
```

```c
esp_bt_octet8_t rand
The random number
```

uint16_t **ediv**
The ediv value

uint8_t **sec_level**
The security level of the security link

uint8_t **key_size**
The key size(7~16) of the security link
Chapter 2. API Reference

```
struct esp_ble_pcsrk_keys_t
BLE CSRK keys.

**Public Members**

uint32_t counter
The counter

esp_bt_octet16_t csrk
The csrk key

uint8_t sec_level
The security level

struct esp_ble_pid_keys_t
BLE pid keys.

**Public Members**

esp_bt_octet16_t irk
The irk value

esp_ble_addr_type_t addr_type
The address type

esp_bd_addr_t static_addr
The static address

struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.

**Public Members**

esp_bt_octet16_t ltk
The long term key

uint16_t div
The div value

uint8_t key_size
The key size of the security link

uint8_t sec_level
The security level of the security link

struct esp_ble_lcsrk_keys
BLE SRK keys.

**Public Members**

uint32_t counter
The counter value

uint16_t div
The div value

uint8_t sec_level
The security level of the security link

esp_bt_octet16_t csrk
The csrk key value
```
struct esp_ble_sec_key_notif_t
    Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t *bd_addr
    peer address

uint32_t passkey
    the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
    Structure of the security request.

Public Members

esp_bd_addr_t *bd_addr
    peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value

Public Members

esp_ble_key_mask_t *key_mask
    the key mask to indicate which key is present

esp_ble_penc_keys_t *penc_key
    received peer encryption key

esp_ble_pcsrk_keys_t *pcsrk_key
    received peer device SRK

esp_ble_pid_keys_t *pid_key
    peer device ID key

struct esp_ble_bond_dev_t
    struct type of the bond device value

Public Members

esp_bd_addr_t *bd_addr
    peer address

esp_ble_bond_key_info_t *bond_key
    the bond key information

struct esp_ble_key_t
    union type of the security key value

Public Members

esp_bd_addr_t *bd_addr
    peer address

esp_ble_key_type_t *key_type
    key type of the security link

esp_ble_key_value_t *p_key_value
    the pointer to the key value
struct esp_ble_local_id_keys_t
structure type of the ble local id keys value

Public Members

esp_bt_octet16_t ir
the 16 bits of the ir value

esp_bt_octet16_t irk
the 16 bits of the ir key value

esp_bt_octet16_t dhk
the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t bd_addr
BD address peer device.

bool key_present
Valid link key value in key element

esp_link_key key
Link key associated with peer device.

uint8_t key_type
The type of Link Key

bool success
TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
Peer device address type

esp_bt_dev_type_t dev_type
Device type

esp_ble_auth_req_t auth_mode
authentication mode

struct esp_ble_gap_ext_adv_params_t
ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t type
ext adv type

uint32_t interval_min
ext adv minimum interval

uint32_t interval_max
ext adv maximum interval

esp_ble_adv_channel_t channel_map
ext adv channel map
\texttt{esp\_ble\_addr\_type\_t} \texttt{own\_addr\_type}  
ext adv own addresss type

\texttt{esp\_ble\_addr\_type\_t} \texttt{peer\_addr\_type}  
ext adv peer address type

\texttt{esp\_bd\_addr\_t} \texttt{peer\_addr}  
ext adv peer address

\texttt{esp\_ble\_adv\_filter\_t} \texttt{filter\_policy}  
ext adv filter policy

\texttt{int8\_t} \texttt{tx\_power}  
ext adv tx power

\texttt{esp\_ble\_gap\_pri\_phy\_t} \texttt{primary\_phy}  
ext adv primary phy

\texttt{uint8\_t} \texttt{max\_skip}  
ext adv maximum skip

\texttt{esp\_ble\_gap\_phy\_t} \texttt{secondary\_phy}  
ext adv secondary phy

\texttt{uint8\_t} \texttt{sid}  
ext adv sid

\texttt{bool} \texttt{scan\_req\_notif}  
ext adv saen request event notify

\texttt{struct esp\_ble\_ext\_scan\_cfg\_t}  
ext scan config

**Public Members**

\texttt{esp\_ble\_scan\_type\_t} \texttt{scan\_type}  
ext scan type

\texttt{uint16\_t} \texttt{scan\_interval}  
ext scan interval

\texttt{uint16\_t} \texttt{scan\_window}  
ext scan window

\texttt{struct esp\_ble\_ext\_scan\_params\_t}  
ext scan parameters

**Public Members**

\texttt{esp\_ble\_addr\_type\_t} \texttt{own\_addr\_type}  
ext scan own addresss type

\texttt{esp\_ble\_scan\_filter\_t} \texttt{filter\_policy}  
ext scan filter policy

\texttt{esp\_ble\_scan\_duplicate\_t} \texttt{scan\_duplicate}  
ext scan duplicate scan

\texttt{esp\_ble\_ext\_scan\_cfg\_mask\_t} \texttt{cfg\_mask}  
ext scan config mask

\texttt{esp\_ble\_ext\_scan\_cfg\_t} \texttt{uncoded\_cfg}  
ext scan uncoded config parameters

\texttt{esp\_ble\_ext\_scan\_cfg\_t} \texttt{coded\_cfg}  
ext scan coded config parameters
struct esp_ble_gap_conn_params_t
create extend connection parameters

Public Members

uint16_t scan_interval
init scan interval

uint16_t scan_window
init scan window

uint16_t interval_min
minimum interval

uint16_t interval_max
maximum interval

uint16_t latency
ext scan type

uint16_t supervision_timeout
connection supervision timeout

uint16_t min_ce_len
minimum ce length

uint16_t max_ce_len
maximum ce length

struct esp_ble_gap_ext_adv_t
extend adv enable parameters

Public Members

uint8_t instance
advertising handle

int duration
advertising duration

int max_events
maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
periodic adv parameters

Public Members

uint16_t interval_min
periodic advertising minimum interval

uint16_t interval_max
periodic advertising maximum interval

uint8_t properties
periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
periodic adv sync parameters
Public Members

`esp_ble_gap_sync_t` filter_policy
periodic advertising sync filter policy

uint8_t sid
periodic advertising sid

`esp_ble_addr_type_t` addr_type
periodic advertising address type

`esp_bd_addr_t` addr
periodic advertising address

uint16_t skip
the maximum number of periodic advertising events that can be skipped

uint16_t sync_timeout
synchronization timeout

`struct esp_ble_gap_ext_adv_report_t`
extend adv report parameters

Public Members

`esp_ble_gap_adv_type_t` event_type
extend advertising type

uint8_t addr_type
extend advertising address type

`esp_bd_addr_t` addr
extend advertising address

`esp_ble_gap_pri_phy_t` primary_phy
extend advertising primary phy

`esp_ble_gap_phy_t` secondly_phy
extend advertising secondary phy

uint8_t sid
extend advertising sid

uint8_t tx_power
extend advertising tx power

int8_t rssi
extend advertising rssi

uint16_t per_adv_interval
periodic advertising interval

uint8_t dir_addr_type
direct address type

`esp_bd_addr_t` dir_addr
direct address

`esp_ble_gap_ext_adv_data_status_t` data_status
data type

uint8_t adv_data_len
extend advertising data length

uint8_t adv_data[251]
extend advertising data
struct esp_ble_gap_periodic_adv_report_t
   periodic adv report parameters

Public Members

uint16_t sync_handle
   periodic advertising train handle

uint8_t tx_power
   periodic advertising tx power

int8_t rssi
   periodic advertising rssi

esp_ble_gap_ext_adv_data_status_t data_status
   periodic advertising data type

uint8_t data_length
   periodic advertising data length

uint8_t data[251]
   periodic advertising data

struct esp_ble_gap_periodic_adv_sync_estab_t
   periodic adv sync establish parameters

Public Members

uint8_t status
   periodic advertising sync status

uint16_t sync_handle
   periodic advertising train handle

uint8_t sid
   periodic advertising sid

esp_ble_addr_type_t addr_type
   periodic advertising address type

esp_bd_addr_t adv_addr
   periodic advertising address

esp_ble_gap_phy_t adv_phy
   periodic advertising adv phy type

uint16_t period_adv_interval
   periodic advertising interval

uint8_t adv_clk_accuracy
   periodic advertising clock accuracy

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC
   BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag

typedef uint8_t esp_ble_auth_req_t
  combination of the above bit pattern

typedef uint8_t esp_ble_io_cap_t
  combination of the io capability

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]

typedef uint16_t esp_ble_ext_adv_type_mask_t

typedef uint8_t esp_ble_gap_phy_t

typedef uint8_t esp_ble_gap_all_phys_t

typedef uint8_t esp_ble_gap_pri_phy_t

typedef uint8_t esp_ble_gap_phy_mask_t

typedef uint16_t esp_ble_gap_prefer_phy_options_t

typedef uint8_t esp_ble_ext_scan_cfg_mask_t

typedef uint8_t esp_ble_gap_ext_adv_data_status_t

typedef uint8_t esp_ble_gap_sync_t

typedef uint8_t esp_ble_gap_adv_type_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_gap_ble_cb_param_t *param)
  GAP callback function type.
Parameters

- **event**: Event type
- **param**: Point to callback parameter, currently is union type

Enumerations

define esp_gap_ble_cb_event_t

GAP BLE callback event type.

Values:

- **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0**
  - When advertising data set complete, the event comes
- **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**
  - When scan response data set complete, the event comes
- **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**
  - When scan parameters set complete, the event comes
- **ESP_GAP_BLE_SCAN_RESULT_EVT**
  - When one scan result ready, the event comes each time
- **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**
  - When raw advertising data set complete, the event comes
- **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**
  - When raw advertising data set complete, the event comes
- **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**
  - When start advertising complete, the event comes
- **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**
  - When start scan complete, the event comes
- **ESP_GAP_BLE_AUTH_CMPL_EVT = 8**
- **ESP_GAP_BLE_KEY_EVT**
- **ESP_GAP_BLE_SEC_REQ_EVT**
- **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**
- **ESP_GAP_BLE_PASSKEY_REQ_EVT**
- **ESP_GAP_BLE_OOB_REQ_EVT**
- **ESP_GAP_BLE_LOCAL_IR_EVT**
- **ESP_GAP_BLE_LOCAL_ER_EVT**
- **ESP_GAP_BLE_NC_REQ_EVT**
- **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
  - When stop adv complete, the event comes
- **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
  - When stop scan complete, the event comes
- **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19**
  - When set the static rand address complete, the event comes
- **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
  - When update connection parameters complete, the event comes
- **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**
  - When pkt length complete, the event comes
- **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**
  - When Enable/disable privacy on the local device complete, the event comes
ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
When setting BLE channels complete, the event comes

ESP_GAP_BLE_READ_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT

ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04

enum esp_ble_adv_channel_t
Advertising channel mask.

Values:
ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02
ADV_CHNL_39 = 0x04
ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
Values:
ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
Allow both scan and connection requests from anyone.
ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
Allow both scan req from White List devices only and connection req from anyone.
ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
Allow both scan req from anyone and connection req from White List devices only.
ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
Values:
ESP_BLE_SEC_ENCRYPT = 1
ESP_BLE_SEC_ENCRYPT_NO_MITM
ESP_BLE_SEC_ENCRYPT_MITM

enum esp_ble_sm_param_t
Values:
ESP_BLE_SM_PASSKEY = 0
ESP_BLE_SM_AUTHEN_REQ_MODE
ESP_BLE_SM_IOCAP_MODE
Chapter 2. API Reference

ESP_BLE_SM_OOB_SUPPORT
ESP_BLE_APP_ENC_KEY_SIZE
ESP_BLE_SM_MAX_PARAM

enum esp_ble_scan_type_t
Ble scan type.
Values:

BLE_SCAN_TYPE_PASSIVE = 0x0
Passive scan

BLE_SCAN_TYPE_ACTIVE = 0x1
Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:

BLE_SCAN_FILTER_ALLOW_ALL = 0x0
Accept all:
1. advertisement packets except directed advertising packets not addressed to this device (default).

BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
Accept only:
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
Accept all:
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:

BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received

BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host
BLE_SCAN_DUPLICATE_MAX = 0x2
0x02 - 0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DISC_BLE_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t

Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_BT_duplicate_exceptional_subcode_type_t

Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list
ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ….

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ….

enum esp_duplicate_scan_exceptional_list_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
duplicate scan exceptional addr list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
duplicate scan exceptional mesh link ID list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
duplicate scan exceptional mesh beacon type list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)
duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)
duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF
duplicate scan exceptional all list

GATTDefines

Overview Instructions

Application Example Instructions

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t
#include <esp_gatt_defs.h> GATT remote read request response type.
Public Members

`esp_gatt_value_t attr_value`
- Gatt attribute structure

`uint16_t handle`
- Gatt attribute handle

Structures

`struct esp_gatt_id_t`
- Gatt id, include uuid and instance id.

Public Members

`esp_bt_uuid_t uuid`
- UUID

`uint8_t inst_id`
- Instance id

`struct esp_gatt_svc_id_t`
- Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

`esp_gatt_id_t id`
- Gatt id, include uuid and instance

`bool is_primary`
- This service is primary or not

`struct esp_attr_desc_t`
- Attribute description (used to create database)

Public Members

`uint16_t uuid_length`
- UUID length

`uint8_t *uuid_p`
- UUID value

`uint16_t perm`
- Attribute permission

`uint16_t max_length`
- Maximum length of the element

`uint16_t length`
- Current length of the element

`uint8_t *value`
- Element value array

`struct esp_attr_control_t`
- attribute auto response flag
Public Members

```c
uint8_t auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.
```

```c
struct esp_gatts_attr_db_t
attribute type added to the gatt server database
```

Public Members

```c
esp_attr_control_t attr_control
The attribute control type
```

```c
esp_attr_desc_t att_desc
The attribute type
```

```c
struct esp_attr_value_t
set the attribute value type
```

Public Members

```c
uint16_t attr_max_len
attribute max value length
```

```c
uint16_t attr_len
attribute current value length
```

```c
uint8_t* attr_value
the pointer to attribute value
```

```c
struct esp_gatts_incl_svc_desc_t
Gatt include service entry element.
```

Public Members

```c
uint16_t start_hdl
Gatt start handle value of included service
```

```c
uint16_t end_hdl
Gatt end handle value of included service
```

```c
uint16_t uuid
Gatt attribute value UUID of included service
```

```c
struct esp_gatts_incl128_svc_desc_t
Gatt include 128 bit service entry element.
```

Public Members

```c
uint16_t start_hdl
Gatt start handle value of included 128 bit service
```

```c
uint16_t end_hdl
Gatt end handle value of included 128 bit service
```

```c
struct esp_gatt_value_t
Gatt attribute value.
```
Public Members

```c
uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value
```

```c
uint16_t handle
    Gatt attribute handle
```

```c
uint16_t offset
    Gatt attribute value offset
```

```c
uint16_t len
    Gatt attribute value length
```

```c
uint8_t auth_req
    Gatt authentication request
```

```c
struct esp_gatt_attribute_value
    Connection parameters information.
```

```c
struct esp_gatt_conn_params_t
    Connection parameters information.
```

```c
uint16_t interval
    connection interval
```

```c
uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```c
uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_gattc_multi_t
    read multiple attribute
```

```c
uint8_t num_attr
    The number of the attribute
```

```c
uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
    The handles list
```

```c
struct esp_gattc_db_elem_t
    data base attribute element
```

```c
esp_gatt_db_attr_type_t type
    The attribute type
```

```c
uint16_t attribute_handle
    The attribute handle, it’s valid for all of the type
```

```c
uint16_t start_handle
    The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
```

```c
uint16_t end_handle
    The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
```
Chapter 2. API Reference

- **esp_gatt_char_prop_t** properties
  The characteristic properties, its valid only when the type = ESP_GATT_DB_CHARACTERISTIC

- **esp_bt_uuid_t** uuid
  The attribute uuid, its valid for all of the type

```c
struct esp_gattc_service_elem_t
service element
```

**Public Members**

- `bool is_primary`
  The service flag, true if the service is primary service, else is secondary service

```c
uint16_t start_handle
The start handle of the service
```

```c
uint16_t end_handle
The end handle of the service
```

```c
esp_bt_uuid_t uuid
The uuid of the service
```

```c
struct esp_gattc_char_elem_t
characteristic element
```

**Public Members**

- `uint16_t char_handle`
  The characteristic handle

```c
esp_gatt_char_prop_t properties
The characteristic properties
```

```c
esp_bt_uuid_t uuid
The characteristic uuid
```

```c
struct esp_gattc_descr_elem_t
descriptor element
```

**Public Members**

- `uint16_t handle`
  The descriptor handle

```c
esp_bt_uuid_t uuid
The characteristic descriptor uuid
```

```c
struct esp_gattc_incl_svc_elem_t
include service element
```

**Public Members**

- `uint16_t handle`
  The include service current attribute handle

```c
uint16_t incl_srvc_s_handle
The start handle of the service which has been included
```

```c
uint16_t incl_srvc_e_handle
The end handle of the service which has been included
```

```

esp_bt_uuid_t uuid
The include service uuid
```

ESP_GATT_CHAR_PROP_BIT_INDICATE
ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
    GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
    If callback report gatec_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:
    ESP_GATT_PREP_WRITE_CANCEL = 0x00
        Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
        Prepare write execute
enum esp_gatt_status_t
    GATT success code and error codes.
    Values:
    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03
    ESP_GATT_INVALID_PDU = 0x04
    ESP_GATT_INSUF_AUTHENTICATION = 0x05
    ESP_GATT_REQ_NOT_SUPPORTED = 0x06

typedef enum esp_gatt_conn_reason_t
{
    ESP_GATT_CONN_UNKNOWN = 0,
    ESP_GATT_CONN_L2C_FAILURE = 1
} GattConnectionReason;
```

---

**Values:**

- `ESP_GATT_CONN_UNKNOWN = 0`
  - Gatt connection unknown
- `ESP_GATT_CONN_L2C_FAILURE = 1`
  - General L2cap failure
ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

enum esp_gatt_auth_req_t
Gatt authentication request type.

Values:

ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t
Values:

ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t
Gatt write type.

Values:

ESP_GATT_WRITE_TYPE_NO_RSP = 1
Gatt write attribute need no response

ESP_GATT_WRITE_TYPE_RSP
Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
the type of attribute element

Values:

ESP_GATT_DB_PRIMARY_SERVICE
Gatt primary service attribute type in the cache

ESP_GATT_DB_SECONDARY_SERVICE
Gatt secondary service attribute type in the cache

ESP_GATT_DB_CHARACTERISTIC
Gatt characteristic attribute type in the cache

ESP_GATT_DB_DESCRIPTOR
Gatt characteristic descriptor attribute type in the cache
**ESP_GATT_DB_INCLUDED_SERVICE**

Gatter include service attribute type in the cache

**ESP_GATT_DB_ALL**

Gatter all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

### GATT SERVER API

#### Overview

**Instructions**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

### API Reference

#### Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

#### Functions

```c
esp_err_t esp_ble_gatts_register_callback(esp_gatts_cb_t callback)
```

This function is called to register application callbacks with BTA GATTs module.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_register(uint16_t app_id)
```

This function is called to register application identifier.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_unregister(esp_if_t gatts_if)
```

unregister with GATT Server.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] gatts_if: GATT server access interface

```c
esp_err_t esp_ble_gatts_create_service(esp_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)
```

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to
report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

```
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db,
    esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)
```
Create a service attribute tab.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] srvc_inst_id: the instance id of the service

```
esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)
```
This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

```
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid,
    esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
    esp_attr_value_t *char_val, esp_attr_control_t *control)
```
This function is called to add a characteristic into a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: Characteristic UUID.
- [in] perm: Characteristic value declaration attribute permission.
- [in] property: Characteristic Properties
- [in] char_val: Characteristic value
- [in] control: attribute response control byte

```
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid,
    esp_gatt_perm_t perm, esp_attr_value_t *char_desc_val, esp_attr_control_t *control)
```
This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return
- ESP_OK: success
- other: failed
Parameters
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] char_descr_val: Characteristic descriptor value
- [in] control: attribute response control byte

**esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)**
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service_handle to be deleted.

**esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)**
This function is called to start a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: the service handle to be started.

**esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)**
This function is called to stop a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service to be topped.

**esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)**
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection id to indicate.
- [in] attr_handle: attribute handle to indicate.
- [in] value_len: indicate value length.
- [in] value: value to indicate.
- [in] need_confirm: Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

**esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)**
This function is called to send a response to a request.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface

• [in] trans_id: transfer id
• [in] status: response status
• [in] rsp: response data.

### esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• [in] attr_handle: the attribute handle which to be set
• [in] length: the value length
• [in] value: the pointer to the attribute value

### esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

**Return**

• ESP_GATT_OK : success
• other : failed

**Parameters**

• [in] attr_handle: Attribute handle.
• [out] length: pointer to the attribute value length
• [out] value: Pointer to attribute value payload, the value cannot be modified by user

### esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• [in] gatts_if: GATT server access interface
• [in] remote_bda: remote device bluetooth device address.
• [in] is_direct: direct connection or background auto connection

### esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)

Close a connection a remote device.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• [in] gatts_if: GATT server access interface
• [in] conn_id: connection ID to be closed.

### esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)

Send service change indication.

**Return**

• ESP_OK : success
• other : failed

**Parameters**

• [in] gatts_if: GATT server access interface
• [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

---

**Unions**

---
union esp_ble_gatts_cb_param_t
#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct esp_ble_gatts_cb_param_t:gatts_reg_evt_param reg
Gatt server callback param of ESP_GATTS_REG_EVT

struct esp_ble_gatts_cb_param_t:gatts_read_evt_param read
Gatt server callback param of ESP_GATTS_READ_EVT

struct esp_ble_gatts_cb_param_t:gatts_write_evt_param write
Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t:gatts_exec_write_evt_param exec_write
Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t:gatts_mtu_evt_param mtu
Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_cb_param_t:gatts_conf_evt_param conf
Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t:gatts_create_evt_param create
Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_cb_param_t:gatts_add_incl_srvc_evt_param add_incl_srvc
Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t:gatts_add_char_evt_param add_char
Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_BLE_gatts_CB_param_t:gatts_add_chardescr_evt_param add_char_descr
Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t:gatts_delete_evt_param del
Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t:gatts_start_evt_param start
Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t:gatts_stop_evt_param stop
Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t:gatts_connect_evt_param connect
Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t:gatts_disconnect_evt_param disconnect

Public Members

\texttt{uint16_t conn_id}
Connection id

\texttt{uint32_t trans_id}
Transfer id

\texttt{esp_bd_addr_t bda}
The bluetooth device address which been written

\texttt{uint16_t handle}
The attribute handle

\texttt{uint16_t offset}
Offset of the value, if the value is too long

\texttt{bool need_rsp}
The write operation need to do response

\texttt{bool is_prep}
This write operation is prepare write

\texttt{uint16_t len}
The write attribute value length

\texttt{uint8_t* value}
The write attribute value

Macros

\texttt{ESP_GATT_PREP_WRITE_CANCEL}
Prepare write flag to indicate cancel prepare write

\texttt{ESP_GATT_PREP_WRITE_EXEC}
Prepare write flag to indicate execute prepare write

Type Definitions

\texttt{typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)}
GATT Server callback function type.

Parameters

- \texttt{event::} Event type
- \texttt{gatts_if::} GATT server access interface, normally different gatts_if correspond to different profile
- \texttt{param::} Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
When register application id, the event comes

ESP_GATTS_READ_EVT = 1
When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4
When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
When gatt send response complete, the event comes
Chapter 2. API Reference

**ESP_GATTS_CREAT_ATTR_TAB_EVT** = 22
When gatt create table complete, the event comes

**ESP_GATTS_SET_ATTR_VAL_EVT** = 23
When gatt set attr value complete, the event comes

**ESP_GATTS_SEND_SERVICE_CHANGE_EVT** = 24
When gatt send service change indication complete, the event comes

---

GATT CLIENT API

**Overview**
Instructions

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

---

API Reference

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h

**Functions**

```c
esp_err_t esp_ble_gattc_register_callback(esp_gattc_cb_t callback)
```
This function is called to register application callbacks with GATTC module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] callback: pointer to the application callback function.

```c
esp_err_t esp_ble_gattc_app_register(uint16_t app_id)
```
This function is called to register application callbacks with GATTC module.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] app_id: Application Identify (UUID), for different application

```c
esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)
```
This function is called to unregister an application from GATTC module.

**Return**
- ESP_OK: success
- other: failed
Parameters
- [in] gattc_if: Gatt client access interface.

```
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                             esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] remote_bda: remote device bluetooth device address.
- [in] remote_addr_type: remote device bluetooth device the address type.
- [in] is_direct: direct connection or background auto connection(by now, background auto connection is not supported).

```
esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                                 esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID to be closed.

```
esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.

```
esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
```

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] filter_uuid: a UUID of the service application is interested in. If null, discover for all services.

```
esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          esp_bt_uuid_t *svc_uuid, esp_gatt_service_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] svc_uuid: the pointer to the service uuid.
- [out] result: The pointer to the service which has been found in the gattc cache.
- [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] offset: Offset of the service position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_all_char(gattc_if, conn_id,svc_uuid,&result, &count,offset)}
\]

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] offset: Offset of the characteristic position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_all_descr(gattc_if, conn_id,svc_uuid,&result, &count,offset)}
\]

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(gattc_if, conn_id,svc_uuid,&result, &count)}
\]

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
Chapter 2. API Reference

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the characteristic handle.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

Return
- ESP_OK: success
Chapter 2. API Reference

- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] incl_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t incl_uuid, uint16_t* count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] type: the attribute type.
- [in] start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gatt_db_elem_t* db, uint16_t* count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] conn_id: connection ID which identify the server.
- [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] count: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
Chapter 2. API Reference

- [in] handle: characteristic handle to read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [in] uuid: The UUID of attribute which will be read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] read_multi: pointer to the read multiple parameter.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristic descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.
### esp_err_t esp_ble_gattc_write_char_descr

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: descriptor handle to write.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `write_type`: the type of attribute write operation.
- [in] `auth_req`: authentication request.

### esp_err_t esp_ble_gattc_prepare_write

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

### esp_err_t esp_ble_gattc_prepare_write_char_descr

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic descriptor handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

### esp_err_t esp_ble_gattc_execute_write

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
### Chapter 2. API Reference

- [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```
This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```
This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```
Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```
Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```
Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**
- ESP_OK: success
- other: failed
Parameters

• \[\text{in}\] gattc_if: Gatt client access interface.

\[
\text{esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)}
\]
Clean the service cache of this device in the gattc stack.

Return

• ESP_OK: success
• other: failed

Parameters

• \[\text{in}\] remote_bda: remote device BD address.

Unions

\[
\text{union esp_ble_gattc_cb_param_t}

```
**uint16_t offset**

The prepare write offset, this value is valid only when prepare write

**Type Definitions**

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

GATT Client callback function type.

**Parameters**

- event: Event type
- gattc_if: GATT client access interface, normally different gattc_if correspond to different profile
- param: Point to callback parameter, currently is union type

**Enumerations**

enum esp_gattc_cb_event_t

GATT Client callback function events.

**Values:**

ESP_GATTC_REG_EVT = 0

When GATT client is registered, the event comes

ESP_GATTC_UNREG_EVT = 1

When GATT client is unregistered, the event comes

ESP_GATTC_OPEN_EVT = 2

When GATT virtual connection is set up, the event comes

ESP_GATTC_READ_CHAR_EVT = 3

When GATT characteristic is read, the event comes

ESP_GATTC_WRITE_CHAR_EVT = 4

When GATT characteristic write operation completes, the event comes

ESP_GATTC_CLOSE_EVT = 5

When GATT virtual connection is closed, the event comes

ESP_GATTC_SEARCH_CMPL_EVT = 6

When GATT service discovery is completed, the event comes

ESP_GATTC_SEARCH_RES_EVT = 7

When GATT service discovery result is got, the event comes

ESP_GATTC_READ_DESCR_EVT = 8

When GATT characteristic descriptor read completes, the event comes

ESP_GATTC_WRITE_DESCR_EVT = 9

When GATT characteristic descriptor write completes, the event comes

ESP_GATTC_NOTIFY_EVT = 10

When GATT notification or indication arrives, the event comes

ESP_GATTC_PREP_WRITE_EVT = 11

When GATT prepare-write operation completes, the event comes

ESP_GATTC_EXEC_EVT = 12

When write execution completes, the event comes

ESP_GATTC_ACL_EVT = 13

When ACL connection is up, the event comes

ESP_GATTC_CANCEL_OPEN_EVT = 14

When GATT client ongoing connection is cancelled, the event comes
ESP_GATTC_SRVC_CHG_EVT = 15
When “service changed” occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
When Scan filter parameters are set, the event comes

ESP_GATTC_SCAN_FLT_STATUS_EVT = 33
When Scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REG_FOR_NOTIFY_EVT = 38
When register for notification of a service completes, the event comes

ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39
When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
When the ble physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
When the ble physical connection disconnected, the event comes
Chapter 2. API Reference

ESP_GATTC_READ_MULTIPLE_EVT = 42
When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATTC_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45
When the ble get gattc address list in cache finish, the event comes

ESP_GATTC_DIS_SRVC_CMPL_EVT = 46
When the ble discover service complete, the event comes

BLUFI API

Overview
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example
Check bluetooth folder in ESP-IDF examples, which contains the following application:

• This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

API Reference

Header File

• components/bt/common/api/include/api/esp_blufi_api.h

Functions

esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)
This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters
• [in] callbacks: callback functions

esp_err_t esp_blufi_profile_init (void)
This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t esp_blufi_profile_deinit (void)
This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)
This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters
• opmode: wifi opmode
• sta_conn_state: station is already in connection or not
Chapter 2. API Reference

- **softap_conn_num**: softap connection number
- **extra_info**: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)
```
This function is called to send wifi list.

**Return**: ESP_OK - success, other - failed

**Parameters**
- **apCount**: wifi list count
- **list**: wifi list

```c
uint16_t esp_blufi_get_version (void)
```
Get BLUFI profile version.

**Return**: Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

**Return**: ESP_OK - success, other - failed

**Parameters**
- **state**: error state

```c
esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)
```
This function is called to send custom data.

**Return**: ESP_OK - success, other - failed

**Parameters**
- **data**: custom data value
- **data_len**: the length of custom data

**Unions**

```c
union esp_blufi_cb_param_t
```
#include <esp_blufi_api.h> BLUFI callback parameters union.

**Public Members**

```c
struct esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish
```
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish
```
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode
```
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_connect_evt_param connect
```
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

```c
struct esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect
```
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param sta_ssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param sta_passwd
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param softap_ssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
Chapter 2. API Reference

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct esp_blufi_cb_param_t::blufi_recv_softap_channel_evt_param softap_channel
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL.

struct esp_blufi_cb_param_t::blufi_recv_username_evt_param username
    Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_cb_param_t::blufi_recv_ca_evt_param ca

signal strength of AP

struct esp_blufi_callbacks_t
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
BLUFI check sum function (FCS)

Macros

ESP_BD_ADDR_LEN
Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_event_cb_t event, esp_blufi_cb_param_t *param)
BLUFI event callback function type.

Parameters

• event:: Event type
• param: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)
BLUFI negotiate data handler.

Parameters

• data:: data from phone
• len: length of data from phone
• output_data: data want to send to phone
• output_len: length of data want to send to phone
• need_free: output reporting if memory needs to be freed or not

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
BLUFI encrypt the data after negotiate a share key.
Return Nonnegative number is encrypted length, if error, return negative number;

Parameters
- iv8: initial vector (8bit), normally, blufi core will input packet sequence number
- crypt_data: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt_len: length of plain text

typedef int (*esp_blufi_decrypt_func_t) (uint8_t *iv8, uint8_t *crypt_data, int crypt_len)
BLUFI decrypt the data after negotiate a share key.

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters
- iv8: initial vector (8bit), normally, blufi core will input packet sequence number
- crypt_data: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- crypt_len: length of encrypted text

typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t *iv8, uint8_t *data, int len)
BLUFI checksum.

Parameters
- iv8: initial vector (8bit), normally, blufi core will input packet sequence number
- data: data need to checksum
- len: length of data

Enumerations
enum esp_blufi_cb_event_t

Values:
- ESP_BLUFI_EVENT_INIT_FINISH = 0
- ESP_BLUFI_EVENT_deinit_finish
- ESP_BLUFI_EVENT_SET_WIFI_OPMODE
- ESP_BLUFI_EVENT_BLE_CONNECT
- ESP_BLUFI_EVENT_BLE_DISCONNECT
- ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP
- ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP
- ESP_BLUFI_EVENT_GET_WIFI_STATUS
- ESP_BLUFI_EVENT_DEAUTHENTICATE_STA
- ESP_BLUFI_EVENT_RECV_STA_BSSID
- ESP_BLUFI_EVENT_RECV_STA_SSID
- ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
- ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

2.1.4 CLASSIC BT
CLASSIC BLUETOOTH GAP API

Overview Instructions

Application Example Instructions
API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

```c
static uint32_t esp_bt_gap_get_cod_svc(uint32_t cod)
get major service field of COD

Return major service bits

Parameters
• [in] cod: Class of Device

static uint32_t esp_BT_gap_get_cod_major_dev(uint32_t cod)
get major device field of COD

Return major device bits

Parameters
• [in] cod: Class of Device

static uint32_t esp_BT_gap_get_cod_minor_dev(uint32_t cod)
get minor service field of COD

Return minor service bits

Parameters
• [in] cod: Class of Device

static uint32_t esp_BT_gap_get_cod_format_type(uint32_t cod)
get format type of COD

Return format type

Parameters
• [in] cod: Class of Device

static bool esp_BT_gap_is_valid_cod(uint32_t cod)
deck the integrity of COD

Return
• true if cod is valid
• false otherwise

Parameters
• [in] cod: Class of Device
```

```c
esp_err_t esp_BT_gap_register_callback(esp_BT_gap_cb_t callback)
register callback function. This function should be called after esp_bluedroid_enable() completes successfully

Return
• ESP_OK: Succeed
• ESP_FAIL: others

esp_err_t esp_BT_gap_set_scan_mode(esp_BT_connection_mode_t c_mode,
esp_BT_discovery_mode_t d_mode)
Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: Succeed
• ESP_ERR_INVALID_ARG: if argument invalid
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] c_mode:: one of the enums of esp_BT_connection_mode_t
• [in] d_mode:: one of the enums of esp_BT_discovery_mode_t
```
**esp_err_t** `esp_bt_gap_start_discovery**(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)**

This function starts Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_RES_EVT` each time the two types of discovery results are got.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

**Parameters**
- [in] mode: - Inquiry mode
- [in] inq_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process.
  - when this time expires, Inquiry will be halted.
- [in] num_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

**esp_err_t** `esp_bt_gap_cancel_discovery**(void)**

Cancel Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` if Inquiry or Name Discovery is cancelled by calling this function.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t** `esp_bt_gap_get_remote_services**(esp_bd_addr_t remote_bda)**

Start SDP to get remote services. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVCS.EVT` after service discovery ends.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t** `esp_bt_gap_get_remote_service_record**(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)**

Start SDP to look up the service matching uuid on the remote device. This function should be called after `esp_bluedroid_enable()` completes successfully.

`esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVC_REC.EVT` after service discovery ends.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**uint8_t** `*esp_bt_gap_resolve_eir_data**(uint8_t *eir, esp_bt_type_t type, uint8_t *length)**

This function is called to get EIR data for a specific type.

**Return**
pointer of starting position of eir data excluding eir data type, NULL if not found

**Parameters**
- [in] eir: - pointer of raw eir data to be resolved
- [in] type: - specific EIR data type
- [out] length: - return the length of EIR data excluding fields of length and data type
esp_err_t esp_bt_gap_config_eir_data (esp_bt_eir_data_t *eir_data)

This function is called to config EIR data.

esp bt_gap cb t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

Return
• ESP_OK : Succeed
• ESP_ERR_INVAL DS TATE: if bluetooth stack is not yet enabled
• ESP_ERR_INV ALD ARG: if param is invalid
• ESP_FAIL: others

Parameters
• [in] eir_data : pointer of EIR data content

esp_err_t esp bt_gap_set_co d (esp bt cod t cod, esp bt cod_mode t mode)

This function is called to set class of device. The structure esp bt_gap cb t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

Return
• ESP_OK : Succeed
• ESP_ERR_INVAL DS TATE: if bluetooth stack is not yet enabled
• ESP_ERR_INV ALD ARG: if param is invalid
• ESP_FAIL: others

Parameters
• [in] cod: - class of device
• [in] mode: - setting mode

esp_err_t esp bt_gap_get_co d (esp bt cod t *cod)

This function is called to get class of device.

Return
• ESP_OK : Succeed
• ESP_FAIL: others

Parameters
• [out] cod: - class of device

esp_err_t esp bt_gap_read_rssi_delta (esp bd addr t remote_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Return
• ESP_OK : Succeed
• ESP_FAIL: others

Parameters
• [in] remote_addr: - remote device address, corresponding to a certain connection handle

esp_err_t esp bt_gap_remove_bond_device (esp bd addr t bd_addr)

Removes a device from the security database list of peer device.

Return - ESP_OK : success
• ESP_FAIL : failed

Parameters
• [in] bd_addr: : BD address of the peer device

int esp bt_gap_get_bond_device_num (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number
• ESP_FAIL : failed

esp_err_t esp bt_gap_get_bond_device_list (int *dev_num, esp bd addr t *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.
Chapter 2. API Reference

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

`esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Set pin type and default pin code for legacy pairing.

Return - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters

- [in] pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

`esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Reply the pin code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters

- [in] bd_addr: BD address of the peer
- [in] accept: Pin_code reply successful or declined.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

`esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)`

Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters

- [in] param_type:: the type of the param which is to be set
- [in] value:: the param value
- [in] len:: the length of the param value

`esp_err_t esp_bt_gap_ssp_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)`

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters

- [in] bd_addr:: BD address of the peer
- [in] accept:: passkey entry successful or declined.
- [in] passkey:: passkey value, must be a 6 digit number, can be lead by 0.

`esp_err_t esp_bt_gap_ssp_confirm_reply(esp_bd_addr_t bd_addr, bool accept)`
Reply the confirm value to the peer device in the legacy connection stage.

**Return**
- ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different

```c
esp_err_t esp_bt_gap_set_afh_channels(esp_bt_gap_afh_channels channels)
```
Set the AFH channels.

**Return**
- ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other: failed

**Parameters**
- [in] channels: The n th such field (in the range 0 to 78) contains the value for channel n:
  0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

```c
esp_err_t esp_bt_gap_read_remote_name(esp_bd_addr_t remote_bda)
```
Read the remote device name.

**Return**
- ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other: failed

**Parameters**
- [in] remote_bda: The remote device’s address

```c
esp_err_t esp_bt_gap_set_qos(esp_bd_addr_t remote_bda, uint32_t t_poll)
```
Config Quality of service.

**Return**
- ESP_OK: success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other: failed

**Parameters**
- [in] remote_bda: The remote device’s address
- [in] t_poll: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625 ms

**Unions**

```c
union esp_bt_gap_cb_param_t
```
GAP state callback parameters.

**Public Members**

```c
struct esp_bt_gap_cb_param_t::disc_res_param disc_res
```
discovery result parameter struct

```c
struct esp_bt_gap_cb_param_t::disc_state_changed_param disc_st_chg
```
discovery state changed parameter struct

```c
struct esp_bt_gap_cb_param_t::rmt_srvcs_param rmt_srvcs
```
services of remote device parameter struct

```c
struct esp_bt_gap_cb_param_t::rmt_srvc_rec_param rmt_srvc_rec
```
specific service record from remote device parameter struct

```c
struct esp_bt_gap_cb_param_t::read_rssi_delta_param read_rssi_delta
```
read rssi parameter struct

```c
struct esp_bt_gap_cb_param_t::config_eir_data_param config_eir_data
```
config EIR data
```c
struct esp_bt_gap_cb_param_t::auth_cmpl_param auth_cmpl
  authentication complete parameter struct

struct esp_bt_gap_cb_param_t::pin_req_param pin_req
  pin request parameter struct

struct esp_bt_gap_cb_param_t::cfm_req_param cfm_req
  confirm request parameter struct

struct esp_bt_gap_cb_param_t::key_notif_param key_notif
  passkey notif parameter struct

struct esp_bt_gap_cb_param_t::key_req_param key_req
  passkey request parameter struct

struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels
  set AFH channel parameter struct

struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name
  read Remote Name parameter struct

struct esp_bt_gap_cb_param_t::mode_chg_param mode_chg
  mode change event parameter struct

struct esp_bt_gap_cb_param_t::bt_remove_bond_dev_cmpl_evt_param remove_bond_dev_cmpl
  Event parameter of ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT

struct esp_bt_gap_cb_param_t::qos_cmpl_param qos_cmpl
  QoS complete parameter struct

struct auth_cmpl_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_AUTH_CMPL_EVT.

Public Members

  esp_bd_addr_t bda
    remote bluetooth device address

  esp_bt_status_t stat
    authentication complete status

  uint8_t device_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]
    device name

struct bt_remove_bond_dev_cmpl_evt_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

  esp_bd_addr_t bda
    remote bluetooth device address

  esp_bt_status_t status
    Indicate the remove bond device operation success status

#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_RSSI_DELTA_EVT *.
```
Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_status_t stat`
read rssi status

`int8_t rssi_delta`
rsi delta value range -128 ~127. The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP_BT_GAP_RSSI_LOW_THRLD to ESP_BT_GAP_RSSI_HIGH_THRLD

`struct rmt_srvc_rec_param`

```
#include <esp_gap_bt_api.h>
ESP_BT_GAP_RMT_SRVC_REC_EVT.
```

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_status_t stat`
service search status

`struct rmt_srvcs_param`

```
#include <esp_gap_bt_api.h>
ESP_BT_GAP_RMT_SRVCS_EVT.
```

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_status_t stat`
service search status

`int num_uuids`
number of UUID in uuid_list

`esp_bt_uuid_t *uuid_list`
list of service UUIDs of remote device

`struct set_afh_channels_param`

```
#include <esp_gap_bt_api.h>
ESP_BT_GAP_SET_AFH_CHANNELS_EVT.
```

Public Members

`esp_bt_status_t stat`
set AFH channel status

Structures

`struct esp_bt_cod_t`
Class of device.

Public Members

`uint32_t reserved_2 : 2`
undefined
uint32_t minor : 6
    minor class
uint32_t major : 5
    major class
uint32_t service : 11
    service class
uint32_t reserved_8 : 8
    undefined

**struct esp_bt_gap_dev_prop_t**
    Bluetooth Device Property Descriptor.

**Public Members**

* esp_bt_gap_dev_prop_type_t* type
    Device property type
int len
    Device property value length
void *val
    Device property value

**struct esp_bt_eir_data_t**
    EIR data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

bool fec_required
    FEC is required or not, true by default
bool include_txpower
    EIR data include TX power, false by default
bool include_uuid
    EIR data include UUID, false by default
uint8_t flag
    EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default
uint16_t manufacturer_len
    Manufacturer data length, 0 by default
uint8_t *p_manufacturer_data
    Manufacturer data point
uint16_t url_len
    URL length, 0 by default
uint8_t *p_url
    URL point

**Macros**

ESP_BT_GAP_RSSI_HIGH_THRLD
    RSSI threshold.
    High RSSI threshold
ESP_BT_GAP_RSSI_LOW_THRLD
    Low RSSI threshold
ESP_BT_GAP_AFH_CHANNELS_LEN
    Espressif Systems 239
**ESP_BT_GAP_MAX_BDNAME_LEN**
Maximum bytes of Bluetooth device name.

**ESP_BT_GAP_EIR_DATA_LEN**
Maximum size of EIR Significant part.

**ESP_BT_EIR_TYPE_FLAGS**
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

**ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID**
Incomplete list of 16-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_16BITS_UUID**
Complete list of 16-bit service UUIDs

**ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID**
Incomplete list of 32-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_32BITS_UUID**
Complete list of 32-bit service UUIDs

**ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID**
Incomplete list of 128-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_128BITS_UUID**
Complete list of 128-bit service UUIDs

**ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME**
Shortened Local Name

**ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME**
Complete Local Name

**ESP_BT_EIR_TYPE_TX_POWER_LEVEL**
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

**ESP_BT_EIR_TYPE_URL**
Uniform resource identifier

**ESP_BT_EIR_TYPE_MANU_SPECIFIC**
Manufacturer specific data

**ESP_BT_EIR_TYPE_MAX_NUM**
MAX number of EIR type

**ESP_BT_EIR_FLAG_LIMIT_DISC**

**ESP_BT_EIR_FLAG_GEN_DISC**

**ESP_BT_EIR_FLAG_BREDR_NOT_SPT**

**ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT**

**ESP_BT_EIR_FLAG_DMT_HOST_SPT**

**ESP_BT_EIR_MAX_LEN**

**ESP_BT_PIN_CODE_LEN**
Max pin code length

**ESP_BT_IO_CAP_OUT**

**ESP_BT_IO_CAP_IO**

**ESP_BT_IO_CAP_IN**

**ESP_BT_IO_CAP_NONE**

**ESP_BT_PM_MD_ACTIVE**
Active mode
**Chapter 2. API Reference**

**ESP_BT_PM_MD_HOLD**
- Hold mode

**ESP_BT_PM_MD_SNIFF**
- Sniff mode

**ESP_BT_PM_MD_PARK**
- Park state

**ESP_BT_COD_SRVC_BIT_MASK**
- Bits of major service class field.
- Major service bit mask

**ESP_BT_COD_SRVC_BIT_OFFSET**
- Major service bit offset

**ESP_BT_COD_MAJOR_DEV_BIT_MASK**
- Bits of major device class field.
- Major device bit mask

**ESP_BT_COD_MAJOR_DEV_BIT_OFFSET**
- Major device bit offset

**ESP_BT_COD_MINOR_DEV_BIT_MASK**
- Bits of minor device class field.
- Minor device bit mask

**ESP_BT_COD_MINOR_DEV_BIT_OFFSET**
- Minor device bit offset

**ESP_BT_COD_FORMAT_TYPE_BIT_MASK**
- Bits of format type.
- Format type bit mask

**ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET**
- Format type bit offset

**ESP_BT_COD_FORMAT_TYPE_1**
- Class of device format type 1.

**ESP_BT_GAP_MIN_INQ_LEN**
- Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
- Maximum inquiry duration, unit is 1.28s

**Type Definitions**

```c
typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
    Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
    Combination of the IO Capability

typedef void(*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
    bluetooth GAP callback function type
```

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter
Enumerations

def enum esp_bt_cod_mode_t
    class of device settings
    
    Values:
    
    ESP_BT_SET_COD_MAJOR_MINOR = 0x01
    overwrite major, minor class
    
    ESP_BT_SET_COD_SERVICE_CLASS = 0x02
    set the bits in the input, the current bit will remain
    
    ESP_BT_CLR_COD_SERVICE_CLASS = 0x04
    clear the bits in the input, others will remain
    
    ESP_BT_SET_COD_ALL = 0x08
    overwrite major, minor, set the bits in service class
    
    ESP_BT_INIT_COD = 0x0a
    overwrite major, minor, and service class

def enum esp_bt_connection_mode_t
    Discoverability and Connectability mode.
    
    Values:
    
    ESP_BT_NON_CONNECTABLE
    Non-connectable
    
    ESP_BT_CONNECTABLE
    Connectable

def enum esp_bt_discovery_mode_t
    Values:
    
    ESP_BT_NON_DISCOVERABLE
    Non-discoverable
    
    ESP_BT_LIMITED_DISCOVERABLE
    Limited Discoverable
    
    ESP_BT_GENERAL_DISCOVERABLE
    General Discoverable

def enum esp_bt_gap_dev_prop_type_t
    Bluetooth Device Property type.
    
    Values:
    
    ESP_BT_GAP_DEV_PROP_BDNAME = 1
    Bluetooth device name, value type is int8_t []
    
    ESP_BT_GAP_DEV_PROP_COD
    Class of Device, value type is uint32_t
    
    ESP_BT_GAP_DEV_PROP_RSSI
    Received Signal strength Indication, value type is int8_t, ranging from -128 to 127
    
    ESP_BT_GAP_DEV_PROP_EIR
    Extended Inquiry Response, value type is uint8_t []

def enum esp_bt_cod_srvc_t
    Major service class field of Class of Device, multiple bits can be set.
    
    Values:
    
    ESP_BT_COD_SRVC_NONE = 0
    None indicates an invalid value
    
    ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x01
    Limited Discoverable Mode
**ESP_BT_COD_SRVC_POSITIONING** = 0x8
Positioning (Location identification)

**ESP_BT_COD_SRVC_NETWORKING** = 0x10
Networking, e.g. LAN, Ad hoc

**ESP_BT_COD_SRVC_RENDERING** = 0x20
Rendering, e.g. Printing, Speakers

**ESP_BT_COD_SRVC_CAPTUREING** = 0x40
Capturing, e.g. Scanner, Microphone

**ESP_BT_COD_SRVC_OBJ_TRANSFER** = 0x80
Object Transfer, e.g. v-Inbox, v-Folder

**ESP_BT_COD_SRVC_AUDIO** = 0x100
Audio, e.g. Speaker, Microphone, Headset service

**ESP_BT_COD_SRVC_TELEPHONY** = 0x200
Telephony, e.g. Cordless telephony, Modem, Headset service

**ESP_BT_COD_SRVC_INFORMATION** = 0x400
Information, e.g., WEB-server, WAP-server

```
enum esp_bt_pin_type_t
Values:

ESP_BT_PIN_TYPE_VARIABLE = 0
Refer to BTM_PIN_TYPE_VARIABLE

ESP_BT_PIN_TYPE_FIXED = 1
Refer to BTM_PIN_TYPE_FIXED
```

```
enum esp_bt_sp_param_t
Values:

ESP_BT_SP_IOCAP_MODE = 0
Set IO mode
```

```
enum esp_bt_cod_major_dev_t
Major device class field of Class of Device.
Values:

ESP_BT_COD_MAJOR_DEV_MISC = 0
Miscellaneous

ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
Computer

ESP_BT_COD_MAJOR_DEV_PHONE = 2
Phone(cellular, cordless, pay phone, modem

ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
LAN, Network Access Point

ESP_BT_COD_MAJOR_DEV_AV = 4
Audio/Video(headset, speaker, stereo, video display, VCR

ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5
Peripheral(mouse, joystick, keyboard)

ESP_BT_COD_MAJOR_DEV_IMAGING = 6
Imaging(printer, scanner, camera, display

ESP_BT_COD_MAJOR_DEV_WEARABLE = 7
Wearable

ESP_BT_COD_MAJOR_DEV_TOY = 8
Toy
```
ESP_BT_COD_MAJOR_DEV_HEALTH = 9
Health
ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
Bluetooth Device Discovery state
Values:
ESP_BT_GAP_DISCOVERY_STOPPED
Device discovery stopped
ESP_BT_GAP_DISCOVERY_STARTED
Device discovery started

enum esp_bt_gap_cb_event_t
BT GAP callback events.
Values:
ESP_BT_GAP_DISC_RES_EVT = 0
Device discovery result event
ESP_BT_GAP_DISC_STATE_CHANGED_EVT
Discovery state changed event
ESP_BT_GAP_RMT_SRVCS_EVT
Get remote services event
ESP_BT_GAP_RMT_SRVC_REC_EVT
Get remote service record event
ESP_BT_GAP_AUTH_CMPL_EVT
Authentication complete event
ESP_BT_GAP_PIN_REQ_EVT
Legacy Pairing Pin code request
ESP_BT_GAP_CFM_REQ_EVT
Security Simple Pairing User Confirmation request.
ESP_BT_GAP_KEY_NOTIF_EVT
Security Simple Pairing Passkey Notification
ESP_BT_GAP_KEY_REQ_EVT
Security Simple Pairing Passkey request
ESP_BT_GAP_READ_RSSI_DELTA_EVT
Read rssi event
ESP_BT_GAP_CONFIG_EIR_DATA_EVT
Config EIR data event
ESP_BT_GAP_SET_AFH_CHANNELS_EVT
Set AFH channels event
ESP_BT_GAP_READ_REMOTE_NAME_EVT
Read Remote Name event
ESP_BT_GAP_MODE_CHG_EVT
ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
remove bond device complete event
ESP_BT_GAP_QOS_CMPL_EVT
QOS complete event
ESP_BT_GAP_EVT_MAX

enum esp_bt_inq_mode_t
Inquiry Mode

Values:

ESP_BT_INQ_MODE_GENERAL_INQUIRY
   General inquiry mode

ESP_BT_INQ_MODE_LIMITED_INQUIRY
   Limited inquiry mode

Bluetooth A2DP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

\texttt{esp_a2d_register_callback (esp_a2d_cb_t callback)}

Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- \texttt{[in] callback}: A2DP event callback function

\texttt{esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)}

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- \texttt{[in] callback}: A2DP sink data callback function

\texttt{esp_a2d_sink_init (void)}

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_sink_deinit (void)
```

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Return**

• ESP_OK: if the deinitialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)
```

Connect to remote bluetooth A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

**Return**

• ESP_OK: connect request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**

• [in] remote_bda: remote bluetooth device address

```
esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)
```

Disconnect from the remote A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

**Return**

• ESP_OK: disconnect request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**

• [in] remote_bda: remote bluetooth device address

```
esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)
```

Media control commands. This API can be used for both A2DP sink and source and must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

**Return**

• ESP_OK: control command is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**

• [in] ctrl: control commands for A2DP data channel

```
esp_err_t esp_a2d_source_init (void)
```

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

**Return**

• ESP_OK: if the initialization request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```
esp_err_t esp_a2d_source_deinit (void)
```

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

**Return**
Chapter 2. API Reference

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)`
Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after `esp_bluedroid_enable()` completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: A2DP source data callback function

`esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)`
Connect to remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

Return
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

Unions

union esp_a2d_cb_param_t

A2DP state callback parameters.

Public Members

`struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat`  
A2DP connection status

`struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat`  
audio stream playing state

`struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg`  
media codec configuration information

`struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat`  
status in acknowledgement to media control commands

`struct esp_a2d_cb_param_t::a2d_prof_stat_param a2d_prof_stat`  
status to indicate a2d prof init or deinit

`struct a2d_audio_cfg_param`  
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.
Public Members

`esp_bd_addr_t remote_bda`
remote bluetooth device address

`esp_a2d_mcc_t mcc`
A2DP media codec capability information

`struct a2d_audio_stat_param`
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_STATE_EVT.

Public Members

`esp_a2d_audio_state_t state`
one of the values from esp_a2d_audio_state_t

`esp_bd_addr_t remote_bda`
remote bluetooth device address

`struct a2d_conn_stat_param`
#include <esp_a2dp_api.h> ESP_A2D_CONNECTION_STATE_EVT.

Public Members

`esp_a2d_connection_state_t state`
one of values from esp_a2d_connection_state_t

`esp_bd_addr_t remote_bda`
remote bluetooth device address

`esp_a2d_disc_rsn_t disc_rsn`
reason of disconnection for “DISCONNECTED”

`struct a2d_prof_stat_param`
#include <esp_a2dp_api.h> ESP_A2D_PROF_STATE_EVT.

Public Members

`esp_a2d_init_state_t init_state`
a2dp profile state param

`struct media_ctrl_stat_param`
#include <esp_a2dp_api.h> ESP_A2D_MEDIA_CTRL_ACK_EVT.

Public Members

`esp_a2d_media_ctrl_t cmd`
media control commands to acknowledge

`esp_a2d_media_ctrl_ack_t status`
acknowledgement to media control commands

Structures

`struct esp_a2d_mcc_t`
A2DP media codec capabilities union
Chapter 2. API Reference

Public Members

```c
enum esp_a2d_mct_t
    A2DP media codec type

typedef uint8_t esp_a2d_mct_t[ESP_A2D_CIE_LEN_SBC]
    SBC codec capabilities

typedef uint8_t esp_a2d_mct_t[ESP_A2D_CIE_LEN_M12]
    MPEG-1,2 audio codec capabilities

typedef uint8_t esp_a2d_mct_t[ESP_A2D_CIE_LEN_M24]
    MPEG-2,4 AAC audio codec capabilities

typedef uint8_t esp_a2d_mct_t[ESP_A2D_CIE_LEN_ATRAC]
    ATRAC family codec capabilities

union esp_a2d_mcc_t::[anonymous] cie
    A2DP codec information element
```

Macros

```c
#define ESP_A2D_MCT_SBC Media codec types supported by A2DP.
#define ESP_A2D_MCT_M12 MPEG-1,2 Audio
#define ESP_A2D_MCT_M24 MPEG-2,4 AAC
#define ESP_A2D_MCT_ATRAC ATRAC family
#define ESP_A2D_MCT_NON_A2DP
#define ESP_A2D_CIE_LEN_SBC
#define ESP_A2D_CIE_LEN_M12
#define ESP_A2D_CIE_LEN_M24
#define ESP_A2D_CIE_LEN_ATRAC
```

Type Definitions

```c
typedef uint8_t esp_a2d_mct_t
    A2DP profile callback function type.

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
    A2DP profile callback function.

typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t *buf, uint32_t len)
    A2DP sink data callback function.

typedef void (*esp_a2d_source_data_cb_t)(const uint8_t *buf, int32_t len)
    A2DP source data read callback function.
```

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter
- `[in] buf`: Pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
- `[in] len`: size(in bytes) in buf

Return

size of bytes read successfully, if the argument len is -1, this value is ignored.

Espressif Systems 249 Release v5.0-dev-1077-g397639d
Submit Document Feedback
Parameters

- `{in} buf`: buffer to be filled with PCM data stream from higher layer
- `{in} len`: size (in bytes) of data block to be copied to `buf`. `-1` is an indication to user that data buffer shall be flushed

Enumerations

```
enum esp_a2d_connection_state_t
    Bluetooth A2DP connection states.
    Values:
    ESP_A2D_CONNECTION_STATE_DISCONNECTED = 0
        connection released
    ESP_A2D_CONNECTION_STATE_CONNECTING
        connecting remote device
    ESP_A2D_CONNECTION_STATE_CONNECTED
        connection established
    ESP_A2D_CONNECTION_STATE_DISCONNECTING
        disconnecting remote device

enum esp_a2d_disc_rsn_t
    Bluetooth A2DP disconnection reason.
    Values:
    ESP_A2D_DISC_RSN_NORMAL = 0
        Finished disconnection that is initiated by local or remote device
    ESP_A2D_DISC_RSN_ABNORMAL
        Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t
    Bluetooth A2DP datapath states.
    Values:
    ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND = 0
        audio stream datapath suspended by remote device
    ESP_A2D_AUDIO_STATE_STOPPED
        audio stream datapath stopped
    ESP_A2D_AUDIO_STATE_STARTED
        audio stream datapath started

enum esp_a2d_media_ctrl_ack_t
    A2DP media control command acknowledgement code.
    Values:
    ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
        media control command is acknowledged with success
    ESP_A2D_MEDIA_CTRL_ACK_FAILURE
        media control command is acknowledged with failure
    ESP_A2D_MEDIA_CTRL_ACK_BUSY
        media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
    A2DP media control commands.
    Values:
    ESP_A2D_MEDIA_CTRL_NONE = 0
        Not for application use, use inside stack only.
```
ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.

Values:

ESP_A2D_DEINIT_SUCCESS = 0
A2DP profile deinit successful event

ESP_A2D_INIT_SUCCESS
A2DP profile init successful event

enum esp_a2d_cb_event_t
A2DP callback events.

Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

ESP_A2DMEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

ESP_A2D_PROF_STATE_EVT
indicate a2dp init&deinit complete

BT AVRCP APIs

Overview       Bluetooth AVRCP reference APIs.
Instructions

Application Example       Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_avrc_api.h

Functions

esp_err_t esp_avrc_ct_register_callback(esp_avrc_ct_cb_t callback)
Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
Chapter 2. API Reference

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] callback: AVRCP controller callback function

esp_err_t esp_avrc_ct_init (void)
Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_deinit (void)
De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_t tl, uint8_t attr_id, uint8_t value_id)
Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values
- [in] attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- [in] value_id: attribute value defined for the specific player application setting attribute

esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd (uint8_t tl)
Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values

esp_err_t esp_avrc_ct_send_register_notification_cmd (uint8_t tl, uint8_t event_id, uint32_t event_parameter)
Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

Parameters
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
• [in] `event_id` : id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• [in] `event_parameter` : playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

```
esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd(uint8_t tl, uint8_t volume)
```

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters

• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values
• [in] `volume`: volume, 0 to 0x7f, means 0% to 100%

```
esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)
```

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
• [in] `attr_mask`: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

```
esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)
```

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
• [in] `key_code`: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
• [in] `key_state`: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED.

```
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)
```

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• [in] `callback`: AVRCP target callback function

```
esp_err_t esp_avrc_tg_init(void)
```

Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.
Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_avrc_tg_deinit(void)`

De-initialize AVRC target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_avrc_tg_get_psth_cmd_filter(esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)`

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_set_psth_cmd_filter(esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)`

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes unallowed commands

`bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)`

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

Return

For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

Parameters

- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code
**esp_err_t esp_avrc_tg_get_rn_evt_cap**

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

For capability type `ESP_AVRC_RN_CAP_ALLOWED_EVT`, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type `ESP_AVRC_RN_CAP_SUPPORTED_EVT`, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`.

**Return**

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not enabled or AVRC TG is not initialized
- **ESP_ERR_INVALID_ARG**: if cap is invalid or `evt_set` is NULL
- **ESP_FAIL**: otherwise

**esp_err_t esp_avrc_tg_set_rn_evt_cap**

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

**Return**

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not enabled
- **ESP_ERR_INVALID_ARG**: if `evt_set` is NULL

**bool esp_avrc_rn_evt_bit_mask_operation**

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

**Return**

For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false.

**Parameters**

- `[in] op`: operation requested on the bit mask field
- `[in] events`: pointer to event notification capability bit mask structure
- `[in] event_id`: notification event code

**esp_err_t esp_avrc_tg_send_rn_rsp**

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

**Return**

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not enabled or AVRC TG is not initialized
- **ESP_ERR_INVALID_ARG**: if `evt_set` is NULL

**Parameters**

- `[in] event_id`: notification event ID that remote AVRCP CT registers
- `[in] rsp`: notification response code
- `[in] param`: parameters included in the specific notification

**Unions**

**union esp_avrc_rn_param_t**

#include `<esp_avrc_api.h>` AVRCP notification parameters.
Public Members

uint8_t volume
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

esp_avrc_playback_stat_t playback
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

uint8_t elm_id[8]
response data for ESP_AVRC_RN_TRACK_CHANGE

uint32_t play_pos
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond

esp_avrc_batt_stat_t batt
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

union esp_avrc_ct_cb_param_t
#include <esp_avrc_api.h> AVRC controller callback parameters.

Public Members

struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
AVRC connection status

struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
passsthrough command response

struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
metadata attributes response

struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
notifications

struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
AVRC features discovered from remote SDP server

struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
get supported event capabilities response from AVRCP target

struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
set absolute volume response event

struct avrc_ct_change_notify_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.

Public Members

uint8_t event_id
id of AVRC event notification

esp_avrc_rn_param_t event_parameter
event notification parameter

struct avrc_ct_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.

Public Members

bool connected
whether AVRC connection is set up
struct avrc_ct_get_rn_caps_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.

Public Members

uint8_t cap_count
number of items provided in event or company_id according to cap_id used

esp_avrc_rn_evt_cap_mask_t evt_set
supported event_ids represented in bit-mask

struct avrc_ct_meta_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.

Public Members

uint8_t attr_id
id of metadata attribute

  point to the id and value of player application attribute

Structures

struct esp_avrc_psth_bit_mask_t
  AVRC passthrough command bit mask.

Public Members

uint16_t bits[8]
  bit mask representation of PASSTHROUGH commands

struct esp_avrc_rn_evt_cap_mask_t
  AVRC target notification event capability bit mask.

Public Members

uint16_t bits
  bit mask representation of PASSTHROUGH commands

struct esp_avrc_set_app_value_param_t
  AVRCP set app value parameters.
Public Members

```c
uint8_t attr_id
player application attribute id

uint8_t attr_val
player application attribute value
```

Macros

```c
#define ESP_AVRC_TRANS_LABEL_MAX max transaction label
```

Type Definitions

```c
typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
```
AVRCP controller callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter union

```c
typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
```
AVRCP target callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter union

Enumerations

```c
eenum esp_avrc_features_t
AVRC feature bit mask.

  now playing content changed

ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
  available players changed

ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
  the addressed player changed

ESP_AVRC_RN_UIDS_CHANGE = 0x0c
  UIDs changed
ESP_AVRC_RN_VOLUME_CHANGE = 0x0d
volume changed locally on TG

ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.

Values:

ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
all of the notification events that can possibly be supported, immutable

ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
notification events selectively supported according to the current configuration

ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.

Values:

ESP_AVRC_RN_RSP_INTERIM = 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

ESP_AVRC_RN_RSP_CHANGED = 15
final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.

Values:

ESP_AVRC_PS_EQUALIZER = 0x01
equalizer, on or off

ESP_AVRC_PS_REPEAT_MODE = 0x02
repeat mode

ESP_AVRC_PS_SHUFFLE_MODE = 0x03
shuffle mode

ESP_AVRC_PS_SCAN_MODE = 0x04
scan mode on or off

ESP_AVRC_PS_MAX_ATTR

enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.

Values:

ESP_AVRC_PS_EQUALIZER_OFF = 0x1
equalizer OFF

ESP_AVRC_PS_EQUALIZER_ON = 0x2
equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.

Values:

ESP_AVRC_PS_REPEAT_OFF = 0x1
repeat mode off

ESP_AVRC_PS_REPEAT_SINGLE = 0x2
single track repeat
\texttt{ESP\_AVRC\_PS\_REPEAT\_GROUP} = 0x3
\texttt{group repeat}

\texttt{enum esp\_avrc\_ps\_shf\_value\_ids\_t}
\texttt{AVRC shuffle modes. Values:}
\texttt{ESP\_AVRC\_PS\_SHUFFLE\_OFF} = 0x1
\texttt{ESP\_AVRC\_PS\_SHUFFLE\_ALL} = 0x2
\texttt{ESP\_AVRC\_PS\_SHUFFLE\_GROUP} = 0x3

\texttt{enum esp\_avrc\_ps\_scn\_value\_ids\_t}
\texttt{AVRC scan modes. Values:}
\texttt{ESP\_AVRC\_PS\_SCAN\_OFF} = 0x1
\texttt{scan off}
\texttt{ESP\_AVRC\_PS\_SCAN\_ALL} = 0x2
\texttt{all tracks scan}
\texttt{ESP\_AVRC\_PS\_SCAN\_GROUP} = 0x3
\texttt{group scan}

\texttt{enum esp\_avrc\_rsp\_t}
\texttt{AVCTP response codes. Values:}
\texttt{ESP\_AVRC\_RSP\_NOT\_IMPL} = 8
\texttt{not implemented}
\texttt{ESP\_AVRC\_RSP\_ACCEPT} = 9
\texttt{accept}
\texttt{ESP\_AVRC\_RSP\_REJECT} = 10
\texttt{reject}
\texttt{ESP\_AVRC\_RSP\_IN\_TRANS} = 11
\texttt{in transition}
\texttt{ESP\_AVRC\_RSP\_IMPL\_STBL} = 12
\texttt{implemented/stable}
\texttt{ESP\_AVRC\_RSP\_CHANGED} = 13
\texttt{changed}
\texttt{ESP\_AVRC\_RSP\_INTERIM} = 15
\texttt{interim}

\texttt{enum esp\_avrc\_batt\_stat\_t}
\texttt{AVRCP battery status. Values:}
\texttt{ESP\_AVRC\_BATT\_NORMAL} = 0
\texttt{normal state}
\texttt{ESP\_AVRC\_BATT\_WARNING} = 1
\texttt{unable to operate soon}
\texttt{ESP\_AVRC\_BATT\_CRITICAL} = 2
\texttt{cannot operate any more}
\texttt{ESP\_AVRC\_BATT\_EXTERNAL} = 3
\texttt{plugged to external power supply}
ESP_AVRC_BATT_FULL_CHARGE = 4
when completely charged from external power supply

**enum esp_avrc_playback_stat_t**

AVRCP current status of playback.

*Values:*

ESP_AVRC_PLAYBACK_STOPPED = 0
stopped

ESP_AVRC_PLAYBACK_PLAYING = 1
playing

ESP_AVRC_PLAYBACK_PAUSED = 2
paused

ESP_AVRC_PLAYBACK_FWD_SEEK = 3
forward seek

ESP_AVRC_PLAYBACK_REV_SEEK = 4
reverse seek

ESP_AVRC_PLAYBACK_ERROR = 0xFF
error

### SPP API

**Overview**

**Instructions**

**Application Example**

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_spp_api.h

**Functions**

`esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)`

This function is called to init callbacks with SPP module.

*Return*

- ESP_OK: success
- other: failed

*Parameters*

- [in] callback: pointer to the init callback function.

`esp_err_t esp_spp_init (esp_spp_mode_t mode)`

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

*Return*

- ESP_OK: success
- other: failed

*Parameters*
Chapter 2. API Reference

- [in] mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

```c
esp_err_t esp_spp_deinit (void)
```

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

Return

- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)
```

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return

- ESP_OK: success
- other: failed

Parameters

- [in] bd_addr: Remote device bluetooth device address.

```c
esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)
```

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return

- ESP_OK: success
- other: failed

Parameters

- [in] role: Master or slave.
- [in] remote_scn: Remote device bluetooth device SCN.
- [in] peer_bd_addr: Remote device bluetooth device address.

```c
esp_err_t esp_spp_disconnect (uint32_t handle)
```

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return

- ESP_OK: success
- other: failed

Parameters

- [in] handle: The connection handle.

```c
esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)
```

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_SRV_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return

- ESP_OK: success
- other: failed

Parameters
Chapter 2. API Reference

- **[in]** `sec_mask`: Security Setting Mask. Suggest to use `ESP_SPP_SEC_NONE`, `ESP_SPP_SEC_AUTHORIZE` or `ESP_SPP_SEC_AUTHENTICATE` only.
- **[in]** `role`: Master or slave.
- **[in]** `local_scn`: The specific channel you want to get. If channel is 0, means get any channel.
- **[in]** `name`: Server’s name.

```c
esp_err_t esp_spp_stop_srv (void)
```

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_stop_srv_scn (uint8_t scn)
```

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
- **[in]** `scn`: Server channel number.

```c
esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)
```

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter `cong` is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter `cong` is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter `cong` equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

Return
- ESP_OK: success
- other: failed

Parameters
- **[in]** `handle`: The connection handle.
- **[in]** `len`: The length of the data written.
- **[in]** `p_data`: The data written.

```c
esp_err_t esp_spp_vfs_register (void)
```

This function is used to register VFS. For now, SPP only supports write, read and close.

Return
- ESP_OK: success
- other: failed

Unions

```c
union esp_spp_cb_param_t
#include <esp_spp_api.h> SPP callback parameters union.
```

Public Members

```c
struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT
```
struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
SPP callback param of ESP_SPP_SRV_STOP_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

esp_spp_status_t status
status

uint32_t handle
The connection handle

uint8_t sec_id
security ID used by this server

bool use_co
TRUE to use co_rfc_data

struct spp_close_evt_param
#include <esp_spp_api.h> ESP_SPP_CLOSE_EVT.

Public Members

esp_spp_status_t status
status

uint32_t port_status
PORT status

uint32_t handle
The connection handle
bool async
   FALSE, if local initiates disconnect

struct spp_cong_evt_param
   #include <esp_spp_api.h> ESP_SPP_CONG_EVT.

Public Members

   esp_spp_status_t status
   uint32_t handle
      The connection handle
   bool cong
      TRUE, congested. FALSE, uncongested

struct spp_data_ind_evt_param
   #include <esp_spp_api.h> ESP_SPP_DATA_IND_EVT.

    #include <esp_spp_api.h> ESP_SPP_WRITE_EVT.

Public Members

    esp_spp_status_t status
    uint32_t handle
        The connection handle
    int len
        The length of the data written.
    bool cong
        congestion status

Macros

ESP_SPP_SEC_NONE
    No security. relate to BTA_SEC_NONE in bta/bta_api.h

ESP_SPP_SEC_AUTHORIZE
    Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

ESP_SPP_SEC_AUTHENTICATE
    Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

ESP_SPP_SEC_ENCRYPT
    Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

ESP_SPP_SEC_MODE4_LEVEL4
    Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

ESP_SPP_SEC_MITM
    Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

ESP_SPP_SEC_IN_16_DIGITS
    Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

ESP_SPP_MAX_MTU
    SPP max MTU

ESP_SPP_MAX_SCN
    SPP max SCN
### Type Definitions

```c
typedef uint16_t esp_spp_sec_t
typedef void(esp_spp_cb_t)(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)
```

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Parameters**
- `event`: Event type
- `param`: Point to callback parameter, currently is union type

### Enumerations

#### `enum esp_spp_status_t`

**Values:**
- `ESP_SPP_SUCCESS = 0`  
  Successful operation.
- `ESP_SPP_FAILURE`  
  Generic failure.
- `ESP_SPP_BUSY`  
  Temporarily can not handle this request.
- `ESP_SPP_NO_DATA`  
  No data
- `ESP_SPP_NO_RESOURCE`  
  No more resource
- `ESP_SPP_NEED_INIT`  
  SPP module shall init first
- `ESP_SPP_NEED_DEINIT`  
  SPP module shall deinit first
- `ESP_SPP_NO_CONNECTION`  
  Connection may have been closed
- `ESP_SPP_NO_SERVER`  
  No SPP server

#### `enum esp_spp_role_t`

**Values:**
- `ESP_SPP_ROLE_MASTER = 0`  
  Role: master
- `ESP_SPP_ROLE_SLAVE = 1`  
  Role: slave

#### `enum esp_spp_mode_t`

**Values:**
- `ESP_SPP_MODE_CB = 0`  
  When data is coming, a callback will come with data
- `ESP_SPP_MODE_VFS = 1`  
  Use VFS to write/read data

#### `enum esp_spp_cb_event_t`

SPP callback function events.

**Values:**
- `ESP_SPP_INIT_EVT = 0`  
  When SPP is inited, the event comes
ESP_SPP_UNINIT_EVT = 1
When SPP is uninited, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
When SPP Server connection open, the event comes

ESP_SPP_SRV_STOP_EVT = 35
When SPP server stopped, the event comes

Type Definitions

typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)

Callback for connection state change. state will have one of the values from BtHfConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)

Callback for audio connection state change. state will have one of the values from BtHFAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)

Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)

Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char*number, esp_bd_addr_t *bd_addr)

Callback for dialing an outgoing call. If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)

Callback for sending DTMF tones. tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)

Callback for enabling/disabling noise reduction/echo cancellation. value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)

Callback for AT+BSC and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)

Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)

Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for keypressed (HSP) event.

Enumerations

enum esp_hf_in_band_ring_state_t
    in-band ring tone state

Values:

    ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0
    ESP_HF_IN_BAND_RINGTONE_PROVIDED
enum esp_hf_vr_state_t
voice recognition state

Values:

ESP_HF_VR_STATE_DISABLED = 0
voice recognition disabled

ESP_HF_VR_STATE_ENABLED
voice recognition enabled

enum esp_hf_volume_control_target_t
Bluetooth HFP audio volume control target.

Values:

ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
speaker

ESP_HF_VOLUME_CONTROL_TARGET_MIC
microphone

enum esp_hf_audio_state_t
Bluetooth HFP audio connection status.

Values:

ESP_HF_AUDIO_STATE_DISCONNECTED = 0
audio connection released

ESP_HF_AUDIO_STATE_CONNECTING
audio connection has been initiated

ESP_HF_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

enum esp_hf_volume_type_t

Values:

+CIND call status indicator values

Values:

ESP_HF_CALL_STATUS_NO_CALLS = 0
no call in progress
ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
call is present (active or held)

enum esp_hf_call_setup_status_t
+CIND call setup status indicator values
Values:

ESP_HF_CALL_SETUP_STATUS_IDLE = 0
no call setup in progress

ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
incoming call setup in progress

ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
outgoing call setup in dialing state

ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
outgoing call setup in alerting state

enum esp_hf_roaming_status_t
+CIND roaming status indicator values
Values:

ESP_HF_ROAMING_STATUS_INACTIVE = 0
roaming is not active

ESP_HF_ROAMING_STATUS_ACTIVE
a roaming is active

enum esp_hf_call_held_status_t
+CIND call held indicator values
Values:

ESP_HF_CALL_Held_STATUS_NONE = 0
no calls held

ESP_HF_CALL_Held_STATUS_HELD_AND_ACTIVE = 1
both active and held call

ESP_HF_CALL_Held_STATUS_HELD = 2
call on hold, no active call

enum esp_hf_current_call_status_t
+CLCC status of the call
Values:

ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
active

ESP_HF_CURRENT_CALL_STATUS_HELD = 1
held

ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
dialing (outgoing calls only)

      outgoing
  ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
      incoming

enum esp_hf_current_call_mpty_type_t
  +CLCC multi-party call flag
  Values:
  ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
      not a member of a multi-party call
  ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
      member of a multi-party call

enum esp_hf_current_call_mode_t
  +CLCC call mode
  Values:
  ESP_HF_CURRENT_CALL_MODE_VOICE = 0
  ESP_HF_CURRENT_CALL_MODE_DATA = 1
  ESP_HF_CURRENT_CALL_MODE_FAX = 2

enum esp_hf_call_addr_type_t
  +CLCC address type
  Values:
  ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
      unknown address type
  ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
      international address

enum esp_hf_subscriber_service_type_t
  +CNUM service type of the phone number
  Values:
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
      unknown
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
      voice service
  ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
      fax service

enum esp_hf_btrh_status_t
  +BTRH response and hold result code
  Values:
  ESP_HF_BTRH_STATUS_HELD = 0
      incoming call is put on held in AG
  ESP_HF_BTRH_STATUS_ACCEPTED
      held incoming call is accepted in AG
  ESP_HF_BTRH_STATUS_REJECTED
      held incoming call is rejected in AG
enum esp_hf_btrh_cmd_t  
AT+BTRH response and hold action code.
Values:
ESP_HF_BTRH_CMD_HOLD = 0  
put the incoming call on hold
ESP_HF_BTRH_CMD_ACCEPT = 1  
accept a held incoming call
ESP_HF_BTRH_CMD_REJECT = 2  
reject a held incoming call

enum esp_hf_nrec_t  
Values:
ESP_HF_NREC_STOP = 0
ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t  
+CCWA response status
Values:
ESP_HF_CALL_WAITING_INACTIVE
ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t  
Values:
ESP_HF_WBS_NONE
ESP_HF_WBS_NO
ESP_HF_WBS_YES

enum esp_hf_connection_state_t  
Bluetooth HFP RFCOMM connection and service level connection status.
Values:
ESP_HF_CONNECTION_STATE_DISCONNECTED = 0  
RFCOMM data link channel released
ESP_HF_CONNECTION_STATE_CONNECTING  
connecting remote device on the RFCOMM data link
ESP_HF_CONNECTION_STATE_CONNECTED  
RFCOMM connection established
ESP_HF_CONNECTION_STATE_SLC_CONNECTED  
service level connection established
ESP_HF_CONNECTION_STATE_DISCONNECTING  
disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t  
AT+CHLD command values.
Values:
ESP_HF_CHLD_TYPE_REL = 0  
<0>, Terminate all held or set UDUB (“busy”) to a waiting call
ESP_HF_CHLD_TYPE_REL_ACC  
<1>, Terminate all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_HOLD_ACC  
<2>, Hold all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference

ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls

ESP_HF_CHLD_TYPE_REL_X
<1x>, releases specified calls only

ESP_HF_CHLD_TYPE_PRIV_X
<2x>, request private consultation mode with specified call

enum esp_hf_at_response_code_t
Values:
ESP_HF_AT_RESPONSE_CODE_OK = 0
acknowledges execution of a command line
ESP_HF_AT_RESPONSE_CODE_ERR
command not accepted
ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
connection terminated
ESP_HF_AT_RESPONSE_CODE_BUSY
busy signal detected
ESP_HF_AT_RESPONSE_CODE_NO_ANSWER
connection completion timeout
ESP_HF_AT_RESPONSE_CODE_DELAYED
delayed
ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
blacklisted
ESP_HF_AT_RESPONSE_CODE_CME
CME error

enum esp_hf_at_response_t
Values:
ESP_HF_AT_RESPONSE_ERROR = 0
ESP_HF_AT_RESPONSE_OK

enum esp_hf_cme_err_t
Extended Audio Gateway Error Result Code Response.
Values:
ESP_HF_CME_AG_FAILURE = 0
ag failure
ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
no connection to phone
ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
operation not allowed
ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
operation not supported
ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
PH-SIM PIN Required
ESP_HF_CME_SIM_NOT_INSERTED = 10
SIM not inserted
ESP_HF_CME_SIM_PIN_REQUIRED = 11
SIM PIN required

ESP_HF_CME_SIM_PUK_REQUIRED = 12
SIM PUK required

ESP_HF_CME_SIM_FAILURE = 13
SIM failure

ESP_HF_CME_SIM_BUSY = 14
SIM busy

ESP_HF_CME_INCORRECT_PASSWORD = 16
incorrect password

ESP_HF_CME_SIM_PIN2_REQUIRED = 17
SIM PIN2 required

ESP_HF_CME_SIM_PUK2_REQUIRED = 18
SIM PUK2 required

ESP_HF_CME_MEMORY_FULL = 20
memory full

ESP_HF_CME_INVALID_INDEX = 21
invalid index

ESP_HF_CME_MEMORY_FAILURE = 23
memory failure

ESP_HF_CME_TEXT_STRING_TOO_LONG = 24
text string too long

ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING = 25
invalid characters in text string

ESP_HF_CME_DIAL_STRING_TOO_LONG = 26
dial string too long

ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING = 27
invalid characters in dial string

ESP_HF_CME_NO_NETWORK_SERVICE = 30
no network service

ESP_HF_CME_NETWORK_TIMEOUT = 31
network timeout

ESP_HF_CME_NETWORK_NOT_ALLOWED = 32
network not allowed emergency calls only

HFP CLIENT API

Overview

API Reference

Header File

components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h
### Functions

#### `esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)`

Register application callback function to HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**

- `[in]` callback: HFP client event callback function

#### `esp_err_t esp_hf_client_init(void)`

Initialize the Bluetooth HFP client module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

#### `esp_err_t esp_hf_client_deinit(void)`

De-initialize for HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

#### `esp_err_t esp_hf_client_connect(esp_bd_addr_t remote_bda)`

Establish a Service Level Connection to remote Bluetooth HFP audio gateway (AG) device. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

**Return**

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_bda: remote Bluetooth device address

#### `esp_err_t esp_hf_client_disconnect(esp_bd_addr_t remote_bda)`

Disconnect from the remote HFP audio gateway. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_bda: remote Bluetooth device address

#### `esp_err_t esp_hf_client_connect_audio(esp_bd_addr_t remote_bda)`

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_bda: remote Bluetooth device address

#### `esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)`

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `[in]` remote_bda: remote Bluetooth device address
Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

```
esp_err_t esp_hf_client_start_voice_recognition (void)
```
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_hf_client_stop_voice_recognition (void)
```
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_hf_client_volume_update (esp_hf_volume_control_target_t type, int volume)
```
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

```
esp_err_t esp_hf_client_dial (const char *number)
```
Place a call with a specified number. If number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] number: number string of the call. If NULL, the last number is called (aka re-dial)

```
esp_err_t esp_hf_client_dial_memory (int location)
```
Place a call with number specified by location(speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] location: location of the number in the memory

```
esp_err_t esp_hf_client_send_chld_cmd (esp_hf_child_type_t child, int idx)
```
Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.
Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] chld: AT+CHLD call hold and multiparty handling AT command.
- [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

```c
esp_err_t esp_hf_client_send_btrh_cmd(esp_hf_btrh_cmd_t btrh)
```
Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] btrh: response and hold action to send

```c
esp_err_t esp_hf_client_answer_call(void)
```
Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_reject_call(void)
```
Reject an incoming call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_query_current_calls(void)
```
Query list of current calls in AG(send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_query_current_operator_name(void)
```
Query the name of currently selected network operator in AG(use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_retrieve_subscriber_info(void)
```
Get subscriber information number from AG(send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
**esp_err_t esp_hf_client_send_dtmf (char code)**

Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if蓝牙 stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] code: dtmf code, single ascii character in the set 0-9, #, *, A-D

**esp_err_t esp_hf_client_request_last_voice_tag_number (void)**

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_send_nrec (void)**

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)**

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

**void esp_hf_client_outgoing_data_ready (void)**

Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

**void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)**

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- [in] src_sps: original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- [in] bits: number of bits per pcm sample (16)
- [in] channels: number of channels (i.e. mono(1), stereo(2)…)

**void esp_hf_client_pcm_resample_deinit (void)**

Deinitialize the down sampling converter.

**int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)**

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.
Return  number of samples converted

Parameters
- \([\text{in}]\) src: pointer to the buffer where the original sampling PCM are stored
- \([\text{in}]\) in_bytes: length of the input PCM sample buffer in byte
- \([\text{in}]\) dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions

\[

HF callback param of ESP_HF_CLIENT_CNUM_EVT

**struct esp_hf_client_cb_param_t::hf_client_bsirparam bsir**

HF callback param of ESP_HF_CLIENT_BSIR_EVT

**struct esp_hf_client_cb_param_t::hf_client_binp_param binp**

HF callback param of ESP_HF_CLIENT_BINP_EVT

**struct hf_client_at_response_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_AT_RESPONSE_EVT.

**Public Members**

- `esp_hf_at_response_code_t code`
  AT response code
- `esp_hf_cme_err_t cme`
  Extended Audio Gateway Error Result Code

**struct hf_client_audio_stat_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_AUDIO_STATE_EVT.

**Public Members**

- `esp_hf_client_audio_state_t state`
  audio connection state
- `esp_bd_addr_t remote_bda`
  remote bluetooth device address

**struct hf_client_battery_level_ind_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT.

**Public Members**

- `int value`
  battery charge value, ranges from 0 to 5

**struct hf_client_binp_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BINP_EVT.

**Public Members**

- `const char * number`
  phone number corresponding to the last voice tag in the HF

**struct hf_client_bsirparam**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BSIR_EVT.

**Public Members**

- `esp_hf_client_in_band_ring_state_t state`
  setting state of in-band ring tone

**struct hf_client_btrh_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BTRH_EVT.

**Public Members**
Public Members

`esp_hf_btrh_status_t status`  
call hold and response status result code

`struct hf_client_bvra_param`  
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BVRA_EVT.

Public Members

`esp_hf_vr_state_t value`  
voice recognition state

`struct hf_client_call_held_ind_param`  
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_HELD_EVT.

Public Members

`esp_hf_call_held_status_t status`  
bluetooth proprietary call hold status indicator

`struct hf_client_call_ind_param`  
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_EVT.

Public Members

`esp_hf_call_status_t status`  
call status indicator

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_SETUP_EVT.

Public Members

`esp_hf_call_setup_status_t status`  
call setup status indicator

`struct hf_client_ccwa_param`  
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CCWA_EVT.

Public Members

`const char *number`  
phone number string of waiting call

`struct hf_client_clcc_param`  
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLCC_EVT.

Public Members

`int idx`  
numbering(starting with 1) of the call

`esp_hf_current_call_direction_t dir`  
direction of the call
`esp_hf_current_call_status_t status`
status of the call

`esp_hf_current_call_mpty_type_t mpty`
multi-party flag

`char *number`  
phone number (optional)

**struct hf_client_clip_param**
#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CLIP_EVT.

**Public Members**

```c
const char *number
```
phone number string of call

**struct hf_client_cnum_param**
#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CNUM_EVT.

**Public Members**

```c
const char *number
```
phone number string

`esp_hf_subscriber_service_type_t type`
service type that the phone number relates to

**struct hf_client_conn_stat_param**
#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CONNECTION_STATE_EVT.

**Public Members**

```c
esp_hf_client_connection_state_t state
```
HF connection state

```c
uint32_t peer_feat
```
AG supported features

```c
uint32_t chld_feat
```
AG supported features on call hold and multiparty services

`esp_bd_addr_t remote_bda`
remote bluetooth device address

**struct hf_client_current_operator_param**
#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT.

**Public Members**

```c
const char *name
```
named of the network operator

**struct hf_client_network_roaming_param**
#include `<esp_hf_client_api.h>` ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT.
Public Members

`esp_hf_roaming_status_t status`
roaming status

`struct hf_client_service_availability_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT.

Public Members

`esp_hf_network_state_t status`
service availability status

`struct hf_client_signal_strength_ind_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT.

Public Members

**Type Definitions**

```c
typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t*buf, uint32_t len)
```

HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

**Parameters**

- `buf`: Pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- `len`: Size (in bytes) in `buf`

```c
typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t*buf, uint32_t len)
```

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Return**

Length of data successfully read

**Parameters**

- `buf`: Pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- `len`: Size (in bytes) in `buf`

```c
typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
```

HFP client callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
class esp_hf_client_connection_state_t
```

Bluetooth HFP RFCOMM connection and service level connection status.

**Values**:

- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED` = 0
  - RFCOMM data link channel released
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING`
  - Connecting remote device on the RFCOMM data link
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED`
  - RFCOMM connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED`
  - Service level connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING`
  - Disconnecting with remote device on the RFCOMM data link

```c
class esp_hf_client_audio_state_t
```

Bluetooth HFP audio connection status.

**Values**:

- `ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED` = 0
  - Audio connection released
- `ESP_HF_CLIENT_AUDIO_STATE_CONNECTING`
  - Audio connection has been initiated
Chapter 2. API Reference

```c
ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

enum esp_hf_client_in_band_ring_state_t
  in-band ring tone state

Values:

ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0
ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_client_cb_event_t
  HF CLIENT callback events.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
connection state change event

ESP_HF_CLIENT_AUDIO_STATE_EVT
audio connection state change event

ESP_HF_CLIENT_BVRA_EVT
voice recognition state change event

ESP_HF_CLIENT_CIND_CALL_EVT
call indication

ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
call setup indication

ESP_HF_CLIENT_CIND_CALL_HELD_EVT
call held indication

ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
network service availability indication

ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
signal strength indication

ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
roaming status indication

ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
battery level indication

ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
current operator information

ESP_HF_CLIENT_BTRH_EVT
call response and hold event

ESP_HF_CLIENT_CLIP_EVT
Calling Line Identification notification

ESP_HF_CLIENT_CCWA_EVT
call waiting notification

ESP_HF_CLIENT_CLCC_EVT
list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL_EVT
audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
AT command response event
```
ESP_HF_CLIENT_CNUM_EVT
subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
requested number of last voice tag from AG

ESP_HF_CLIENT_RING_IND_EVT
ring indication event

HFP AG API

API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h

Functions

\textbf{esp_err_t} \textbf{esp bt hf register callback (esp hf cb t callback)}
Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

\textbf{Return}
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

\textbf{Parameters}
- \([\text{in}]\) \text{callback}: HFP AG event callback function

\textbf{esp_err_t} \textbf{esp bt hf init (esp bd addr t remote addr)}
Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

\textbf{Return}
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\textbf{Parameters}
- \([\text{in}]\) \text{remote_addr}: remote bluetooth device address

\textbf{esp_err_t} \textbf{esp bt hf deinit (esp bd addr t remote addr)}
De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

\textbf{Return}
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

\textbf{Parameters}
- \([\text{in}]\) \text{remote_addr}: remote bluetooth device address

\textbf{esp_err_t} \textbf{esp bt hf connect (esp bd addr t remote bda)}
To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

\textbf{Return}
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
Parameters
- \([\text{in}]\) remote_bda: remote bluetooth HFP client device address

`esp_err_t esp_bt_hf_disconnect(esp_bd_addr_t remote_bda)`
Disconnected from the remote HFP client. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- \([\text{in}]\) remote_bda: remote bluetooth device address

`esp_err_t esp_bt_hf_connect_audio(esp_bd_addr_t remote_bda)`
Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- \([\text{in}]\) remote_bda: remote bluetooth device address

`esp_err_t esp_bt_hf_disconnect_audio(esp_bd_addr_t remote_bda)`
Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- \([\text{in}]\) remote_bda: remote bluetooth device address

`esp_err_t esp_bt_hf_vra(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)`
Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- \([\text{in}]\) remote_bda: the device address of voice recognition initiator
- \([\text{in}]\) value: 0 - voice recognition disabled, 1- voice recognition enabled

`esp_err_t esp_bt_hf_volume_control(esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)`
Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- \([\text{in}]\) remote_bda: remote bluetooth device address
- \([\text{in}]\) type: volume control target, speaker or microphone
- \([\text{in}]\) volume: gain of the speaker of microphone, ranges 0 to 15

`esp_err_t esp_hf_unat_response(esp_bd_addr_t remote_addr, char *unat)`
Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection...
shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] unat: User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

\[ \text{esp_err_t esp_bt_hf_cmee_response(esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)} \]

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] response_code: AT command response code
- [in] error_code: CME error code

\[ \text{esp_err_t esp_bt_hf_indchange_notification(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)} \]

Usolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5

\[ \text{esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal, esp_hf_roaming_status_t roam, int batt_lev, esp_hf_call_held_status_t call_held_status)} \]

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5
- [in] roam: roam state
Chapter 2. API Reference

- [in] batt_lev: battery level from 0 to 5
- [in] call_held_status: call held status

```c
esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)
```
Reponse for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
- [in] name: current operator name

```c
esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_mpty_type_t mpty, char *number, esp_hf_call_addr_type_t type)
```
Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
- [in] index: the index of current call
- [in] dir: call direction (incoming/outgoing)
- [in] current_call_state: current call state
- [in] mode: current call mode (voice/data/fax)
- [in] mpty: single or multi type
- [in] number: current call number
- [in] type: international type or unknow

```c
esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number, esp_hf_subscriber_service_type_t type)
```
Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
- [in] number: registration number
- [in] type: service type (unknown/voice/fax)

```c
esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)
```
Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address
API Reference

- [in] state: in-band ring tone state

```c
esp_err_t esp_bt hf_answer_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
    esp HF call status_t call_state, esp HF call setup status_t call_setup_state, char *number,
    esp HF call addr type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp bt hf reject call (esp bd addr_t remote_addr, int num active, int num held,
    esp HF call status_t call_state, esp HF call setup status_t call_setup_state, char *number,
    esp HF call addr type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp bt hf out call (esp bd addr_t remote_addr, int num active, int num held,
    esp HF call status_t call_state, esp HF call setup status_t call_setup_state, char *number,
    esp HF call addr type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the outgoing call
- [in] call_addr_type: call address type
esp_err_t esp_bt_hf_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] remote_addr: remote Bluetooth device address
• [in] num_active: the number of active call
• [in] num_held: the number of held call
• [in] call_state: call state
• [in] call_setup_state: call setup state
• [in] number: number of the call
• [in] call_addr_type: call address type

esp_err_t esp_bt_hf_register_data_callback (esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

Return
• ESP_OK: success
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters
• [in] recv: HFP client incoming data callback function
• [in] send: HFP client outgoing data callback function

void esp_hf_outgoing_data_ready (void)

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled. As a precondition to use this API, Service Level Connection shall exist with HFP client. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data

Unions
union esp_hf_cb_param_t

# include <esp_hf_ag_api.h> HFP AG callback parameters.

Public Members

struct esp_hf_cb_param_t::hf_conn_stat_param conn_stat

Type Definitions

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters
Chapter 2. API Reference

- **[in]** `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.

  ```c
  typedef uint32_t(*esp_hf_outgoing_data_cb_t)(uint8_t*buf, uint32_t len)
  ```

  AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

  **Return** length of data successfully read

  **Parameters**
  - **[in]** `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
  - **[in]** `len`: size (in bytes) in `buf`

- **typedef** `void(*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)`

  HF AG callback function type.

  **Parameters**
  - `event`: Event type
  - `param`: Pointer to callback parameter

**Enumerations**

```c
cenum esp_hf_cb_event_t
{
    ESP_HF_CONNECTION_STATE_EVT = 0,
    ESP_HF_AUDIO_STATE_EVT,
    ESP_HF_BVRA_RESPONSE_EVT,
    ESP_HF_VOLUME_CONTROL_EVT,
    ESP_HF_UNAT_RESPONSE_EVT,
    ESP_HF_IND_UPDATE_EVT,
    ESP_HF_CIND_RESPONSE_EVT,
    ESP_HF_COPS_RESPONSE_EVT,
    ESP_HF_CLCC_RESPONSE_EVT,
    ESP_HF_CNUM_RESPONSE_EVT,
    ESP_HF_VTS_RESPONSE_EVT,
    ESP_HF_NREC_RESPONSE_EVT,
    ESP_HF_ATA_RESPONSE_EVT
}
```
2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function nimble_port_freertos_init. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host. Typical programming sequence with NimBLE stack consists of the following steps:
- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`.

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

### API Reference

#### Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

#### Functions

**`esp_err_t esp_nimble_hci_init()`**

- **Description**: Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.
- **Returns**:
  - `ESP_OK` if the initialization is successful
  - Appropriate error code from `esp_err_t` in case of an error

**`esp_err_t esp_nimble_hci_and_controller_init()`**

- **Description**: Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.
- **Returns**:
  - `ESP_OK` if the initialization is successful
  - Appropriate error code from `esp_err_t` in case of an error

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_-_stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d ", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.
Return
  • ESP_OK if the initialization is successful
  • Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_deinit (void)`
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return
  • ESP_OK if the deinitialization is successful
  • Appropriate error codes from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit (void)`
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

Note This function should not be executed in the context of Bluetooth host task.

Note This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
  nimble_port_deinit();
  ret = esp_nimble_hci_and_controller_deinit();
  if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with_-
    -error: %d", ret);
  }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return
  • ESP_OK if the de initialization is successful
  • Appropriate error codes from esp_err_t in case of an error

Macros

- BLE_HCI_UART_H4_NONE
- BLE_HCI_UART_H4_CMD
- BLE_HCI_UART_H4_ACL
- BLE_HCI_UART_H4_SCO
- BLE_HCI_UART_H4_EVT

2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an un provisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision un provisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.
Chapter 2. API Reference

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *Getting Started with ESP-BLE-MESH*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH Architecture*.

### Application Examples and Demos

Please refer to Sections *ESP-BLE-MESH Examples* and *ESP-BLE-MESH Demo Videos*.

### API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- **ESP-BLE-MESH Definitions**
- **ESP-BLE-MESH Core API Reference**
- **ESP-BLE-MESH Models API Reference**

#### ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

#### Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

#### Unions

union esp_ble_mesh_prov_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

#### Public Members

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param
provision_register_comp
Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param
node_set_unprov_dev_name_comp
Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param
node_prov_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param
node_prov_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param
node_prov_link_open
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param
node_prov_link_close
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param
node_prov_output_num
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param
node_prov_output_str
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
```

Submit Document Feedback
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param node_prov_input
    Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_completeEvt_param node_prov_complete
    Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_reset_param node_prov_reset
    Event parameter of ESP_BLE_MESH_NODE_PROV_RESET_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_oob_pub_key_comp_param node_prov_set_oob_pub_key_comp
    Event parameter of ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_number_comp_param node_prov_input_num_comp
    Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_string_comp_param node_prov_input_str_comp
    Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_identity_enable_comp_param node_proxy_identity_enable_comp
    Event parameter of ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_enable_comp_param node_proxy_gatt_enable_comp
    Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_disable_comp_param node_proxy_gatt_disable_comp
    Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param node_add_net_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param node_add_app_key_comp
    Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_param node_bind_app_key_to_model
    Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param provisioner_recv_unprov_adv_pkt
    Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param provisioner_prov_enable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param provisioner_prov_disable_comp
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param provisioner_prov_link_open
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_evt_param provisioner_prov_read_oob_pub_key
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_evt_param provisioner_prov_input
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_output_evt_param provisioner_prov_output
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_close_evt_param provisioner_prov_link_close
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_complete_param provisioner_prov_complete
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param provisioner_add_unprov_dev
    Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param provisioner_prov_dev_with_addr
    Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_dev_comp_param
 provisioning_delete_dev_comp
 Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_uuid_match_comp_param
 provisioning_set_dev_uuid_match
 Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_prov_data_info_comp_param
 provisioning_set_prov_data_info
 Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param
 provisioning_set_static_oob_val
 Event parameter of ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primary_elem_addr_comp_param
 provisioning_set_primary_elem_addr
 Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
 provisioning_prov_read_oob_pub_key
 Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
 provisioning_prov_input_num
 Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
 provisioning_prov_input_str
 Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
 provisioning_set_node_name
 Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
 provisioning_add_app_key
 Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
 provisioning_update_app_key
 Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param
 provisioning_bind_app_key_to_model
 Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param
 provisioning_add_net_key
 Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param
 provisioning_update_net_key
 Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param
 provisioning_store_node
 Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param
 provisioning_delete_node
 Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
 provisioning_delete_node
 Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
 Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
 Indicate the result of setting the heartbeat filter type by the Provisioner
 Indicate the result of setting the heartbeat filter address by the Provisioner
 Indicate the result of directly erasing settings by the Provisioner
 Indicate the result of opening settings with index by the Provisioner
 Indicate the result of opening settings with user id by the Provisioner
 Indicate the result of closing settings with index by the Provisioner
 Indicate the result of closing settings with user id by the Provisioner
 Indicate the result of deleting settings with index by the Provisioner
 Indicate the result of deleting settings with user id by the Provisioner
bool enable
   Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp
   ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
   Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp
   ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
   Operation (add, remove, clean)

uint16_t hb_src
   Heartbeat source address

uint16_t hb_dst
   Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_info_comp
   ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
   Heartbeat InitTTL

uint8_t rx_ttl
   Heartbeat RxTTL

uint8_t hops
   Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
   Bit field of currently active features of the node

int8_t rssi
   RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_recv_heartbeat
   ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_direct_erase_settings_comp
   ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
   Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_index_comp
   ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
   Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
   Provisioner settings user id

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_uid_comp
   ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
   Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::*[anonymous] provisioner_close_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*[anonymous] provisioner_close_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*[anonymous] provisioner_delete_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*[anonymous] provisioner_delete_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_set_fast_prov_info_comp_param set_fast_prov_info_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_set_fast_prov_action_comp_param set_fast_prov_action_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_heartbeat_msg_recv_param heartbeat_msg_recv
Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_recv_adv_pkt_param proxy_client_recv_adv_pkt
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_connected_param proxy_client_connected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_disconnected_param proxy_client_disconnected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_recv_filter_status_param proxy_client_recv_filter_status
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_connect_comp_param proxy_client_connect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_disconnect_comp_param proxy_client_disconnect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::*ble_mesh_proxy_client_set_filter_type_comp_param proxy_client_set_filter_type
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
**Chapter 2. API Reference**

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_add_filter_addr_comp_param proxy_client_add_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_remove_filter_addr_comp_param proxy_client_remove_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_sub_group_addr_comp_param model_sub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_unsub_group_addr_comp_param model_unsub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_deinit_mesh_comp_param deinit_mesh_comp
Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
```

```c
struct ble_mesh_deinit_mesh_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.
```

**Public Members**

```c
int err_code
Indicate the result of BLE Mesh deinitialization
```

```c
struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.
```

**Public Members**

```c
uint16_t lpn_addr
Low Power Node unicast address
```

```c
struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
```

**Public Types**

```c
enum [anonymous]
This enum value is the reason of friendship termination on the friend node side
```

**Values:**

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established
```

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
```

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node
```

```c
ESP_BLE_MESH_FRND_FRIENDSHIP TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node
```

```c
ESP_BLE_MESH_FRND_FRIENDSHIP TERMINATE Disable
Friend feature disabled or corresponding NetKey is deleted
```
Public Members

uint16_t lpn_addr
Low Power Node unicast address

esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

struct ble_mesh_model_publish_update_evt_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.
```

Public Members

```c
esp_ble_mesh_model_t *model
   Pointer to the model which is going to update its publish message
```

```
struct ble_mesh_model_send_comp_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.
```

Public Members

```c
int err_code
   Indicate the result of sending a message

uint32_t opcode
   Opcode of the message

esp_ble_mesh_model_t *model
   Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t *ctx
   Context of the message
```

```
struct ble_mesh_server_model_update_state_comp_param
   #include <esp_ble_mesh_defs.h>ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
```
Public Members

```c
int err_code
Indicate the result of updating server model state
```

```c
esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated
```

```c
esp_ble_mesh_server_state_type_t type
Type of the updated server state
```

Structures

```c
struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters
```

Public Members

```c
bool erase_flash
Indicate if erasing flash when deinit mesh stack
```

```c
struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h
```

Public Members

```c
uint16_t element_addr
Element Address, assigned during provisioning.
```

```c
const uint16_t location
Location Descriptor (GATT Bluetooth Namespace Descriptors)
```

```c
const uint8_t sig_model_count
SIG Model count
```

```c
const uint8_t vnd_model_count
Vendor Model count
```

```c
esp_ble_mesh_model_t *sig_models
SIG Models
```

```c
esp_ble_mesh_model_t *vnd_models
Vendor Models
```

```c
struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.
```

```c
uint16_t publish_addr
Publish Address.
```

```c
uint16_t app_idx : 12
Publish AppKey Index.
```

```c
uint16_t cred : 1
Friendship Credentials Flag.
```

uint16_t send_rel
   Force reliable sending (segment acks)

uint8_t ttl
   Publish Time to Live.

uint8_t retransmit
   Retransmit Count & Interval Steps.

uint8_t period
   Publish Period.

uint8_t period_div : 4
   Divisor for the Period.

uint8_t fast_period : 1
   Use FastPeriodDivider

uint8_t count : 3
   Retransmissions left.

uint32_t period_start
   Start of the current period.

struct net_buf_simple *msg
   Publication buffer, containing the publication message.
   This will get correctly created when the publication context has been defined using the
   ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
   ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
   Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
   Publish Period Timer. Initialized by the stack.

uint8_t dev_role
   Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
   Abstraction that describes a model operation context. This structure is associated with struct
   bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
   Message opcode

const size_t min_len
   Message minimum length

esp_ble_mesh_cb_t param_cb
   Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
   Abstraction that describes a model callback structure. This structure is associated with struct
   bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
   Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]:[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.
uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
    Received TTL value. Not used for sending.

uint8_t send_rel : 1
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

**Public Members**

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

**Public Members**

*esp_ble_mesh_bd_addr_t* addr
    Device address

*esp_ble_mesh_addr_type_t* addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled
**esp_ble_mesh_prov_bearer_t**

Provisioning Bearer

**struct esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

**Public Members**

- **esp_ble_mesh_bd_addr_t** **addr**
  - Device address
- **esp_ble_mesh_addr_type_t** **addr_type**
  - Device address type
- **uint8_t** **uuid[16]**
  - Device UUID
- **uint8_t** **flag**
  - BIT0: device address; BIT1: device UUID

**struct esp_ble_mesh_prov_data_info_t**

Information of the provisioner which is going to be updated.

**Public Members**

- **uint16_t** **net_idx**
  - NetKey Index
- **uint8_t** **flags**
  - Flags
- **uint32_t** **iv_index**
  - IV Index
- **uint8_t** **flag**
  - BIT0: net_idx; BIT1: flags; BIT2: iv_index

**struct esp_ble_mesh_node_t**

Information of the provisioned node

**Public Members**

- **esp_ble_mesh_bd_addr_t** **addr**
  - Node device address
- **esp_ble_mesh_addr_type_t** **addr_type**
  - Node device address type
- **uint8_t** **dev_uuid[16]**
  - Device UUID
- **uint16_t** **oob_info**
  - Node OOB information
- **uint16_t** **unicast_addr**
  - Node unicast address
- **uint8_t** **element_num**
  - Node element number
- **uint16_t** **net_idx**
  - Node NetKey Index
uint8_t flags
   Node key refresh flag and iv update flag

uint32_t iv_index
   Node IV Index

uint8_t dev_key[16]
   Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
   Node name

uint16_t comp_length
   Length of Composition Data

uint8_t* comp_data
   Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
   Minimum unicast address used for fast provisioning

uint16_t unicast_max
   Maximum unicast address used for fast provisioning

uint16_t net_idx
   Netkey index used for fast provisioning

uint8_t flags
   Flags used for fast provisioning

uint32_t iv_index
   IV Index used for fast provisioning

uint8_t offset
   Offset of the UUID to be compared

uint8_t match_len
   Length of the UUID to be compared

uint8_t match_val[16]
   Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
   Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
   Heartbeat source address (unicast address)

uint16_t hb_dst
   Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
   BLE Mesh client models related definitions.
   Client model Get/Set message opcode and corresponding Status message opcode
Public Members

```c
uint32_t cli_op
```
The client message opcode

```c
uint32_t status_op
```
The server status opcode corresponding to the client message opcode

### struct esp_ble_mesh_client_t

Client Model user data context.

#### Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the client model. Initialized by the stack.

```c
int op_pair_size
```
Size of the op_pair

```c
const esp_ble_mesh_client_op_pair_t *op_pair
```
Table containing get/set message opcode and corresponding status message opcode

```c
uint32_t publish_status
```
Callback used to handle the received unsolicited message. Initialized by the stack.

```c
void *internal_data
```
Pointer to the internal data of client model

```c
uint8_t msg_role
```
Role of the device (Node/Provisioner) that is going to send messages

### struct esp_ble_mesh_client_common_param_t

Common parameters of the messages sent by Client Model.

#### Public Members

```c
esp_ble_mesh_opcode_t opcode
```
Message opcode

```c
esp_ble_mesh_model_t *model
```
Pointer to the client model structure

```c
esp_ble_mesh_msg_ctx_t ctx
```
The context used to send message

```c
int32_t msg_timeout
```
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

```c
uint8_t msg_role
```
Role of the device - Node/Provisioner

### struct esp_ble_mesh_state_transition_t

Parameters of the server model state transition

#### Public Functions

`BLE_MESH_ATOMIC_DEFINE` (flag, `ESP_BLE_MESH_SERVER_FLAG_MAX`)  
Flag used to indicate if the transition timer has been started internally.

If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

Espressif Systems

Submit Document Feedback

Release v5.0-dev-1077-g397639d
And users can use this flag to indicate whether the timer is started or not.

**Public Members**

- `bool just_started`
  Indicate if the state transition has just started
- `uint8_t trans_time`
  State transition time
- `uint8_t remain_time`
  Remaining time of state transition
- `uint8_t delay`
  Delay before starting state transition
- `uint32_t quo_tt`
  Duration of each divided transition step
- `uint32_t counter`
  Number of steps which the transition duration is divided
- `uint32_t total_duration`
  State transition total duration
- `int64_t start_timestamp`
  Time when the state transition is started
- `struct k_delayed_work timer`
  Timer used for state transition

**Public Members**

- `uint8_t tid`
  Transaction number of the last message
- `uint16_t src`
  Source address of the last message
- `uint16_t dst`
  Destination address of the last message
- `int64_t timestamp`
  Time when the last message is received

**Public Members**

- `uint8_t get_auto_rsp : 1`
  BLE Mesh Server Response Option.
  1. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
  2. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
  3. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Set messages

```c
uint8_t set_auto_rsp : 1
   Response control for Client Set messages

uint8_t status_auto_rsp : 1
   Response control for Server Status messages
```

### Macros

- **ESP_BLE_MESH_SDU_MAX_LEN**
  - The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.
- **ESP_BLE_MESH_MIC_SHORT**
  - Length of a long Mesh MIC.
- **ESP_BLE_MESH_MIC_LONG**
  - The maximum length of a BLE Mesh provisioned node name
- **ESP_BLE_MESH_NODE_NAME_MAX_LEN**
  - The maximum length of a BLE Mesh unprovisioned device name
- **ESP_BLE_MESH_DEVICE_NAME_MAX_LEN**
  - The maximum length of settings user id
- **ESP_BLE_MESH_SETTINGS_UID_SIZE**
  - Invalid settings index
- **ESP_BLE_MESH_INVALID_SETTINGS_IDX**
  - Define the BLE Mesh octet 16 bytes size
- **ESP_BLE_MESH_OCTET16_LEN**
- **ESP_BLE_MESH_OCTET8_LEN**
- **ESP_BLE_MESH_CID_NVAL**
  - Special TTL value to request using configured default TTL
- **ESP_BLE_MESH_TTL_DEFAULT**
  - Maximum allowed TTL value
- **ESP_BLE_MESH_TTL_MAX**
- **ESP_BLE_MESH_ADDR_UNASSIGNED**
- **ESP_BLE_MESH_ADDR_ALL_NODES**
- **ESP_BLE_MESH_ADDR_PROXIES**
- **ESP_BLE_MESH_ADDR_FRIENDS**
- **ESP_BLE_MESH_ADDR_RELAYS**
- **ESP_BLE_MESH_KEY_UNUSED**
- **ESP_BLE_MESH_KEY_DEV**
- **ESP_BLE_MESH_KEY_PRIMARY**
  - Primary Network Key index
- **ESP_BLE_MESH_NET_PRIMARY**
  - Relay state value

ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST(addr)
ESP_BLE_MESH_ADDR_IS_GROUP(addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
Encode transmission count & interval steps.

Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters
• count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)
Decode transmit count from a transmit value.

Return Transmission count (actual transmissions equal to N + 1).

Parameters
• transmit: Encoded transmit count & interval value.
ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decode transmit interval from a transmit value.

Return Transmission interval in milliseconds.

Parameters
- transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encode Publish Retransmit count & interval steps.

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters
- count: Number of retransmissions (first transmission is excluded).
- int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)
Decode Publish Retransmit count from a given value.

Return Retransmission count (actual transmissions equal to N + 1).

Parameters
- transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Return Transmission interval in milliseconds.

Parameters
- transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN
Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)
ESP_BLE_MESH_MODEL_OP_2 (b0, b1)
ESP_BLE_MESH_MODEL_OP_3 (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (.id, .op, .pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (.company, .id, .op, .pub, _user_data)

ESP_BLE_MESH_ELEMENT (.loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
- loc: Location Descriptor.
- mods: Array of SIG models.
- vnd_mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN
BD_ADDR_LEN
ESP_BLE_MESH_ADDR_TYPE_PUBLIC
ESP_BLE_MESH_ADDR_TYPE_RANDOM
ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC
ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
- _name: Variable name given to the context.
- _msg_len: Length of the publication message.
- _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
- _opcode: Message opcode.
- _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG
DEL_DEV_UUID_FLAG
PROV_DATA_NET_IDX_FLAG
PROV_DATA_FLAGS_FLAG
PROV_DATA_IV_INDEX_FLAG
ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST
ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST
Provisioner heartbeat filter operation

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD
ESP_BLE_MESH_HEARTBEAT_FILTER_REMOVE

ESP_BLE_MESH_MODEL_ID_CONFIG_SRV
BLE Mesh models related Model ID and Opcode definitions.

Type Definitions
typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
  Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
  Invalid Company ID
typedef uint32_t esp_ble_mesh_cb_t
typedef uint8_t UINT8
typedef uint16_t UINT16
typedef uint32_t UINT32
typedef uint64_t UINT64
typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]
typedef uint8_t BD_ADDR[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_addr_type_t
  BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t
This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t
esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t
End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.
Enumerations

enum esp_ble_mesh_cb_type_t
Values:

    FAST_PROV_ACT_EXIT
    FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
    Values:
    PROXY_FILTER_WHITELIST
    PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
    Values:
    ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
        Initialize BLE Mesh provisioning capabilities and internal data information completion event
    ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
        Set the unprovisioned device name completion event
    ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
        Enable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
        Disable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
        Establish a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
        Close a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
        Generate Node input OOB public key event
    ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
        Generate Node Output Number event
ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROVCOMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
**ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event

**ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

**ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event

**ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

**ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event

**ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event

**ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event

**ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

**ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

**ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

**ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

**ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

**ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event

**ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

**ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event

**ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event

**ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event

**ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event

**ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event

**ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event
ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

Values:
ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states

Values:
ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:
ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event
ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
Chapter 2. API Reference

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- ESP-BLE-MESH Stack Initialization
- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

`esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)`
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

`esp_err_t esp_ble_mesh_deinit (esp_ble_mesh_deinit_param_t *param)`
De-initialize BLE Mesh module.

Note This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

Return ESP_OK on success or error code otherwise.

Parameters

Reading of Local Data Information
**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

**Functions**

```c
int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

**Return**
Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**
- **[in]** model: Model instance pointer.

```c
uint16_t esp_ble_mesh_get_primary_element_address (void)
```

Get the address of the primary element.

**Return**
Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

```c
uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)
```

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return**
Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**
- **[in]** model: Pointer to the model.
- **[in]** group_addr: Group address.

```c
dsp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)
```

Find the BLE Mesh element pointer via the element address.

**Return**
Pointer to the element on success, or NULL on failure.

**Parameters**
- **[in]** element_addr: Element address.

```c
uint8_t esp_ble_mesh_get_element_count (void)
```

Get the number of elements that have been registered.

**Return**
Number of elements.

```c
dsp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)
```

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return**
Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**
- **[in]** element: Element to which the model belongs.
- **[in]** company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

```c
dsp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)
```

Find the SIG model with the given element and Model id.

**Return**
Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**
- **[in]** element: Element to which the model belongs.
- **[in]** model_id: SIG model identifier.
const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)
Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.
**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** element_addr: Unicast address of the element to which the model belongs.
- **[in]** company_id: A 16-bit company identifier.
- **[in]** model_id: A 16-bit model identifier.
- **[in]** group_addr: The group address to be subscribed.

esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.
**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** element_addr: Unicast address of the element to which the model belongs.
- **[in]** company_id: A 16-bit company identifier.
- **[in]** model_id: A 16-bit model identifier.
- **[in]** group_addr: The subscribed group address.

const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)
This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**
- **[in]** net_idx: NetKey index.

const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)
This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**
- **[in]** app_idx: AppKey index.

esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.
**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** net_key: NetKey to be added.
- **[in]** net_idx: NetKey Index.

esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called by Node to add a local AppKey.

**Note** The net_idx must be an existing one. This function can only be called after the device is provisioned.
**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** app_key: AppKey to be added.
- **[in]** net_idx: NetKey Index.
Chapter 2. API Reference

• [in] app_idx: AppKey Index.

```c
esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
```

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] element_addr: Node local element address
- [in] company_id: Node local company id
- [in] model_id: Node local model id
- [in] app_idx: Node local appkey index

**Low Power Operation (Updating)**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_lpn_enable(void)
```

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_disable(bool force)
```

Disable BLE Mesh device LPN functionality.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] force: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll(void)
```

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

**Send/Publish Messages, add Local AppKey, etc.**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

**Functions**
Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] callback`: Pointer to the callback function.

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] data`: Pointer to the message data.

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t_t`) of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] model`: BLE Mesh Client model to which the message belongs.

De-initialize the user-defined client model.

**Note** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

Send server model messages (such as server model status messages).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] model`: BLE Mesh Server Model to which the message belongs.
- `[in] ctx`: Message context, includes keys, TTL, etc.
- `[in] length`: Message length (exclude the message opcode).
- `[in] data`: Parameters of Access Payload (exclude the message opcode) to be sent.
Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] model`: BLE Mesh Client Model to which the message belongs.
- `[in] ctx`: Message context, includes keys, TTL, etc.
- `[in] length`: Message length (exclude the message opcode).
- `[in] data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- `[in] msg_timeout`: Time to get response to the message (in milliseconds).
- `[in] need_rsp`: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- `[in] device_role`: Role of the device (Node/Provisioner) that sends the message.

Send a model publication message.

Note Before calling this function, the user needs to ensure that the model publication message (`esp_ble_mesh_model_pub_t::msg`) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] length`: Message length (exclude the message opcode).
- `[in] data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- `[in] device_role`: Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note Currently this API is used to update bound state value, not for all server model states.

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] model`: Server model which is going to update the state.
- `[in] value`: Server model state value.

Reset the provisioning procedure of the local BLE Mesh node.

Note All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

Return ESP_OK on success or error code otherwise.

This function is called to set the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] index: Index of the node in the node queue.
• [in] name: Name (end by ‘\0’) to be set for the node.

```c
const char* esp_ble_mesh_provisioner_get_node_name(uint16_t index)
```

This function is called to get the node (provisioned device) name.

**Note**: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return**: Node name on success, or NULL on failure.

**Parameters**
• [in] index: Index of the node in the node queue.

```c
uint16_t esp_ble_mesh_provisioner_get_node_index(const char* name)
```

This function is called to get the node (provisioned device) index.

**Return**: Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**
• [in] name: Name of the node (end by ‘\0’).

```c
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)
```

This function is called to store the Composition Data of the node.

**Return**: ESP_OK on success or error code otherwise.

**Parameters**
• [in] unicast_addr: Element address of the node
• [in] data: Pointer of Composition Data
• [in] length: Length of Composition Data

```c
esp_ble_mesh_node_t* esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])
```

This function is called to get the provisioned node information with the node device uuid.

**Return**: Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] uuid: Device UUID of the node

```c
esp_ble_mesh_node_t* esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)
```

This function is called to get the provisioned node information with the node unicast address.

**Return**: Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] unicast_addr: Unicast address of the node

```c
esp_ble_mesh_node_t* esp_ble_mesh_provisioner_get_node_with_name(const char* name)
```

This function is called to get the provisioned node information with the node name.

**Return**: Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] name: Name of the node (end by ‘\0’).

```c
uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)
```

This function is called by Provisioner to get provisioned node count.

**Return**: Number of the provisioned nodes.

```c
const esp_ble_mesh_node_t** esp_ble_mesh_provisioner_get_node_table_entry(void)
```

This function is called by Provisioner to get the entry of the node table.

**Note**: After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t**)node)` is NULL. For example:

```c
const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < Espressif Systems 367 Release v5.0-dev-1077-g397639d Submit Document Feedback`
CONFIG_BLE_MESH_MAX_PROV_NODES; i++) {
    const esp_ble_mesh_node_t *node = entry[i];
    if (node) { …… } } 
```
Return Pointer to the start of the node table.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
```
This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] uuid: Device UUID of the node

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
```
This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] unicast_addr: Unicast address of the node

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16],
                                                   uint16_t net_idx, uint16_t app_idx)
```
This function is called to add a local AppKey for Provisioner.

Note app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one.
app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] app_key: The app key to be set for the local BLE Mesh stack.
• [in] net_idx: The network key index.
• [in] app_idx: The app key index.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16],
                                                       uint16_t net_idx, uint16_t app_idx)
```
This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] app_key: Value of the AppKey.
• [in] net_idx: Corresponding NetKey Index.
• [in] app_idx: The AppKey Index

```c
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```
This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters
• [in] app_idx: Application key index.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr,
                                                              uint16_t app_idx,
                                                              uint16_t model_id,
                                                              uint16_t company_id)
```
This function is called by Provisioner to bind own model with proper app key.

Note company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] element_addr: Provisioner local element address
Chapter 2. API Reference

• [in] app_idx: Provisioner local app key index
• [in] model_id: Provisioner local model id
• [in] company_id: Provisioner local company id

`esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16],
                                                  uint16_t net_idx)`

This function is called by Provisioner to add local network key.

Note net_key: If set to NULL, net_key will be generated internally.
net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.
• [in] net_idx: The network key index.

`esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16],
                                                      uint16_t net_idx)`

This function is called by Provisioner to update a local network key.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] net_key: Value of the NetKey.
• [in] net_idx: The NetKey Index.

`const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)`

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

`esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)`

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] enable: Enable or disable receiving heartbeat messages.

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)`

This function is called by Provisioner to set the heartbeat filter type.

Note 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] type: Heartbeat filter type (acceptlist or rejectlist).

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op,
                                                             esp_ble_mesh_heartbeat_filter_info_t *info)`

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • The filter entry with the same SRC or DST will be removed.

Note 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
Chapter 2. API Reference

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] op: Add or REMOVE
- [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address;
  hb_dst - Heartbeat destination address;

esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] index: Settings index.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] uid: Settings user id.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
   1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
   3. The working process shall be as following: a) Open settings Ab) Start to provision and control nodes c) Close settings Ad) Open settings B e) Start to provision and control other nodes f) Close settings B g) ... .

Return ESP_OK on success or error code otherwise.

Parameters
- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
   1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A) Start to provision and control nodes c) Close settings A) Open settings B) e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

 esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Settings index.

 esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.

 const char * esp_ble_mesh_provisioner_get_settings_uid (uint8_t index)

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters

- [in] index: Settings index.

uint8_t esp_ble_mesh_provisioner_get_settings_index (const char *uid)

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters

- [in] uid: Settings user id.

uint8_t esp_ble_mesh_provisioner_get_free_settings_count (void)

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

 const uint8_t * esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters

- [in] app_idx: Application key index.

Type Definitions

typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning
### Header File
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

### Functions

**esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)**

Register BLE Mesh provisioning callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] callback: Pointer to the callback function.

**bool esp_ble_mesh_node_is_provisioned(void)**

Check if a device has been provisioned.

**Return** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

**esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)**

Enable specific provisioning bearers to get the device ready for provisioning.

**Note** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_mesh_prov_bearer_t bearers)**

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y
- [in] private_key: Unprovisioned device’s Private Key

**esp_err_t esp_ble_mesh_node_input_number(uint32_t number)**

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] number: Number input by device.

**esp_err_t esp_ble_mesh_node_input_string(const char *string)**

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] string: String input by device.
Chapter 2. API Reference

```c
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)
```

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` name: Unprovisioned device name

```c
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` link_idx: The provisioning link index
- `[in]` pub_key_x: Unprovisioned device’s Public Key X
- `[in]` pub_key_y: Unprovisioned device’s Public Key Y

```c
esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)
```

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with `ESP_BLE_MESH_ENTER_STRING` as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` string: String input by Provisioner.
- `[in]` link_idx: The provisioning link index.

```c
esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with `ESP_BLE_MESH_ENTER_NUMBER` as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` number: Number input by Provisioner.
- `[in]` link_idx: The provisioning link index.

```c
esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

```c
esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

```c
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.
Return ESP_OK on success or error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   • In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

• [in] add_dev: Pointer to a struct containing the device information
• [in] flags: Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
            esp_ble_mesh_bd_addr_t addr,
            esp_ble_mesh_addr_type_t addr_type,
            esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
            uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return Zero on success or (negative) error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

3. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.
Parameters
- [in] uuid: Device UUID of the unprovisioned device
- [in] addr: Address of the unprovisioned device
- [in] addr_type: Device address type of the unprovisioned device
- [in] bearer: Provisioning bearer going to be used by Provisioner
- [in] oob_info: OOB info of the unprovisioned device
- [in] unicast_addr: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```
Delete device from queue, and reset current provisioning link with the device.

Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] del_dev: Pointer to a struct containing the device information.

```
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,
                                                   uint8_t match_len, uint8_t offset,
                                                   bool prov_after_match)
```
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] match_val: Value to be compared with the part of the device UUID.
- [in] match_len: Length of the compared match value.
- [in] offset: Offset of the device UUID to be compared (based on zero).
- [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```
This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

```
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value,
                                                        uint8_t length)
```
This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Return ESP_OK on success or error code otherwise.

Parameters
- [in] value: Pointer to the static oob value.
- [in] length: Length of the static oob value.

```
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```
This function is called by Provisioner to set own Primary element address.

Note This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own
primary element address. And if the unicast address going to assigned for the next unprovisioned de-
vice is smaller than the input address + element number of Provisioner, then the address for the next
unprovisioned device will be recalculated internally.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] addr: Unicast address of the Primary element of Provisioner.

esp_err_t esp_ble_mesh_set_fast_prov_info (esp_ble_mesh_fast_prov_info_t *fast_prov_info)
This function is called to set provisioning data information before starting fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)
This function is called to start/suspend/exit fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] action: fast provisioning action (i.e. enter, suspend, exit).

Type Definitions
typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t event,
                                           esp_ble_mesh_prov_cb_param_t *param)
: event, event code of provisioning events; param, parameters of provisioning events

typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t addr,
                                           const esp_ble_mesh_addr_type_t addr_type,
                                           const uint8_t adv_type,
                                           const uint8_t *dev_uuid, uint16_t oob_info,
                                           esp_ble_mesh_prov_bearer_t bearer)
Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the
unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters
• [in] addr: Pointer to the unprovisioned device address.
• [in] addr_type: Unprovisioned device address type.
• [in] adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
• [in] oob_info: OOB information of the unprovisioned device.
• [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions
esp_err_t esp_ble_mesh_proxy_identity_enable (void)
Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising
using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal
conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically
by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_gatt_enable (void)
Enable BLE Mesh GATT Proxy Service.
**Return** ESP_OK on success or error code otherwise.

*esp_err_t* `esp_ble_mesh_proxy_gatt_disable (void)`  
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP_OK on success or error code otherwise.

*esp_err_t* `esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)`  
Proxy Client creates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `addr`: Device address of the Proxy Server.
- **[in]** `addr_type`: Device address type (public or static random).
- **[in]** `net_idx`: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

*esp_err_t* `esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)`  
Proxy Client terminates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `conn_handle`: Proxy connection handle.

*esp_err_t* `esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)`  
Proxy Client sets the filter type of the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `filter_type`: whitelist or blacklist.

*esp_err_t* `esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`  
Proxy Client adds address to the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `addr`: Pointer to the filter address.
- **[in]** `addr_num`: Number of the filter address.

*esp_err_t* `esp_ble_mesh_proxy_client_remove_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`  
Proxy Client removes address from the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `addr`: Pointer to the filter address.
- **[in]** `addr_num`: Number of the filter address.
ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside.
  Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions
union esp_ble_mesh_cfg_client_get_state_t

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures

Struct esp BLE mesh config srv
Configuration Server Model context
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Configuration Server Model

uint8_t `net_transmit`
Network Transmit state

uint8_t `relay`
Relay Mode state

uint8_t `relay_retransmit`
Relay Retransmit state

uint8_t `beacon`
Secure Network Beacon state

uint8_t `gatt_proxy`
GATT Proxy state

uint8_t `friend_state`
Friend state

uint8_t `default_ttl`
Default TTL

`struct k_delayed_work timer`
Heartbeat Publication timer

uint16_t `dst`
Destination address for Heartbeat messages

uint16_t `count`
Number of Heartbeat messages to be sent
Number of Heartbeat messages received

uint8_t `period`
Period for sending Heartbeat messages

uint8_t `ttl`
TTL to be used when sending Heartbeat messages

uint16_t `feature`
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t `net_idx`
NetKey Index used by Heartbeat Publication

`struct esp_ble_mesh_cfg_srv::<anonymous>heartbeat_pub`
Heartbeat Publication

int64_t `expiry`
Timestamp when Heartbeat subscription period is expired

uint16_t `src`
Source address for Heartbeat messages

uint8_t `min_hops`
Minimum hops when receiving Heartbeat messages

uint8_t `max_hops`
Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`
Optional heartbeat subscription tracking function

`struct esp_ble_mesh_cfg_srv::<anonymous>heartbeat_sub`
Heartbeat Subscription
**struct esp_ble_mesh_cfg_composition_data_get_t**
Parameters of Config Composition Data Get.

**Public Members**

`uint8_t page`
Page number of the Composition Data.

**struct esp_ble_mesh_cfg_model_pub_get_t**
Parameters of Config Model Publication Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_sig_model_sub_get_t**
Parameters of Config SIG Model Subscription Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

**struct esp_ble_mesh_cfg_vnd_model_sub_get_t**
Parameters of Config Vendor Model Subscription Get.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_app_key_get_t**
Parameters of Config AppKey Get.

**Public Members**

`uint16_t net_idx`
The network key index

**struct esp_ble_mesh_cfg_node_identity_get_t**
Parameters of Config Node Identity Get.
Public Members

```c
uint16_t net_idx
   The network key index
```

**struct esp_ble_mesh_cfg_sig_model_app_get_t**
Parameters of Config SIG Model App Get.

Public Members

```c
uint16_t element_addr
   The element address
```

```c
uint16_t model_id
   The model id
```

**struct esp_ble_mesh_cfg_vnd_model_app_get_t**
Parameters of Config Vendor Model App Get.

Public Members

```c
uint16_t element_addr
   The element address
```

```c
uint16_t model_id
   The model id
```

```c
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_get_t**
Parameters of Config Key Refresh Phase Get.

Public Members

```c
uint16_t net_idx
   The network key index
```

**struct esp_ble_mesh_cfg_lpn_polltimeout_get_t**
Parameters of Config Low Power Node PollTimeout Get.

Public Members

```c
uint16_t lpn_addr
   The unicast address of the Low Power node
```

**struct esp_ble_mesh_cfg_beacon_set_t**
Parameters of Config Beacon Set.

Public Members

```c
uint8_t beacon
   New Secure Network Beacon state
```

**struct esp_ble_mesh_cfg_default_ttl_set_t**
Parameters of Config Default TTL Set.
Public Members

```c
uint8_t ttl
The default TTL state value
```

```c
tstruct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.
```

Public Members

```c
uint8_t friend_state
The friend state value
```

```c
tstruct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.
```

Public Members

```c
uint8_t gatt_proxy
The GATT Proxy state value
```

```c
tstruct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.
```

Public Members

```c
uint8_t relay
The relay value
```

```c
uint8_t relay_retransmit
The relay retransmit value
```

```c
tstruct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.
```

Public Members

```c
uint16_t net_idx
The network key index
```

```c
uint8_t net_key[16]
The network key value
```

```c
tstruct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.
```

Public Members

```c
uint16_t net_idx
The network key index
```

```c
uint16_t app_idx
The app key index
```

```c
uint8_t app_key[16]
The app key value
```

```c
tstruct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.
```
Public Members

uint16_t **element_addr**
The element address

uint16_t **model_app_idx**
Index of the app key to bind with the model

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.
```

Public Members

uint16_t **element_addr**
The element address

uint16_t **publish_addr**
Value of the publish address

uint16_t **publish_app_idx**
Index of the application key

```c
bool **cred_flag**
Value of the Friendship Credential Flag
```

```c
uint8_t **publish_ttl**
Default TTL value for the publishing messages
```

```c
uint8_t **publish_period**
Period for periodic status publishing
```

```c
uint8_t **publish_retransmit**
Number of retransmissions and number of 50-millisecond steps between retransmissions
```

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.
```

Public Members

uint16_t **element_addr**
The element address

uint16_t **sub_addr**
The address to be added to the Subscription List

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.
```
Public Members

```
uint16_t element_addr
  The element address
```

```
uint16_t sub_addr
  The address to be removed from the Subscription List
```

```
uint16_t model_id
  The model id
```

```
uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_model_sub_overwrite_t**
Parameters of Config Model Subscription Overwrite.

Public Members

```
uint16_t element_addr
  The element address
```

```
uint16_t sub_addr
  The address to be added to the Subscription List
```

```
uint16_t model_id
  The model id
```

```
uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_model_sub_va_add_t**
Parameters of Config Model Subscription Virtual Address Add.

Public Members

```
uint16_t element_addr
  The element address
```

```
uint8_t label_uuid[16]
  The Label UUID of the virtual address to be added to the Subscription List
```

```
uint16_t model_id
  The model id
```

```
uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_model_sub_va_delete_t**
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

```
uint16_t element_addr
  The element address
```

```
uint8_t label_uuid[16]
  The Label UUID of the virtual address to be removed from the Subscription List
```

```
uint16_t model_id
  The model id
```
uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_overwrite_t**
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

- uint16_t **element_addr**
The element address
- uint8_t **label_uuid[16]**
The Label UUID of the virtual address to be added to the Subscription List
- uint16_t **model_id**
The model id
- uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_pub_va_set_t**
Parameters of Config Model Publication Virtual Address Set.

**Public Members**

- uint16_t **element_addr**
The element address
- uint8_t **label_uuid[16]**
  Value of the Label UUID publish address
- uint16_t **publish_app_idx**
  Index of the application key
- bool **cred_flag**
  Value of the Friendship Credential Flag
- uint8_t **publish_ttl**
  Default TTL value for the publishing messages
- uint8_t **publish_period**
  Period for periodic status publishing
- uint8_t **publish_retransmit**
  Number of retransmissions and number of 50-millisecond steps between retransmissions
- uint16_t **model_id**
The model id
- uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_delete_all_t**
Parameters of Config Model Subscription Delete All.

**Public Members**

- uint16_t **element_addr**
The element address
- uint16_t **model_id**
The model id

```
uint16_t **company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

   Public Members

   uint16_t net_idx
      The network key index
    uint8_t net_key[16]
      The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

   Public Members

   uint16_t net_idx
      The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.

   Public Members

   uint16_t net_idx
      The network key index
    uint16_t app_idx
      The app key index
    uint8_t app_key[16]
      The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
   Parameters of Config AppKey Delete.

   Public Members

   uint16_t net_idx
      The network key index
    uint16_t app_idx
      The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
   Parameters of Config Node Identity Set.

   Public Members

   uint16_t net_idx
      The network key index
    uint8_t identity
      New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
   Parameters of Config Model App Unbind.
```
Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_app_idx
    Index of the app key to bind with the model
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
uint8_t transition
    New Key Refresh Phase Transition
```

```c
struct esp_ble_mesh_cfg_net_transmit_set_t
    Parameters of Config Network Transmit Set.
```

Public Members

```c
uint8_t net_transmit
    Network Transmit State
```

```c
struct esp_ble_mesh_cfg_heartbeat_pub_set_t
    Parameters of Config Model Heartbeat Publication Set.
```

Public Members

```c
uint16_t dst
    Destination address for Heartbeat messages
```

```c
uint8_t count
    Number of Heartbeat messages to be sent
```

```c
uint8_t period
    Period for sending Heartbeat messages
```

```c
uint8_t ttl
    TTL to be used when sending Heartbeat messages
```

```c
uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed
```

```c
uint16_t net_idx
    NetKey Index
```

```c
struct esp_ble_mesh_cfg_heartbeat_sub_set_t
    Parameters of Config Model Heartbeat Subscription Set.
```
Public Members

uint16_t src
   Source address for Heartbeat messages

uint16_t dst
   Destination address for Heartbeat messages

uint8_t period
   Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
   Parameter of Config Beacon Status

Public Members

uint8_t beacon
   Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
   Parameters of Config Composition Data Status

Public Members

uint8_t page
   Page number of the Composition Data

struct net_buf_simple *composition_data
   Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
   Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
   Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
   Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
   GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
   Parameters of Config Relay Status

Public Members

uint8_t relay
   Relay state value

uint8_t retransmit
   Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)
struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

**struct esp_ble_mesh_cfg_app_key_status_cb_t**
Parameters of Config AppKey Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

**struct esp_ble_mesh_cfg_mod_app_status_cb_t**
Parameters of Config Model App Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID

uint16_t model_id
Model ID

**struct esp_ble_mesh_cfg_friend_status_cb_t**
Parameter of Config Friend Status

**Public Members**

uint8_t friend_state
Friend state value

**struct esp_ble_mesh_cfg hb_pub_status_cb_t**
Parameters of Config Heartbeat Publication Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t dst
Destination address for Heartbeat messages

uint8_t count
Number of Heartbeat messages remaining to be sent

uint8_t period
Period for sending Heartbeat messages
Chapter 2. API Reference

uint8_t ttl
   TTL to be used when sending Heartbeat messages

uint16_t features
   Features that trigger Heartbeat messages when changed

uint16_t net_idx
   Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
   Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
   Status Code for the request message

uint16_t src
   Source address for Heartbeat messages

uint16_t dst
   Destination address for Heartbeat messages

uint8_t period
   Remaining Period for processing Heartbeat messages

uint8_t count
   Number of Heartbeat messages received

uint8_t min_hops
   Minimum hops when receiving Heartbeat messages

uint8_t max_hops
   Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
   Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count
   Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step
   Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
   Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
   Status Code for the request message

uint16_t element_addr
   Address of the element

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID
Chapter 2. API Reference

```
struct net_buf_simple *sub_addr
    A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
    Parameter of Config NetKey List

Public Members

struct net_buf_simple *net_idx
    A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
    Parameters of Config AppKey List

Public Members

uint8_t status
    Status Code for the request message

uint16_t net_idx
    NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
    A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t
    Parameters of Config Node Identity Status

Public Members

uint8_t status
    Status Code for the request message

uint16_t net_idx
    Index of the NetKey

uint8_t identity
    Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status
```
Public Members

uint8_t status
    Status Code for the request message

uint16_t net_idx
    Index of the NetKey

uint8_t phase
    Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
    Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
    The unicast address of the Low Power node

int32_t poll_timeout
    The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
    Configuration Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
    The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
    Configuration Server model related context.

Public Members

uint16_t element_addr
    Element Address

uint16_t pub_addr
    Publish Address

uint16_t app_idx
    AppKey Index

bool cred_flag
    Friendship Credential Flag

uint8_t pub_ttl
    Publish TTL

uint8_t pub_period
    Publish Period

uint8_t pub_retransmit
    Publish Retransmit
uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t sub_addr
        Subscription Address

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t sub_addr
        Subscription Address

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
    Parameters of Config NetKey Add

    Public Members

    uint16_t net_idx
        NetKey Index

    uint8_t net_key[16]
        NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
    Parameters of Config NetKey Update

    Public Members

    uint16_t net_idx
        NetKey Index

    uint8_t net_key[16]
        NetKey
struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t element_addr
Element Address
uint16_t app_idx
AppKey Index
uint16_t company_id
Company ID
uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
   Parameters of Config Model App Unbind

   Public Members

   uint16_t element_addr
      Element Address
   uint16_t app_idx
      AppKey Index
   uint16_t company_id
      Company ID
   uint16_t model_id
      Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
   Parameters of Config Key Refresh Phase Set

   Public Members

   uint16_t net_idx
      NetKey Index
   uint8_t kr_phase
      New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
   Configuration Server model callback parameters

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the server model structure
   esp_ble_mesh_msg_ctx_t *ctx
      Context of the received message
   esp_ble_mesh_cfg_server_cb_value_t value
      Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
   Define a new Config Server Model.
   
   Note The Config Server Model can only be included by a Primary Element.
   
   Return New Config Server Model instance.
   
   Parameters
   
      • srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
   Define a new Config Client Model.
   
   Note The Config Client Model can only be included by a Primary Element.
   
   Return New Config Client Model instance.
   
   Parameters
   
      • cli_data: Pointer to a unique struct esp_ble_mesh_client_t.
Type Definitions

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context
```

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                         esp_ble_mesh_cfg_client_cb_param_t *param)
```

Configuration Client Model callback function type.

- **Parameters**
  - event: Event type
  - param: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                          esp_ble_mesh_cfg_server_cb_param_t *param)
```

Configuration Server Model callback function type.

- **Parameters**
  - event: Event type
  - param: Pointer to callback parameter

Enumerations

```c
enum esp_ble_mesh_cfg_client_cb_event_t
    This enum value is the event of Configuration Client Model
```

- **Values**
  - ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
  - ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
  - ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
  - ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
  - ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

```c
enum esp_ble_mesh_cfg_server_cb_event_t
    This enum value is the event of Configuration Server model
```

- **Values**
  - ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
  - ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)
```

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

- **Return** ESP_OK on success or error code otherwise.
- **Parameters**
  - [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)
```

Register BLE Mesh Health Server Model callback.
Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] element: The element to which the Health Server Model belongs.

Unions

```c
union esp_ble_mesh_health_client_get_state_t

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
```

the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

```c
esp_ble_mesh_health_fault_get_t fault_get

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.
```

```c
union esp_ble_mesh_health_client_set_state_t

```

the set_state parameter in the esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

```c
esp_ble_mesh_health_attention_set_t attention_set

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.
```
Chapter 2. API Reference

**esp_ble_mesh_health_period_set_t**

The `period_set` for `ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET` or `ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK`.

**esp_ble_mesh_health_fault_test_t**

The `fault_test` for `ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST` or `ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK`.

**esp_ble_mesh_health_fault_clear_t**

The `fault_clear` for `ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR` or `ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK`.

**union esp_ble_mesh_health_client_common_cb_param_t**

#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

### Public Members

**esp_ble_mesh_health_current_status_cb_t** `current_status`

The health current status value.

**esp_ble_mesh_health_fault_status_cb_t** `fault_status`

The health fault status value.

**esp_ble_mesh_health_period_status_cb_t** `period_status`

The health period status value.

**esp_ble_mesh_health_attention_status_cb_t** `attention_status`

The health attention status value.

### Structures

**struct esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback.

### Public Members

**esp_ble_mesh_health_fault_update_comp_cb_t** `fault_update_comp`

Clear health registered faults. Initialized by the stack.

**esp_ble_mesh_health_fault_test_cb_t** `fault_test`

Run a specific health test. Initialized by the stack.
Chapter 2. API Reference

`esp_ble_mesh_cb_t attention_on`
Health attention on callback. Initialized by the stack.

`esp_ble_mesh_cb_t attention_off`
Health attention off callback. Initialized by the stack.

```c
struct esp_ble_mesh_health_test_t
ESP BLE Mesh Health Server test Context
```

**Public Members**

```c
uint8_t id_count
Number of Health self-test ID

const uint8_t *test_ids
Array of Health self-test IDs

uint16_t company_id
Company ID used to identify the Health Fault state

uint8_t prev_test_id
Current test ID of the health fault test

uint8_t *current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of current faults

uint8_t *registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of registered faults
```

```c
struct esp_ble_mesh_health_srv_t
ESP BLE Mesh Health Server Model Context
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
Health callback struct

struct k_delayed_work attention_timer
Attention Timer state

bool attention_timer_start
Attention Timer start flag

esp_ble_mesh_health_test_t health_test
Health Server fault test

struct esp_ble_mesh_health_fault_get_t
Parameter of Health Fault Get
```

**Public Members**

```c
uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
Parameter of Health Attention Set
```
Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
Parameter of Health Period Set

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
Parameter of Health Fault Test

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID
uint8_t test_id
ID of a specific test to be performed

struct esp_ble_mesh_health_fault_clear_t
Parameter of Health Fault Clear

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
Parameters of Health Current Status

Public Members

uint8_t test_id
ID of a most recently performed test
uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
Parameters of Health Fault Status

Public Members

uint8_t test_id
ID of a most recently performed test
uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values
struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t status_cb
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int error_code
The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event
Public Members

```c
esp_ble_mesh_model_t *model
PointertotheHealthServerModel
```

```c
uint8_t test_id
IDofaspecifictesttobeperformed
```

```c
uint16_t company_id
Bluetoothassigned16-bitCompanyID
```

```c
struct esp_ble_mesh_health_attention_on_cb_t
ParameterofHealthAttentionOnevent
```

Public Members

```c
esp_ble_mesh_model_t *model
PointertotheHealthServerModel
```

```c
uint8_t time
Durationofattentiontimeron(inseconds)
```

```c
struct esp_ble_mesh_health_attention_off_cb_t
ParameterofHealthAttentionOffevent
```

Public Members

```c
esp_ble_mesh_model_t *model
PointertotheHealthServerModel
```

Macros

```c
ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
DefineanewHealthServerModel.
```

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**

- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

```c
ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
DefineanewHealthClientModel.
```

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**

- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
Ahelper todefeineahealthpublicationcontext
```

**Parameters**

- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

```c
ESP_BLE_MESH_HEALTH_STANDARD_TEST
SIGidentifierofHealthFaultTest. 0x01~0xFF:VendorSpecificTest.
```
ESP_BLE_MESH_NO_FAULT
  Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

#### Type Definitions

**typedef void(*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)**

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

**typedef void(*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)**

Health Server Model callback function type.

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

#### Enumerations

**enum esp_ble_mesh_health_client_cb_event_t**

This enum value is the event of Health Client Model

Values:

- **ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT**
- **ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT**
- **ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT**
- **ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT**
- **ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX**

**enum esp_ble_mesh_health_server_cb_event_t**

This enum value is the event of Health Server Model

Values:

- **ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT**
Chapter 2. API Reference

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)
```

Register BLE Mesh Generic Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] callback`: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                               esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] get_state`: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                               esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] set_state`: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- `[in] callback`: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_generic_client_get_state_t
    #include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.
```
Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
Parameters of Generic Level Set.

Public Members

bool op_en
Indicate if optional parameters are included

int16_t level
Target value of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
Parameters of Generic Delta Set.

Public Members

bool op_en
Indicate if optional parameters are included

int32_t level
Delta change of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
Parameters of Generic Move Set.

Public Members

bool op_en
Indicate if optional parameters are included
**int16_t** `delta_level`
   Delta Level step to calculate Move speed for Generic Level state

**uint8_t** `tid`
   Transaction ID

**uint8_t** `trans_time`
   Time to complete state transition (optional)

**uint8_t** `delay`
   Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_def_trans_time_set_t**
   Parameter of Generic Default Transition Time Set.

**Public Members**

**uint8_t** `trans_time`
   The value of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_set_t**
   Parameter of Generic OnPowerUp Set.

**Public Members**

**uint8_t** `onpowerup`
   The value of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_level_set_t**
   Parameters of Generic Power Level Set.

**Public Members**

**bool** `op_en`
   Indicate if optional parameters are included

**uint16_t** `power`
   Target value of Generic Power Actual state

**uint8_t** `tid`
   Transaction ID

**uint8_t** `trans_time`
   Time to complete state transition (optional)

**uint8_t** `delay`
   Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_power_default_set_t**
   Parameter of Generic Power Default Set.

**Public Members**

**uint16_t** `power`
   The value of the Generic Power Default state

**struct esp_ble_mesh_gen_power_range_set_t**
   Parameters of Generic Power Range Set.
Public Members

```plaintext
ut16_t range_min
   Value of Range Min field of Generic Power Range state
```

```plaintext

   Property ID identifying a Generic User Property
```

```plaintext
struct net_buf_simple *property_value
   Raw value for the User Property
```
struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.
Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t present_onoff
   Current value of Generic OnOff state

uint8_t target_onoff
   Target value of Generic OnOff state (optional)

   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
   Parameters of Generic Level Status.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t present_level
   Current value of Generic Level state

int16_t target_level
   Target value of the Generic Level state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
   Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

Public Members

uint8_t onpowerup
   The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
   Parameters of Generic Power Level Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_power
   Current value of Generic Power Actual state

uint16_t target_power
   Target value of Generic Power Actual state (optional)
Chapter 2. API Reference

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
StatusCode for the request message
uint16_t range_min
Value of Range Min field of Generic Power Range state
uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

uint32_t battery_level : 8
Value of Generic Battery Level state
uint32_t time_to_discharge : 24
Value of Generic Battery Time to Discharge state
uint32_t time_to_charge : 24
Value of Generic Battery Time to Charge state
uint32_t flags : 8
Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)
int32_t global_longitude
Global Coordinates (Longitude)
\[
\text{int16_t} \quad \text{global\_altitude}
\]
Global Altitude

\textbf{struct esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t}
Parameters of Generic Location Local Status.

\textbf{Public Members}

\text{int16_t} \quad \text{local\_north}
Local Coordinates (North)

\text{int16_t} \quad \text{local\_east}
Local Coordinates (East)

\text{int16_t} \quad \text{local\_altitude}
Local Altitude

\text{uint8_t} \quad \text{floor\_number}
Floor Number

\text{uint16_t} \quad \text{uncertainty}
Uncertainty

\textbf{struct esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t}
Parameter of Generic User Properties Status.

\textbf{Public Members}

\textbf{struct net\_buf\_simple *property\_ids}
Buffer contains a sequence of N User Property IDs

\textbf{struct esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t}
Parameters of Generic User Property Status.

\textbf{Public Members}

\text{bool} \quad \text{op\_en}
Indicate if optional parameters are included

\text{uint16_t} \quad \text{property\_id}
Property ID identifying a Generic User Property

\text{uint8_t} \quad \text{user\_access}
Enumeration indicating user access (optional)

\textbf{struct net\_buf\_simple *property\_value}
Raw value for the User Property (C.1)

\textbf{struct esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t}
Parameter of Generic Admin Properties Status.

\textbf{Public Members}

\textbf{struct net\_buf\_simple *property\_ids}
Buffer contains a sequence of N Admin Property IDs

\textbf{struct esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t}
Parameters of Generic Admin Property Status.
Chapter 2. API Reference

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_adminufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_properties_status_cb_t
Parameter of Generic Client Properties Status.

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_gen_client_status_cb_t *status_cb
The generic status message callback values
struct esp_ble_mesh_gen_onoff_state_t
Parameters of Generic OnOff state

Public Members

uint8_t onoff
The present value of the Generic OnOff state

uint8_t target_onoff
The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
Parameters of Generic Level state

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model
Public Members

*model
Pointer to the Generic Level Server Model. Initialized internally.

rsp_ctrl
Response control of the server model received messages

state
Parameters of the Generic Level state

last
Parameters of the last received set message

transition
Parameters of state transition

tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state

Public Members

trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model

Public Members

*model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.

rsp_ctrl
Response control of the server model received messages

state
Parameters of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_state_t
Parameter of Generic OnPowerUp state

Public Members

onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_srv_t
User data of Generic Power OnOff Server Model

Public Members

*model
Pointer to the Generic Power OnOff Server Model. Initialized internally.

rsp_ctrl
Response control of the server model received messages
Chapter 2. API Reference

`esp_ble_mesh_gen_onpowerup_state_t *state`
Parameters of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_onoff_setup_srv_t`
User data of Generic Power OnOff Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_onpowerup_state_t *state`
Parameters of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_state_t`
Parameters of Generic Power Level state

**Public Members**

uint16_t `power_actual`
The present value of the Generic Power Actual state

uint16_t `target_power_actual`
The target value of the Generic Power Actual state

uint16_t `power_last`
The value of the Generic Power Last state

uint16_t `power_default`
The value of the Generic Power Default state

uint8_t `status_code`
The status code of setting Generic Power Range state

uint16_t `power_range_min`
The minimum value of the Generic Power Range state

uint16_t `power_range_max`
The maximum value of the Generic Power Range state

`struct esp_ble_mesh_gen_power_level_srv_t`
User data of Generic Power Level Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition
Chapter 2. API Reference

```c
int32_t tt_delta_level
Delta change value of level state transition
```

```c
struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state
```

```c
struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model
```

**Public Members**

```c
uint32_t battery_level : 8
The value of the Generic Battery Level state
```

```c
uint32_t time_to_discharge : 24
The value of the Generic Battery Time to Discharge state
```

```c
uint32_t time_to_charge : 24
The value of the Generic Battery Time to Charge state
```

```c
uint32_t battery_flags : 8
The value of the Generic Battery Flags state
```

```c
struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Battery Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_battery_state_t *state
Parameters of the Generic Battery state
```

```c
struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
```

**Public Members**

```c
int32_t global_latitude
The value of the Global Latitude field
```

```c
int32_t global_longitude
The value of the Global Longitude field
```

```c
int16_t global_altitude
The value of the Global Altitude field
```

```c
struct esp_ble_mesh_gen_location_state_t
Parameters of Generic Location state
```

**Public Members**

```c
int32_t global_latitude
The value of the Global Latitude field
```

```c
int32_t global_longitude
The value of the Global Longitude field
```

```c
int16_t global_altitude
The value of the Global Altitude field
```
int16_t local_north
   The value of the Local North field

int16_t local_east
   The value of the Local East field

int16_t local_altitude
   The value of the Local Altitude field

uint8_t floor_number
   The value of the Floor Number field

uint16_t uncertainty
   The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
   User data of Generic Location Server Model

Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Generic Location Server Model. Initialized internally.

   esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
      Response control of the server model received messages

   esp_ble_mesh_gen_location_state_t *state
      Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
   User data of Generic Location Setup Server Model

Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Generic Location Setup Server Model. Initialized internally.

   esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
      Response control of the server model received messages

   esp_ble_mesh_gen_location_state_t *state
      Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
   Parameters of Generic Property states

Public Members

   uint16_t id
      The value of User/Admin/Manufacturer Property ID

   uint8_t user_access
      The value of User Access field

   uint8_t admin_access
      The value of Admin Access field

   uint8_t manu_access
      The value of Manufacturer Access field

   struct net_buf_simple *val
      The value of User/Admin/Manufacturer Property
struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic User Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Admin Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Manufacturer Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
Chapter 2. API Reference

uint8_t id_count
   Generic Client Property ID count

uint16_t *property_ids
   Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
   Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
   The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
   Parameter of Generic Level Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
   Parameter of Generic Delta Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
   Parameter of Generic Move Set state change event

Public Members

uint8_t trans_time
   The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
   The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
   Parameter of Generic Power Level Set state change event
Public Members

uint16_t power
  The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
  Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
  The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
  Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
  The minimum value of Generic Power Range state
uint16_t range_max
  The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
  Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
  The Global Latitude value of Generic Location state
int32_t longitude
  The Global Longitude value of Generic Location state
int16_t altitude
  The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
  Parameters of Generic Location Local Set state change event

Public Members

int16_t north
  The Local North value of Generic Location state
int16_t east
  The Local East value of Generic Location state
int16_t altitude
  The Local Altitude value of Generic Location state
uint8_t floor_number
  The Floor Number value of Generic Location state
uint16_t uncertainty
  The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
  Parameters of Generic User Property Set state change event
Public Members

```c
uint16_t id
    The property id of Generic User Property state

struct net_buf_simple *value
    The property value of Generic User Property state
```

```c
struct esp_ble_mesh_state_change_gen_admin_property_set_t
    Parameters of Generic Admin Property Set state change event
```

Public Members

```c
uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state
```

```c
struct esp_ble_mesh_state_change_gen_manu_property_set_t
    Parameters of Generic Manufacturer Property Set state change event
```

Public Members

```c
uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_get_t
    Context of the received Generic User Property Get message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_get_t
    Context of the received Generic Admin Property Get message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
    Context of the received Generic Manufacturer Property message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Generic Manufacturer Property
```

```c
struct esp_ble_mesh_server_recv_gen_client_properties_get_t
    Context of the received Generic Client Properties Get message
```
Public Members

`uint16_t property_id`
A starting Client Property ID present within an element

`struct esp_ble_mesh_server_recv_gen_onoff_set_t`
Context of the received Generic OnOff Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint8_t onoff`
Target value of Generic OnOff state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_level_set_t`
Context of the received Generic Level Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`int16_t level`
Target value of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_delta_set_t`
Context of the received Generic Delta Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`int32_t delta_level`
Delta change of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)
**Chapter 2. API Reference**

```
uint8_t delay

Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_move_set_t**

Context of the received Generic Move Set message

**Public Members**

bool op_en

Indicate if optional parameters are included

int16_t delta_level

Delta Level step to calculate Move speed for Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t**

Context of the received Generic Default Transition Time Set message

**Public Members**

uint8_t trans_time

The value of the Generic Default Transition Time state

**struct esp_ble_mesh_server_recv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

**Public Members**

uint8_t onpowerup

The value of the Generic OnPowerUp state

**struct esp_ble_mesh_server_recv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

**Public Members**

bool op_en

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_power_default_set_t**

Context of the received Generic Power Default Set message
```
Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_recv_gen_loc_global_set_t
Context of the received Generic Location Global Set message

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property
Chapter 2. API Reference

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
  Context of the received Generic Admin Property Set message

Public Members

uint16_t property_id
  Property ID identifying a Generic Admin Property

uint8_t user_access
  Enumeration indicating user access

struct net_buf_simple *property_value
  Raw value for the Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
  Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t property_id
  Property ID identifying a Generic Manufacturer Property

uint8_t user_access
  Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
  Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
  Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
  Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
  Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI(cli_pub, cli_data)
  Define a new Generic OnOff Client Model.

  Note This API needs to be called for each element on which the application needs to have a Generic OnOff
  Client Model.

  Return New Generic OnOff Client Model instance.

  Parameters
    • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
    • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI(cli_pub, cli_data)
  Define a new Generic Level Client Model.

  Note This API needs to be called for each element on which the application needs to have a Generic Level
  Client Model.

  Return New Generic Level Client Model instance.

  Parameters
    • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
    • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)
Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)
Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)
Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Property Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

---

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.

Define a new Generic OnOff Server Model.
Chapter 2. API Reference

Note 1. The Generic OnOff Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic OnOff Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV` (srv_pub, srv_data)
Define a new Generic Level Server Model.

Note 1. The Generic Level Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Level Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV` (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

Note 1. The Generic Default Transition Time Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV` (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV` (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

1. This model shall support model subscription.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV` (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

Espressif Systems 437 Release v5.0-dev-1077-g397639d
Submit Document Feedback
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_battery_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)
Define a new Generic Location Server Model.

Note 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that knows its location (global or local).

Return New Generic Location Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note 1. The Generic Location Setup Server model extends the Generic Location Server model.
1. This model shall support model subscription.

Return New Generic Location Setup Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note 1. The Generic User Property Server model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic User Property Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_user_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note 1. The Generic Admin Property Server model extends the Generic User Property Server model.
1. This model shall support model publication and model subscription.

Return New Generic Admin Property Server Model instance.
Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_admin_prop_srv_t.
ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**Note** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note** 1. The Generic Client Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Type Definitions**

typedef void (*esp_ble_mesh_generic_client_cb_t)(
  esp_ble_mesh_generic_client_cb_event_t event,
  esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(
  esp_ble_mesh_generic_server_cb_event_t event,
  esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_generic_client_cb_event_t
This enum value is the event of Generic Client Model

**Values**:

ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t
This enum value is the access value of Generic User Property

**Values**:

ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property

Values:
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property

Values:
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t
This enum value is the event of Generic Server Model

Values:
ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.
ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.
ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.
ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)

Register BLE Mesh Sensor Client Model callback.

Return  ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.
Chapter 2. API Reference

```c
esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_sensor_client_get_state_t *get_state)
```

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] get_state`: Pointer to sensor get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_sensor_client_set_state_t *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] set_state`: Pointer to sensor set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)
```

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] callback`: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_sensor_client_get_state_t
#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.

  ```c
  uint16_t property_id
  Property ID of a sensor
  ```
Public Members

uint16_t property_id
Property ID for the sensor

uint8_t fast_cadence_period_divisor : 7
Divisor for the publish period

uint8_t status_trigger_type : 1
The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
Delta up value that triggers a status message

uint8_t status_min_interval
Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get
Chapter 2. API Reference

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple * **raw_value_x**
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple * **raw_value_x1**
Raw value identifying a starting column (optional)

struct net_buf_simple * **raw_value_x2**
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple * **descriptor**
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

Public Members

uint16_t **property_id**
Property for the sensor

struct net_buf_simple * **sensor_cadence_value**
Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
Parameters of Sensor Settings Status
Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
Parameters of Sensor Setting Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
Parameter of Sensor Status

Public Members

struct net_buf_simple *marshalled_sensor_data
Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
Parameters of Sensor Column Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters
Public Members

int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_bleMeshClientCommonParam_t*params
The client common parameters.

esp_bleMeshSensorClientStatusCb_tstatus_cb
The sensor status message callback values

struct esp_bleMeshSensorDescriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance : 12
The value of Sensor Positive Tolerance field

uint32_t negative_tolerance : 12
The value of Sensor Negative Tolerance field

uint32_tsampling_function : 8
The value of Sensor Sampling Function field

uint8_t measure_period
The value of Sensor Measurement Period field

uint8_t update_interval
The value of Sensor Update Interval field

struct esp_bleMeshSensorSetting_t
Parameters of Sensor Setting state

Public Members

uint16_t property_id
The value of Sensor Setting Property ID field

uint8_t access
The value of Sensor Setting Access field

struct net_buf_simple *raw
The value of Sensor Setting Raw field

struct esp_bleMeshSensorCadence_t
Parameters of Sensor Cadence state

Public Members

uint8_t period_divisor : 7
The value of Fast Cadence Period Divisor field

uint8_t trigger_type : 1
The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field
**Public Members**

```c
struct net_buf_simple *trigger_delta_up
  The value of Status Trigger Delta Up field
```

```c
uint8_t min_interval
  The value of Status Min Interval field
```

```c
struct net_buf_simple *fast_cadence_low
  The value of Fast Cadence Low field
```

```c
struct net_buf_simple *fast_cadence_high
  The value of Fast Cadence High field
```

```c
struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state
```

```c
uint8_t format : 1
  Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
  Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format
```

```c
uint8_t length : 7
  The value of the Sensor Data length
```

```c
struct net_buf_simple *raw_value
  The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state
```

```c
struct net_buf_simple *raw_value_x
  The value of Sensor Raw Value X field
```

```c
struct net_buf_simple *column_width
  The value of Sensor Column Width field
```

```c
struct net_buf_simple *raw_value_y
  The value of Sensor Raw Value Y field
```

```c
struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states
```

```c
uint16_t sensor_property_id
  The value of Sensor Property ID field
```

```c
esp_ble_mesh_sensor_descriptor_t descriptor
  Parameters of the Sensor Descriptor state
```

```c
const uint8_t setting_count
  Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.
```

```c
esp_ble_mesh_sensor_setting_t *settings
  Parameters of the Sensor Setting state
```
The Sensor Cadence state may be not supported by sensors based on device properties referencing "non-scalar characteristics" such as "histograms" or "composite characteristics". Parameters of the Sensor Cadence state

```c
esp_ble_mesh_sensor_data_t *sensor_data
```
Parameters of the Sensor Data state

```c
esp_ble_mesh_sensor_series_column_t *series_column
```
Parameters of the Sensor Series Column state

```c
struct esp_ble_mesh_sensor_srv_t
```
User data of Sensor Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Sensor Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```c
const uint8_t state_count
```
Sensor state count

```c
esp_ble_mesh_sensor_state_t *states
```
Parameters of the Sensor states

```c
struct esp_ble_mesh_sensor_setup_srv_t
```
User data of Sensor Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Sensor Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```c
const uint8_t state_count
```
Sensor state count

```c
esp_ble_mesh_sensor_state_t *states
```
Parameters of the Sensor states

```c
struct esp_ble_mesh_state_change_sensor_cadence_set_t
```
Parameters of Sensor Cadence Set state change event

**Public Members**

```c
uint16_t property_id
```
The value of Sensor Property ID state

```c
uint8_t period_divisor : 7
```
The value of Fast Cadence Period Divisor state

```c
uint8_t trigger_type : 1
```
The value of Status Trigger Type state

```c
struct net_buf_simple *trigger_delta_down
```
The value of Status Trigger Delta Down state
struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
    Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
    The value of Sensor Property ID state

uint16_t setting_property_id
    The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
    The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message
Chapter 2. API Reference

Public Members

uint16_t property_id
Property ID of a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
Context of the received Sensor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
Context of the received Sensor Column Get message

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message
Chapter 2. API Reference

Public Members

`uint16_t property_id`
Property ID identifying a sensor

`uint16_t setting_property_id`
Setting ID identifying a setting within a sensor

`struct net_buf_simple *setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_server_cb_param_t`
Sensor Server Model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Sensor Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_sensor_server_cb_value_t value`
Value of the received Sensor Messages

Macros

`ESP_BLE_MESH_MODEL_SENSOR_CLI(cli_pub, cli_data)`
Define a new Sensor Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Sensor Client Model.

**Return** New Sensor Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SRV(srv_pub, srv_data)`
Define a new Sensor Server Model.

**Note** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV(srv_pub, srv_data)`
Define a new Sensor Setup Server Model.

**Note** 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

`ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID`
Invalid Sensor Property ID

`ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN`
Length of Sensor Property ID
ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
   Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
   Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
   Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
   Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
   Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
   Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
   Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
   Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
   Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
   Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
   Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
   Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
   Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
   Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
   Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
   Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
   Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
   Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
   MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
   MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
   Zero length of Sensor Data.

   Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT(_data)
   Get format of the sensor data.
Chapter 2. API Reference

**Note** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**Return** Format of the sensor data.

**Parameters**
- `_data`: Pointer to the start of the sensor data.

`ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)`
Get length of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**Return** Length (zero-based) of the sensor data.

**Parameters**
- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

`ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)`
Get Sensor Property ID of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**
- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

`ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)`
Generate a MPID value for sensor data with Format A.

**Note**
1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return** 2-octet MPID value for sensor data with Format A.

**Parameters**
- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

`ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)`
Generate a MPID value for sensor data with Format B.

**Note**
1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return** 3-octet MPID value for sensor data with Format B.

**Parameters**
- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Parameters**
Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Enumerations

enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model
Values:

ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function
Values:

ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t
This enum value is the event of Sensor Server Model
Values:

ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
1. When get auto rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
2. When set auto rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
When get auto rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
When set auto rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback (esp_ble_mesh_time_scene_client_cb_t callback)`

Register BLE Mesh Time Scene Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

`esp_err_t esp_ble_mesh_time_scene_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)`

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** get_state: Pointer to time scene get message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_time_scene_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state)`

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** set_state: Pointer to time scene set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_time_scene_server_callback (esp_ble_mesh_time_scene_server_cb_t callback)`

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

Unions

`union esp_ble_mesh_time_scene_client_get_state_t`

Include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model get message union.

Public Members

- `esp_ble_mesh_scheduler_act_get_t scheduler_act_get`

For ESP_BLE_MESH_MODEL_OP_SCHEDULER_ACT_GET

`union esp_ble_mesh_time_scene_client_set_state_t`

Include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model set message union.

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
```

Public Members

```c
uint8_t tai_seconds[5]
The current TAI time in seconds
```

```c
uint8_t sub_second
The sub-second time in units of 1/256 second
```

```c
uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds
```

```c
uint8_t time_zone_offset
The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_zone_set_t
Parameters of Time Zone Set
```

Public Members

```c
uint8_t time_zone_offset_new
Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_tai_utc_delta_set_t
Parameters of TAI-UTC Delta Set
```
Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_store_t
Parameter of Scene Store

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get
Chapter 2. API Reference

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set

Public Members

uint64_t index : 4
Index of the Schedule Register entry to set

uint64_t year : 7
Scheduled year for the action

uint64_t month : 12
Scheduled month for the action

uint64_t day : 5
Scheduled day of the month for the action

uint64_t hour : 5
Scheduled hour for the action

uint64_t minute : 6
Scheduled minute for the action

uint64_t second : 6
Scheduled second for the action

uint64_t day_of_week : 7
Scheduled days of the week for the action

uint64_t action : 4
Action to be performed at the scheduled time

uint64_t trans_time : 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_status_cb_t
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t sub_second
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds

```c
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status
```

**Public Members**

- `uint8_t time_zone_offset_curr`
  Current local time zone offset
- `uint8_t time_zone_offset_new`
  Upcoming local time zone offset
- `uint8_t tai_zone_change[5]`
  TAI Seconds time of the upcoming Time Zone Offset change

```c
struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status
```

**Public Members**

- `uint16_t tai_utc_delta_curr : 15`
  Current difference between TAI and UTC in seconds
- `uint16_t padding_1 : 1`
  Always 0b0. Other values are Prohibited.
- `uint16_t tai_utc_delta_new : 15`
  Upcoming difference between TAI and UTC in seconds
- `uint16_t padding_2 : 1`
  Always 0b0. Other values are Prohibited.
- `uint8_t tai_delta_change[5]`
  TAI Seconds time of the upcoming TAI-UTC Delta change

```c
struct esp_ble_mesh_time_role_status_cb_t
    Parameter of Time Role Status
```

**Public Members**

- `uint8_t time_role`
  The Time Role for the element

```c
struct esp_ble_mesh_scene_status_cb_t
    Parameters of Scene Status
```

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint8_t status_code`
  Status code of the last operation
- `uint16_t current_scene`
  Scene Number of the current scene
- `uint16_t target_scene`
  Scene Number of the target scene (optional)
uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status

Public Members

uint8_t status_code
  Status code for the previous operation
uint16_t current_scene
  Scene Number of the current scene
struct net_buf_simple *scenes
  A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameters of Scheduler Status

Public Members

uint16_t schedules
  Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index: 4
  Enumerates (selects) a Schedule Register entry
uint64_t year: 7
  Scheduled year for the action
uint64_t month: 12
  Scheduled month for the action
uint64_t day: 5
  Scheduled day of the month for the action
uint64_t hour: 5
  Scheduled hour for the action
uint64_t minute: 6
  Scheduled minute for the action
uint64_t second: 6
  Scheduled second for the action
uint64_t day_of_week: 7
  Schedule days of the week for the action
uint64_t action: 4
  Action to be performed at the scheduled time
uint64_t trans_time: 8
  Transition time for this action
uint16_t scene_number
  Transition time for this action
struct esp_ble_mesh_time_scene_client_cb_param_t
    Time Scene Client Model callback parameters

    Public Members

    int error_code
        Appropriate error code

    esp_ble_mesh_client_common_param_t *params
        The client common parameters.

    esp_ble_mesh_time_scene_client_status_cb_t status_cb
        The scene status message callback values

struct esp_ble_mesh_time_state_t
    Parameters of Time state

    Public Members

    uint8_t tai_seconds[5]
        The value of the TAI Seconds state

    uint8_t subsecond
        The value of the Subsecond field

    uint8_t uncertainty
        The value of the Uncertainty field

    uint8_t time_zone_offset_curr
        The value of the Time Zone Offset Current field

    uint8_t time_zone_offset_new
        The value of the Time Zone Offset New state

    uint8_t tai_zone_change[5]
        The value of the TAI of Zone Chaneg field

    uint16_t time_authority : 1
        The value of the Time Authority bit

    uint16_t tai_utc_delta_curr : 15
        The value of the TAI-UTC Delta Current state

    uint16_t tai_utc_delta_new : 15
        The value of the TAI-UTC Delta New state

    uint8_t tai_delta_change[5]
        The value of the TAI of Delta Change field

    struct esp_ble_mesh_time_state_t::[anonymous] time
        Parameters of the Time state

    uint8_t time_role
        The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Time Server Model. Initialized internally.
Chapter 2. API Reference

**esp_ble_mesh_server_rsp_ctrl_t**
- **rst_ctrl**
  - Response control of the server model received messages

**esp_ble_mesh_time_state_t**
- **state**
  - Parameters of the Time state

**struct esp_ble_mesh_time_setup_srv_t**
- User data of Time Setup Server Model

**Public Members**

**esp_ble_mesh_model_t**
- **model**
  - Pointer to the Time Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t**
- **rst_ctrl**
  - Response control of the server model received messages

**esp_ble_mesh_time_state_t**
- **state**
  - Parameters of the Time state

**struct esp_ble_mesh_time_setup_srv_t**

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

**Public Members**

**uint16_t**
- **scene_number**
  - The value of the Scene Number

**uint8_t**
- **scene_type**
  - The value of the Scene Type

**struct net_buf_simple**
- **scene_value**
  - Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

**struct esp_ble_mesh_scenes_state_t**
- Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.
Public Members

`const` uint16_t `scene_count`
The Scenes state’s scene count

`exp_ble_mesh_scene_register_t *scenes`
Parameters of the Scenes state

uint16_t `current_scene`
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t `target_scene`
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t `status_code`
The status code of the last scene operation

bool `in_progress`
Indicate if the scene transition is in progress

`struct esp_ble_mesh_scene_srv_t`
User data of Scene Server Model

Public Members

`exp_ble_mesh_model_t *model`
Pointer to the Scene Server Model. Initialized internally.

`exp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`exp_ble_mesh_scenes_state_t *state`
Parameters of the Scenes state

`exp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`exp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`struct esp_ble_mesh_scene_setup_srv_t`
User data of Scene Setup Server Model
Public Members

*esp_ble_mesh_model_t* `model`
   
   Pointer to the Scene Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
   
   Response control of the server model received messages

*esp_ble_mesh_scenes_state_t* `state`
   
   Parameters of the Scenes state

*struct esp_ble_mesh_schedule_register_t*
   
   Parameters of Scheduler Register state

Public Members

bool `in_use`
   
   Indicate if the registered schedule is in use

uint64_t `year`: 7
   
   The value of Scheduled year for the action

uint64_t `month`: 12
   
   The value of Scheduled month for the action

uint64_t `day`: 5
   
   The value of Scheduled day of the month for the action

uint64_t `hour`: 5
   
   The value of Scheduled hour for the action

uint64_t `minute`: 6
   
   The value of Scheduled minute for the action

uint64_t `second`: 6
   
   The value of Scheduled second for the action

uint64_t `day_of_week`: 7
   
   The value of Schedule days of the week for the action

uint64_t `action`: 4
   
   The value of Action to be performed at the scheduled time

uint64_t `trans_time`: 8
   
   The value of Transition time for this action

uint16_t `scene_number`
   
   The value of Scene Number to be used for some actions

*struct esp_ble_mesh_scheduler_state_t*
   
   Parameters of Scheduler state

Public Members

const uint8_t `schedule_count`
   
   Scheduler count

*esp_ble_mesh_schedule_register_t* `schedules`
   
   Up to 16 scheduled entries

*struct esp_ble_mesh_scheduler_srv_t*
   
   User data of Scheduler Server Model
Public Members

*esp_ble_mesh_model_t* 
Pointer to the Scheduler Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* 
Response control of the server model received messages

*esp_ble_mesh_scheduler_state_t* 
Parameters of the Scheduler state

**struct esp_ble_mesh_scheduler_setup_srv_t**
User data of Scheduler Setup Server Model

Public Members

*esp_ble_mesh_model_t* 
Pointer to the Scheduler Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* 
Response control of the server model received messages

*esp_ble_mesh_scheduler_state_t* 
Parameters of the Scheduler state

**struct esp_ble_mesh_state_change_time_set_t**
Parameters of Time Set state change event

Public Members

**uint8_t tai_seconds[5]**
The current TAI time in seconds

**uint8_t subsecond**
The sub-second time in units of 1/256 second

**uint8_t uncertainty**
The estimated uncertainty in 10-millisecond steps

**uint16_t time_authority : 1**
0 = No Time Authority, 1 = Time Authority

**uint16_t tai_utc_delta_curr : 15**
Current difference between TAI and UTC in seconds

**uint8_t time_zone_offset_curr**
The local time zone offset in 15-minute increments

**struct esp_ble_mesh_state_change_time_status_t**
Parameters of Time Status state change event

Public Members

**uint8_t tai_seconds[5]**
The current TAI time in seconds

**uint8_t subsecond**
The sub-second time in units of 1/256 second

**uint8_t uncertainty**
The estimated uncertainty in 10-millisecond steps
uint16_t **time_authority**: 1
  0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr**: 15
  Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**
  The local time zone offset in 15-minute increments

**struct esp_ble_mesh_state_change_time_zone_set_t**
Parameters of Time Zone Set state change event

**Public Members**

uint8_t **time_zone_offset_new**
  Upcoming local time zone offset

uint8_t **tai_zone_change[5]**
  TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_state_change_tai_utc_delta_set_t**
Parameters of TAI UTC Delta Set state change event

**Public Members**

uint16_t **tai_utc_delta_new**: 15
  Upcoming difference between TAI and UTC in seconds

uint8_t **tai_delta_change[5]**
  TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_state_change_time_role_set_t**
Parameter of Time Role Set state change event

**Public Members**

uint8_t **time_role**
  The Time Role for the element

**struct esp_ble_mesh_state_change_scene_store_t**
Parameter of Scene Store state change event

**Public Members**

uint16_t **scene_number**
  The number of scenes to be stored

**struct esp_ble_mesh_state_change_scene_recall_t**
Parameter of Scene Recall state change event

**Public Members**

uint16_t **scene_number**
  The number of scenes to be recalled

**struct esp_ble_mesh_state_change_scene_delete_t**
Parameter of Scene Delete state change event
Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
Parameter of Scheduler Action Set state change event

Public Members

uint64_t index : 4
Index of the Schedule Register entry to set

tuint64_t year : 7
Scheduled year for the action

tuint64_t month : 12
Scheduled month for the action

tuint64_t day : 5
Scheduled day of the month for the action

tuint64_t hour : 5
Scheduled hour for the action

tuint64_t minute : 6
Scheduled minute for the action

tuint64_t second : 6
Scheduled second for the action

tuint64_t day_of_week : 7
Schedule days of the week for the action

tuint64_t action : 4
Action to be performed at the scheduled time

tuint64_t trans_time : 8
Transition time for this action

tuint16_t scene_number
Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
Context of the received Time Set message

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second
uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
Context of the received Time Role Set message

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
Context of the received Scene Store message

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
Context of the received Scene Recall message
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t scene_number
   The number of scenes to be recalled

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
   Context of the received Scene Delete message

Public Members

uint16_t scene_number
   The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
   Context of the received Scheduler Action Set message

Public Members

uint64_t index : 4
   Index of the Schedule Register entry to set

uint64_t year : 7
   Scheduled year for the action

uint64_t month : 12
   Scheduled month for the action

uint64_t day : 5
   Scheduled day of the month for the action

uint64_t hour : 5
   Scheduled hour for the action

uint64_t minute : 6
   Scheduled minute for the action

uint64_t second : 6
   Scheduled second for the action

uint64_t day_of_week : 7
   Schedule days of the week for the action

uint64_t action : 4
   Action to be performed at the scheduled time

uint64_t trans_time : 8
   Transition time for this action

uint16_t scene_number
   Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
   Context of the received Time Status message
Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
    Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
    Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t value
    Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
    Define a new Time Client Model.
    Note This API needs to be called for each element on which the application needs to have a Time Client Model.
    Return New Time Client Model instance.
    Parameters
        • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
        • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
    Define a new Scene Client Model.
    Note This API needs to be called for each element on which the application needs to have a Scene Client Model.
    Return New Scene Client Model instance.
    Parameters
        • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
        • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
    Define a new Scheduler Client Model.
    Note This API needs to be called for each element on which the application needs to have a Scheduler Client Model.
    Return New Scheduler Client Model instance.
    Parameters
        • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
        • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_TIME_SRV** (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

**Return** New Time Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

**ESP_BLE_MESH_MODEL_TIME_SETUP_SRV** (srv_data)

Define a new Time Setup Server Model.

**Note** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   2. This model does not support subscribing nor publishing.

**Return** New Time Setup Server Model instance.

**Parameters**
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

**ESP_BLE_MESH_MODEL_SCENE_SRV** (srv_pub, srv_data)

Define a new Scene Server Model.

**Note** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.

**Return** New Scene Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

**ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV** (srv_pub, srv_data)

Define a new Scene Setup Server Model.

**Note** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   1. This model shall support model subscription.
   2. The model may be present only on the Primary element of a node.

**Return** New Scene Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**ESP_BLE_MESH_MODEL_SCHEDULER_SRV** (srv_pub, srv_data)

Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.
   3. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE
Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN
Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number

ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

**Type Definitions**

```c
typedef void(*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.
Time Scene Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.
Time Scene Server Model callback function type

**Parameters**

- `event`: Event type
**Enumerations**

```c
enum esp_ble_mesh_time_scene_client_cb_event_t
{
    ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX
};
```

This enum value is the event of Time Scene Client Model

**Values:**

1. `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT`
2. `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT`
3. `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
4. `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`
5. `ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX`  

```c
enum esp_ble_mesh_time_scene_server_cb_event_t
{
    ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX
};
```

This enum value is the event of Time Scene Server Model

**Values:**

1. `ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT`
2. `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT`
3. `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT`
4. `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT`

**Lighting Client/Server Models**

**Header File**

```c
#include <esp_ble_mesh_lighting_model_api.h>
```

**Functions**

```c
esp_err_t esp_ble_mesh_register_light_client_callback(esp_ble_mesh_light_client_cb_t callback)
```

Register BLE Mesh Light Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in]` `callback`: pointer to the callback function.

```c
esp_err_t esp_ble_mesh_light_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                          esp_ble_mesh_light_client_get_state_t *get_state)
```

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`
Return ESP_OK on success or error code otherwise.

Parameters

•  [in] params: Pointer to BLE Mesh common client parameters.
•  [in] get_state: Pointer of light get message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)`

Set the value of Light Server Model states using the Light Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

•  [in] params: Pointer to BLE Mesh common client parameters.
•  [in] set_state: Pointer of light set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)`

Register BLE Mesh Lighting Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

•  [in] callback: Pointer to the callback function.

```

```c
uint16_t hsl_saturation
    Current value of light hsl saturation state
```

```c
uint8_t remain_time
    Time to complete state transition (optional)
```

```c
struct esp_ble_mesh_light_hsl_target_status_cb_t
    Parameters of Light HSL Target Status
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t hsl_lightness_target
    Target value of light hsl lightness state
```

```c
uint16_t hsl_hue_target
    Target value of light hsl hue state
```

```c
uint16_t hsl_saturation_target
    Target value of light hsl saturation state
```

```c
uint8_t remain_time
    Time to complete state transition (optional)
```

```c
struct esp_ble_mesh_light_hsl_hue_status_cb_t
    Parameters of Light HSL Hue Status
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t present_hue
    Current value of light hsl hue state
```
uint16_t target_hue
Target value of light hsl hue state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_saturation
Current value of light hsl saturation state

uint16_t target_saturation
Target value of light hsl saturation state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
Parameters of Light HSL Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
Parameters of Light xYL Status
Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The present value of the Light xyL Lightness state

uint16_t xyl_x
   The present value of the Light xyL x state

uint16_t xyl_y
   The present value of the Light xyL y state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
   Parameters of Light xyL Target Status

Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t target_xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t target_xyl_x
   The target value of the Light xyL x state

uint16_t target_xyl_y
   The target value of the Light xyL y state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
   Parameters of Light xyL Default Status

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t xyl_x
   The value of the Light xyL x Default state

uint16_t xyl_y
   The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
   Parameters of Light xyL Range Status

Public Members

uint8_t status_code
   Status Code for the requesting message

uint16_t xyl_x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state
uint16_t xyl_x_range_max
    The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t xyl_y_range_min
    The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t xyl_y_range_max
    The value of the xyl y Range Max field of the Light xyl y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
    Parameter of Light LC Mode Status

Public Members

uint8_t mode
    The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
    Parameter of Light LC OM Status

Public Members

uint8_t mode
    The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
    Parameters of Light LC Light OnOff Status

Public Members

bool op_en
    Indicate whether optional parameters included

uint8_t present_light_onoff
    The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
    The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
    Parameters of Light LC Property Status

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
    Lighting Client Model callback parameters
Public Members

int **error_code**
Appropriate error code

*esp_ble_mesh_client_common_param_t* **params**
The client common parameters.

*esp_ble_mesh_light_client_status_cb_t* **status_cb**
The light status message callback values

*struct esp_ble_mesh_light_lightness_state_t*
Parameters of Light Lightness state

Public Members

uint16_t **lightness_linear**
The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**
The target value of Light Lightness Linear state

uint16_t **lightness_actual**
The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**
The target value of Light Lightness Actual state

uint16_t **lightness_last**
The value of Light Lightness Last state

uint16_t **lightness_default**
The value of Light Lightness Default state

uint8_t **status_code**
The status code of setting Light Lightness Range state

uint16_t **lightness_range_min**
The minimum value of Light Lightness Range state

uint16_t **lightness_range_max**
The maximum value of Light Lightness Range state

*struct esp_ble_mesh_light_lightness_srv_t*
User data of Light Lightness Server Model

Public Members

*esp_ble_mesh_model_t* **model**
Pointer to the Lighting Lightness Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* **rsp_ctrl**
Response control of the server model received messages

*esp_ble_mesh_light_lightness_state_t* **state**
Parameters of the Light Lightness state

*esp_ble_mesh_last_msg_info_t* **last**
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* **actual_transition**
Parameters of state transition

*esp_ble_mesh_state_transition_t* **linear_transition**
Parameters of state transition
int32_t *tt_delta_lightness_actual
    Delta change value of lightness actual state transition

int32_t *tt_delta_lightness_linear
    Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
    The present value of Light CTL Lightness state

uint16_t target_lightness
    The target value of Light CTL Lightness state

uint16_t temperature
    The present value of Light CTL Temperature state

uint16_t target_temperature
    The target value of Light CTL Temperature state

int16_t delta_uv
    The present value of Light CTL Delta UV state

int16_t target_delta_uv
    The target value of Light CTL Delta UV state

uint8_t status_code
    The status code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t temperature_default
    The value of Light CTL Temperature Default state

int16_t delta_uv_default
    The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model
Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Lighting CTL Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
   Response control of the server model received messages

*esp_ble_mesh_light_ctl_state_t* state
   Parameters of the Light CTL state

*esp_ble_mesh_last_msg_info_t* last
   Parameters of the last received set message

*esp_ble_mesh_state_transition_t* transition
   Parameters of state transition

int32_t tt_delta_lightness
   Delta change value of lightness state transition

int32_t tt_delta_temperature
   Delta change value of temperature state transition

int32_t tt_delta_delta_uv
   Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
   User data of Light CTL Setup Server Model

Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Lighting CTL Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
   Response control of the server model received messages

*esp_ble_mesh_light_ctl_state_t* state
   Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
   User data of Light CTL Temperature Server Model

Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
   Response control of the server model received messages

*esp_ble_mesh_light_ctl_state_t* state
   Parameters of the Light CTL state

*esp_ble_mesh_last_msg_info_t* last
   Parameters of the last received set message

*esp_ble_mesh_state_transition_t* transition
   Parameters of state transition

int32_t tt_delta_temperature
   Delta change value of temperature state transition

int32_t tt_delta_delta_uv
   Delta change value of delta uv state transition
struct esp_ble_mesh_light_hsl_state_t
Parameters of Light HSL state

Public Members

uint16_t lightness
The present value of Light HSL Lightness state

uint16_t target_lightness
The target value of Light HSL Lightness state

uint16_t hue
The present value of Light HSL Hue state

uint16_t target_hue
The target value of Light HSL Hue state

uint16_t saturation
The present value of Light HSL Saturation state

uint16_t target_saturation
The target value of Light HSL Saturation state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t hue_default
The value of Light HSL Hue Default state

uint16_t saturation_default
The value of Light HSL Saturation Default state

uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t *last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition
int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_hue
Delta change value of hue state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

struct esp_ble_mesh_light_hsl_hue_srv_t
User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_hue
Delta change value of hue state transition

struct esp_ble_mesh_light_hsl_sat_srv_t
User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

```
esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

struct esp_ble_mesh_light_xyl_state_t
Parameters of Light xyL state

Public Members

uint16_t lightness
The present value of Light xyL Lightness state

uint16_t target_lightness
The target value of Light xyL Lightness state

uint16_t x
The present value of Light xyL x state

uint16_t target_x
The target value of Light xyL x state

uint16_t y
The present value of Light xyL y state

uint16_t target_y
The target value of Light xyL y state

uint16_t lightness_default
The value of Light xyL Lightness Default state

uint16_t x_default
The value of Light xyL x Default state

uint16_t y_default
The value of Light xyL y Default state

uint8_t status_code
The status code of setting Light xyL x & y Range state

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state
```
### esp_ble_mesh_last_msg_info_t
Parameters of the last received set message

### esp_ble_mesh_state_transition_t
Parameters of state transition

- int32_t tt_delta_lightness
  Delta change value of lightness state transition

- int32_t tt_delta_x
  Delta change value of x state transition

- int32_t tt_delta_y
  Delta change value of y state transition

### struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyl Setup Server Model

#### Public Members

- esp_ble_mesh_model_t *model
  Pointer to the Lighting xyl Setup Server Model. Initialized internally.

- esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

- esp_ble_mesh_light_xyl_state_t *state
  Parameters of the Light xyl state

### struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states

#### Public Members

- uint32_t mode
  The controller is turned off.
  - 0b0 The binding with the Light Lightness state is disabled.
  - 0b1 The controller is turned on.

- uint32_t occupancy_mode
  The value of Light LC Occupancy Mode state

- uint32_t light_onoff
  The present value of Light LC Light OnOff state

- uint32_t target_light_onoff
  The target value of Light LC Light OnOff state

- uint32_t occupancy
  The value of Light LC Occupancy state

- uint32_t ambient_luxlevel
  The value of Light LC Ambient LuxLevel state

- uint16_t linear_output
  1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
  2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
  3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state
**struct esp_ble_mesh_light_lc_property_state_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**

**uint32_t time_occupancy_delay**
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32_t time_fade_on**
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32_t time_run_on**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32_t time_fade**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

**uint32_t time_prolong**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32_t time_fade_standby_auto**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32_t time_fade_standby_manual**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

**uint16_t lightness_on**
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16_t lightness_prolong**
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16_t lightness_standby**
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16_t ambient_luxlevel_on**
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16_t ambient_luxlevel_prolong**
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16_t ambient_luxlevel_standby**
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state
Chapter 2. API Reference

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine
struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

*esp_ble_mesh_light_lc_state_t* state
Parameters of Light LC state

*esp_ble_mesh_light_lc_property_state_t* prop_state
Parameters of Light LC Property state

*esp_ble_mesh_light_lc_state_machine_t* state_machine
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

*esp_ble_mesh_model_t* *model
Pointer to the Lighting LC Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* *rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_control_t* *lc
Parameters of the Light controller

*esp_ble_mesh_last_msg_info_t* last
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* transition
Parameters of state transition

struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model

Public Members

*esp_ble_mesh_model_t* *model
Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* *rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_control_t* *lc
Parameters of the Light controller

struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event

Public Members

uint16_t lightness
The value of Light Lightness Actual state

struct esp_ble_mesh_state_change_light_lightness_linear_set_t
Parameter of Light Lightness Linear state change event
Public Members

```c
uint16_t lightness
The value of Light Lightness Linear state
```

```c
struct esp_ble_mesh_state_change_light_lightness_default_set_t
Parameter of Light Lightness Default state change event
```

Public Members

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
struct esp_ble_mesh_state_change_light_lightness_range_set_t
Parameters of Light Lightness Range state change event
```

Public Members

```c
uint16_t range_min
The minimum value of Light Lightness Range state
```

```c
uint16_t range_max
The maximum value of Light Lightness Range state
```

```c
struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event
```

Public Members

```c
uint16_t lightness
The value of Light CTL Lightness state
```

```c
uint16_t temperature
The value of Light CTL Temperature state
```

```c
int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event
```

Public Members

```c
uint16_t temperature
The value of Light CTL Temperature state
```

```c
int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event
```

Public Members

```c
uint16_t range_min
The minimum value of Light CTL Temperature Range state
```

```c
uint16_t range_max
The maximum value of Light CTL Temperature Range state
```
struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness Default state

uint16_t hue
The value of Light HSL Hue Default state

uint16_t saturation
The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event
Public Members

`uint16_t hue_range_min`
The minimum hue value of Light HSL Range state

`uint16_t hue_range_max`
The maximum hue value of Light HSL Range state

`uint16_t saturation_range_min`
The minimum saturation value of Light HSL Range state

`uint16_t saturation_range_max`
The maximum saturation value of Light HSL Range state

`struct esp_ble_mesh_state_change_light_xyl_set_t`
Parameters of Light xyL state change event

Public Members

`uint16_t lightness`
The value of Light xyL Lightness state

`uint16_t x`
The value of Light xyL x state

`uint16_t y`
The value of Light xyL y state

`struct esp_ble_mesh_state_change_light_xyl_default_set_t`
Parameters of Light xyL Default state change event

Public Members

`uint16_t lightness`
The value of Light Lightness Default state

`uint16_t x`
The value of Light xyL x Default state

`uint16_t y`
The value of Light xyL y Default state

`struct esp_ble_mesh_state_change_light_xyl_range_set_t`
Parameters of Light xyL Range state change event

Public Members

`uint16_t x_range_min`
The minimum value of Light xyL x Range state

`uint16_t x_range_max`
The maximum value of Light xyL x Range state

`uint16_t y_range_min`
The minimum value of Light xyL y Range state

`uint16_t y_range_max`
The maximum value of Light xyL y Range state

`struct esp_ble_mesh_state_change_light_lc_mode_set_t`
Parameter of Light LC Mode state change event
Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_onoff_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message
Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
Value of range min field of light lightness range state
**uint16_t range_max**
Value of range max field of light lightness range state

**struct esp_ble_mesh_server_recv_light_ctl_set_t**
Context of the received Light CTL Set message

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light ctl lightness state

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t**
Context of the received Light CTL Temperature Set message

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t**
Context of the received Light CTL Temperature Range Set message

**Public Members**

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state
struct esp_ble_mesh_server_recv_light_ctl_default_set_t
  Context of the received Light CTL Default Set message

Public Members

uint16_t lightness
  Value of light lightness default state

uint16_t temperature
  Value of light temperature default state

int16_t delta_uv
  Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
  Context of the received Light HSL Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t lightness
  Target value of light hsl lightness state

uint16_t hue
  Target value of light hsl hue state

uint16_t saturation
  Target value of light hsl saturation state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
  Context of the received Light HSL Hue Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t hue
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
  Context of the received Light HSL Saturation Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t hue
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyL Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyL Lightness state

uint16_t x
The target value of the Light xyL x state
Chapter 2. API Reference

\texttt{uint16_t \ y}

The target value of the Light xyL y state

\texttt{uint8_t \ tid}

Transaction Identifier

\texttt{uint8_t \ trans_time}

Time to complete state transition (optional)

\texttt{uint8_t \ delay}

Indicate message execution delay (C.1)

\textbf{struct esp_ble_mesh_server_recv_light_xyl_default_set_t}

Context of the received Light xyL Default Set message

\textbf{Public Members}

\texttt{uint16_t \ lightness}

The value of the Light Lightness Default state

\texttt{uint16_t \ x}

The value of the Light xyL x Default state

\texttt{uint16_t \ y}

The value of the Light xyL y Default state

\textbf{struct esp_ble_mesh_server_recv_light_xyl_range_set_t}

Context of the received Light xyL Range Set message

\textbf{Public Members}

\texttt{uint16_t \ x_range_min}

The value of the xyL x Range Min field of the Light xyL x Range state

\texttt{uint16_t \ x_range_max}

The value of the xyL x Range Max field of the Light xyL x Range state

\texttt{uint16_t \ y_range_min}

The value of the xyL y Range Min field of the Light xyL y Range state

\texttt{uint16_t \ y_range_max}

The value of the xyL y Range Max field of the Light xyL y Range state

\textbf{struct esp_ble_mesh_server_recv_light_lc_mode_set_t}

Context of the received Light LC Mode Set message

\textbf{Public Members}

\texttt{uint8_t \ mode}

The target value of the Light LC Mode state

\textbf{struct esp_ble_mesh_server_recv_light_lc_om_set_t}

Context of the received Light OM Set message

\textbf{Public Members}

\texttt{uint8_t \ mode}

The target value of the Light LC Occupancy Mode state

\textbf{struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t}

Context of the received Light LC Light OnOff Set message

\textbf{Public Members}

\texttt{uint8_t \ mode}

The target value of the Light LC Light OnOff Set state
Public Members

bool op_en
  Indicate whether optional parameters included

uint8_t light_onoff
  The target value of the Light LC Light OnOff state

uint8_t tid
  Transaction Identifier

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
  Context of the received Light LC Property Set message

Public Members

uint16_t property_id
  Property ID identifying a Light LC Property

struct net_buf_simple *property_value
  Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
  Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
  Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
  Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
  Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
  Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
  Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
  Define a new Light Lightness Client Model.

Note  This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Return  New Light Lightness Client Model instance.

Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)
Define a new Light CTL Client Model.

Note  This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Return  New Light CTL Client Model instance.
Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)
Define a new Light HSL Client Model.

Note  This API needs to be called for each element on which the application needs to have a Light HSL Client Model.
Return  New Light HSL Client Model instance.
Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)
Define a new Light xyL Client Model.

Note  This API needs to be called for each element on which the application needs to have a Light xyL Client Model.
Return  New Light xyL Client Model instance.
Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)
Define a new Light LC Client Model.

Note  This API needs to be called for each element on which the application needs to have a Light LC Client Model.
Return  New Light LC Client Model instance.
Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

Note  1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
Return  New Light Lightness Server Model instance.
Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

Note  1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
1. This model shall support model subscription.
Return  New Light Lightness Setup Server Model instance.
Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.
**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (srv_pub, srv_data)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

---

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

---

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

---

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (srv_pub, srv_data)

Define a new Light HSL Server Model.

**Note** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**Return** New Light HSL Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

---

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

**Note** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.
Return New Light HSL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xYL Server Model.

Note 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Light xYL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.

Note 1. The Light xYL Setup Server model extends the Light xYL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xYL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)
Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)
Define a new Light LC Setup Server Model.
Chapter 2. API Reference

1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
2. This model shall support model publication and model subscription.
3. This model may be used to configure setup parameters for the Light LC Server model.

Return
New Light LC Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

Type Definitions

```c
typedef void(*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

Enumerations

```c
enum esp_ble_mesh_light_client_cb_event_t
```
This enum value is the event of Lighting Client Model

Values:
- ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

```c
enum esp_ble_mesh_lc_state_t
```
This enum value is the Light LC State Machine states

Values:
- ESP_BLE_MESH_LC_OFF
- ESP_BLE_MESH_LC_STANDBY
- ESP_BLE_MESH_LC_FADE_ON
- ESP_BLE_MESH_LC_RUN
- ESP_BLE_MESH_LC_FADE
- ESP_BLE_MESH_LC_PROLONG
- ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
- ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
Chapter 2. API Reference

enum esp_ble_mesh_lighting_server_cb_event_t

This enum value is the event of Lighting Server Model.

Values:

ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usescases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF) [English]
- ESP32 Bluetooth Architecture (PDF) [中文]

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Station/AP-coexistence mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
• Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples
The wifi directory of ESP-IDF examples contains the following applications:

• Code examples for Wi-Fi.
• A simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

• components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t esp_wifi_init (const wifi_init_config_t *config)
Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Return
• ESP_OK: succeed
• ESP_ERR_NO_MEM: out of memory
• others: refer to error code esp_err.h

Parameters
• config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

esp_err_t esp_wifi_deinit (void)
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Functions

esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)
Get current operating mode of WiFi.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

Parameters
• [out] mode: WiFi operating mode

esp_err_t esp_wifi_set_mode (wifi_mode_t mode)
Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

Parameters
• mode: WiFi operating mode
**esp_err_t esp_wifi_start**(void)

Start WiFi according to current configuration. If mode is WIFI_MODE_STA, it create station control block and start station. If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP. If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

**esp_err_t esp_wifi_stop**(void)

Stop WiFi. If mode is WIFI_MODE_STA, it stop station and free station control block. If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_restore**(void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth
- esp_wifi_set_protocol
- esp_wifi_set_config related
- esp_wifi_set_mode

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_connect**(void)

Connect the ESP32 WiFi station to the AP.

**Attention**
1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect**(void)

Disconnect the ESP32 WiFi station from the AP.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors
**esp_err_t esp_wifi_clear_fast_connect (void)**
Currently this API is just a stub API.

Return
- ESP_OK: succeed
- others: fail

**esp_err_t esp_wifi_deauth_sta (uint16_t aid)**
deauthenticate all stations or associated id equals to aid

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)**
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters
- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**esp_err_t esp_wifi_scan_stop (void)**
Stop the scan in process.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)**
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

Parameters
- [out] number: store number of APIs found in last scan

**esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)**
Get AP list found in last scan.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory

Parameters

- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: wifi_ap_record_t array to hold the found APs

**esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)**

Get information of AP which the ESP32 station is associated with.

**Attention**
When the obtained country information is empty, it means that the AP does not carry country information.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

Parameters

- ap_info: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1r in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

**esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)**

Set current WiFi power save type.

**Attention**
Default power save type is WIFI_PS_MIN_MODEM.

**Return**
ESP_OK: succeed

Parameters

- type: power save type

**esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)**

Get current WiFi power save type.

**Attention**
Default power save type is WIFI_PS_MIN_MODEM.

**Return**
ESP_OK: succeed

Parameters

- [out] type: store current power save type

**esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)**

Set protocol type of specified interface. The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N) mode.

**Attention**
Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

Parameters

- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

**esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t *protocol_bitmap)**

Get the current protocol bitmap of the specified interface.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

Parameters
### Chapter 2. API Reference

- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

**esp_err_t esp_wifi_set_bandwidth** *(wifi_interface_t ifx, wifi_bandwidth_t bw)*

Set the bandwidth of ESP32 specified interface.

**Attention**
1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth

**esp_err_t esp_wifi_get_bandwidth** *(wifi_interface_t ifx, wifi_bandwidth_t *bw)*

Get the bandwidth of ESP32 specified interface.

**Attention**
1. API return false if try to get a interface that is not enabled

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- ifx: interface to be configured
- *bw: store bandwidth of interface ifx

**esp_err_t esp_wifi_set_channel** *(uint8_t primary, wifi_second_chan_t second)*

Set primary/secondary channel of ESP32.

**Attention**
1. This API should be called after esp_wifi_start()
2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

**esp_err_t esp_wifi_get_channel** *(uint8_t *primary, wifi_second_chan_t *second)*

Get the primary/secondary channel of ESP32.

**Attention**
1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: store current primary channel
- *second: store current second channel
Esp_err_t esp_wifi_set_country (const wifi_country_t *country)

configure country info

Attention 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

Attention 2. The default country is CHINA {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

Attention 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="USA", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

Attention 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 6. The country configuration is stored into flash.

Attention 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: the configured country info

Esp_err_t esp_wifi_get_country (wifi_country_t *country)

ger the current country info

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: country info

Esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

Parameters
- ifx: interface
- mac: the MAC address

Esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])

Get MAC of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- `ifx`: interface
- `[out] mac`: store mac of the interface ifx

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- `cb`: callback

```c
esp_err_t esp_wifi_set_promiscuous (bool en)
```

Enable the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- `en`: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous (bool *en)
```

Get the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `[out] en`: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)
```

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- `filter`: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)
```

Get the promiscuous filter.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `[out] filter`: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_ctrl_filter_t *filter)
```

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- `filter`: the subtype of the control packet filtered in promiscuous mode.
**esp_err_t esp_wifi_get_promiscuous_ctrl_filter** *(wifi_promiscuous_filter_t *filter)*

Get the subtype filter of the control packet in promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

**esp_err_t esp_wifi_set_config** *(wifi_interface_t interface, wifi_config_t *conf)*

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

**Parameters**
- interface: interface
- conf: station or soft-AP configuration

**esp_err_t esp_wifi_get_config** *(wifi_interface_t interface, wifi_config_t *conf)*

Get configuration of specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- interface: interface
- [out] conf: station or soft-AP configuration

**esp_err_t esp_wifi_ap_get_sta_list** *(wifi_sta_list_t *sta)*

Get STAs associated with soft-AP.

**Attention** SSC only API

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**esp_err_t esp_wifi_ap_get_sta_aid** *(const uint8_t mac[6], uint16_t *aid)*

Get AID of STA connected with soft-AP.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**esp_err_t esp_wifi_ap_get_sta_aid** *(const uint8_t mac[6], uint16_t *aid)*

Get AID of STA connected with soft-AP.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NOT_FOUND: Requested resource not found
• ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
• mac: STA’s mac address
• [out] aid: Store the AID corresponding to STA mac

`esp_err_t esp_wifi_set_storage(wifi_storage_t storage)`

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• storage: : storage type

`esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
• ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
• ESP_ERR_NO_MEM: Out of memory

Parameters
• enable: If true, specified IE is enabled. If false, specified IE is removed.
• type: Information Element type. Determines the frame type to associate with the IE.
• idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
• vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

`esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)`

Register Vendor-Specific Information Element monitoring callback.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• cb: Callback function
• ctx: Context argument, passed to callback function.

`esp_err_t esp_wifi_set_max_tx_power(int8_t power)`

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.
Attention 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.
Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19], 8}, {[20, 27], 20}, {[28, 33], 28}, {[34, 43], 34}, {[44, 51], 44}, {[52, 55], 52}, {[56, 59], 56}, {[60, 65], 60}, {[66, 71], 66}, {[72, 79], 72}, {[80, 84], 80}}.
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

Parameters
- power: Maximum WiFi transmitting power.

```c
esp_err_t esp_wifi_get_max_tx_power (int8_t *power)
```
Get maximum transmitting power after WiFi start.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- power: Maximum WiFi transmitting power, unit is 0.25dBm.

```c
esp_err_t esp_wifi_set_event_mask (uint32_t mask)
```
Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WiFi_EVENT_MASK_constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

Attention 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- mask: WiFi event mask.

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```
Get mask of WiFi events.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- mask: WiFi event mask.

```c
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```
Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Return
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

Parameters
- ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer: raw ieee80211 buffer
- len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after
the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

- Return
  - ESP_OK: succeed
  - ESP_ERR_WIFI_ARG: invalid argument

- Parameters
  - `cb`: callback
  - `ctx`: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)
```

Set CSI data configuration.

- Return
  - ESP_OK: succeed
  - ESP_ERR_WIFI_ARG: invalid argument

- Parameters
  - `config`: configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

- Return
  - ESP_OK: succeed
  - ESP_ERR_WIFI_ARG: invalid argument

- Parameters
  - `en`: true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

- Return
  - ESP_OK: succeed
  - ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid GPIO number etc

- Parameters
  - `config`: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)
```

Get current antenna GPIO configuration.

- Return
  - ESP_OK: succeed
  - ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

- Parameters
  - `config`: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)
```

Set antenna configuration.

- Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
• config: Antenna configuration.

`esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)`
Get current antenna configuration.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna configuration.

`int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)`
Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention: Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return
0 or the TSF time

Parameters
• interface: The interface whose tsf_time is to be retrieved.

`esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)`
Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
Attention 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
Attention 3. The inactive time configuration is not stored into flash

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
• ifx: interface to be configured.
• sec: Inactive time. Unit seconds.

`esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t *sec)`
Get inactive time of specified interface.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument

Parameters
• ifx: Interface to be configured.
• sec: Inactive time. Unit seconds.

`esp_err_t esp_wifi_stats_dump(uint32_t modules)`
Dump WiFi statistics.

Return
• ESP_OK: succeed
• others: failed

Parameters
• modules: statistic modules to be dumped
**esp_err_t esp_wifi_set_rssi_threshold(int32_t rssi)**

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- rssi: threshold value in dbm between -100 to 0

**esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)**

Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- cfg: FTM Initiator session configuration

**esp_err_t esp_wifi_ftm_end_session(void)**

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Return**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)**

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- offset_cm: T1 Offset to be added in centimeters

**esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)**

Enable or disable 11b rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- disable: true means disable 11b rate while false means enable 11b rate.

**esp_err_t esp_wifi_config_espnow_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)**

Config ESPNOW rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- rate: Phy rate to be configured.
**esp_err_t esp_wifi_set_connectionless_wake_interval** (uint16_t interval)

Set interval for station to wake up periodically at disconnected.

**Attention**
1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work.
2. This configuration only work for station mode and disconnected status.
3. This configuration would influence nothing until some module configure wake_window.
4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**
- interval: how much microsecond would the chip wake up, from 1 to 65535.

**esp_err_t esp_wifi_set_country_code** (const char *country, bool ieee80211d_enabled)

configure country

**Attention**
1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
   E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP.
   If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
2. When ieee80211d_enabled is disabled, then the configured country info is used always.
3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe/response/beacon of the soft-AP is also changed.
4. The country configuration is stored into flash.
5. Supported country codes are “01” (world safe mode), “AT”,” AU”,” BE”,” BG”,” BR”,” CA”,” CH”,” CN”,” CY”,” CZ”,” DE”,” DK”,” EE”,” ES”,” FI”,” FR”,” GB”,” GR”,” HK”,” HR”,” HU”,” IE”,” IN”,” IS”,” IT”,” JP”,” KR”,” LI”,” LT”,” LU”,” LV”,” MT”,” MX”,” NL”,” NO”,” NZ”,” PL”,” PT”,” RO”,” SE”,” SI”,” SK”,” TW”,” US”.
6. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
7. The default country is “CN” and ieee80211d_enabled is TRUE.

**Return**
- ESP_OK: succeed
- ESP.ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP.ERR_INVALID_ARG: invalid argument

**Parameters**
- country: the configured country ISO code
- ieee80211d_enabled: 802.11d is enabled or not

**esp_err_t esp_wifi_get_country_code** (char *country)

generate the current country code

**Return**
- ESP_OK: succeed
- ESP.ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP.ERR_INVALID_ARG: invalid argument

**Parameters**
- country: country code

**esp_err_t esp_wifi_config_80211_tx_rate** (wifi_interface_t ifx, wifi_phy_rate_t rate)

Configure 80211 tx rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- rate: Phy rate to be configured.
struct wifi_init_config_t
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

system_event_handler_t event_handler
WiFi event handler

wifi_osi_funcs_t *osi_funcs
WiFi OS functions

wpa_crypto_funcs_t wpa_crypto_funcs
WiFi station crypto functions when connect

int static_rx_buf_num
WiFi static RX buffer number

int dynamic_rx_buf_num
WiFi dynamic RX buffer number

int tx_buf_type
WiFi TX buffer type

int static_tx_buf_num
WiFi static TX buffer number

int dynamic_tx_buf_num
WiFi dynamic TX buffer number

int cache_tx_buf_num
WiFi TX cache buffer number

int csi_enable
WiFi channel state information enable flag

int ampdu_rx_enable
WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
WiFi AMPDU TX feature enable flag

int amsdu_tx_enable
WiFi AMSDU TX feature enable flag

int nvs_enable
WiFi NVS flash enable flag

int nano_enable
Nano option for printf/scan family enable flag

int rx_ba_win
WiFi Block Ack RX window size

int wifi_task_core_id
WiFi Task Core ID

int beacon_max_len
WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t feature_caps
Enables additional WiFi features and capabilities

bool sta_disconnected_pm
WiFi Power Management for station at disconnected status
int magic
    WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT
    WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED
    WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED
    WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF
    WiFi interface error
ESP_ERR_WIFI_MODE
    WiFi mode error
ESP_ERR_WIFI_STATE
    WiFi internal state error
ESP_ERR_WIFI_CONN
    WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NV
    WiFi internal NVS module error
ESP_ERR_WIFI_MAC
    MAC address is invalid
ESP_ERR_WIFI_SSID
    SSID is invalid
ESP_ERR_WIFI_PASSWORD
    Password is invalid
ESP_ERR_WIFI_TIMEOUT
    Timeout error
ESP_ERR_WIFI_WAKE_FAIL
    WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK
    The caller would block
ESP_ERR_WIFI_NOT_CONNECT
    Station still in disconnect status
ESP_ERR_WIFI_POST
    Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE
    Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE
    Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC
    The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW
    The WiFi TX is disallowed
WIFI_STATIC_TX_BUFFER_NUM

Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)
The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
• buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
• type: promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
const vendor_ie_data_t *vnd_ie, int rssi)
Function signature for received Vendor-Specific Information Element callback.

Parameters
• ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
• type: Information element type, based on frame type received.
• sa: Source 802.11 address.
• vnd_ie: Pointer to the vendor specific element data received.
• rssi: Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters
• ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
• data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File
• components/esp_wifi/include/esp_wifi_types.h
Unions

union wifi_config_t

```
#include <esp_wifi_types.h>
```

Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

- `wifi_ap_config_t ap`
  - configuration of AP
- `wifi_sta_config_t sta`
  - configuration of STA

Structures

struct wifi_country_t

Structure describing WiFi country-based regional restrictions.

Public Members

- `char cc[3]`
  - country code string
- `uint8_t schan`
  - start channel
- `uint8_t nchan`
  - total channel number
- `int8_t max_tx_power`
  - This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

- `wifi_country_policy_t policy`
  - country policy

struct wifi_active_scan_time_t

Range of active scan times per channel.

Public Members

- `uint32_t min`
  - minimum active scan time per channel, units: millisecond
- `uint32_t max`
  - maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t

Aggregate of active & passive scan time per channel.

Public Members

- `wifi_active_scan_time_t active`
  - active scan time per channel, units: millisecond.
- `uint32_t passive`
  - passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.
struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t * ssid
SSID of AP

uint8_t * bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

wifi_scan_time_t scan_time
scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

Public Members

uint8_t bssid[6]
MAC address of AP

uint8_t ssid[33]
SSID of AP

uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not
uint32_t wps : 1
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder : 1
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator : 1
    bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved : 25
    bit: 7..31 reserved

struct wifi_country_t country
    country information of AP

struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.

Public Members

int8_t rssi
    The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t authmode
    The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame

Public Members

bool capable
    Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if
    other device also advertizes PMF capability.

bool required
    Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable
    devices.

struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
    SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length
    is set according to ssid_len.

uint8_t password[64]
    Password of ESP32 soft-AP.

uint8_t ssid_len
    Optional length of SSID field.

uint8_t channel
    Channel of ESP32 soft-AP

wifi_auth_mode_t authmode
    Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t ssid_hidden
    Broadcast SSID or not, default 0, broadcast the SSID
**Chapter 2. API Reference**

**uint8_t** `max_connection`
Max number of stations allowed to connect in, default 4, max 10

**uint16_t** `beacon_interval`
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**wifi_cipher_type_t** `pairwise_cipher`
Pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

**bool** `ftm_responder`
Enable FTM Responder mode

**struct wifi_sta_config_t**
STA configuration settings for the ESP32.

**Public Members**

**uint8_t** `ssid[32]`
SSID of target AP.

**uint8_t** `password[64]`
Password of target AP.

**wifi_scan_method_t** `scan_method`
do all channel scan or fast scan

**bool** `bssid_set`
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**uint8_t** `bssid[6]`
MAC address of target AP

**uint8_t** `channel`
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16_t** `listen_interval`
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi_sort_method_t** `sort_method`
sort the connect AP in the list by rss or security mode

**wifi_scan_threshold_t** `threshold`
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi_pmf_config_t** `pmf_cfg`
Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

**uint32_t** `rm_enabled` : 1
Whether Radio Measurements are enabled for the connection

**uint32_t** `btm_enabled` : 1
Whether BSS Transition Management is enabled for the connection

**uint32_t** `mbo_enabled` : 1
Whether MBO is enabled for the connection
uint32_t reserved: 29
    Reserved for future feature set

struct wifi_sta_info_t
        Description of STA associated with AP.

Public Members

uint8_t mac[6]
    mac address

int8_t rssi
    current average rssi of sta connected

uint32_t phy_11b : 1
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
    bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child : 1
    bit: 4 flag to identify mesh child

uint32_t reserved : 27
    bit: 5..31 reserved

struct wifi_sta_list_t
        List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
        station list

int num
    number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
        Vendor Information Element header.
        The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
    Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
    Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
    Vendor identifier (OUI).

uint8_t vendor_oui_type
    Vendor-specific OUI type.

uint8_t payload[0]
    Payload. Length is equal to value in ‘length’ field, minus 4.
struct wifi_pkt_rx_ctrl_t
  Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi : 8
  Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned rate : 5
  PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__ : 1
  reserved

unsigned sig_mode : 2
  0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__ : 16
  reserved

unsigned mcs : 7
  Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)

unsigned cwb : 1
  Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__ : 16
  reserved

unsigned smoothing : 1
  reserved

unsigned not_sounding : 1
  reserved

unsigned __pad3__ : 1
  reserved

unsigned aggregation : 1
  Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc : 2
  Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding : 1
  Flag is set for 11n packets which are LDPC

unsigned sgi : 1
  Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed noise_floor : 8
  noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned ampdu_cnt : 8
  ampdu cnt

unsigned channel : 4
  primary channel on which this packet is received

unsigned secondary_channel : 4
  secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad4__ : 8
  reserved
Chapter 2. API Reference

unsigned \texttt{timestamp} : 32
\hspace*{1em} timestamp: The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned \_\_\_pad5\_\_ : 32
\hspace*{1em} reserved

unsigned \_\_\_pad6\_\_ : 31
\hspace*{1em} reserved

unsigned \texttt{ant} : 1
\hspace*{1em} antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned \texttt{sig\_len} : 12
\hspace*{1em} length of packet including Frame Check Sequence(FCS)

unsigned \_\_\_pad7\_\_ : 12
\hspace*{1em} reserved

unsigned \texttt{rx\_state} : 8
\hspace*{1em} state of the packet. 0: no error; others: error numbers which are not public

\textbf{struct wifi\_promiscuous\_pkt\_t}
\hspace*{1em} Payload passed to ‘\texttt{buf}’ parameter of promiscuous mode RX callback.

\textbf{Public Members}

\texttt{wifi\_pkt\_rx\_ctrl\_t} \texttt{rx\_ctrl}
\hspace*{1em} metadata header

\texttt{uint8\_t} \texttt{payload}[0]
\hspace*{1em} Data or management payload. Length of payload is described by \texttt{rx\_ctrl\_sig\_len}. Type of content determined by packet type argument of callback.

\textbf{struct wifi\_promiscuous\_filter\_t}
\hspace*{1em} Mask for filtering different packet types in promiscuous mode.

\textbf{Public Members}

\texttt{uint32\_t} \texttt{filter\_mask}
\hspace*{1em} OR of one or more filter values WIFI\_PROMIS\_FILTER\_ *

\textbf{struct wifi\_csi\_config\_t}
\hspace*{1em} Channel state information(CSI) configuration type.

\textbf{Public Members}

\texttt{bool} \texttt{lltf\_en}
\hspace*{1em} enable to receive legacy long training field(lltf) data. Default enabled

\texttt{bool} \texttt{htlltf\_en}
\hspace*{1em} enable to receive HT long training field(htlltf) data. Default enabled

\texttt{bool} \texttt{stbc\_htlltf2\_en}
\hspace*{1em} enable to receive space time block code HT long training field(stbc-htlltf2) data. Default enabled

\texttt{bool} \texttt{ltf\_merge\_en}
\hspace*{1em} enable to generate htlf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use hltf data directly. Default enabled

\texttt{bool} \texttt{channel\_filter\_en}
\hspace*{1em} enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled
bool manu_scale
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the
shift bits. false: automatically. true: manually. Default false

uint8_t shift
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
received packet radio metadata header of the CSI data

uint8_t [mac[6]
source MAC address of the CSI data

bool first_word_invalid
first four bytes of the CSI data is invalid or not

int8_t *buf
buffer of CSI data

uint16_t len
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select : 1
Whether this GPIO is connected to external antenna switch

uint8_t gpio_num : 7
The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving

wifi_ant_t rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO
Chapter 2. API Reference

```c
uint8_t enabled_ant0 : 4
    Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1 : 4
    Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
    Action Frame Tx Request.
```

**Public Members**

```c
wifi_interface_t ifx
    WiFi interface to send request to

uint8_t dest_mac[6]
    Destination MAC address

bool no_ack
    Indicates no ack required

wifi_action_rx_cb_t rx_cb
    Rx Callback to receive any response

uint32_t data_len
    Length of the appended Data

uint8_t data[0]
    Appended Data payload
```

```c
struct wifi_ftm_initiator_cfg_t
    FTM Initiator configuration.
```

**Public Members**

```c
uint8_t resp_mac[6]
    MAC address of the FTM Responder

uint8_t channel
    Primary channel of the FTM Responder

uint8_t frm_count
    No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
    Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)
```

```c
struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event
```

**Public Members**

```c
uint32_t status
    status of scanning APs: 0 — success, 1 - failure

uint8_t number
    number of scan results

uint8_t scan_id
    scan sequence number, used for block scan
```

```c
struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event
```
Public Members

uint8_t ssid[32]
SSID of connected AP

uint8_t ssid_len
SSID length of connected AP

uint8_t bssid[6]
BSSID of connected AP

uint8_t channel
channel of connected AP

wifi_auth_mode_t authmode
authentication mode used by AP

struct wifi_event_sta_disconnected_t
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
SSID of disconnected AP

uint8_t ssid_len
SSID length of disconnected AP

uint8_t bssid[6]
BSSID of disconnected AP

uint8_t reason
reason of disconnection

struct wifi_event_sta_authmode_change_t
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
Number of AP credentials received
**Chapter 2. API Reference**

```c
uint8_t ssid[MAX_SSID_LEN]
SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
Argument structure for WIFI_EVENT_AP_STACONNECTED event

**Public Members**

uint8_t mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

**Public Members**

uint8_t mac[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t aid
the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

**Public Members**

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

**Public Members**

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for
Chapter 2. API Reference

Public Members

uint8_t dlog_token
Dialog Token of the FTM frame

int8_t rssi
RSSI of the FTM frame received

uint32_t rtt
Round Trip Time in pSec with a peer

uint64_t t1
Time of departure of FTM frame from FTM Responder in pSec

uint64_t t2
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3
Time of departure of ACK from FTM Initiator in pSec

uint64_t t4
Time of arrival of ACK at FTM Responder in pSec

struct wifi_event_ftm_report_t
Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t peer_mac[6]
MAC address of the FTM Peer

wifi_ftm_status_t status
Status of the FTM operation

uint32_t rtt_raw
Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est
Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est
Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t *ftm_report_data
Pointer to FTM Report with multiple entries, should be freed after use

uint8_t ftm_report_num_entries
Number of entries in the FTM Report data

struct wifi_event_action_tx_status_t
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t ifx
WiFi interface to send request to

uint32_t context
Context to identify the request

uint8_t da[6]
Destination MAC address

uint8_t status
Status of the operation
struct wifi_event_roc_done_t
   Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

   uint32_t context
      Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
   max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
   filter all packets
WIFI_PROMIS_FILTER_MASK_MGMT
   filter the packets with type of WIFI_PKT_MGMT
WIFI_PROMIS_FILTER_MASK_CTRL
   filter the packets with type of WIFI_PKT_CTRL
WIFI_PROMIS_FILTER_MASK_DATA
   filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
   filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
   filter the MPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
   filter the AMPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_FCSFAIL
   filter the FCS failed packets, do not open it in general
WIFI_PROMIS_CTRL_FILTER_MASK_ALL
   filter all control packets
WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
   filter the control packets with subtype of Control Wrapper
WIFI_PROMIS_CTRL_FILTER_MASK_BAR
   filter the control packets with subtype of Block Ack Request
WIFI_PROMIS_CTRL_FILTER_MASK_BA
   filter the control packets with subtype of Block Ack
WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
   filter the control packets with subtype of PS-Poll
WIFI_PROMIS_CTRL_FILTER_MASK_RTS
  filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
  filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
  filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
  filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
  filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
  mask all WiFi events

WIFI_EVENT_MASK_NONE
  mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
  mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN
MAX_PASSPHRASE_LEN
MAX_WPS_AP_CRED

WIFI_STATIS_BUFFER
WIFI_STATIS_RXTX
WIFI_STATIS_HW
WIFI_STATIS_DIAG
WIFI_STATIS_PS
WIFI_STATIS_ALL

Type Definitions
typedef int (*wifi_action_rx_cb_t)(uint8_t*hdr, uint8_t*payload, size_tlen, uint8_tchannel)
The Rx callback function of Action Tx operations.

Parameters
  • hdr: pointer to the IEEE 802.11 Header structure
  • payload: pointer to the Payload following 802.11 Header
  • len: length of the Payload
  • channel: channel number the frame is received on

Enumerations
enum wifi_mode_t
  Values:
    WIFI_MODE_NULL = 0
      null mode

    WIFI_MODE_STA
      WiFi station mode

    WIFI_MODE_AP
      WiFi soft-AP mode

    WIFI_MODE_APSTA
      WiFi station + soft-AP mode
WIFI_MODE_MAX

enum wifi_interface_t
Values:

WIFI_IF_STA = ESP_IF_WIFI_STA
WIFI_IF_AP = ESP_IF_WIFI_AP

enum wifi_country_policy_t
Values:

WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
Values:

WIFI_AUTH_OPEN = 0
authenticate mode: open

WIFI_AUTH_WEP
authenticate mode: WEP

WIFI_AUTH_WPA_PSK
authenticate mode: WPA_PSK

WIFI_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
authenticate mode: WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode: WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode: WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode: WPA2_WPA3_PSK

WIFI_AUTH_WAPI_PSK
authenticate mode: WAPI_PSK

WIFI_AUTH_MAX

enum wifi_err_reason_t
Values:

WIFI_REASON_UNSPECIFIED = 1
WIFI_REASON_AUTH_EXPIRE = 2
WIFI_REASON_AUTH_LEAVE = 3
WIFI_REASON_ASSOC_EXPIRE = 4
WIFI_REASON_ASSOC_TOOMANY = 5
WIFI_REASON_NOT_AUTHED = 6
WIFI_REASON_NOT_ASSOCED = 7
WIFI_REASON_ASSOC_LEAVE = 8
WIFI_REASON_ASSOC_NOT_AUTHED = 9
WIFI_REASON_DISASSOC_PWRCAP_BAD = 10
WIFI_REASON_DISASSOC_SUPCHAN_BAD = 11
WIFI_REASON_BSS_TRANSITION_DISASSOC = 12
WIFI_REASON_IE_INVALID = 13
WIFI_REASON_MIC_FAILURE = 14
WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT = 15
WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT = 16
WIFI_REASON_IE_IN_4WAY_DIFFERS = 17
WIFI_REASON_GROUP_CIPHER_INVALID = 18
WIFI_REASON_PAIRWISE_CIPHER_INVALID = 19
WIFI_REASON_AKMP_INVALID = 20
WIFI_REASON_UNSUPP_RSN_IE_VERSION = 21
WIFI_REASON_INVALID_RSN_IE_CAP = 22
WIFI_REASON_802_1X_AUTH_FAILED = 23
WIFI_REASON_CIPHER_SUITE_REJECTED = 24
WIFI_REASON_INVALID_PMKID = 53
WIFI_REASON_BEACON_TIMEOUT = 200
WIFI_REASON_NO_AP_FOUND = 201
WIFI_REASON_AUTH_FAIL = 202
WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t
Values:

WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20
WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel
WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:

WIFI_SCAN_TYPE_ACTIVE = 0
active scan
WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:

WIFI_CIPHER_TYPE_NONE = 0
the cipher type is none
WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_SMS4
the cipher type is SMS4

WIFI_CIPHER_TYPE_GCMP
the cipher type is GCMP

WIFI_CIPHER_TYPE_GCMP256
the cipher type is GCMP-256

WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.

Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:
WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
Values:
WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:
WIFI_STORAGE_FLASH
all configuration will store in both memory and flash
WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:
WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:
WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:
WIFI_PKT_MGMT
Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.
enum wifi_ant_mode_t
   WiFi antenna mode.
   Values:
   WIFI_ANT_MODE_ANT0
       Enable WiFi antenna 0 only
   WIFI_ANT_MODE_ANT1
       Enable WiFi antenna 1 only
   WIFI_ANT_MODE_AUTO
       Enable WiFi antenna 0 and 1, automatically select an antenna
   WIFI_ANT_MODE_MAX
       Invalid WiFi enabled antenna

enum wifi_phy_rate_t
   WiFi PHY rate encodings.
   Values:
   WIFI_PHY_RATE_1M_L = 0x00
       1 Mbps with long preamble
   WIFI_PHY_RATE_2M_L = 0x01
       2 Mbps with long preamble
   WIFI_PHY_RATE_5M_L = 0x02
       5.5 Mbps with long preamble
   WIFI_PHY_RATE_11M_L = 0x03
       11 Mbps with long preamble
   WIFI_PHY_RATE_2M_S = 0x05
       2 Mbps with short preamble
   WIFI_PHY_RATE_5M_S = 0x06
       5.5 Mbps with short preamble
   WIFI_PHY_RATE_11M_S = 0x07
       11 Mbps with short preamble
   WIFI_PHY_RATE_48M = 0x08
       48 Mbps
   WIFI_PHY_RATE_24M = 0x09
       24 Mbps
   WIFI_PHY_RATE_12M = 0x0A
       12 Mbps
   WIFI_PHY_RATE_6M = 0x0B
       6 Mbps
   WIFI_PHY_RATE_54M = 0x0C
       54 Mbps
   WIFI_PHY_RATE_36M = 0x0D
       36 Mbps
   WIFI_PHY_RATE_18M = 0x0E
       18 Mbps
   WIFI_PHY_RATE_9M = 0x0F
       9 Mbps
   WIFI_PHY_RATE_MCS0_LGI = 0x10
       MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
WIFI_PHY_RATE_MCS1_LGI = 0x11
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_LGI = 0x12
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_LGI = 0x13
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_LGI = 0x14
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_LGI = 0x15
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_LGI = 0x16
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_LGI = 0x17
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS0_SGI = 0x18
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_SGI = 0x19
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_SGI = 0x1A
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_SGI = 0x1B
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_SGI = 0x1C
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_SGI = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_SGI = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_SGI = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t
Wi-Fi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 Wi-Fi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop
WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX
enum wifi_ftm_status_t
    FTM operation status types.

Values:

    FTM_STATUS_SUCCESS = 0
    FTM exchange is successful

    FTM_STATUS_UNSUPPORTED
    Peer does not support FTM

    FTM_STATUS_CONF_REJECTED
    Peer rejected FTM configuration in FTM Request

    FTM_STATUS_NO_RESPONSE
    Peer did not respond to FTM Requests

    FTM_STATUS_FAIL
    Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check Provisioning API.

Application Example  Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

* components/esp_wifi/include/esp_smartconfig.h

Functions

*esp_smartconfig_get_version (void)
    Get the version of SmartConfig.

Return
    * SmartConfig version const char.

*esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
    Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention  1. This API can be called in station or softAP-station mode.
Attention  2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
    * ESP_OK: succeed
    * others: fail

Parameters
    * config: pointer to smartconfig start configure structure

*esp_err_t esp_smartconfig_stop (void)
    Stop SmartConfig, free the buffer taken by esp_smartconfig_start.
**Attention**  Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config_start.

**Return**  
- ESP_OK: succeed  
- others: fail

```c
esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
```
Set timeout of SmartConfig process.

**Attention**  Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Return**  
- ESP_OK: succeed  
- others: fail

**Parameters**  
- time_s: range 15s~255s, offset:45s.

```c
esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)
```
Set protocol type of SmartConfig.

**Attention**  If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

**Return**  
- ESP_OK: succeed  
- others: fail

**Parameters**  
- type: Choose from the smartconfig_type_t.

```c
esp_err_t esp_smartconfig_fast_mode (bool enable)
```
Set mode of SmartConfig. default normal mode.

**Attention**  
1. Please call it before API esp_smartconfig_start.  
2. Fast mode have corresponding APP(phone).  
3. Two mode is compatible.

**Return**  
- ESP_OK: succeed  
- others: fail

**Parameters**  
- enable: false-disable(default); true-enable;

```c
esp_err_t esp_smartconfig_get_rvd_data (uint8_t* rvd_data, uint8_t len)
```
Get reserved data of ESPTouch v2.

**Return**  
- ESP_OK: succeed  
- others: fail

**Parameters**  
- rvd_data: reserved data  
- len: length of reserved data

**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
```
Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

```c
uint8_t ssid[32]
```
SSID of the AP. Null terminated string.

```c
uint8_t password[64]
```
Password of the AP. Null terminated string.

```c
bool bssid_set
```
whether set MAC address of target AP or not.
uint8_t bssid[6]
   MAC address of target AP.

smartconfig_type_t type
   Type of smartconfig (ESPTouch or AirKiss).

uint8_t token
   Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
   IP address of cellphone.

struct smartconfig_start_config_t
   Configure structure for esp_smartconfig_start

Public Members

bool enable_log
   Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
   Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
   ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations

define smartconfig_type_t
   Values:

   SC_TYPE_ESPTOUCH = 0
      protocol: ESPTouch

   SC_TYPE_AIRKISS
      protocol: AirKiss

   SC_TYPE_ESPTOUCH_AIRKISS
      protocol: ESPTouch and AirKiss

   SC_TYPE_ESPTOUCH_V2
      protocol: ESPTouch v2

enum smartconfig_event_t
   Smartconfig event declarations

   Values:

   SC_EVENT_SCAN_DONE
      ESP32 station smartconfig has finished to scan for APs

   SC_EVENT_FOUND_CHANNEL
      ESP32 station smartconfig has found the channel of the target AP

   SC_EVENT_GOT_SSID_PSWD
      ESP32 station smartconfig got the SSID and password

   SC_EVENT_SEND_ACK_DONE
      ESP32 station smartconfig has sent ACK to cellphone
ESP-NOW

Overview ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

```
<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7~</td>
<td></td>
</tr>
</tbody>
</table>
```

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value filed is used to prevents relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>
```

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call esp_now_set_pmk() to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call esp_now_init() to initialize ESP-NOW and esp_now_deinit() to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When esp_now_deinit() is called, all of the information of paired devices will be deleted.
Add Paired Device  Call esp_now_add_peer() to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data  Call esp_now_send() to send ESP-NOW data and esp_now_register_send_cb to register sending callback function. It will return ESP_NOW_SEND_SUCCESS in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return ESP_NOW_SEND_FAIL. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call esp_now_send() to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data  Call esp_now_register_recv_cb to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Application Examples

• Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.
• For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

API Reference

Header File

• components/esp_wifi/include/esp_now.h

Functions

esp_err_t esp_now_init(void)
Initialize ESPNOW function.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_INTERNAL : Internal error

esp_err_t esp_now_deinit(void)
De-initialize ESPNOW function.

Return
• ESP_OK : succeed

esp_err_t esp_now_get_version(uint32_t *version)
Get the version of ESPNOW.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_ARG: invalid argument

Parameters
• version: ESPNOW version

esp_err_t esp_now_register_recv_cb(esp_now_recv_cb_t cb)
Register callback function of receiving ESPNOW data.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL: internal error

Parameters
• cb: callback function of receiving ESPNOW data

esp_err_t esp_now_unregister_recv_cb(void)
Unregister callback function of receiving ESPNOW data.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

esp_err_t esp_now_register_send_cb(esp_now_send_cb_t cb)
Register callback function of sending ESPNOW data.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

Parameters
• cb: callback function of sending ESPNOW data

esp_err_t esp_now_unregister_send_cb(void)
Unregister callback function of sending ESPNOW data.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

esp_err_t esp_now_send(const uint8_t* peer_addr, const uint8_t* data, size_t len)
Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_INTERNAL: internal error
• ESP_ERR_ESPNOW_NO_MEM: out of memory
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
• ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

Parameters
• peer_addr: peer MAC address
• data: data to send
• len: length of data

esp_err_t esp_now_add_peer(const esp_now_peer_info_t* peer)
Add a peer to peer list.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
Chapter 2. API Reference

- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_EXIST: peer has existed

### Parameters
- peer: peer information

#### esp_err_t esp_now_del_peer (const uint8_t *peer_addr)
Delete a peer from peer list.

#### Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

#### Parameters
- peer_addr: peer MAC address

#### esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)
Modify a peer.

#### Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

#### Parameters
- peer: peer information

#### esp_err_t esp_now_get_peer (const uint8_t *peer_addr, esp_now_peer_info_t *peer)
Get a peer whose MAC address matches peer_addr from peer list.

#### Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

#### Parameters
- peer_addr: peer MAC address
- peer: peer information

#### esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)
Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

#### Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

#### Parameters
- from_head: fetch from head of list or not
- peer: peer information

#### bool esp_now_is_peer_exist (const uint8_t *peer_addr)
Peer exists or not.

#### Return
- true: peer exists
- false: peer not exists

#### Parameters
- peer_addr: peer MAC address
Chapter 2. API Reference

```c
esp_err_t esp_now_get_peer_num(esp_now_peer_num_t *num)
Get the number of peers.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• num: number of peers
```

```c
esp_err_t esp_now_set_pmk(const uint8_t *pmk)
Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• pmk: primary master key
```

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
Set esp_now wake window for sta_disconnected power management.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
Attention 2. This configuration only work for station mode and disconnected status
Attention 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked
Attention 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time
Attention 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Parameters
• window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535
```

**Structures**

```c
struct esp_now_peer_info
ESPNOW peer information parameters.
```

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]
ESPNOW peer local master key that is used to encrypt data

uint8_t channel
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx
Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt
ESPNOW data that this peer sends/receives is encrypted or not
```
void *priv
    ESPNOW peer private data

struct esp_now_peer_num
    Number of ESPNOW peers which exist currently.

Public Members

int total_num
    Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num
    Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

Macros

ESP_ERR_ESPNOW_BASE
    ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
    ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG
    Invalid argument

ESP_ERR_ESPNOW_NO_MEM
    Out of memory

ESP_ERR_ESPNOW_FULL
    ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
    ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
    Internal error

ESP_ERR_ESPNOW_EXIST
    ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
    Interface error

ESP_NOW_ETH_ALEN
    Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
    Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
    Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
    Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
    Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
    ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
    Number of ESPNOW peers which exist currently.
typedef void(*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.

Parameters
• mac_addr: peer MAC address
• data: received data
• data_len: length of received data

typedef void(*esp_now_send_cb_t)(const uint8_t*mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.

Parameters
• mac_addr: peer MAC address
• status: status of sending ESPNOW data (succeed or fail)

Enumerations
define esp_now_send_status_t
Status of sending ESPNOW data.

Values:
ESP_NOW_SEND_SUCCESS = 0
Send ESPNOW data successfully
ESP_NOW_SEND_FAIL
Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

Software Stack The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

System Events An application interfaces with ESP-WIFI-MESH via ESP-WIFI-MESH Events. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The mesh_event_id_t defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via esp_event_handler_register() to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.
Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack. Each node is required to initialize LwIP by calling `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
```
Chapter 2. API Reference

(continued from previous page)

```c
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT,
ESP_EVENT_ANY_ID,
&ip_,
event_handler,
NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT,
ESP_EVENT_ANY_ID,
&mesh_,
&event_handler,
NULL));
```

**Configuring an ESP-WIFI-MESH Network** ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

### Start Mesh

The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

### Self Organized Networking

Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

### Toggling Self Organized Networking

Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending on the node type and the node’s current state. This parameter is unused when disabling self organized networking.
Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
|               |              | • Nodes previously scanning for a parent node will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
|               |              | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
|               |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
```

(continues on next page)
//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();

Calling Wi-Fi API  There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of esp_mesh_set_self_organized() which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call esp_wifi_scan_start() whilst using ESP-WIFI-MESH.

//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

• components/esp_wifi/include/esp_mesh.h
Chapter 2. API Reference

Functions

**esp_err_t esp_mesh_init (void)**
Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_deinit (void)**
Mesh de-initialization.

- Release resources and stop the mesh

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_start (void)**
Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

**esp_err_t esp_mesh_stop (void)**
Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)**
Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
Chapter 2. API Reference

- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

Parameters

- [in] to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- [in] data: pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- [in] flag: bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- [in] opt: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- [in] opt_count: option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

```
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```
Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK

**Parameters**

- [in] time_ms: blocking time of esp_mesh_send(), unit:ms

```
esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```
Receive a packet targeted to self over the mesh network.
flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

**Parameters**
- **[out]** from: the address of the original source of the packet
- **[out]** data: pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **[in]** timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- **[out]** flag: bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network

```c
esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to external IP network.
- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

**Attention** This API is only called by the root.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

**Parameters**
- **[out]** from: the address of the original source of the packet
- **[out]** to: the address contains remote IP address and port (IPv4:PORT)
- **[out]** data: pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **[in]** timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- **[out]** flag: bitmap for data received
– MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

**Parameters**

- [out] `opt`: options desired to receive
- [in] `opt_count`: option count desired to receive

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

Get mesh stack configuration.

**Parameters**

- [in] `config`: pointer to mesh stack configuration

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [in] `router`: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```

Get router configuration.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [out] `router`: pointer to router configuration
**esp_err_t esp_mesh_set_id(const mesh_addr_t *id)**
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- [in] id: pointer to mesh network ID

**esp_err_t esp_mesh_get_id(mesh_addr_t *id)**
Get mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] id: pointer to mesh network ID

**esp_err_t esp_mesh_set_type(mesh_type_t type)**
Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] type: device type

**mesh_type_t esp_mesh_get_type(void)**
Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** mesh type

**esp_err_t esp_mesh_set_max_layer(int max_layer)**
Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] max_layer: max layer value

**int esp_mesh_get_max_layer(void)**
Get max layer value.

**Return** max layer value

**esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)**
Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
Chapter 2. API Reference

- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters
- [in] pwd: pointer to the password
- [in] len: password length

\texttt{esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)}
Set mesh softAP authentication mode.

\textbf{Attention} This API shall be called before mesh is started.

\textbf{Return}
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters
- [in] authmode: authentication mode

\textbf{wifi_auth_mode_t esp_mesh_get_ap_authmode(void)}
Get mesh softAP authentication mode.

\textbf{Return} authentication mode

\textbf{esp_err_t esp_mesh_set_ap_connections(int connections)}
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

\textbf{Attention} This API shall be called before mesh is started.

\textbf{Return}
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters
- [in] connections: the number of max connections

\textbf{int esp_mesh_get_ap_connections(void)}
Get mesh max connection configuration.

\textbf{Return} the number of mesh max connections

\textbf{int esp_mesh_get_non_mesh_connections(void)}
Get non-mesh max connection configuration.

\textbf{Return} the number of non-mesh max connections

\textbf{int esp_mesh_get_layer(void)}
Get current layer value over the mesh network.

\textbf{Attention} This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

\textbf{Return} layer value

\textbf{esp_err_t esp_mesh_get_parent_bssid(mesh_addr_t *bssid)}
Get the parent BSSID.

\textbf{Attention} This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

\textbf{Return}
- ESP_OK
- ESP_FAIL

Parameters
- [out] bssid: pointer to parent BSSID

\textbf{bool esp_mesh_is_root(void)}
Return whether the device is the root node of the network.

\textbf{Return} true/false
**esp_err_t esp_mesh_set_self_organized**(bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] enable: enable or disable self-organized networking
- [in] select_parent: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool **esp_mesh_get_self_organized**(void)

Return whether enable self-organized networking or not.

**Return**
- true/false

**esp_err_t esp_mesh_waive_root**(const mesh_vote_t *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD

**Parameters**
- [in] vote: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

**esp_err_t esp_mesh_set_vote_percentage**(float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] percentage: vote percentage threshold
float `esp_mesh_get_vote_percentage` (void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire` (int `seconds`)
Set mesh softAP associate expired time (default: 10 seconds)
- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] `seconds`: the expired time

int `esp_mesh_get_ap_assoc_expire` (void)
Get mesh softAP associate expired time.

Return `seconds`

int `esp_mesh_get_total_node_num` (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Return total number of devices (including the root)

int `esp_mesh_get_routing_table_size` (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

`esp_err_t esp_mesh_get_routing_table` (mesh_addr_t *mac, int `len`, int *`size`)
Get routing table of this device’s sub-network (including itself)

Return
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters
- [out] `mac`: pointer to routing table
- [in] `len`: routing table size (in bytes)
- [out] `size`: pointer to the number of devices in routing table (including itself)

`esp_err_t esp_mesh_post_toDS_state` (bool `reachable`)
Post the toDS state to the mesh stack.

Attention This API is only for the root.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] `reachable`: this state represents whether the root is able to access external IP network

`esp_err_t esp_mesh_get_tx_pending` (mesh_tx_pending_t *`pending`)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [out] `pending`: pointer to the TX pending

`esp_err_t esp_mesh_get_rx_pending` (mesh_rx_pending_t *`pending`)
Return the number of packets available in the queue waiting to be received by applications.
Chapter 2. API Reference

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the RX pending

int esp_mesh_available_txupQ_num(const mesh_addr_t *addr, uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.

Parameters
• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize(int qsize)
Set the number of queue.
Attention This API shall be called before mesh is started.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize(void)
Get queue size.

esp_err_t esp_mesh_allow_root_conflicts(bool allowed)
Set whether allow more than one root existing in one network.
Return
• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START

Parameters
• [in] allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed(void)
Check whether allow more than one root to exist in one network.
Return true/false

esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
Set group ID addresses.
Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• [in] addr: pointer to new group ID addresses
• [in] num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
Delete group ID addresses.
Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• [in] addr: pointer to deleted group ID address
• [in] num: the number of group ID addresses

int esp_mesh_get_group_num(void)
Get the number of group ID addresses.
**Return** the number of group ID addresses

*esp_err_t* **esp_mesh_get_group_list** (*mesh_addr_t** *addr*, **int** *num*)

Get group ID addresses.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- **[out]** addr: pointer to group ID addresses
- **[in]** num: the number of group ID addresses

*bool* **esp_mesh_is_my_group** (*const* *mesh_addr_t* *addr*)

Check whether the specified group address is my group.

**Return** true/false

*esp_err_t* **esp_mesh_set_capacity_num** (**int** *num*)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- **[in]** num: mesh network capacity

*int* **esp_mesh_get_capacity_num** (**void**)?

Get mesh network capacity.

**Return** mesh network capacity

*esp_err_t* **esp_mesh_set_ie_crypto_funcs** (*const* *mesh_crypto_funcs_t** *crypto_funcs*)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK

**Parameters**
- **[in]** crypto_funcs: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

*esp_err_t* **esp_mesh_set_ie_crypto_key** (*const* *char** *key*, **int** *len*)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- **[in]** key: ASCII crypto key
- **[in]** len: length in bytes, range:8~64

*esp_err_t* **esp_mesh_get_ie_crypto_key** (**char** *key*, **int** *len*)

Get mesh IE crypto key.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- **[out]** key: ASCII crypto key
- **[in]** len: length in bytes, range:8~64

*esp_err_t* **esp_mesh_set_root_healing_delay** (**int** *delay_ms*)

Set delay time before starting root healing.
Chapter 2. API Reference

Return

• ESP_OK

Parameters

• [in] delay_ms: delay time in milliseconds

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

Return delay time in milliseconds

esp_err_t esp_mesh_fix_root (bool enable)
Enable network Fixed Root Setting.

• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

Return

• ESP_OK

Parameters

• [in] enable: enable or not

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return

• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

Parameters

• [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  – If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise
    the device will never find this specified parent.
• [in] parent_mesh_id: parent mesh ID.
  – If this value is not set, the original mesh ID is used.
• [in] my_type: mesh type
  – MESH_STA is not supported.
  – If the parent set for the device is the same as the router in the network configuration, then
    my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
• [in] my_layer: mesh layer
  – my_layer of the device may change after joining the network.
  – If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  – If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer
    has the ability to extend the network.

esp_err_t esp_mesh_scan_get_ap_ie_len (int *len)
Get mesh networking IE length of one AP.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG
• ESP_ERR_WIFI_FAIL

Parameters
Chapter 2. API Reference

• [out] len: mesh networking IE length

```c
esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)
```
Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time.
See “manual_networking” example.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP

```c
esp_err_t esp_mesh_flush_upstream_packets (void)
```
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)
```
Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
```
Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_disconnect (void)
```
Disconnect from current parent.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_connect (void)
```
Connect to current parent.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_flush_scan_result (void)
```
Flush scan result.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_switch_channel (const uint8_t *new_bssid, int csa_newchan, int csa_count)
```
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.
Chapter 2. API Reference

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**
- ESP_OK

**Parameters**
- [in] new_bssid: the new router BSSID if the router changes
- [in] csa_newchan: the new channel number to which the whole network is moving
- [in] csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

```c
esp_err_t esp_mesh_get_router_bssid (uint8_t *router_bssid)
```
Get the router BSSID.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

**Parameters**
- [out] router_bssid: pointer to the router BSSID

```c
int64_t esp_mesh_get_tsf_time (void)
```
Get the TSF time.

**Return** the TSF time

```c
esp_err_t esp_mesh_set_topology (esp_mesh_topology_t topo)
```
Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_mesh_topology_t esp_mesh_get_topology (void)
```
Get mesh topology.

**Return** MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_err_t esp_mesh_enable_ps (void)
```
Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_disable_ps (void)
```
Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```c
bool esp_mesh_is_ps_enabled (void)
```
Check whether the mesh Power Save function is enabled.
bool esp_mesh_is_device_active (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PSDEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Return
- ESP_OK

Parameters
- [out] dev_duty: device duty cycle
- [out] dev_duty_type: device PS duty cycle type

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears,
the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.

• If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
• After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] nwk_duty: network duty cycle
• [in] duration_mins: duration (unit: minutes)
• [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

desk_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

Return
• ESP_OK

Parameters
• [out] nwk_duty: current network duty cycle
• [out] duration_mins: the duration of current nwk_duty
• [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
• [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

int esp_mesh_get_running_active_duty_cycle(void)

Get the running active duty cycle.

• The running active duty cycle of the root is 100.
• If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
• If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
• In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Return the running active duty cycle

desk_err_t esp_mesh_ps_duty_signaling(int fwd_times)

Duty signaling.

Return
• ESP_OK

Parameters
• [in] fwd_times: the times of forwarding duty signaling packets

Unions

union mesh_addr_t
#include <esp_mesh.h> Mesh address.

Public Members

uint8_t addr[6]
mac address
mip

mip address

union mesh_event_info_t

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t channel_switch
channel switch

mesh_event_child_connected_t child_connected
child connected

mesh_event_child_disconnected_t child_disconnected
child disconnected

mesh_event_routing_table_change_t routing_table
routing table change

mesh_event_connected_t connected
parent connected

mesh_event_disconnected_t disconnected
parent disconnected

mesh_event_no_parent_found_t no_parent
no parent found

mesh_event_layer_change_t layer_change
layer change

mesh_event_toDS_state_t toDS_state
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
vote started

mesh_event_root_address_t root_addr
root address

mesh_event_root_switch_req_t switch_req
root switch request

mesh_event_root_conflict_t root_conflict
other powerful root

mesh_event_root_fixed_t root_fixed
fixed root

mesh_event_scan_done_t scan_done
scan done

mesh_event_network_state_t network_state
network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
network found that can join

mesh_event_router_switch_t router_switch
new router information

mesh_event_ps_duty_t ps_duty
PS duty information
union mesh_rc_config_t
   #include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
   max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
   a new root address specified by users for API esp_mesh_waive_root()

Structures

struct mip_t
   IP address and port.

Public Members

ip4_addr_t ip4
   IP address

uint16_t port
   port

struct mesh_event_channel_switch_t
   Channel switch information.

Public Members

uint8_t channel
   new channel

struct mesh_event_connected_t
   Parent connected information.

Public Members

wifi_event_sta_connected_t connected
   parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
   layer

uint8_t duty
   parent duty

struct mesh_event_no_parent_found_t
   No parent found information.

Public Members

int scan_times
   scan times being through

struct mesh_event_layer_change_t
   Layer change information.
Public Members

**uint16_t new_layer**
new layer

**struct mesh_event_vote_started_t**
vote started information

**Public Members**

**int reason**
vote reason, vote could be initiated by children or by the root itself

**int attempts**
max vote attempts before stopped

**mesh_addr_t rc_addr**
root address specified by users via API esp_mesh_waive_root()

**struct mesh_event_find_network_t**
find a mesh network that this device can join

Public Members

**uint8_t channel**
channel number of the new found network

**uint8_t router_bssid[6]**
router BSSID

**struct mesh_event_root_switch_req_t**
Root switch request information.

**Public Members**

**int reason**
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

**mesh_addr_t rc_addr**
the address of root switch requester

**struct mesh_event_root_conflict_t**
Other powerful root address.

**Public Members**

**int8_t rssi**
rssi with router

**uint16_t capacity**
the number of devices in current network

**uint8_t addr[6]**
other powerful root address

**struct mesh_event_routing_table_change_t**
Routing table change.
Chapter 2. API Reference

Public Members

```c
uint16_t rt_size_new
    the new value
uint16_t rt_size_change
    the changed value
```

```c
struct mesh_event_root_fixed_t
    Root fixed.
```

Public Members

```c
bool is_fixed
    status
```

```c
struct mesh_event_scan_done_t
    Scan done event information.
```

Public Members

```c
uint8_t number
    the number of APs scanned
```

```c
struct mesh_event_network_state_t
    Network state information.
```

Public Members

```c
bool is_rootless
    whether current mesh network has a root
```

```c
struct mesh_event_ps_duty_t
    PS duty information.
```

Public Members

```c
uint8_t duty
    parent or child duty
```

```c
mesh_event_child_connected_t child_connected
    child info
```

```c
struct mesh_opt_t
    Mesh option.
```

Public Members

```c
uint8_t type
    option type
uint16_t len
    option length
uint8_t *val
    option value
```

```c
struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv()
```
**Public Members**

```c
uint8_t* data
```

data

```c
uint16_t size
```

data size

```c
mesh_proto_t proto
```

data protocol

```c
mesh_tos_t tos
```

data type of service

**struct mesh_router_t**

Router configuration.

**Public Members**

```c
uint8_t ssid[32]
```

SSID

```c
uint8_t ssid_len
```

length of SSID

```c
uint8_t bssid[6]
```

BSSID, if this value is specified, users should also specify “allow_router_switch”.

```c
uint8_t password[64]
```

cpassword

```c
bool allow_router_switch
```

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**

Mesh softAP configuration.

**Public Members**

```c
uint8_t password[64]
```

mesh softAP password

```c
uint8_t max_connection
```

max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

```c
uint8_t nonmesh_max_connection
```

max non-mesh connections

**struct mesh_cfg_t**

Mesh initialization configuration.

**Public Members**

```c
uint8_t channel
```

channel, the mesh network on
bool allow_channel_switch
    if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel
    scan for a network that could join. The default value is false.

mesh_addr_t mesh_id
    mesh network identification

mesh_router_t router
    router configuration

mesh_ap_cfg_t mesh_ap
    mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
    crypto functions

struct mesh_vote_t
    Vote.

Public Members

float percentage
    vote percentage threshold for approval of being a root

bool is_rc_specified
    if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
    network start root election.

mesh_rc_config_t config
    vote address configuration

struct mesh_tx_pending_t
    The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
    to parent queue

int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS
int toSelf
    to self

Macros
MESH_ROOT_LAYER
    root layer value
MESH_MTU
    max transmit unit (in bytes)
MESH_MPS
    max payload size (in bytes)
ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started
ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized
ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured
ESP_ERR_MESH_NOT_START
    mesh isn’t started
ESP_ERR_MESH_NOT.Support
    not supported yet
ESP_ERR_MESH_NOT_ALLOWED
    operation is not allowed
ESP.ERR_MESH_NO_MEMORY
    out of memory
ESP.ERR_MESH_ARGUMENT
    illegal argument
ESP.ERR_MESH_EXCEED_MTU
    packet size exceeds MTU
ESP.ERR_MESH_TIMEOUT
    timeout
ESP.ERR_MESH_DISCONNECTED
    disconnected with parent on station interface
ESP.ERR_MESH_QUEUE_FAIL
    queue fail
ESP.ERR_MESH_QUEUE_FULL
    queue full
ESP.ERR_MESH_NO_PARENT_FOUND
    no parent found to join the mesh network
ESP.ERR_MESH_NO_ROUTE_FOUND
    no route found to forward the packet
ESP.ERR_MESH_OPTION_NULL
    no option found
ESP.ERR_MESH_OPTION_UNKNOWN
    unknown option
ESP.ERR_MESH_XON_NO_WINDOW
    no window for software flow control on upstream
Chapter 2. API Reference

ESP_ERR_MESH_INTERFACE
  low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
  discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
  discard the packet

ESP_ERR_MESH_VOTING
  vote in progress

ESP_ERR_MESH_XMIT
  XMIT

ESP_ERR_MESH_QUEUE_READ
  error in reading queue

ESP_ERR_MESH_PS
  mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
  release esp_mesh_recv_toDS

MESH_DATA_ENC
  Flags bitmap for esp_mesh_send() and esp_mesh_recv()
  data encrypted (Unimplemented)

MESH_DATA_P2P
  point-to-point delivery over the mesh network

MESH_DATA_FROMDS
  receive from external IP network

MESH_DATA_TODS
  identify this packet is target to external IP network

MESH_DATA_NONBLOCK
  esp_mesh_send() non-block

MESH_DATA_DROP
  in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
  identify this packet is target to a group address

MESH_OPT_SEND_GROUP
  Option definitions for esp_mesh_send() and esp_mesh_recv()
  data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
  return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
  Flag of mesh networking IE.
  vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
  no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
  root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
  fixed root
**MESH_PS_DEVICE_DUTY_REQUEST**

Mesh PS (Power Save) duty cycle type. requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network.

**MESH_PS_DEVICE_DUTY_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle.

**MESH_PS_NETWORK_DUTY_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master).

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

Type Definitions

```c
typedef mesh_addr_t mesh_event_root_address_t
  Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
  Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
  Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
  Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
  New router information.
```

Enumerations

```c
enum mesh_event_id_t
  Enumerated list of mesh event id.

Values:

  MESH_EVENT_STARTED
  mesh is started

  MESH_EVENT_STOPPED
  mesh is stopped

  MESH_EVENT_CHANNEL_SWITCH
  channel switch

  MESH_EVENT_CHILD_CONNECTED
  a child is connected on softAP interface

  MESH_EVENT_CHILD_DISCONNECTED
  a child is disconnected on softAP interface

  MESH_EVENT_ROUTING_TABLE_ADD
  routing table is changed by adding newly joined children

  MESH_EVENT_ROUTING_TABLE_REMOVE
  routing table is changed by removing leave children

  MESH_EVENT_PARENT_CONNECTED
  parent is connected on station interface

  MESH_EVENT_PARENT_DISCONNECTED
  parent is disconnected on station interface
```
MESH_EVENT_NO_PARENT_FOUND
no parent found

MESH_EVENT_LAYER_CHANGE
layer changes over the mesh network

MESH_EVENT_TODS_STATE
state represents whether the root is able to access external IP network

MESH_EVENT_VOTE_STARTED
the process of voting a new root is started either by children or by the root

MESH_EVENT_VOTE_STOPPED
the process of voting a new root is stopped

MESH_EVENT_ROOT_ADDRESS
the root address is obtained. It is posted by mesh stack automatically.

MESH_EVENT_ROOT_SWITCH_REQ
root switch request sent from a new voted root candidate

MESH_EVENT_ROOT_SWITCH_ACK
root switch acknowledgment responds the above request sent from current root

MESH_EVENT_ROOT_ASKED_YIELD
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

MESH_EVENT_ROOT_FIXED
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

MESH_EVENT_SCAN_DONE
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

MESH_EVENT_NETWORK_STATE
network state, such as whether current mesh network has a root.

MESH_EVENT_STOP_RECONNECTION
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

MESH_EVENT_FIND_NETWORK
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_PS_PARENT_DUTY
parent duty

MESH_EVENT_PS_CHILD_DUTY
child duty

MESH_EVENT_PS_DEVICE_DUTY
device duty

MESH_EVENT_MAX

enum mesh_type_t
Device type.

Values:
**MESH_IDLE**

hasn’t joined the mesh network yet

**MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**MESH_LEAF**

has no forwarding ability

**MESH_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

```c
enum mesh_proto_t
{
    MESH_PROTO_BIN        // binary
    MESH_PROTO_HTTP       // HTTP protocol
    MESH_PROTO_JSON       // JSON format
    MESH_PROTO_MQTT       // MQTT protocol
    MESH_PROTO_AP         // IP network mesh communication of node’s AP interface
    MESH_PROTO_STA        // IP network mesh communication of node’s STA interface
}
```

**MESH_TOS**

For reliable transmission, mesh stack provides three type of services.

```c
enum mesh_tos_t
{
    MESH_TOS_P2P          // provide P2P (point-to-point) retransmission on mesh stack by default
    MESH_TOS_E2E          // provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
    MESH_TOS_DEF          // no retransmission on mesh stack
}
```

**MESH_VOTE_REASON**

Vote reason.

```c
enum mesh_vote_reason_t
{
    MESH_VOTE_REASON_ROOT_INITIATED = 1  // vote is initiated by the root
    MESH_VOTE_REASON_CHILD_INITIATED   // vote is initiated by children
}
```

**MESH_DISCONNECT_REASON**

Mesh disconnect reason code.

```c
enum mesh_disconnect_reason_t
{
    MESH_REASON_CYCLIC = 100  // cyclic is detected
}
```
MESH_REASON_PARENT_IDLE
parent is idle

MESH_REASON_LEAF
the connected device is changed to a leaf

MESH_REASON_DIFF_ID
in different mesh ID

MESH_REASON_ROOTS
root conflict is detected

MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

MESH_REASON_SCAN_FAIL
scan fail

MESH_REASON_IE_UNKNOWN
unknown IE

MESH_REASON_WAIVE_ROOT
waive root

MESH_REASON_PARENT_WORSE
parent with very poor RSSI

MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

c enum esp_mesh_topology_t
Mesh topology.

Values:

MESH_TOPO_TREE
tree topology

MESH_TOPO_CHAIN
chain topology

c enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)

Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

MESH_TODS_REACHABLE
the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

• components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
Initialize DPP Supplicant.
Starts DPP Supplicant and initializes related Data Structures.
return
• ESP_OK: Success
• ESP_FAIL: Failure
```

**Parameters**

• evt_cb: Callback function to receive DPP related events

```c
void esp_supp_dpp_deinit (void)
De-initialize DPP Supplicant.
Frees memory from DPP Supplicant Data Structures.
```

```c
esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type,
const char *key, const char *info)
Generates Bootstrap Information as an Enrollee.
Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.
Return
• ESP_OK: Success
• ESP_FAIL: Failure
```

**Parameters**

• chan_list: List of channels device will be available on for listening
• type: Bootstrap method type, only QR Code method is supported for now.
• key: (Optional) Private Key used to generate a Bootstrapping Public Key
• info: (Optional) Ancilliary Device Information like Serial Number

```c
esp_err_t esp_supp_dpp_start_listen (void)
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.
Listens on every Channel from Channel List for a pre-defined wait time.
Return
• ESP_OK: Success
```
void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.
Stops listening on Channels and cancels ongoing listen operation.

Macros
ESP_ERR_DPP_FAILURE
Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE
DPP Frame Tx failed OR not Aced
ESP_ERR_DPP_INVALID_ATTR
Encountered invalid DPP Attribute

Type Definitions
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
Types of Bootstrap Methods for DPP.
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
Callback function for receiving DPP Events from Supplicant.
Callback function will be called with DPP related information.
Parameters
• evt: DPP event ID
• data: Event data payload

Enumerations
enum dpp_bootstrap_type
Types of Bootstrap Methods for DPP.
Values:
DPP_BOOTSTRAP_QR_CODE
QR Code Method
DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method
DPP_BOOTSTRAP_NFC_URI
NFC URI record Method
enum esp_supp_dpp_event_t
Types of Callback Events received from DPP Supplicant.
Values:
ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping
ESP_SUPP_DPP_CFG_RECVED
Config received via DPP Authentication
ESP_SUPP_DPP_FAIL
DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.
2.2.2 Ethernet

Overview
ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver

Basic Ethernet Concepts

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless rage expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

![Fig. 4: Ethernet Data Frame Format](image)

Preamble and Start-of-Frame Delimiter

The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence...
10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field, if the value in this field is ≤ 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is ≥ 1536, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.
Chapter 2. API Reference

**Note:** Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

**Configure MAC and PHY**  Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface) and etc.

One of the obvious difference between MII and RMII is the signal consumption. For MII, it usually costs up to 18 signals. Instead, RMII interface can reduce the consumption to 9.

In RMII mode, both the receiver and transmitter signals are referenced to the REF_CLK. **REF_CLK must be stable during any access to PHY and MAC.** Generally there’re three ways to generate the REF_CLK depending on the PHY device in your design:

- Some PHY chip can derive the REF_CLK from its external connected 25MHz crystal oscillator (as seen the option a in the picture). In this case, you should select `CONFIG_ETH_RMII_CLK_INPUT` in `CONFIG_ETH_RMII_CLK_MODE`.
- Some PHY chip uses an external connected 50MHz crystal oscillator or other clock source, which can also be used as the REF_CLK for MAC side (as seen the option b in the picture). In this case, you still need to select `CONFIG_ETH_RMII_CLK_INPUT` in `CONFIG_ETH_RMII_CLK_MODE`.
- Some EMAC controller can generate the REF_CLK using its internal high precision PLL (as seen the option c in the picture). In this case, you should select `CONFIG_ETH_RMII_CLK_OUTPUT` in `CONFIG_ETH_RMII_CLK_MODE`.

**Note:** REF_CLK is configured via Project Configuration as described above by default. However, it can be overwritten from user application code by appropriately setting interface and clock_config members of `eth_mac_config_t` structure. See `emac_rmii_clock_mode_t` and `emac_rmii_clock_gpio_t` for more details.

**Warning:** If the RMII clock mode is selected to `CONFIG_ETH_RMII_CLK_OUTPUT`, then GPIO0 can be used to output the REF_CLK signal. See `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO` for more information. What’s more, if you’re not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock. See `CONFIG_ETH_RMII_CLK_OUT_GPIO` for more information.

If the RMII clock mode is selected to `CONFIG_ETH_RMII_CLK_INPUT`, then GPIO0 is the only choice to input the REF_CLK signal. Please note that, GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround of this issue is disabling the REF_CLK in hardware by default, so that the strapping pin won’t be interfered by other signals in boot stage. Then re-enable the REF_CLK in Ethernet driver installation stage. The ways to disable the REF_CLK signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
- Force the PHY device in reset status (as the case a in the picture). **This could fail for some PHY device** (i.e. it still outputs signal to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of REF_CLK in your hardware design! Keep the trace as short as possible. Keep it away from RF devices. Keep it away from inductor elements.

**Note:** ESP-IDF only supports the RMII interface (i.e. always select `CONFIG_ETH_PHY_INTERFACE_RMII` in Kconfig option `CONFIG_ETH_PHY_INTERFACE`). Signals used in data plane are fixed to specific GPIOs via MUX, they can’t be modified to other GPIOs. Signals used in control plane can be routed to any free GPIOs via Matrix. Please refer to `ESP32-Ethernet-Kit` for hardware
Fig. 5: Ethernet RMII Interface
We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `rx_task_stack_size` and `rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.
- `smi_mdc_gpio_num` and `smi_mdio_gpio_num`: the GPIO number used to connect the SMI signals.
- `interface`: configuration of MAC Data interface to PHY (MII/RMII).
- `clock_config`: configuration of EMAC Interface clock (REF_CLK mode and GPIO number in case of RMII).

Configuration for PHY is described in `eth_phy_config_t`, including:

- `phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

Create MAC and PHY Instance Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

Internal EMAC + External PHY

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC
      ~configuration
mac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO
      ~used for MDC signal
mac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // alter the GPIO
      ~used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY
      ~configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY
      ~address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO
      ~used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
      // ESP-IDF officially supports several different Ethernet PHY chip driver
      // esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
      // esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
      // esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);
```
Optional Runtime MAC Clock Configuration

EMAC REF_CLK can be optionally configured from user application code.

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration

// ...

mac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
mac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
mac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number used to input/output EMAC REF_CLK

esp_eth_mac_t *mac = esp_eth_mac_new_esp32(mac_config); // create MAC instance
```

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration

phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset

// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);

spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};

eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;

esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_PHY_new_dm9051(&phy_config);
```

Note:
- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don’t have other choices but the integrated PHY.
- We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to **SPI Master**.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) can be different for other Ethernet modules.
Chapter 2. API Reference

Please check out your module’s spec and the examples in esp-idf.

**Install Driver**  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- **mac**: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- **phy**: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- **check_link_period_ms**: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- **stack_input**: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- **on_lowlevel_init_done** and **on_lowlevel_deinit_done**: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                     mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
```

`esp_event_loop_create_default();` // create a default event loop that running in background

(continues on next page)
### Chapter 2. API Reference

(continued from previous page)

```c
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
```

// register Ethernet event handler (to deal with user specific stuffs when event like link up/down happened)

---

**Start Ethernet Driver**  After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to *LwIP*.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to *Network Interface*.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~");
}
```

esp_netif_init();  // Initialize TCP/IP network interface (should be called only once in application)

esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH();  // apply default network interface configuration for Ethernet

esp_netif_t *eth_netif = esp_netif_new(&cfg);  // create network interface for Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle));  // attach Ethernet driver to TCP/IP stack

esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL);  // register user defined IP event handlers

esp_eth_start(eth_handle);  // start Ethernet driver state machine

---

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.

---

**Misc control of Ethernet driver**  The following functions should only be invoked after the Ethernet driver has been installed.
Chapter 2. API Reference

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control**  Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

**Application Example**

- Ethernet basic example: `ethernet/basic`
- Ethernet iperf example: `ethernet/iperf`
- Ethernet to Wi-Fi AP “router” : `ethernet/eth2ap`
- Most of protocol examples should also work for Ethernet: `protocols`

**API Reference**

**Header File**

- `components/esp_eth/include/esp_eth.h`

**Functions**

```c
esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
```

Install Ethernet driver.

**Return**

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVAL_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
• ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**
- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)
```
Uninstall Ethernet driver.

**Note**
It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note**
This API will start driver state machine and internal software timer (for checking link status).

**Return**
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```
Stop Ethernet driver.

**Note**
This function does the opposite operation of esp_eth_start.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input) esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv)
```
Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note**
After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [in] stack_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack_input callback without any modification

```c
esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void *buf, size_t length)
```
General Transmit.
Return

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

```
esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t* buf, uint32_t* length)
```

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Note This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with esp_eth_update_input_path.

Return

- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

```
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void* data)
```

Misc IO function of Etherent driver.

The following IO control commands are supported:

- ETH_CMD_S_MAC_ADDR sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH_CMD_G_MAC_ADDR gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH_CMD_S_PHY_ADDR sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- ETH_CMD_G_PHY_ADDR gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- ETH_CMD_S_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH_CMD_G_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- ETH_CMD_S_SPEED sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_FLOW_CTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_DUPLEX_MODE sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
• ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

Return
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

Parameters
• [in] hdl: handle of Ethernet driver
• [in] cmd: IO control command
• [inout] data: address of data for set command or address where to store the data when used with get command

esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
Increase Ethernet driver reference.

Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)
Decrease Ethernet driver reference.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

Structures
struct esp_eth_config_t
Configuration of Ethernet driver.

Public Members

esp_eth_mac_t *mac
Ethernet MAC object.

esp_eth_phy_t *phy
Ethernet PHY object.

uint32_t check_link_period_ms
Period time of checking Ethernet link status.

esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)
Input frame buffer to user’s stack.

Return
• ESP_OK: input frame buffer to upper stack successfully
• ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters
• [in] eth_handle: handle of Ethernet driver
• [in] buffer: frame buffer that will get input to upper stack
• [in] length: length of the frame buffer

`esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when low level initialization is finished.

**Return**

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**

- [in] eth_handle: handle of Ethernet driver

`esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when low level deinitialization is finished.

**Return**

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**

- [in] eth_handle: handle of Ethernet driver

`esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Read PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**Parameters**

- [in] eth_handle: handle of Ethernet driver
    - [in] phy_addr: PHY chip address (0~31)
    - [in] phy_reg: PHY register index code
    - [out] reg_value: PHY register value

`esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Write PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Parameters**

- [in] eth_handle: handle of Ethernet driver
    - [in] phy_addr: PHY chip address (0~31)
    - [in] phy_reg: PHY register index code
    - [in] reg_value: PHY register value

**Macros**

`ETH_DEFAULT_CONFIG(emac, ephy)`

Default configuration for Ethernet driver.

**Type Definitions**
typedef void *esp_eth_handle_t
    Handle of Ethernet driver.

Enumerations
enum esp_eth_io_cmd_t
    Command list for ioctl API.
    
Values:

ETH_CMD_G_MAC_ADDR
    Get MAC address

ETH_CMD_S_MAC_ADDR
    Set MAC address

ETH_CMD_G_PHY_ADDR
    Get PHY address

ETH_CMD_S_PHY_ADDR
    Set PHY address

ETH_CMD_G_AUTONEGO
    Get PHY Auto Negotiation

ETH_CMD_S_AUTONEGO
    Set PHY Auto Negotiation

ETH_CMD_G_SPEED
    Get Speed

ETH_CMD_S_SPEED
    Set Speed

ETH_CMD_S_PROMISCUOUS
    Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
    Set flow control

ETH_CMD_G_DUPLEX_MODE
    Get Duplex mode

ETH_CMD_S_DUPLEX_MODE
    Set Duplex mode

ETH_CMD_S_PHYLOOPBACK
    Set PHY loopback

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)
    Detect PHY address.

Return

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Parameters

- [in] eth: mediator of Ethernet driver
- [out] detected_addr: a valid address after detection
Structures

struct esp_eth_mediator_s
  Ethernet mediator.

Public Members

esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
  Read PHY register.
  Return
  • ESP_OK: read PHY register successfully
  • ESP_FAIL: read PHY register failed because some error occurred
  Parameters
  • [in] eth: mediator of Ethernet driver
  • [in] phy_addr: PHY Chip address (0–31)
  • [in] phy_reg: PHY register index code
  • [out] reg_value: PHY register value

esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
  Write PHY register.
  Return
  • ESP_OK: write PHY register successfully
  • ESP_FAIL: write PHY register failed because some error occurred
  Parameters
  • [in] eth: mediator of Ethernet driver
  • [in] phy_addr: PHY Chip address (0–31)
  • [in] phy_reg: PHY register index code
  • [in] reg_value: PHY register value

esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
  Deliver packet to upper stack.
  Return
  • ESP_OK: deliver packet to upper stack successfully
  • ESP_FAIL: deliver packet failed because some error occurred
  Parameters
  • [in] eth: mediator of Ethernet driver
  • [in] buffer: packet buffer
  • [in] length: length of the packet

esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
  Callback on Ethernet state changed.
  Return
  • ESP_OK: process the new state successfully
  • ESP_FAIL: process the new state failed because some error occurred
  Parameters
  • [in] eth: mediator of Ethernet driver
  • [in] state: new state
  • [in] args: optional argument for the new state

Type Definitions

typedef struct esp_eth_mediator_s esp_eth_mediator_t
  Ethernet mediator.

Enumerations
enum esp_eth_state_t
    Ethernet driver state.

    Values:
    ETH_STATE_LLINIT
        Low level init done
    ETH_STATE_DEINIT
        Deinit done
    ETH_STATE_LINK
        Link status changed
    ETH_STATE_SPEED
        Speed updated
    ETH_STATE_DUPLEX
        Duplex updated
    ETH_STATE_PAUSE
        Pause ability updated

enum eth_event_t
    Ethernet event declarations.

    Values:
    ETHERNET_EVENT_START
        Ethernet driver start
    ETHERNET_EVENT_STOP
        Ethernet driver stop
    ETHERNET_EVENT_CONNECTED
        Ethernet got a valid link
    ETHERNET_EVENT_DISCONNECTED
        Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h

Functions

esp_eth_mac_t *esp_eth_mac_new_esp32 (const eth_mac_config_t *config)
    Create ESP32 Ethernet MAC instance.

    Return
    - instance: create MAC instance successfully
    - NULL: create MAC instance failed because some error occurred

    Parameters
    - config: Ethernet MAC configuration

Unions

union eth_mac_clock_config_t
    #include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

Public Members

struct eth_mac_clock_config_t::[anonymous] mii
    EMAC MII Clock Configuration
**emac_rmii_clock_mode_t**
RMII Clock Mode Configuration

**emac_rmii_clock_gpio_t**
RMII Clock GPIO Configuration

**struct eth_mac_clock_conf_t**: [anonymous] rmii
EMAC RMII Clock Configuration

### Structures
**struct esp_eth_mac_s**
Ethernet MAC.

### Public Members

**esp_err_t** (*set_mediator*) (**esp_eth_mac_t** *mac, **esp_eth_mediator_t** *eth)
Set mediator for Ethernet MAC.

- **Return**
  - ESP_OK: set mediator for Ethernet MAC successfully
  - ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

- **Parameters**
  - [in] mac: Ethernet MAC instance
  - [in] eth: Ethernet mediator

**esp_err_t** (*init*) (**esp_eth_mac_t** *mac)
Initialize Ethernet MAC.

- **Return**
  - ESP_OK: initialize Ethernet MAC successfully
  - ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
  - ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

- **Parameters**
  - [in] mac: Ethernet MAC instance

**esp_err_t** (*deinit*) (**esp_eth_mac_t** *mac)
Deinitialize Ethernet MAC.

- **Return**
  - ESP_OK: deinitialize Ethernet MAC successfully
  - ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred

- **Parameters**
  - [in] mac: Ethernet MAC instance

**esp_err_t** (*start*) (**esp_eth_mac_t** *mac)
Start Ethernet MAC.

- **Return**
  - ESP_OK: start Ethernet MAC successfully
  - ESP_FAIL: start Ethernet MAC failed because some other error occurred

- **Parameters**
  - [in] mac: Ethernet MAC instance

**esp_err_t** (*stop*) (**esp_eth_mac_t** *mac)
Stop Ethernet MAC.

- **Return**
  - ESP_OK: stop Ethernet MAC successfully
  - ESP_FAIL: stop Ethernet MAC failed because some other error occurred

- **Parameters**
  - [in] mac: Ethernet MAC instance
Esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
Transmit packet from Ethernet MAC.

Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
• ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
• ESP_FAIL: transmit packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] buf: packet buffer to transmit
• [in] length: length of packet

Esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.
Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer.
After the function returned, the value of “length” means the real length of received data.

Return
• ESP_OK: receive packet successfully
• ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
• ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
• ESP_FAIL: receive packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [out] buf: packet buffer which will preserve the received frame
• [out] length: length of the received packet

Esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
Read PHY register.

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [out] reg_value: PHY register value

Esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
Write PHY register.

Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [in] reg_value: PHY register value

Esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
Set MAC address.

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

`esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)`

Get MAC address.

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

`esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)`

Set speed of MAC.

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

`esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)`

Set duplex mode of MAC.

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

`esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)`

Set link status of MAC.

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] link: Link status

`esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)`

Set promiscuous of MAC.

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
Enable flow control on MAC layer or not.

Return
• ESP_OK: set flow control successfully
• ESP_FAIL: set flow control failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] enable: set true to enable flow control; set false to disable flow control

del(esp_eth_mac_t *mac)
Free memory of Ethernet MAC.

Return
• ESP_OK: free Ethernet MAC instance successfully
• ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance

struct eth_mac_config_t
Configuration of Ethernet MAC object.

Public Members

uint32_t sw_reset_timeout_ms
Software reset timeout value (Unit: ms)

uint32_t rx_task_stack_size
Stack size of the receive task

uint32_t rx_task_prio
Priority of the receive task

int smi_mdc_gpio_num
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int smi_mdio_gpio_num
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32_t flags
Flags that specify extra capability for mac driver

eth_data_interface_t *interface
EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t *clock_config
EMAC Interface clock configuration

Macros
ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
Pin MAC task to the CPU core where driver installation happened
**ETH_MAC_DEFAULT_CONFIG()**

Default configuration for Ethernet MAC object.

**Type Definitions**

```c
typedef struct esp_eth_mac_s esp_eth_mac_t

Ethernet MAC.
```

**Enumerations**

```c
defined emac_rmii_clock_mode_t

RMII Clock Mode Options.

Values:

- **EMAC_CLK_DEFAULT**
  Default values configured using Kconfig are going to be used when “Default” selected.

- **EMAC_CLK_EXT_IN**
  Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

  **Note** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

- **EMAC_CLK_OUT**
  Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

```

```c
defined emac_rmii_clock_gpio_t

RMII Clock GPIO number Options.

Values:

- **EMAC_CLK_IN_GPIO** = 0
  MAC will get RMII clock from outside at this GPIO.

  **Note** ESP32 only supports GPIO0 to input the RMII clock.

- **EMAC_APPL_CLK_OUT_GPIO** = 0
  Output RMII Clock from internal APLL Clock available at GPIO0.

  **Note** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have a direct relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

- **EMAC_CLK_OUT_GPIO** = 16
  Output RMII Clock from internal APLL Clock available at GPIO16.

- **EMAC_CLK_OUT_180_GPIO** = 17
  Inverted Output RMII Clock from internal APLL Clock available at GPIO17.
```

**Header File**

- components/esp_eth/include/esp_eth_phy.h

**Functions**

```c
esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)

Create a PHY instance of IP101.

Return

- instance: create PHY instance successfully
```
Chapter 2. API Reference

- NULL: create PHY instance failed because some error occurred

Parameters
  - [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_rt8201(const eth_phy_config_t *config)
```
Create a PHY instance of RTL8201.

Return
  - instance: create PHY instance successfully
  - NULL: create PHY instance failed because some error occurred

Parameters
  - [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)
```
Create a PHY instance of LAN87xx.

Return
  - instance: create PHY instance successfully
  - NULL: create PHY instance failed because some error occurred

Parameters
  - [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)
```
Create a PHY instance of DP83848.

Return
  - instance: create PHY instance successfully
  - NULL: create PHY instance failed because some error occurred

Parameters
  - [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_ksz80xx(const eth_phy_config_t *config)
```
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Return
  - instance: create PHY instance successfully
  - NULL: create PHY instance failed because some error occurred

Parameters
  - [in] config: configuration of PHY

Structures
```
struct esp_eth_phy_s
```
Ethernet PHY.

Public Members
```
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

Return
  - ESP_OK: set mediator for Ethernet PHY instance successfully
  - ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters
  - [in] phy: Ethernet PHY instance
  - [in] mediator: mediator of Ethernet driver
```
esp_err_t (*reset)(esp_eth_phy_t *phy)
Software Reset Ethernet PHY.

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*init)(esp_eth_phy_t *phy)
Initialize Ethernet PHY.

Return
• ESP_OK: initialize Ethernet PHY successfully
• ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*deinit)(esp_eth_phy_t *phy)
Deinitialize Ethernet PHY.

Return
• ESP_OK: deinitialize Ethernet PHY successfully
• ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
Configure auto negotiation.

Return
• ESP_OK: restart auto negotiation successfully
• ESP_FAIL: restart auto negotiation failed because some error occurred
• ESP_ERR_INVALID_ARG: invalid command

Parameters
• [in] phy: Ethernet PHY instance
• [in] cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
• [out] autonego_en_stat: Address where to store current status of auto negotiation configuration

esp_err_t (*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.

Return
```
Chapter 2. API Reference

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```
Set PHY chip address.

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```
Get PHY chip address.

**Return**
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

```c
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
```
Advertise pause function supported by MAC layer.

**Return**
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

```c
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
```
Sets the PHY to loopback mode.

**Return**
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: enables or disables PHY loopback

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```
Sets PHY speed mode.

**Note** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] speed: Speed mode to be set

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.

**Note** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**
• ESP_OK: PHY instance duplex mode has been configured successfully
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] duplex: Duplex mode to be set

```c
del(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Return**

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**

```c
struct eth_phy_config_t
```

Ethernet PHY configuration.

**Public Members**

```c
int32_t phy_addr
```

PHY address, set -1 to enable PHY address detection at initialization stage

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset

**Macros**

```c
ESP_ETH_PHY_ADDR_AUTO
```

Default configuration for Ethernet PHY object.

**Type Definitions**

```c
typedef struct esp Eth Phy_s esp_eth Phy_t
```

Ethernet PHY.

**Enumerations**

```c
enum eth_phy_autoneg_cmd_t
```

Auto-negotiation control commands.

**Values:**

```c
ESP_ETH_PHY_AUTONEGO_RESTART
ESP_ETH_PHY_AUTONEGO_EN
ESP_ETH_PHY_AUTONEGO_DIS
ESP_ETH_PHY_AUTONEGO_G_STAT
```

**Header File**

- components/esp_eth/include/esp_eth_netif_glue.h
Chapter 2. API Reference

Functions

```c
esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
```
Create a netif glue for Ethernet driver.

**Note** netif glue is used to attach io driver to TCP/IP netif

**Parameters**

- `eth_hdl`: Ethernet driver handle

```c
esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
```
Delete netif glue of Ethernet driver.

**Return** ESP_OK: delete netif glue successfully

**Parameters**

- `eth_netif_glue`: netif glue

Type Definitions

```c
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```
Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

### 2.2.3 Thread

**Thread**

**Introduction** Thread is an IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples** The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

**Header File**

- `components/openthread/include/esp_openthread.h`

**Functions**

```c
esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)
```
Initializes the full OpenThread stack.

**Note** The OpenThread instance will also be initialized in this function.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**Parameters**

- `[in]` `init_config`: The initialization configuration.

```c
esp_err_t esp_openthread_launch_mainloop(void)
```
Launches the OpenThread main loop.
Chapter 2. API Reference

Note This function will not return unless error happens when running the OpenThread stack.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_deinit (void)
```

This function performs OpenThread stack and platform driver deinitialization.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

```c
otInstance *esp_openthread_get_instance (void)
```

This function acquires the underlying OpenThread instance.

Note This function can be called on other tasks without lock.

Return The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

```c
struct esp_openthread_mainloop_context_t
```

This structure represents a context for a select() based mainloop.

Public Members

- `fd_set read_fds`
  The read file descriptors
- `fd_set write_fds`
  The write file descriptors
- `fd_set error_fds`
  The error file descriptors
- `int max_fd`
  The max file descriptor
- `struct timeval timeout`
  The timeout

```c
struct esp_openthread_uart_config_t
```

The uart port config for OpenThread.

Public Members

- `uart_port_t port`
  UART port number
- `uart_config_t uart_config`
  UART configuration, see `uart_config_t` docs
- `int rx_pin`
  UART RX pin
- `int tx_pin`
  UART TX pin

```c
struct esp_openthread_radio_config_t
```

The OpenThread radio configuration.
Public Members

*esp_openthread_radio_mode_t* radio_mode
The radio mode

*esp_openthread_uart_config_t* radio_uart_config
The uart configuration to RCP

*struct esp_openthread_host_connection_config_t*
The OpenThread host connection configuration.

Public Members

*esp_openthread_host_connection_mode_t* host_connection_mode
The host connection mode

*esp_openthread_uart_config_t* host_uart_config
The uart configuration to host

*struct esp_openthread_host_connection_config_t*
The OpenThread port specific configuration.

Public Members

*const char* storage_partition_name
The partition for storing OpenThread dataset

*uint8_t* netif_queue_size
The packet queue size for the network interface

*uint8_t* task_queue_size
The task queue size

*struct esp_openthread_platform_config_t*
The OpenThread platform configuration.

Public Members

*esp_openthread_radio_config_t* radio_config
The radio configuration

*esp_openthread_host_connection_config_t* host_config
The host connection configuration

*esp_openthread_port_config_t* port_config
The port configuration

Enumerations

*enum esp_openthread_event_t*
OpenThread event declarations.

Values:

*OPENTHREAD_EVENT_START*
OpenThread stack start

*OPENTHREAD_EVENT_STOP*
OpenThread stack stop

*OPENTHREAD_EVENT_IF_UP*
OpenThread network interface up
Chapter 2. API Reference

**OPENTHREAD_EVENT_IF_DOWN**
OpenThread network interface down

**OPENTHREAD_EVENT_GOT_IP6**
OpenThread stack added IPv6 address

**OPENTHREAD_EVENT_LOST_IP6**
OpenThread stack removed IPv6 address

**OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**
OpenThread stack joined IPv6 multicast group

**OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**
OpenThread stack left IPv6 multicast group

**OPENTHREAD_EVENT_TREL_ADD_IP6**
OpenThread stack added TREL IPv6 address

**OPENTHREAD_EVENT_TREL_REMOVE_IP6**
OpenThread stack removed TREL IPv6 address

**OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**
OpenThread stack joined TREL IPv6 multicast group

**enum esp_openthread_radio_mode_t**
The radio mode of OpenThread.

Values:

- **RADIO_MODE_NATIVE** = 0x0
  Use the native 15.4 radio

- **RADIO_MODE_UART_RCP** = 0x1
  UART connection to a 15.4 capable radio co-processor (RCP)

- **RADIO_MODE_SPI_RCP** = 0x2
  SPI connection to a 15.4 capable radio co-processor (RCP)

**enum esp_openthread_host_connection_mode_t**
How OpenThread connects to the host.

Values:

- **HOST_CONNECTION_MODE_NONE** = 0x0
  Disable host connection

- **HOST_CONNECTION_MODE_CLI_UART** = 0x1
  CLI UART connection to the host

- **HOST_CONNECTION_MODE_RCP_UART** = 0x2
  RCP UART connection to the host

**Header File**
- components/openthread/include/esp_openthread_lock.h

**Functions**

- **esp_err_t esp_openthread_lock_init (void)**
  This function initializes the OpenThread API lock.

  **Return**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if allocation has failed
  - ESP_ERR_INVALID_STATE if already initialized

- **void esp_openthread_lock_deinit (void)**
  This function deinitializes the OpenThread API lock.
bool esp_openthread_lock_acquire (TickType_t block_ticks)
This function acquires the OpenThread API lock.

Note  Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that
the call site is in OT callbacks.

Return  
• True on lock acquired
• False on failing to acquire the lock with the timeout.

Parameters  
• [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.

void esp_openthread_lock_release (void)
This function releases the OpenThread API lock.

Header File
• components/openthread/include/esp_openthread_netif_glue.h

Functions
void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
This function initializes the OpenThread network interface glue.

Return  
• glue pointer on success
• NULL on failure

Parameters  
• [in] config: The platform configuration.

void esp_openthread_netif_glue_deinit (void)
This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
This function acquires the OpenThread netif.

Return  The OpenThread netif or NULL if not initialzied.

Header File
• components/openthread/include/esp_openthread_border_router.h

Functions
void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.

Note  This function must be called before esp_openthread_init

Parameters  
• [in] backbone_netif: The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.

Note  Calling this function will make the device behave as an OpenThread border router. Kconfig option
CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Return  
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if feature not supported
• ESP_ERR_INVALID_STATE if already initialized
• ESP_FIAL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not initialized
• ESP_FAIL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)

Gets the backbone interface of OpenThread border router.

Return The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

2.2.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

• It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
• The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

(continues on next page)
Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver  Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to network stack
C) ESP-NETIF, former tcpip_adapter  ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack  Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface  The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by if_key (e.g. ETH_DEF) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization  To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by CONFIG_ESP_NETIF_L2_TAP first and then registered by esp_vfs_l2tap_intf_register() prior usage of any VFS function.

open()  Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net.tap”. The same path path name can be opened multiple times up to CONFIG_ESP_NETIF_L2_TAP_MAX_FDS and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with O_NONBLOCK file status flag to the read() does not block. Note that the write() may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using fcntl().
On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

`ioctl()` The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor.
- **ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.
- **ENOSPC** - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.
- **ENOSYS** - unsupported operation, passed configuration option does not exists.

`read()` Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **EAGAIN** - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

`write()` A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.
In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the \texttt{write()} may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, \texttt{write()} returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and \texttt{errno} is set to indicate the error.

\textbf{EBADF} - not a valid file descriptor.

\textbf{EBADMSG} - Ethernet type of the frame is different then file descriptor configured filter.

\textbf{EIO} - Network interface not available or busy.

\textbf{close()} \quad \text{Opened ESP-NETIF L2 TAP file descriptor can be closed by the \texttt{close()} to free its allocated resources. The ESP-NETIF L2 TAP implementation of \texttt{close()} may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first task read operation then ends with error.}

On success, \texttt{close()} returns zero. On error, -1 is returned, and \texttt{errno} is set to indicate the error.

\textbf{EBADF} - not a valid file descriptor.

\textbf{select()} \quad \text{Select is used in a standard way, just \textit{CONFIG\_VFS\_SUPPORT\_SELECT} needs to be enabled to be the \texttt{select()} function available.}

\textbf{ESP-NETIF programmer’s manual} \quad \text{Please refer to the example section for basic initialization of default interfaces:}

\begin{itemize}
  \item WiFi Station: \texttt{wifi/getting_started/station/main/station_example_main.c}
  \item WiFi Access Point: \texttt{wifi/getting_started/softAP/main/softap_example_main.c}
  \item Ethernet: \texttt{ethernet/basic/main/ethernet_example_main.c}
\end{itemize}

For more specific cases please consult this guide: \textit{ESP-NETIF Custom I/O Driver}.

\textbf{WiFi default initialization} \quad \text{The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:}

\begin{itemize}
  \item \texttt{esp\_netif\_create\_default\_wifi\_ap()}
  \item \texttt{esp\_netif\_create\_default\_wifi\_sta()}
\end{itemize}

Please note that these functions return the \texttt{esp\_netif} handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

\begin{itemize}
  \item The created object has to be destroyed if a network de-initialization is provided by an application using \texttt{esp\_netif\_destroy\_default\_wifi()}.\n  \item These \texttt{default} interfaces must not be created multiple times, unless the created handle is deleted using \texttt{esp\_netif\_destroy()}.\n  \item When using Wifi in \texttt{AP+STA} mode, both these interfaces has to be created.
\end{itemize}
API Reference

Header File

- components/esp_netif/include/esp_netif.h

Functions

**esp_err_t esp_netif_init (void)**

Initialize the underlying TCP/IP stack.

**Return**
- ESP_OK on success
- ESP_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

**esp_err_t esp_netif_deinit (void)**

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Return**
- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

**esp_netif_t** *esp_netif_new (const esp_netif_config_t **esp_netif_config)**

Creates an instance of new esp-netif object based on provided config.

**Return**
- pointer to esp-netif object on success
- NULL otherwise

**Parameters**
- [in] esp_netif_config: pointer esp-netif configuration

**void esp_netif_destroy (esp_netif_t **esp_netif)**

Destroys the esp_netif object.

**Parameters**
- [in] esp_netif: pointer to the object to be deleted

**esp_err_t esp_netif_set_driver_config (esp_netif_t **esp_netif,**
const esp_netif_driver_ifconfig_t **driver_config)**

Configures driver related options of esp_netif object.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**
- [inout] esp_netif: pointer to the object to be configured
- [in] driver_config: pointer esp-netif io driver related configuration

**esp_err_t esp_netif_attach (esp_netif_t **esp_netif,**
esp_netif_iodriver_handle driver_handle)**

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**
- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle
esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Return
• ESP_OK

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] buffer: Received data
• [in] len: Length of the data frame
• [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

esp_err_t esp_netif_transmit_hook_attach(esp_netif_t *esp_netif, void *hook_fn)

Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to transmit hook call-back function

esp_err_t esp_netif_post_transmit_hook_attach(esp_netif_t *esp_netif, void *hook_fn)

Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

Note Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to post transmit hook call-back function

esp_err_t esp_netif_recv_hookAttach(esp_netif_t *esp_netif, void *hook_fn)

Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to receive hook callback function

esp_err_t esp_netif_transmit_hook_detach(esp_netif_t *esp_netif)

Removes reference to previously attached transmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_post_transmit_hook_detach(esp_netif_t *esp_netif)

Removes reference to previously attached posttransmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG
Parameters

- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_recv_hook_detach(esp_netif_t *esp_netif)`

Removes reference to previously attached receive hook callback function.

Return

- ESP_OK - success
- ESP_ERR_INVALID_ARG

Parameters

- [in] esp_netif: Handle to esp-netif instance

`void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

Note: This API can be directly used as event handler

Parameters

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver stop event.

Note: This API can be directly used as event handler

Parameters

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver connected event.

Note: This API can be directly used as event handler

Parameters

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver disconnected event.

Note: This API can be directly used as event handler

Parameters

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_got_ip(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:
void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group join.

Note This API can be directly used as event handler
Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group leave.

Note This API can be directly used as event handler
Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 address added by the underlying stack.

Note This API can be directly used as event handler
Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note This API can be directly used as event handler
Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])
Set the mac address for the interface instance.

Return
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] mac: Desired mac address for the related network interface

esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])
Get the mac address for the interface instance.

Return
• ESP_OK - success
• ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
• ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] mac: Resultant mac address for the related network interface

`esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)`

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Return**

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)`

Get interface hostname.

**Return**

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

`bool esp_netif_is_netif_up (esp_netif_t *esp_netif)`

Test if supplied interface is up or down.

**Return**

- true - Interface is up
- false - Interface is down

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

`esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.
esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: Store the old IP information for the specified interface

int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
Get net interface index from network stack implementation.

**Note** This index could be used in setsockopt() to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied esp_netif

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)
Get net interface name from network stack implementation.

**Note** This name could be used in setsockopt() to bind socket with appropriate interface

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)
**esp_err_t** esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t** esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t** esp_netif_dhcpc_start(esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** esp_netif_dhcpc_stop(esp_netif_t *esp_netif)

Stop DHCP client (only if enabled in interface object)

**Note** Calling action_netif_stop() will also stop the DHCP Client if it is running.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_CLIENT_FAILED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP client status.

**Return**
• ESP_OK

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] status: If successful, the status of DHCP client will be returned in this argument.

esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
Get DHCP Server status.

Return
• ESP_OK

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] status: If successful, the status of the DHCP server will be returned in this argument.

esp_err_t esp_netif_dhcps_start(esp_netif_t *esp_netif)
Start DHCP server (only if enabled in interface object)

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_dhcps_stop(esp_netif_t *esp_netif)
Stop DHCP server (only if enabled in interface object)

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled
If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease
if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is
designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.
If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server
option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
• This function can override it by setting server type ESP_NETIF_DNS_MAIN.
• Other DNS Server types are not supported for the Wi-Fi AP interface.

Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [in] dns: DNS Server address to set

esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
Get DNS Server information.
Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [out] dns: DNS Server result is written here on success

`esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)`
Create interface link-local IPv6 address.
Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.
This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)`
Get interface link-local IPv6 address.
If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

`esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)`
Get interface global IPv6 address.
If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

`int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])` Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: Array of IPv6 addresses will be copied to the argument

`void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)` Sets IPv4 address to the specified octets.
Parameters
• `[out] addr`: IP address to be set
• `a`: the first octet (127 for IP 127.0.0.1)
• `b`: 
• `c`: 
• `d`: 

`char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)`
Converts numeric IP address into decimal dotted ASCII representation.

Return either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

Parameters
• `addr`: ip address in network order to convert
• `buf`: target buffer where the string is stored
• `buflen`: length of buf

`uint32_t esp_ip4addr_aton(const char *addr)`
Ascii internet address interpretation routine The value returned is in network order.

Return ip address in network order

Parameters
• `addr`: IP address in ascii representation (e.g. “127.0.0.1”)

`esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)`
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return • ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• `[in] src`: IPv4 address in ascii representation (e.g. “127.0.0.1”)
• `[out] dst`: Address of the target esp_ip4_addr_t structure to receive converted address

`esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)`
Converts Ascii internet IPv6 address into esp_ip4_addr_t. Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

Return • ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• `[in] src`: IPv6 address in ascii representation (e.g.
  2001:db8:85a3:0000:0000:0000:0002:0001”)
• `[out] dst`: Address of the target esp_ip6_addr_t structure to receive converted address

`esp_netif_iiodriver_handle esp_netif_get_io_driver(esp_netif_t *esp_netif)`
Gets media driver handle for this esp-netif instance.

Return opaque pointer of related IO driver

Parameters
• `[in] esp_netif`: Handle to esp-netif instance

`esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)`
Searches over a list of created objects to find an instance with supplied if_key.

Return Handle to esp-netif instance

Parameters
• `if_key`: Textual description of network interface

`esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)`
Returns configured flags for this interface.

Return Configuration flags
Chapter 2. API Reference

Parameters
- [in] esp_netif: Handle to esp-netif instance

**const char*`esp_netif_get_ifkey`** (esp_netif_t *`esp_netif`)  
Returns configured interface key for this esp-netif instance.

Return  
Textual description of related interface

Parameters
- [in] esp_netif: Handle to esp-netif instance

**const char*`esp_netif_get_desc`** (esp_netif_t *`esp_netif`)  
Returns configured interface type for this esp-netif instance.

Return  
Enumerated type of this interface, such as station, AP, ethernet

Parameters
- [in] esp_netif: Handle to esp-netif instance

**int esp_netif_get_route_prio** (esp_netif_t *`esp_netif`)  
Returns configured routing priority number.

Return  
Integer representing the instance’s route-prio, or -1 if invalid parameters

Parameters
- [in] esp_netif: Handle to esp-netif instance

**int32_t esp_netif_get_event_id** (esp_netif_t *`esp_netif`, esp_netif_ip_event_type_t `event_type`)  
Returns configured event for this esp-netif instance and supplied event type.

Return  
specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

Parameters
- [in] esp_netif: Handle to esp-netif instance
- `event_type`: (either get or lost IP)

**esp_netif_t*`esp_netif_next`** (esp_netif_t *`esp_netif`)  
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return  
First netif from the list if supplied parameter is NULL, next one otherwise

Parameters
- [in] esp_netif: Handle to esp-netif instance

**size_t esp_netif_get_nr_of_ifs** (void)  
Returns number of registered esp_netif objects.

Return  
Number of esp_netifs

void **esp_netif_netstack_buf_ref** (void *`netstack_buf`)  
Increase the reference counter of net stack buffer

Parameters
- [in] netstack_buf: the net stack buffer

void **esp_netif_netstack_buf_free** (void *`netstack_buf`)  
Free the netstack buffer

Parameters
- [in] netstack_buf: the net stack buffer

**Macros**

_`ESP_NETIF_SUPPRESS_LEGACY_WARNING_`

WiFi default API reference
Header File

- components/esp_wifi/include/esp_wifi_default.h

Functions

`esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)`
Attaches wifi station interface to supplied netif.

Return
- ESP_OK on success
- ESP_FAIL if attach failed

Parameters
- `esp_netif`: instance to attach the wifi station to

`esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)`
Attaches wifi soft AP interface to supplied netif.

Return
- ESP_OK on success
- ESP_FAIL if attach failed

Parameters
- `esp_netif`: instance to attach the wifi AP to

`esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`
Sets default wifi event handlers for STA interface.

Return
- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`
Sets default wifi event handlers for AP interface.

Return
- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void)`
Clears default wifi event handlers for supplied network interface.

Return
- ESP_OK on success, error returned from esp_event_handler_register if failed

Parameters
- `esp_netif`: instance of corresponding if object

`esp_netif_t *esp_netif_create_default_wifi_ap(void)`
Creates default WIFI AP. In case of any init error this API aborts.

Note The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Return pointer to esp-netif instance

`esp_netif_t *esp_netif_create_default_wifi_sta(void)`
Creates default WIFI STA. In case of any init error this API aborts.

Note The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

Return pointer to esp-netif instance

`void esp_netif_destroy_default_wifi(void *esp_netif)`
Destroys default WIFI netif created with esp_netif_create_default_wifi···() API.

Note This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

Parameters
- `[in]` esp_netif: object to detach from WiFi and destroy
Chapter 2. API Reference

esp_netif_t* esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Return pointer to esp-netif instance

Parameters
• [in] wifi_if: type of wifi interface
• [in] esp_netif_config: inherent esp-netif configuration pointer

esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled.
Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Return ESP_OK on success

Parameters
• [out] p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
• [out] p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

2.2.5 IP Network Layer

TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor ESP-NETIF.

Updating network connection code

Network stack initialization Simply replace tcpip_adapter_init() with esp_netif_init(). Please note that the ESP-NETIF initialization API returns standard error code and the esp_netif_deinit() for un-initialization is available.

Also replace #include "tcpip_adapter.h" with #include "esp_netif.h".

Network interface creation TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the ESP-NETIF to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call esp_netif_create_default_wifi_sta(); or esp_netif_create_default_wifi_ap(); after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
Replacing other tcpip_adapter API  All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers  Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip:\n", IP2STR(esp_netif_event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(esp_netif_event->ip_info.ip));
```

Since `ip4addr_ntoa()` is a LwIP API, the `esp-netif` provides `esp_ip4addr_ntoa()` as a replacement, but the above method is generally preferred.

IP addresses  It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

Next steps  Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration:

```c
esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle);
```

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:
It is assumed that the esp_netif_iodriver_handle is a pointer to driver’s object, a struct derived from struct esp_netif_driver_base_s, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*!< base structure reserved as
    esp-netif driver */
    driver_impl *h; /*!< handle of driver implementation */
} my_netif_driver_t;
```

with actual values of my_netif_driver_t::base.post_attach and the actual drivers handle my_netif_driver_t::h. So when the esp_netif_attach() gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example driver start -> network start, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

**Header File**

- components/esp_netif/include/esp_netif_net_stack.h
Functions

```c
esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)
  Returns esp_netif handle.
  Parameters
  • [in] dev: opaque ptr to network interface of specific TCP/IP stack
```  

```c
void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)
  Returns network stack specific implementation handle (if supported)
  Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode
  Parameters
  • [in] esp_netif: Handle to esp-netif instance
```  

```c
esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)
  Outputs packets from the TCP/IP stack to the media to be transmitted.
  Return ESP_OK on success, an error passed from the I/O driver otherwise
  Parameters
  • [in] esp_netif: Handle to esp-netif instance
  • [in] data: Data to be transmitted
  • [in] len: Length of the data frame
```  

```c
esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
  Outputs packets from the TCP/IP stack to the media to be transmitted.
  Return ESP_OK on success, an error passed from the I/O driver otherwise
  Parameters
  • [in] esp_netif: Handle to esp-netif instance
  • [in] data: Data to be transmitted
  • [in] len: Length of the data frame
  • [in] netstack_buf: net stack buffer
```  

```c
void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
  Free the rx buffer allocated by the media driver.
  This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)
  Parameters
  • [in] esp_netif: Handle to esp-netif instance
  • [in] buffer: Rx buffer pointer
```  

Code examples for TCP/IP socket APIs are provided in the `protocols/sockets` directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the `TCP/IP Adapter Migration Guide` to update existing IDF applications.

### 2.2.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

### 2.3 Peripherals API
2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 18 measurement channels (analog enabled pins).

These channels are supported:

**ADC1:**
- 8 channels: GPIO32 - GPIO39

**ADC2:**
- 10 channels: GPIO0, GPIO2, GPIO4, GPIO12 - GPIO15, GPIO25 - GPIO27

ADC Attenuation

Vref is the reference voltage used internally by ESP32 ADCs for measuring the input voltage. The ESP32 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>100 mV - 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>100 mV - 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>150 mV - 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>150 mV - 2450 mV</td>
</tr>
</tbody>
</table>

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \tag{1}
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see <em>ADC Attenuation</em>.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See *ADC Calibration*.

ADC Limitations

Note:
Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:

- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Since the ADC2 module is also used by the Wi-Fi, only one of them could get the preemption when using together, which means the \texttt{adc2\_get\_raw()} may get blocked until Wi-Fi stops, and vice versa.

**Driver Usage**

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

**Note:** ADC readings from a pin not connected to any signal are random.

**ADC Single Read mode**

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions \texttt{adc1\_config\_width()} and \texttt{adc1\_config\_channel\_atten()}.
- For ADC2, configure the attenuation by \texttt{adc2\_config\_channel\_atten()}. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see \texttt{adc1\_channel\_t} and \texttt{adc2\_channel\_t}, set as a parameter of above functions.

Then it is possible to read ADC conversion result with \texttt{adc1\_get\_raw()} and \texttt{adc2\_get\_raw()}. Reading width of ADC2 should be set as a parameter of \texttt{adc2\_get\_raw()} instead of in the configuration functions.

Single Read mode ADC example can be found in \texttt{peripherals/adc\_single\_read} directory of ESP-IDF examples.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function \texttt{hall\_sensor\_read()}. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function \texttt{adc1\_ulp\_enable()} and then set precision and attenuation as discussed above.

There is another specific function \texttt{adc\_vref\_to\_gpio()} used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section **ADC Calibration**.

**Note:** See **ADC Limitations** for the limitation of using ADC single read mode.

**Minimizing Noise**

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

**ADC Calibration**

The \texttt{esp\_adc\_cal/include/esp\_adc\_cal.h} API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The
Fig. 6: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

Fig. 7: Graph illustrating effect of differing reference voltages on the ADC voltage curve.
characteristics curve is in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \) and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values** Calibration values are used to generate characteristic curves that account for the variation of ADC reference voltage of a particular ESP32 chip. There are currently 3 source(s) of calibration values on ESP32. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150 mV and 850 mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the eFuse Vref has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

![ESP32 Chip Surface Marking](image)

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif (sales@espressif.com) directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if eFuse Vref is present by running the espefuse.py tool with adc_info parameter

```bash
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace /dev/ttyUSB0 with ESP32 board’s port name.

A chip that has specific eFuse Vref value programmed (in this case 1093 mV) will be reported as follows:

**ADC VRef calibration: 1093 mV**

In another example below the eFuse Vref is not programmed:

**ADC VRef calibration: None (1100 mV nominal)**

For a chip with two point calibration the message will look similar to:
ADC VRef calibration: 1149 mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading (150 mV): 306
  ADC1 High reading (850 mV): 3153
  ADC2 Low reading (150 mV): 389
  ADC2 High reading (850 mV): 3206

Application Extensions

For a full example see esp-idf: peripherals/adc/single_read

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

  esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
  esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
  //Check type of calibration value used to characterize ADC
  if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref\n");
  } else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point\n");
  } else {
    printf("Default\n");
  }
```

Reading an ADC then converting the reading to a voltage:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

  uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
  uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

```c
#include "driver/adc.h"
...

  esp_err_t status = adc_vref_to_gpio(ADC_UNIT_1, GPIO_NUM_25);
  if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
  } else {
    printf("failed to route v_ref\n");
  }
```

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0.
2. ADC1_GPIO0 Channel is the ADC1 channel number of GPIO n.
API Reference

This reference covers three components:

- **ADC driver**
- **ADC Calibration**
- **GPIO Lookup Macros**

ADC driver

Header File

- components/driver/include/driver/adc.h

Functions

- `void adc_power_on (void)`
  Enable ADC power.
- `void adc_power_off (void)`
  Power off SAR ADC.
- `void adc_power_acquire (void)`
  Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.
- `void adc_power_release (void)`
  Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

`esp_err_t adc1_pad_get_io_num (adc1_channel_t channel, gpio_num_t *gpio_num)`

Get the GPIO number of a specific ADC1 channel.

**Return**

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

`esp_err_t adc1_config_channel_atten (adc1_channel_t channel, adc_atten_t atten)`

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation</th>
<th>suggested range</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(dB)</td>
<td>(mV)</td>
</tr>

</table>

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Note For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

Note This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc1_config_width(adc_bits_width_t width_bit)
```
Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `width_bit`: Bit capture width for ADC1

```c
int adc1_get_raw(adc1_channel_t channel)
```
Take an ADC1 reading from a single channel.

Note ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Note Call `adc1_config_width()` before the first time this function is called.

Note For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

Return
- -1: Parameter error
- Other: ADC1 channel reading.

Parameters
- `channel`: ADC1 channel to read

```c
esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `adc_unit`: ADC unit index
- `inv_en`: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```
Set ADC source clock.

Return
- ESP_OK success

Parameters
- clk_div: ADC clock divider, ADC clock is divided from APB clock

```c
esp_err_t adc_set_data_width (adc_unit_t adc_unit, adc_bits_width_t width_bit)
```
Configure ADC capture width.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- width_bit: Bit capture width for ADC unit.

```c
void adc1_ulp_enable (void)
```
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten`, `adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

```c
esp_err_t adc2_pad_get_io_num (adc2_channel_t channel, gpio_num_t *gpio_num)
```
Get the GPIO number of a specific ADC2 channel.

Return
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters
- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

```c
esp_err_t adc2_config_channel_atten (adc2_channel_t channel, adc_atten_t atten)
```
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

```
+----------+-------------+-----------------+
| SoC      | attenuation | suggested range |
|----------|-------------+-----------------|
|         | (dB)        | (mV)            |
|----------+-------------+-----------------|
|         | 0           | 100 ~ 950       |
|         | 2.5         | 100 ~ 1250      |
| ESP32   | 6           | 150 ~ 1750      |
|         | 11          | 150 ~ 2450      |
|         | 0           | 0 ~ 750         |
|         | 2.5         | 0 ~ 1050        |
| ESP32-S2| 6           | 0 ~ 1300        |
|         | 11          | 0 ~ 2500        |
+----------+-------------+-----------------+
```
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```
Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of `ECO_and_Workarounds_for_Bugs_in_ESP32` for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 supports hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)
```
Output ADC1 or ADC2’s reference voltage to `adc2_channe_t`’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `adc_unit`: ADC unit index
- `[in]` `gpio`: GPIO number (Only ADC2’s channels IO are supported)

```c
esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)
```
Output ADC2 reference voltage to `adc2_channe_t`’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `gpio`: GPIO number (ADC2’s channels are supported)
Chapter 2. API Reference

```
\texttt{esp_err_t \textbf{adc_digi_initialize}(const \texttt{adc_digi_init_config_t \*init_config})}

Initialize the Digital ADC.

\textbf{Return}
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

\textbf{Parameters}
- \texttt{init_config}: Pointer to Digital ADC initialization config. Refer to \texttt{adc_digi_init_config_t}.

\texttt{esp_err_t \textbf{adc_digi_read_bytes}(uint8_t \*buf, uint32_t length_max, uint32_t \*out_length, uint32_t \*timeout_ms)}

Read bytes from Digital ADC through DMA.

\textbf{Return}
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

\textbf{Parameters}
- \texttt{[out] buf}: Buffer to read from ADC.
- \texttt{[in] length_max}: Expected length of data read from the ADC.
- \texttt{[out] out_length}: Real length of data read from the ADC via this API.
- \texttt{[in] timeout_ms}: Time to wait for data via this API, in millisecond.

\texttt{esp_err_t \textbf{adc_digi_start}()}

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

\textbf{Return}
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

\texttt{esp_err_t \textbf{adc_digi_stop}()}

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

\textbf{Return}
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

\texttt{esp_err_t \textbf{adc_digi_deinitialize}()}

Deinitialize the Digital ADC.

\textbf{Return}
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

\texttt{esp_err_t \textbf{adc_digi_controller_configure}(const \texttt{adc_digi_configuration_t \*config})}

Setting the digital controller.

\textbf{Return}
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

\textbf{Parameters}
- \texttt{config}: Pointer to digital controller parameter. Refer to \texttt{adc_digi_config_t}.

\texttt{int \textbf{hall_sensor_read}()}

Read Hall Sensor.

\textbf{Note} When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of “ECO_and_Workarounds_for_Bugs_in_ESP32” for the description of this issue.

Espressif Systems 662 Release v5.0-dev-1077-g397639d

Submit Document Feedback
Note: The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

Note: The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

Return: The hall sensor reading.

`esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)`
Set I2S data source.

- **Return**: ESP_OK success
- **Parameters**:
  - `src`: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

`esp_err_t adc_i2s_mode_init(adc_unit_t adc_unit, adc_channel_t channel)`
Initialize I2S ADC mode.

- **Return**:
  - ESP_OK success
  - ESP_ERR_INVALID_ARG Parameter error

- **Parameters**:
  - `adc_unit`: ADC unit index
  - `channel`: ADC channel index

**Structures**

`struct adc_digi_init_config_s`
ADC DMA driver configuration.

**Public Members**

- `uint32_t max_store_buf_size`
  Max length of the converted data that driver can store before they are processed.

- `uint32_t conv_num_each_intr`
  Bytes of data that can be converted in 1 interrupt.

- `uint32_t adc1_chan_mask`
  Channel list of ADC1 to be initialized.

- `uint32_t adc2_chan_mask`
  Channel list of ADC2 to be initialized.

`struct adc_digi_configuration_t`
ADC digital controller settings.

**Public Members**

- `bool conv_limit_en`
  To limit ADC conversion times. Conversion stops after finishing conv_limit_num times conversion.

- `uint32_t conv_limit_num`
  Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

- `uint32_t pattern_num`
  Number of ADC channels that will be used.

- `adc_digi_pattern_config_t *adc_pattern`
  List of configs for each ADC channel that will be used.

- `uint32_t sample_freq_hz`
  The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs:
sampling frequency; Fd: digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

*adc_digi_convert_mode_t conv_mode*
ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

*adc_digi_output_format_t format*
ADC DMA conversion output format, see `adc_digi_output_format_t`.

**Macros**

`ADC_ATTEN_0db`
ADC rtc controller attenuation option.

*Note* This definitions are only for being back-compatible

`ADC_ATTEN_2_5db`

`ADC_ATTEN_6db`

`ADC_ATTEN_11db`

`ADC_WIDTH_BIT_DEFAULT`
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.

`ADC_WIDTH_9Bit`

`ADC_WIDTH_10Bit`

`ADC_WIDTH_11Bit`

`ADC_WIDTH_12Bit`

`ADC_MAX_DELAY`
Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

**Type Definitions**

typedef struct *adc_digi_init_config_s* `adc_digi_init_config_t`
ADC DMA driver configuration.

**Enumerations**

enum `adc1_channel_t`  
*Values:*

`ADC1_CHANNEL_0` = 0
ADC1 channel 0 is GPIO36

`ADC1_CHANNEL_1`
ADC1 channel 1 is GPIO37

`ADC1_CHANNEL_2`
ADC1 channel 2 is GPIO38

`ADC1_CHANNEL_3`
ADC1 channel 3 is GPIO39

`ADC1_CHANNEL_4`
ADC1 channel 4 is GPIO32

`ADC1_CHANNEL_5`
ADC1 channel 5 is GPIO33

`ADC1_CHANNEL_6`
ADC1 channel 6 is GPIO34
ADC1_CHANNEL_7
ADC1 channel 7 is GPIO35

ADC1_CHANNEL_MAX

enum adc2_channel_t
Values:
ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)
ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)
ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)
ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)
ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)
ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)
ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)
ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)
ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)
ADC2_CHANNEL_MAX

enum adc_i2s_encode_t
ADC digital controller encode option.
Values:
ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data
ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data
ADC_ENCODE_MAX

Header File
- components/hal/include/hal/adc_types.h

Structures
struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members

uint8_t atten
Attenuation of this ADC channel.

```c
uint8_t channel
ADC channel.

uint8_t unit
ADC unit.

uint8_t bit_width
ADC output bit width.
```

```c
struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.
```

**Note** ESP32: Only type1 is valid. ADC2 does not support DMA mode.

**Note** ESP32-S2: Member channel can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

### Public Members

```c
uint16_t data: 12
ADC real output data info. Resolution: 12 bit.

uint16_t channel: 4
ADC channel index info.
```

ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

```c
uint16_t unit: 1
ADC unit index info. 0: ADC1; 1: ADC2.
```

```c
struct adc_digi_output_data_t::<anonymous>::<anonymous> type2
When the configured output format is 11bit. ADC_DIGI_FORMAT_11BIT
```

```c
uint16_t val
Raw data value
```

### Enumerations

```c
defined adc_unit_t
ADC unit enumeration.
```

**Note** For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

**Values:**

- **ADC_UNIT_1** = 1
  - SAR ADC 1.
- **ADC_UNIT_2** = 2
  - SAR ADC 2.
- **ADC_UNIT_BOTH** = 3
  - SAR ADC 1 and 2.
- **ADC_UNIT_ALTER** = 7
  - SAR ADC 1 and 2 alternative mode.

```c
defined adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.
```

**Note** For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

**Values:**
ADC_CHANNEL_0 = 0
    ADC channel
ADC_CHANNEL_1
    ADC channel
ADC_CHANNEL_2
    ADC channel
ADC_CHANNEL_3
    ADC channel
ADC_CHANNEL_4
    ADC channel
ADC_CHANNEL_5
    ADC channel
ADC_CHANNEL_6
    ADC channel
ADC_CHANNEL_7
    ADC channel
ADC_CHANNEL_8
    ADC channel
ADC_CHANNEL_9
    ADC channel
ADC_CHANNEL_MAX

enum adc_atten_t
    ADC attenuation parameter. Different parameters determine the range of the ADC. See adc1_config_channel_atten.
    Values:
            ADC_ATTEN_DB_0 = 0
                No input attenuation, ADC can measure up to approx. 800 mV.
            ADC_ATTEN_DB_2_5 = 1
                The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)
            ADC_ATTEN_DB_6 = 2
                The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)
            ADC_ATTEN_DB_11 = 3
                The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)
            ADC_ATTEN_MAX

enum adc_bits_width_t
    ADC resolution setting option.
    Note: Only used in single read mode
    Values:
            ADC_WIDTH_BIT_9 = 0
                ADC capture width is 9Bit.
            ADC_WIDTH_BIT_10 = 1
                ADC capture width is 10Bit.
            ADC_WIDTH_BIT_11 = 2
                ADC capture width is 11Bit.
ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:

ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn, e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 …..

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data.
(adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data.
(adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1

ADC_DIGI_OUTPUT_FORMAT_TYPE2
See adc_digi_output_data_t.type2

enum adc_i2s_source_t
ESP32 ADC DMA source selection.

Values:

ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX

ADC Calibration

Header File

- components/esp_adc_cal/include/esp_adc_cal.h
Functions

**esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)**

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32.

**Note** in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

**Return**

- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

**Parameters**

- **value_type**: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

**esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)**

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[ y = \text{coeff}_a \times x + \text{coeff}_b \]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32S2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

**Return**

- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

**Parameters**

- **[in]** adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- **[in]** atten: Attenuation to characterize
- **[in]** bit_width: Bit width configuration of ADC
- **[in]** default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- **[out]** chars: Pointer to empty structure used to store ADC characteristics

**uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)**

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**

- **[in]** adc_reading: ADC reading
- **[in]** chars: Pointer to initialized structure containing ADC characteristics

**esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)**

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())
Return

• ESP_OK: ADC read and converted to mV
• ESP_ERR_INVALID_ARG: Error due to invalid arguments
• ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Parameters

• [in] channel: ADC Channel to read
• [in] chars: Pointer to initialized ADC characteristics structure
• [out] voltage: Pointer to store converted voltage

Structures

struct esp_adc_cal_characteristics_t

Structure storing characteristics of an ADC.

Note Call esp_adc_cal_characterize() to initialize the structure

Public Members

adc_unit_t adc_num
ADC number

adc_atten_t atten
ADC attenuation

adc_bits_width_t bit_width
ADC bit width

uint32_t coeff_a
Gradient of ADC-Voltage curve

uint32_t coeff_b
Offset of ADC-Voltage curve

uint32_t vref
Vref used by lookup table

const uint32_t* low_curve
Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t* high_curve
Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t version
ADC Calibration

Enumerations

enum esp_adc_cal_value_t

Type of calibration value used in characterization.

Values:

ESP_ADC_CAL_VAL_EFUSE_VREF = 0
Characterization based on reference voltage stored in eFuse

ESP_ADC_CAL_VAL_EFUSE_TP = 1
Characterization based on Two Point values stored in eFuse

ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
Characterization based on default reference voltage

ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
Characterization based on Two Point values and fitting curve coefficients stored in eFuse

ESP_ADC_CAL_VAL_MAX
ESP_ADC_CAL_VAL_NOT_SUPPORTED = ESP_ADC_CAL_VAL_MAX

2.3.2 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the \textit{I2S driver} when using the “built-in DAC mode”.

For other analog output options, see the \textit{Sigma-delta Modulation module} and the \textit{LED Control module}. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>

... 

dac_output_enable(DAC_CHANNEL_1);

dac_output_voltage(DAC_CHANNEL_1, 200);
```

API Reference

Header File

- components/driver/esp32/include/driver/dac.h

Functions

\textit{esp_err_t dac_i2s_enable} (void)

Enable DAC output data from I2S.

\textbf{Return}

- ESP_OK success

\textit{esp_err_t dac_i2s_disable} (void)

Disable DAC output data from I2S.

\textbf{Return}

- ESP_OK success

Header File

- components/driver/include/driver/dac_common.h
## Functions

**esp_err_t dac_pad_get_io_num**(dac_channel_t channel, gpio_num_t *gpio_num)
Get the GPIO number of a specific DAC channel.

- **Return**
  - ESP_OK if success
- **Parameters**
  - channel: Channel to get the gpio number
  - gpio_num: output buffer to hold the gpio number

**esp_err_t dac_output_voltage**(dac_channel_t channel, uint8_t dac_value)
Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

- **Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26
- **Return**
  - ESP_OK success
- **Parameters**
  - channel: DAC channel
  - dac_value: DAC output value

**esp_err_t dac_output_enable**(dac_channel_t channel)
DAC pad output enable.

- **Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1
- **Parameters**
  - channel: DAC channel

**esp_err_t dac_output_disable**(dac_channel_t channel)
DAC pad output disable.

- **Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26
- **Return**
  - ESP_OK success
- **Parameters**
  - channel: DAC channel

**esp_err_t dac_cw_generator_enable**(void)
Enable cosine wave generator output.

- **Return**
  - ESP_OK success

**esp_err_t dac_cw_generator_disable**(void)
Disable cosine wave generator output.

- **Return**
  - ESP_OK success

**esp_err_t dac_cw_generator_config**(dac cw config_t *cw)
Config the cosine wave generator function in DAC module.

- **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG The parameter is NULL.
- **Parameters**
  - cw: Configuration.

### GPIO Lookup Macros

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. `DAC_CHANNEL_1_GPIO_NUM` is the GPIO number of channel 1 (GPIO25);
2. `DAC_GPIO26_CHANNEL` is the channel number of GPIO 26 (channel 2).
Chapter 2. API Reference

Header File

- components/soc/esp32/include/soc/dac_channel.h

Macros

DAC_GPIO25_CHANNEL
DAC_CHANNEL_1_GPIO_NUM
DAC_GPIO26_CHANNEL
DAC_CHANNEL_2_GPIO_NUM

Header File

- components/hal/include/hal/dac_types.h

Structures

struct dac_cw_config_t
Config the cosine wave generator function in DAC module.

Public Members

dac_channel_t en_ch
Enable the cosine wave generator of DAC channel.

dac_cw_scale_t scale
Set the amplitude of the cosine wave generator output.

dac_cw_phase_t phase
Set the phase of the cosine wave generator output.

uint32_t freq
Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8_t offset
Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations

enum dac_channel_t
Values:

DAC_CHANNEL_1 = 0
DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)

DAC_CHANNEL_2 = 1
DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

DAC_CHANNEL_MAX

enum dac_cw_scale_t
The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

DAC_CW_SCALE_1 = 0x0
1/1. Default.

DAC_CW_SCALE_2 = 0x1
1/2.

DAC_CW_SCALE_4 = 0x2
1/4.
**Chapter 2. API Reference**

\[
\text{DAC_CW_SCALE_8} = 0x3
\]

1/8.

**enum dac_cw_phase_t**

Set the phase of the cosine wave generator output.

*Values:*

\[
\text{DAC_CW_PHASE_0} = 0x2
\]

Phase shift +0°

\[
\text{DAC_CW_PHASE_180} = 0x3
\]

Phase shift +180°

### 2.3.3 GPIO & RTC GPIO

**Overview**

The ESP32 chip features 34 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

Each pin can be used as a general purpose I/O or can be connected to an internal peripheral signal. The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

**Note:**

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to ESP32 datasheet.
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you’re using Wi-Fi and you’re having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead, that should solve your problem. For more details, please refer to ADC limitations.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use.

**Application Example**

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

**API Reference - Normal GPIO**

**Header File**

- components/driver/include/driver/gpio.h

**Functions**

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin(gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP_OK.

**Parameters**

- gpio_num: GPIO number.
```c
esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)  
GPIO set interrupt trigger type.
```

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to set the trigger type of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `intr_type`: Interrupt type, select from gpio_int_type_t

```c
esp_err_t gpio_intr_enable(gpio_num_t gpio_num)  
Enable GPIO module interrupt signal.
```

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_intr_disable(gpio_num_t gpio_num)  
Disable GPIO module interrupt signal.
```

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)  
GPIO set output level.
```

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
- `gpio_num`: GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `level`: Output level. 0: low; 1: high

```c
int gpio_get_level(gpio_num_t gpio_num)  
GPIO get input level.
```

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)  
GPIO set direction.
```

**Return** Configure GPIO direction, such as output_only,input_only,output_and_input

```c
int gpio_get_level(gpio_num_t gpio_num)  
GPIO get input level.
```

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

Parameters
- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `mode`: GPIO direction

`esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)`
Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Parameters
- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `pull`: GPIO pull up/down mode.

`esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`
Enable GPIO wake-up function.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Parameters
- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

`esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)`
Disable GPIO wake-up function.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Parameters
- `gpio_num`: GPIO number

`esp_err_t gpio_isr_register(void (*fn)(void *), void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

Parameters
- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en(gpio_num_t gpio_num)`
Enable pull-up on GPIO.
## Chapter 2. API Reference

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

### `esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)`
Disable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

### `esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)`
Enable pull-down on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

### `esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)`
Disable pull-down on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

### `esp_err_t gpio_install_isr_service(int intr_alloc_flags)`
Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers. This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

### `void gpio_uninstall_isr_service(void)`
Uninstall the driver’s GPIO ISR service, freeing related resources.

### `esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)`
Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**
ESP_OK Success
ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number
- isr_handler: ISR handler function for the corresponding GPIO number.
- args: parameter for ISR handler.

gpio_isr_handler_remove (gpio_num_t gpio_num)
Remove ISR handler for the corresponding GPIO pin.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number

gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

gpio_hold_en (gpio_num_t gpio_num)
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, gpio_deep_sleep_hold_en should also be called.

Power down or call gpio_hold_dis will disable this function.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- gpio_num: GPIO number, only support output-capable GPIOs

gpio_hold_dis (gpio_num_t gpio_num)
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level(because gpio18 is input mode by
default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- `gpio_num`: GPIO number, only support output-capable GPIOs

void `gpio_deep_sleep_hold_en` (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void `gpio_deep_sleep_hold_dis` (void)

Disable all digital gpio pad hold function during Deep-sleep.

void `gpio_iomux_in` (uint32_t `gpio_num`, uint32_t `signal_idx`)

Set pad input to a peripheral signal through the IOMUX.

Parameters
- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void `gpio_iomux_out` (uint8_t `gpio_num`, int `func`, bool `oen_inv`)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters
- `gpio_num`: gpio_num GPIO number of the pad.
- `func`: The function number of the peripheral pinto output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- `oen_inv`: True if the output enable needs to be inverted, otherwise False.

`esp_err_t gpio_sleep_sel_en` (gpio_num_t `gpio_num`)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

Return
- ESP_OK Success

Parameters
- `gpio_num`: GPIO number of the pad.

`esp_err_t gpio_sleep_sel_dis` (gpio_num_t `gpio_num`)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

Return
- ESP_OK Success

Parameters
- `gpio_num`: GPIO number of the pad.

`esp_err_t gpio_sleep_set_direction` (gpio_num_t `gpio_num`, gpio_mode_t `mode`)

GPIO set direction at sleep.

Configure GPIO direction, such as output_only,input_only,output_and_input

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

Parameters
• **gpio_num**: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **mode**: GPIO direction

`esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)`
Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
• **gpio_num**: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **pull**: GPIO pull up/down mode.

**Macros**
`GPIO_PIN_COUNT`
`GPIO_IS_VALID_GPIO (gpio_num)`
Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)`
Check whether it can be a valid GPIO number of output mode.

**Type Definitions**
`typedef intr_handle_t gpio_isr_handle_t`**

**Header File**
• components/hal/include/hal/gpio_types.h

**Structures**
`struct gpio_config_t`
Configuration parameters of GPIO pad for gpio_config function.

**Public Members**
`uint64_t pin_bit_mask`
GPIO pin: set with bit mask, each bit maps to a GPIO

`gpio_mode_t mode`
GPIO mode: set input/output mode

`gpio_pullup_t pull_up_en`
GPIO pull-up

`gpio_pulldown_t pull_down_en`
GPIO pull-down

`gpio_int_type_t intr_type`
GPIO interrupt type

API Reference - RTC GPIO

Header File
  • components/driver/include/driver/rtc_io.h

Functions
bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
  Determine if the specified GPIO is a valid RTC GPIO.
  
  Return true if GPIO is valid for RTC GPIO use. false otherwise.
  
  Parameters
  • gpio_num: GPIO number

int rtc_io_number_get (gpio_num_t gpio_num)
  Get RTC IO index number by gpio number.
  
  Return >=0: Index of rtcio. -1 : The gpio is not rtcio.
  
  Parameters
  • gpio_num: GPIO number

esp_err_t rtc_gpio_init (gpio_num_t gpio_num)
  Init a GPIO as RTC GPIO.
  
  This function must be called when initializing a pad for an analog function.
  
  Return
  • ESP_OK success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
  
  Parameters
  • gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)
  Init a GPIO as digital GPIO.
  
  Return
  • ESP_OK success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
  
  Parameters
  • gpio_num: GPIO number (e.g. GPIO_NUM_12)

uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)
  Get the RTC IO input level.
  
  Return
  • 1 High level
  • 0 Low level
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})

\texttt{esp\_err\_t rtc\_gpio\_set\_level (gpio\_num, uint32\_t level)}

Set the RTC IO output level.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})
- \texttt{level}: output level

\texttt{esp\_err\_t rtc\_gpio\_set\_direction (gpio\_num, rtc\_gpio\_mode\_t mode)}

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})
- \texttt{mode}: GPIO direction

\texttt{esp\_err\_t rtc\_gpio\_set\_direction\_in\_sleep (gpio\_num, rtc\_gpio\_mode\_t mode)}

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})
- \texttt{mode}: GPIO direction

\texttt{esp\_err\_t rtc\_gpio\_pullup\_en (gpio\_num)}

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call \texttt{gpio\_pullup\_en}, which will work both for normal GPIOs and RTC IOs.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})

\texttt{esp\_err\_t rtc\_gpio\_pulldown\_en (gpio\_num)}

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call \texttt{gpio\_pulldown\_en}, which will work both for normal GPIOs and RTC IOs.

Return
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number (e.g. \texttt{GPIO\_NUM\_12})

\texttt{esp\_err\_t rtc\_gpio\_pullup\_dis (gpio\_num)}

RTC GPIO pullup disable.
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters:
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```
esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num);
```

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters:
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```
esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength);
```

Set RTC GPIO pad drive capability.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters:
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

```
esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength);
```

Get RTC GPIO pad drive capability.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters:
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

```
esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num);
```

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters:
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```
esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num);
```

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters:
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
**esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)**

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12).

**esp_err_t rtc_gpio_force_hold_all(void)**

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all(void)**

Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**
- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)**

Disable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Parameters**
- gpio_num: GPIO number

**Macros**

RTC_GPIO_IS_VALID_GPIO(gpio_num)

**Header File**
- components/hal/include/hal/rtc_io_types.h

**Enumerations**

enum rtc_gpio_mode_t

RTCIO output/input mode type.

**Values:**

- RTC_GPIO_MODE_INPUT_ONLY
  - Pad input
- RTC_GPIO_MODE_OUTPUT_ONLY
  - Pad output
2.3.4 General Purpose Timer (GPTimer)

Introduction

A general purpose timer is a hardware timer with high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution time stamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get count value** - covers how to force the timer counting from a start point and how to get the count value at anytime.
- **Start and Stop timer** - covers which parameters should be set up to start the timer with specific alarm event behavior.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.

Resource Allocation

Different ESP chip might have different number of independent timer groups, and within each group, there could also be several independent timers. Refer to the datasheet to find out how many hardware timers exist (usually described in the “General Purpose Timer” chapter).

From driver’s point of view, a GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that users don’t need to care about which timer and which group it belongs to.

To install a timer instance, there’s a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to `Power management` section.
- `direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to \(\frac{1}{\text{resolution}_hz}\) seconds.

Some ESP chip might only support a sub-set of the clocks, if an unsupported clock source is specified, you will get a runtime error during timer installation.
• Optional `intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to `Interrupt Handling`.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, you should stop it by `gptimer_stop()` in advance or make sure it has not started yet by `gptimer_start()`.

### Creating a GPTimer Handle with Resolution of 1MHz

```c
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_APB,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

### Set and Get Count Value

When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the hardware timer’s bit-width, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at anytime.

### Set Up Alarm Action

Most of the use cases of GPTimer should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, one should configure several members of `gptimer_alarm_config_t` based on how he takes use of the alarm event:

- `alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `alarm_count` and `reload_count` can’t be set to the same value when `auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `auto_reload_on_alarm` is set to true.
- `auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `reload_count` into counter immediately when alarm event happens.

To make the alarm configurations take effect, one should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

### Note:

- If an alarm value is set and the timer has already crossed this value, the alarm will be triggered immediately.

### Register Event Callbacks

After the timer starts up, it can generate specific event (e.g. the “Alarm Event”) dynamically. If you have some function that should be called when event happens, you should hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in the `gptimer_event_callbacks_t`.
on_alarm sets callback function for alarm event. As this function is called within the ISR context, user must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in gptimer_alarm_cb_t.

One can save his own context to gptimer_register_event_callbacks() as well, via the parameter user_data. The user data will be directly passed to the callback functions.

**Start and Stop Timer**  
To start a timer means to enable its internal counter, it can only be achieved by calling gptimer_start(). The timer can be stopped at any time (even in the interrupt context) by gptimer_stop(). One thing should be kept in mind, calling of gptimer_start() should have the same times of calling gptimer_stop() before you delete the timer, otherwise the driver might be put in an undetermined state. For example, the timer might keep a Power Management lock, which in return increase the power consumption. Also see Power management section.

**Start Timer As a Wall Clock**

```c
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

**Trigger Period Events**

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don’t introduce complex logics in callbacks.
    // Suggest dealing with event data in the main loop, instead of in this(callback.
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

**Trigger One-Shot Event**
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing the alarm value of gptimer_alarm_event_data_t. Then the alarm value will be updated after the callback function returns.

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

Power Management When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the driver creates a GPTimer instance that has selected GPTIMER_CLK_SRC_APB as its clock source, the driver will guarantee that the power management lock is acquired when the timer is started by gptimer_start(). Likewise, the driver releases the lock when gptimer_stop() is called for that timer. This requires that the gptimer_start() and gptimer_stop() should appear in pairs.

IRAM Safe By default, the GPTimer interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option CONFIG_GPTIMER_ISR_IRAM_SAFE that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- gptimer_start()
- gptimer_stop()
- gptimer_get_raw_count()
- gptimer_set_raw_count()
- gptimer_set_alarm_action()

Application Examples

Typical use cases of GPTimer are listed in the example: peripherals/timer_group/gptimer.

API Reference

Header File

- components/driver/include/driver/gptimer.h

On_alarm callback and the functions invoked by itself should also be placed in IRAM, users need to take care of them by themselves.
Functions

`esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)`
Create a new General Purpose Timer, and return the handle.

**Note** Once a timer is created, it is placed in the stopped state and will not start until `gptimer_start()` is called.

**Return**
- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

**Parameters**
- [in] config: GPTimer configuration
- [out] ret_timer: Returned timer handle

`esp_err_t gptimer_del_timer(gptimer_handle_t timer)`
Delete the GPTimer handle.

**Note** A timer must be in a stop state before it can be deleted.

**Return**
- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer has not stopped
- ESP_FAIL: Delete GPTimer failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()

`esp_err_t gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value)`
Set GPTimer raw count value.

**Note** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [in] value: Count value to be set

`esp_err_t gptimer_get_raw_count(gptimer_handle_t timer, uint64_t *value)`
Get GPTimer raw count value.

**Note** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [out] value: Returned GPTimer count value

`esp_err_t gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)`
Set callbacks for GPTimer.

**Note** The user registered callbacks are expected to be runnable within ISR context

**Return**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Parameters**
- [in] timer: Timer handle created by `gptimer_new_timer()`
- [in] cbs: Group of callback functions
- [in] user_data: User data, which will be passed to callback functions directly

```c
esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**Parameters**
- [in] timer: Timer handle created by `gptimer_new_timer()`
- [in] config: Alarm configuration, especially, set config to NULL means disabling the alarm function

```c
esp_err_t gptimer_start (gptimer_handle_t timer)
```

Start GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not in stop state
- ESP_FAIL: Start GPTimer failed because of other error

**Parameters**
- [in] timer: Timer handle created by `gptimer_new_timer()`

```c
esp_err_t gptimer_stop (gptimer_handle_t timer)
```

Stop GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in start state
- ESP_FAIL: Stop GPTimer failed because of other error

**Parameters**
- [in] timer: Timer handle created by `gptimer_new_timer()`

**Structures**

```c
struct gptimer_alarm_event_data_t
```

GPTimer event data.
Chapter 2. API Reference

Public Members

uint64_t count_value
Current count value

uint64_t alarm_value
Current alarm value

struct gptimer_event_callbacks_t
Group of supported GPTimer callbacks.

Note The callbacks are all running under ISR environment

Public Members

gptimer_alarm_cb_t on_alarm
Timer alarm callback

struct gptimer_config_t
General Purpose Timer configuration.

Public Members

gptimer_clock_source_t clk_src
GPTimer clock source

gptimer_count_direction_t direction
Count direction

uint32_t resolution_hz
Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

uint32_t intr_shared: 1
Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_alarm_config_t
General Purpose Timer alarm configuration.

Public Members

uint64_t alarm_count
Alarm target count value

uint64_t reload_count
Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm: 1
Reload the count value by hardware, immediately at the alarm event

Type Definitions

typedef struct gptimer_t *gptimer_handle_t
Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
Timer alarm callback prototype.

Return Whether a high priority task has been waken up by this function

Parameters

• [in] timer: Timer handle created by gptimer_new_timer()
• [in] edata: Alarm event data, fed by driver
• [in] user_ctx: User data, passed from gptimer_config_t

Header File

• components/hal/include/hal/timer_types.h

Enumerations

enum gptimer_clock_source_t
GPTimer clock source.

Note: The clock source listed here is not supported on all targets
Note: Users should select the clock source based on real requirements:

<table>
<thead>
<tr>
<th>GPTimer clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPTIMER_CLK_SRC_APB</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>GPTIMER_CLK_SRC_XTAL</td>
<td>Medium resolution, high accuracy</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

Values:

GPTIMER_CLK_SRC_APB
Select APB as the source clock

enum gptimer_count_direction_t
GPTimer count direction.

Values:

GPTIMER_COUNT_DOWN
Decrease count value

GPTIMER_COUNT_UP
Increase count value

2.3.5 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on the I2C bus. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

• Reading and writing bytes in Master mode
• Slave mode
• Reading and writing to registers which are in turn read/written by the master
Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO, // select GPIO specific to your project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO, // select GPIO specific to your project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your project
    // .clk_flags = 0, /*!< Optional, you can use I2C_SCLK_SRC_FLAG_* flags to choose i2c source clock here. */
};
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO, // select GPIO specific to your project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO, // select GPIO specific to your project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.addr_10bit_en = ESP_SLAVE_ADDR, // address of your project
};
```
At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see `Customized Configuration`.

**Source Clock Configuration**  
*Clock sources allocator* is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

### Table 2: Characteristics of ESP32 clock sources

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB clock</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. **I2C_SCLK_SRC_FLAG_AWARE_DFS**: Clock’s baud rate will not change while APB clock is changing.
2. **I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

### Install Driver

After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master**  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.
**Master Write**  The example below shows how to build a command link for an I2C master to send \( n \) bytes to a slave.

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`. Then, populate it with the series of data to be sent to the slave:
   a) **Start bit** - `i2c_master_start()`
   b) **Slave address** - `i2c_master_write_byte()` The single byte address is provided as an argument of this function call.
   c) **Data** - One or more bytes as an argument of `i2c_master_write()`
   d) **Stop bit** - `i2c_master_stop()` Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read**  The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read**  After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:
Fig. 10: I2C command link - master read example

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling** During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32 Technical Reference Manual > I2C Controller (I2C) > Interrupts [PDF]* for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration** As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`. 

---

**Communication as Slave**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves:

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**

During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32 Technical Reference Manual > I2C Controller (I2C) > Interrupts [PDF]* for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration**

As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`. 

---

**Communication as Slave**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves:

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**

During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32 Technical Reference Manual > I2C Controller (I2C) > Interrupts [PDF]* for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration**

As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`. 

---

**Communication as Slave**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves:

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**

During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32 Technical Reference Manual > I2C Controller (I2C) > Interrupts [PDF]* for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration**

As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`. 

---
Table 3: Other Configurable I2C Communication Parameters

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

**Error Handling**  The majority of I2C driver functions either return ESP_OK on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt I2C_TIME_OUT_INT will be triggered. For detailed information, see Interrupt Handling.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver**  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C master and slave example: peripherals/i2c.

**API Reference**

**Header File**
- components/driver/include/driver/i2c.h
Chapter 2. API Reference

Functions

**esp_err_t i2c_driver_install**(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)

Install an I2C driver.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we cannot access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**Parameters**
- i2c_num: I2C port number
- mode: I2C mode (either master or slave)
- slv_rx_buf_len: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- slv_tx_buf_len: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**esp_err_t i2c_driver_delete**(i2c_port_t i2c_num)

Delete I2C driver.

**Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port to delete

**esp_err_t i2c_param_config**(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)

Configure an I2C bus with the given configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port to configure
- i2c_conf: Pointer to the I2C configuration

**esp_err_t i2c_reset_tx_fifo**(i2c_port_t i2c_num)

Reset I2C tx hardware fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

**esp_err_t i2c_reset_rx_fifo**(i2c_port_t i2c_num)

Reset I2C rx fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

**esp_err_t i2c_isr_register**(i2c_port_t i2c_num, void (*fn)(), void *arg, int intr_alloc_flags, intr_handle_t *handle)

Register an I2C ISR handler.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number to attach handler to
- fn: ISR handler function
- arg: Parameter for the ISR handler
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Handle return from esp_intr_alloc.

```c
esp_err_t i2c_isr_free (intr_handle_t handle)
```

Delete and free I2C ISR handle.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- handle: Handle of isr to delete.

```c
esp_err_t i2c_set_pin (i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
```

Configure GPIO pins for I2C SCK and SDA signals.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C SDA signal
- scl_io_num: GPIO number for I2C SCL signal
- sda_pullup_en: Enable the internal pullup for SDA pin
- scl_pullup_en: Enable the internal pullup for SCL pin
- mode: I2C mode

```c
esp_err_t i2c_master_write_to_device (i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
```

Perform a write to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc … It shall only be called in I2C master mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters

- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_read_from_device (i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a read to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc … It shall only be called in I2C master mode.

Return

Espressif Systems
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number to perform the transfer on
• device_address: I2C device’s 7-bit address
• read_buffer: Buffer to store the bytes received on the bus
• read_size: Size, in bytes, of the read buffer
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address,
const uint8_t *write_buffer, size_t write_size,
uint8_t *read_buffer, size_t read_size, TickType_t
   ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc... It shall only be called in I2C master mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number to perform the transfer on
• device_address: I2C device’s 7-bit address
• write_buffer: Bytes to send on the bus
• write_size: Size, in bytes, of the write buffer
• read_buffer: Buffer to store the bytes received on the bus
• read_size: Size, in bytes, of the read buffer
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

i2c_cmd_handle_t i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete_static().

Note It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro I2C_LINK_RECOMMENDED_SIZE would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

Return Handle to the I2C command link or NULL if the buffer provided is too small, please use I2C_LINK_RECOMMENDED_SIZE macro to get the recommended size for the buffer.

Parameters
• buffer: Buffer to use for commands allocations
• size: Size in bytes of the buffer

i2c_cmd_handle_t i2c_cmd_link_create(void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete() to release and return the resources. The required bytes will be dynamically allocated.

Return Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list allocated statically with i2c_cmd_link_create_static.

Parameters
Chapter 2. API Reference

- **cmd_handle**: I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

```c
void i2c_cmd_link_delete (i2c_cmd_handle_t cmd_handle)
```

Free the I2C commands list.

**Parameters**
- **cmd_handle**: I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

```c
esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)
```

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_ERR_NO_MEM**: The static buffer used to create `cmd_handler` is too small
- **ESP_FAIL**: No more memory left on the heap

**Parameters**
- **cmd_handle**: I2C commands list

```c
esp_err_t i2c_master_write_byte (i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)
```

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_ERR_NO_MEM**: The static buffer used to create `cmd_handler` is too small
- **ESP_FAIL**: No more memory left on the heap

**Parameters**
- **cmd_handle**: I2C commands list
- **data**: Byte to send on the port
- **ack_en**: Enable ACK signal

```c
esp_err_t i2c_master_write (i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)
```

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_ERR_NO_MEM**: The static buffer used to create `cmd_handler` is too small
- **ESP_FAIL**: No more memory left on the heap

**Parameters**
- **cmd_handle**: I2C commands list
- **data**: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to ESP_INTR_FLAG_IRAM, `data` should be allocated from internal RAM.
- **data_len**: Length, in bytes, of the data buffer
- **ack_en**: Enable ACK signal

```c
esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)
```

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- **ESP_OK**: Success
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_ERR_NO_MEM**: The static buffer used to create `cmd_handler` is too small
- **ESP_FAIL**: No more memory left on the heap
Parameters

- cmd_handle: I2C commands list
- data: Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
- ack: ACK signal

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

Parameters

- cmd_handle: I2C commands list
- data: Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
- data_len: Size, in bytes, of the `data` buffer
- ack: ACK signal

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

Parameters

- cmd_handle: I2C commands list

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters

- i2c_num: I2C port number
- cmd_handle: I2C commands list
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note: This function shall only be called in I2C slave mode.

Return

- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Bytes to write into internal buffer
• size: Size, in bytes, of data buffer
• ticks_to_wait: Maximum ticks to wait.

int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Buffer to fill with ringbuffer’s bytes
• max_size: Maximum bytes to read
• ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
Set I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
• low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)
Get I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow down the SCL clock.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number to filter
• cyc_num: the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
Disable filter on I2C bus.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters
- `i2c_num`: I2C port number

```c
esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```
set I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- `hold_time`: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

```c
esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```
get I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```
set I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- `hold_time`: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```
get I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time.
- `hold_time`: pointer to get hold time.

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```
set I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `i2c_num`: I2C port number
- `sample_time`: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- `hold_time`: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value
**esp_err_t i2c_get_data_timing** (i2c_port_t i2c_num, int* sample_time, int* hold_time)

get I2C data signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- sample_time: pointer to get sample time
- hold_time: pointer to get hold time

**esp_err_t i2c_set_timeout** (i2c_port_t i2c_num, int timeout)

set I2C timeout value

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**esp_err_t i2c_get_timeout** (i2c_port_t i2c_num, int* timeout)

get I2C timeout value

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- timeout: pointer to get timeout value

**esp_err_t i2c_set_data_mode** (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)

set I2C data transfer mode

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

**esp_err_t i2c_get_data_mode** (i2c_port_t i2c_num, i2c_trans_mode_t* tx_trans_mode, i2c_trans_mode_t* rx_trans_mode)

get I2C data transfer mode

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

**Structures**

**struct i2c_config_t**

I2C initialization parameters.

\begin{itemize}
\item For light sleep mode.
\end{itemize}

\texttt{I2C\_INTERNAL\_STRUCT\_SIZE}
\begin{itemize}
\item Minimum size, in bytes, of the internal private structure used to describe I2C commands link.
\end{itemize}

\texttt{I2C\_LINK\_RECOMMENDED\_SIZE(TRANSACTIONS)}
\begin{itemize}
\item The following macro is used to determine the recommended size of the buffer to pass to \texttt{i2c\_cmd\_link\_create\_static()} function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants
to perform a read on an I2C device register, **TRANSACTIONS** must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

**Type Definitions**

```c
typedef void *i2c_cmd_handle_t
I2C command handle
```

**Header File**

- components/hal/include/hal/i2c_types.h

**Macros**

```c
I2C_CLK_FREQ_MAX
Use the highest speed that is available for the clock source picked by clk_flags.
```

**Type Definitions**

```c
typedef int i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```

**Enumerations**

```c
enum i2c_mode_t
Values:

I2C_MODE_SLAVE = 0
I2C slave mode

I2C_MODE_MASTER
I2C master mode

I2C_MODE_MAX

enum i2c_rw_t
Values:

I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data

enum i2c_trans_mode_t
Values:

I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first

I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:

I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode
```
I2C_ADDR_BIT_10
I2C 10bit address for slave mode

I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:
I2C_MASTER_ACK = 0x0
I2C ack for each byte read
I2C_MASTER_NACK = 0x1
I2C nack for each byte read
I2C_MASTER_LAST_NACK = 0x2
I2C nack for the last byte
I2C_MASTER_ACK_MAX

enum i2c_sclk_t
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.
Values:
I2C_SCLK_DEFAULT = 0
I2C source clock not selected
I2C_SCLK_APB
I2C source clock from APB, 80M
I2C_SCLK_MAX

enum i2c_opmode_t
Values:
I2C_CMD_RESTART = 0
I2C restart command
I2C_CMD_WRITE
I2C write command
I2C_CMD_READ
I2C read command
I2C_CMD_STOP
I2C stop command
I2C_CMD_END
I2C end command

2.3.6 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:
- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:
• Operation as system master or slave
• Capable of acting as transmitter or receiver
• DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

• LCD master transmitting mode
• Camera slave receiving mode
• ADC/DAC mode

For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

Note: For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to TRUE. If `i2s_config_t::use_apll = TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: 0 < MCLK/LRCK/channels/bits_per_sample < 64.

Functional Overview

Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

• Port number
• The structure `i2s_config_t` with defined communication parameters
• Event queue size and handle

Once `i2s_driver_install` returns ESP_OK, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // I2S port number

i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
  .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
  .communication_format = I2S_COMM_FORMAT_STAND_I2S
  .tx_desc_auto_clear = false,
  .dma_frame_num = 64,
  .use_apll = false,
  .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```
Chapter 2. API Reference

Setting Communication Pins  Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```
static const i2s_pin_config_t pin_config = {
  .mck_io_num = 0,
  .bck_io_num = 4,
  .ws_io_num = 5,
  .data_out_num = 18,
  .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_set_pin(i2s_num, &pin_config);
```

Running I2S Communication  To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read, 100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver  If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

Application Example

A code example for the I2S driver can be found in the directory `peripherals/i2s`. In addition, there are two short configuration examples for the I2S driver.

I2S configuration  Example for general usage.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // I2S port number
```

(continues on next page)
i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

... // You can reset parameters by calling 'i2s_set_clk'

// The low 16 bits are the valid data bits in one chan and the high 16 bits are
// the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
// be set to a same value as low 16 bits.

uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;

i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

Configuring I2S to use internal DAC for analog output

#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // default interrupt priority
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .use_apll = false
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s...

...
i2s_set_pin(i2s_num, NULL); // for internal DAC, this will enable both of the internal channels

// You can call i2s_set_dac_mode to set built-in DAC output mode.
// i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050); // set sample rates

i2s_driver_uninstall(i2s_num); // stop & destroy i2s driver

Application Notes  If you are using a high sample rate like more than 48 kHz or see the data being lost, the following information might help.

Considering different applications have different requirements, dma_desc_num and dma_frame_num are made public. Here is the detailed explanation to these two fields:

- **dma_desc_num**: The total number of descriptors used by I2S DMA to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, dma_desc_num can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to i2s_read() and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

- **dma_frame_num**: The number of frames for one-time sampling. The frame here means the total data from all the channels in one WS cycle. For example, if two channels in stereo mode (i.e., channel_format is set to I2S_CHANNEL_FMT_RIGHT_LEFT) are active, and each channel transfers 32 bits (i.e., bits_per_sample is set to I2S_BITS_PER_CHAN_32BIT), then the total number of bytes of a frame is channel_format * bits_per_sample = \(2 \times 32 / 8 = 8\) bytes. For example, we assume that the current dma_frame_num is 100, then the length of the DMA buffer is 8 * 100 = 800 bytes. Note that the length of an internal DMA buffer shouldn’t be greater than 4092.

When the data received by DMA reach the size of internal DMA buffer, a receive interrupt is triggered, and an internal message queue will transport this buffer to i2s_read(). The main task of i2s_read() is to copy the data in the internal DMA buffer into the user given buffer. Since the internal DMA buffer is usually not equal to the user given buffer size, there are two cases:

- If the size of internal DMA buffers is smaller than the user given buffer size, i2s_read() will consume several internal DMA buffers to fill up the user given buffer. If the message queue of DMA buffer is not long enough, i2s_read() will be blocked on receive message queue until getting enough data. You can estimate the time i2s_read() function is blocked by the formula block_time (sec) = (given_buffer_size) / (sample_rate * channel_num * channel_bytes). If we place i2s_read() in a while loop together with other functions we should also consider the time the loop execution is blocked by the other functions before i2s_read() is executed again. It is not allowed to exceed the max_wait_time (sec) = ((dma_desc_num - 1) * dma_buffer_size) / (sample_rate), otherwise the internal message queue will overflow and consequently some data will be lost.

- If the DMA buffer size is greater than the user given buffer size, it means i2s_read() would need to be called in a loop several times to take all the data, the max_wait_time may be exceeded, and the message queue overflow is likely to happen. Therefore it is quite risky to use a small user buffer for data receiving.

Here are a couple of tips when the sample rate is high:

1. Increasing dma_frame_num can help to reduce the I2S DMA interrupt frequency;
2. Increasing dma_desc_num can help to allow a longer max_wait_time to be spent by the other functions in the loop containing i2s_read();

while (1) {
  ... // Other operations (e.g. Waiting on a semaphore)
  i2s_read(I2S_NUM, user_given_buffer, user_given_buffer_size, &i2s_bytes_read, 100);
  ... // Other operations (e.g. Sending the data to another thread... Avoid any data processing here.)
}
3. Increasing the size of the buffer internal to `i2s_read()` can help to increase the max_wait_time. When you process I2S data (like storing the data to an SD card) in another thread, the time spent in processing thread for one loop should not exceed the max_wait_time otherwise some data will be lost. So if the processing of the received data is rather slow, please allow `i2s_read()` a big internal buffer for storing the read data;

4. Allocating at least two user given buffers can improve the data receipt efficiency. One buffer can continue to receive data while the other one is under processing. But we have to guarantee the buffer that is going to read data is not under processing in the other thread. We can use a semaphore or another lock to avoid overwriting the data in the buffer while it is still under processing;

```c
uint8_t **user_given_buffers = (uint8_t **)calloc(buffer_num, sizeof(uint8_t *));
// Don't forget to check if user_given_buffers is NULL here
for (int i = 0; i < buffer_num; i++) {
    user_given_buffers[i] = (uint8_t *)calloc(user_given_buffer_size, sizeof(uint8_t *));
    // Don't forget to check if user_given_buffers[i] is NULL here
}
int cnt = 0;
while (1) {
    ... // Other operations (e.g. Waiting on a semaphore)
    i2s_read(I2S_NUM, user_given_buffer[cnt], user_given_buffer_size, &i2s_bytes_read, 100);
    ... // Other operations (e.g. Sending the data to another thread... Avoid any data processing here.)
    cnt++;
    cnt %= buffer_num;
}
```

5. Increasing the priority of the thread that contains `i2s_read()` can help the data in the message queue to be taken more timely.

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```c
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive I2S_EVENT_RX_Q_OVF event when there are data lost.

**API Reference**

**Header File**

- components/driver/include/driver/i2s.h

**Functions**

```c
esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)
```

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**

- `i2s_num`: I2S port number
- `pin`: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)
Chapter 2. API Reference

**Note** if *pin* is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call i2s_set_dac_mode instead.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

```c
esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t downsamp);
```

Set PDM mode down-sample rate. In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be (fpcm * 64) or (fpcm * 128) accordingly.

**Note** After calling this function, it would call i2s_set_clk inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- i2s_num: I2S port number
- downsamp: i2s RX down sample rate for PDM mode.

```c
esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg);
```

Set TX PDM mode up-sample rate.

**Note** If you have set PDM mode while calling `i2s_driver_install`, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- i2s_num: I2S port number
- upsample_cfg: Set I2S PDM up-sample rate configuration

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue);
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**
- i2s_num: I2S port number
- i2s_config: I2S configurations - see i2s_config_t struct
- queue_size: I2S event queue size/depth.
- i2s_queue: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num);
```

Uninstall I2S driver.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)
Parameters

- `i2s_num`: I2S port number

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see `i2s_config_t`).

Parameters

- `i2s_num`: I2S port number
- `src`: Source address to write from
- `size`: Size of data in bytes
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```

Read data from I2S DMA receive buffer.

Note If the built-in ADC mode is enabled, we should call `i2s_adc_enable` and `i2s_adc_disable` around the whole reading process, to prevent the data getting corrupted.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2s_num`: I2S port number
- `dest`: Destination address to read into
- `size`: Size of data in bytes
- `[out] bytes_read`: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- `ticks_to_wait`: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read...
from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

\[
\text{bit_clock} = \text{rate} \times (\text{number of channels}) \times \text{bits_per_sample}
\]

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- i2s_num: I2S port number
- rate: I2S sample rate (ex: 8000, 44100…)

```
esp_err_t i2s_stop(i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2s_num: I2S port number

```
esp_err_t i2s_start(i2s_port_t i2s_num)
```

Start I2S driver.

It is not necessary to call this function after i2s_driver_install() (it is started automatically), however it is necessary to call it after i2s_stop().

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2s_num: I2S port number

```
esp_err_t i2s_zero_dma_buffer(i2s_port_t i2s_num)
```

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2s_num: I2S port number

```
esp_err_t i2s_set_clk(i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to i2s_set_sample_rates(), but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

Parameters
• i2s_num: I2S port number
• rate: I2S sample rate (ex: 8000, 44100…)
• bits_cfg: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’ ) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’ ) high 16bits =0 means same as the bits per sample.
• ch: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

float i2s_get_clk (i2s_port_t i2s_num)
get clock set on particular port number.

Return
• actual clock set by i2s driver

Parameters
• i2s_num: I2S port number

esp_err_t i2s_set_adc_mode (adc_unit_t adc_unit, adc1_channel_t adc_channel)
Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

Note In this mode, the ADC maximum sampling rate is 150KHz. Set the sampling rate through i2s_config_t.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• adc_unit: SAR ADC unit index
• adc_channel: ADC channel index

esp_err_t i2s_adc_enable (i2s_port_t i2s_num)
Start to use I2S built-in ADC mode.

Note This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

Parameters
• i2s_num: i2s port index

esp_err_t i2s_adc_disable (i2s_port_t i2s_num)
Stop to use I2S built-in ADC mode.

Note This function would release the lock of ADC so that other tasks can use ADC.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

Parameters
• i2s_num: i2s port index

esp_err_t i2s_set_dac_mode (i2s_dac_mode_t dac_mode)
Set I2S dac mode, I2S built-in DAC is disabled by default.

Note Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one cannot be used as RTC DAC function at the same time.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
Chapter 2. API Reference

- `dac_mode`: DAC mode configurations - see `i2s_dac_mode_t`

**Structures**

`struct i2s_pdm_tx_upsample_cfg_t`

I2S PDM up-sample rate configuration.

**Note** TX PDM can only be set to the following two upsampling rate configurations: 1: `fp = 960, fs = sample_rate / 100`, in this case, `Fpdm = 128*48000`  2: `fp = 960, fs = 480`, in this case, `Fpdm = 128*Fpcm = 128*sample_rate` If the pdm receiver do not care the pdm serial clock, it’s recommended set `Fpdm = 128*48000`. Otherwise, the second configuration should be applied.

**Public Members**

```c
int sample_rate
I2S PDM sample rate

int fp
I2S PDM TX upsampling parameter. Normally it should be set to 960

int fs
I2S PDM TX upsampling parameter. When it is set to 480, the pdm clock frequency `Fpdm = 128 * sample_rate`, when it is set to `sample_rate / 100`, `Fpdm` will be fixed to `128*48000`
```

`struct i2s_pin_config_t`

I2S pin number for `i2s_set_pin`.

**Public Members**

```c
int mck_io_num
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int bck_io_num
BCK in out pin

int ws_io_num
WS in out pin

int data_out_num
DATA out pin

int data_in_num
DATA in pin
```

`struct i2s_driver_config_t`

I2S driver configuration parameters.

**Public Members**

```c
i2s_mode_t mode
I2S work mode

uint32_t sample_rate
I2S sample rate

i2s_bits_per_sample_t bits_per_sample
I2S sample bits in one channel

i2s_channel_fmt_t channel_format
I2S channel format.

i2s_comm_format_t communication_format
I2S communication format
```
int intr_alloc_flags
   Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int dma_desc_num
   The total number of descriptors used by I2S DMA to receive/transmit data

int dma_buf_count
   This is an alias to ‘dma_desc_num’ for backward compatibility

int dma_frame_num
   Number of frames for one-time sampling. The frame here means the total data from all the channels in a WS cycle

int dma_buf_len
   This is an alias to ‘dma_frame_num’ for backward compatibility

bool use_apll
I2S using APPLL as main I2S clock, enable it to get accurate clock

bool tx_desc_auto_clear
   I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int fixed_mclk
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect

i2s_mclk_multiple_t mclk_multiple
   The multiple of I2S master clock(MCLK) to sample rate

i2s_bits_per_chan_t bits_per_chan
   I2S total bits in one channel, only take effect when larger than ‘bits_per_sample’, default ‘0’ means equal to ‘bits_per_sample’

struct i2s_event_t
   Event structure used in I2S event queue.

Public Members

i2s_event_type_t type
   I2S event type

size_t size
   I2S data size for I2S_DATA event

Macros

I2S_PIN_NO_CHANGE
   Use in i2s_pin_config_t for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG (rate)
   Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

typedef i2s_driver_config_t i2s_config_t

typedef intr_handle_t i2s_isr_handle_t

Enumerations

enum i2s_port_t
   I2S port number, the max port number is (I2S_NUM_MAX -1).

Values:
Chapter 2. API Reference

I2S_NUM_0 = 0
I2S port 0

I2S_NUM_1 = 1
I2S port 1

I2S_NUM_MAX
I2S port max

enum i2s_event_type_t
I2S event queue types.

Values:

I2S_EVENT_DMA_ERROR
I2S_DMA finish sent 1 buffer

I2S_EVENT_TX_DONE
I2S DMA finish received 1 buffer

I2S_EVENT_RX_DONE
I2S DMA sent queue overflow

I2S_EVENT_RX_Q_OVF
I2S DMA receive queue overflow

I2S_EVENT_MAX
I2S event max index

Header File

- components/hal/include/hal/i2s_types.h

Enumerations

enum i2s_bits_per_sample_t
I2S bit width per sample.

Values:

I2S_BITS_PER_SAMPLE_8BIT = 8
  data bit-width: 8

I2S_BITS_PER_SAMPLE_16BIT = 16
  data bit-width: 16

I2S_BITS_PER_SAMPLE_24BIT = 24
  data bit-width: 24

I2S_BITS_PER_SAMPLE_32BIT = 32
  data bit-width: 32

enum i2s_bits_per_chan_t
I2S bit width per chan.

Values:

I2S_BITS_PER_CHAN_DEFAULT = 0
  channel bit-width equals to data bit-width

I2S_BITS_PER_CHAN_8BIT = 8
  channel bit-width: 8

I2S_BITS_PER_CHAN_16BIT = 16
  channel bit-width: 16

I2S_BITS_PER_CHAN_24BIT = 24
  channel bit-width: 24
I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32

enum i2s_channel_t
I2S channel.

Values:

I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels

I2S_CHANNEL_STEREO = 0x03
I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.

enum i2s_comm_format_t
I2S communication standard format.

Values:

I2S_COMM_FORMAT_STAND_I2S = 0X01
I2S communication I2S Philips standard, data launch at second BCK

I2S_COMM_FORMAT_STAND_MSB = 0X02
I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_PCM_SHORT = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_PCM_LONG = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_MAX
standard max

I2S_COMM_FORMAT_I2S = 0x01
I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01
I2S format MSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02
I2S format LSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04
I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04
PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08
PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t
I2S channel format type.

Values:

I2S_CHANNEL_FMT_RIGHT_LEFT
Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT
Load right channel data in both two channels
Chapter 2. API Reference

I2S_CHANNEL_FMT_ALL_LEFT
Load left channel data in both two channels

I2S_CHANNEL_FMT_ONLY_RIGHT
Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT
Only load data in left channel (mono mode)

enum i2s_mode_t
I2S Mode.

Values:

I2S_MODE_MASTER = (0x1 << 0)
Master mode

I2S_MODE_SLAVE = (0x1 << 1)
Slave mode

I2S_MODE_TX = (0x1 << 2)
TX mode

I2S_MODE_RX = (0x1 << 3)
RX mode

I2S_MODE_DAC_BUILT_IN = (0x1 << 4)
Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

I2S_MODE_ADC_BUILT_IN = (0x1 << 5)
Input I2S data from built-in ADC, each data can be 12-bit width at most

I2S_MODE_PDM = (0x1 << 6)
I2S PDM mode

enum i2s_clock_src_t
I2S source clock.

Values:

I2S_CLK_D2CLK = 0
Clock from PLL_D2_CLK(160M)

I2S_CLK_APLL
Clock from APLL

enum i2s_mclk_multiple_t
The multiple of mclk to sample rate.

Values:

I2S_MCLK_MULTIPLE_DEFAULT = 0
Default value. mclk = sample_rate * 256

I2S_MCLK_MULTIPLE_128 = 128
mclk = sample_rate * 128

I2S_MCLK_MULTIPLE_256 = 256
mclk = sample_rate * 256

I2S_MCLK_MULTIPLE_384 = 384
mclk = sample_rate * 384

enum i2s_dac_mode_t
I2S DAC mode for i2s_set_dac_mode.

Note: Built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:
I2S_DAC_CHANNEL_DISABLE = 0
Disable I2S built-in DAC signals

I2S_DAC_CHANNEL_RIGHT_EN = 1
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

I2S_DAC_CHANNEL_LEFT_EN = 2
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

I2S_DAC_CHANNEL_BOTH_EN = 0x3
Enable both of the I2S built-in DAC channels.

I2S_DAC_CHANNEL_MAX = 0x4
I2S built-in DAC mode max index

enum i2s_pdm_dsr_t
I2S PDM RX downsample mode.
Values:

I2S_PDM_DSR_8S = 0
downsampling number is 8 for PDM RX mode

I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode

I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t
Values:

I2S_PDM_SIG_SCALING_DIV_2 = 0
I2S TX PDM sigmadelta signal scaling: /2

I2S_PDM_SIG_SCALING_MUL_1 = 1
I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2
I2S TX PDM sigmadelta signal scaling: x2

I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4

2.3.7 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.
Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- LVGL porting and animation UI - peripherals/lcd/lvgl
- GC9A01 user customized driver and dash board UI - peripherals/lcd/ge9a01

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Enumerations

enum lcd_clock_source_t

LCD clock source.

Note User should select the clock source based on the real requirement:

<table>
<thead>
<tr>
<th>LCD clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_CLK_SRC_PLL160M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_APLL</td>
<td>Configurable resolution</td>
<td>ESP_PM_NO_LIGHT_SLEEP lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_XTAL</td>
<td>Medium resolution</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

Values:

- **LCD_CLK_SRC_PLL160M**
  Select PLL160M as the source clock

- **LCD_CLK_SRC_APLL**
  Select APLL as the source clock

- **LCD_CLK_SRC_XTAL**
  Select XTAL as the source clock

Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t

LCD color space type definition.

Values:

- **ESP_LCD_COLOR_SPACE_RGB**
  Color space: RGB

- **ESP_LCD_COLOR_SPACE_BGR**
  Color space: BGR

- **ESP_LCD_COLOR_SPACE_MONOCHROME**
  Color space: monochrome
Chapter 2. API Reference

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

**Note** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **[in]** `io`: LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`.
- **[in]** `lcd_cmd`: The specific LCD command
- **[in]** `param`: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **[in]** `param_size`: Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

**Note** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **[in]** `io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`.
- **[in]** `lcd_cmd`: The specific LCD command
- **[in]** `color`: Buffer that holds the RGB color data
- **[in]** `color_size`: Size of `color` in memory, in bytes

```c
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destory LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **[in]** `io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`.

```c
esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for SPI interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

Parameters

- **[in]** bus: SPI bus handle
- **[in]** io_config: IO configuration, for SPI interface
- **[out]** ret_io: Returned IO handle

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- **[in]** bus: I2C bus handle
- **[in]** io_config: IO configuration, for I2C interface
- **[out]** ret_io: Returned IO handle

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

Parameters

- **[in]** bus_config: Bus configuration
- **[out]** ret_bus: Returned bus handle

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

Parameters

- **[in]** bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- **[in]** bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
- **[in]** io_config: IO configuration, for i80 interface
- **[out]** ret_io: Returned panel IO handle

Structures

```c
struct esp_lcd_panel_io_event_data_t
```

Type of LCD panel IO event data.
struct esp_lcd_panel_io_spi_config_t
Panel IO configuration structure, for SPI interface.

Public Members

int cs_gpio_num
GPIO used for CS line

int dc_gpio_num
GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int spi_mode
Traditional SPI mode (0~3)

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_as_cmd_phase : 1
D/C line value is encoded into SPI transaction command phase

unsigned int dc_low_on_data : 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int octal_mode : 1
transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

struct esp_lcd_panel_io_i2c_config_t

Public Members

uint32_t dev_addr
I2C device address

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

size_t control_phase_bytes
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int dc_bit_offset
Offset of the D/C selection bit in control phase

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter
unsigned int dc_low_on_data : 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

**struct esp_lcd_i80_bus_config_t**

LCD Intel 8080 bus configuration structure.

**Public Members**

- **int dc_gpio_num**
  - GPIO used for D/C line
- **int wr_gpio_num**
  - GPIO used for WR line
- **lcd_clock_source_t clk_src**
  - Clock source for the I80 LCD peripheral
- **int data_gpio_nums[(24)]**
  - GPIOs used for data lines
- **size_t bus_width**
  - Number of data lines, 8 or 16
- **size_t max_transfer_bytes**
  - Maximum transfer size, this determines the length of internal DMA link

**struct esp_lcd_panel_io_i80_config_t**

Panel IO configuration structure, for intel 8080 interface.

**Public Members**

- **int cs_gpio_num**
  - GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus
- **unsigned int pclk_hz**
  - Frequency of pixel clock
- **size_t trans_queue_depth**
  - Transaction queue size, larger queue, higher throughput
- **esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done**
  - Callback invoked when color data was transferred done
- **void *user_ctx**
  - User private data, passed directly to on_color_trans_done’s user_ctx
- **int lcd_cmd_bits**
  - Bit-width of LCD command
- **int lcd_param_bits**
  - Bit-width of LCD parameter
- **unsigned int dc_idle_level : 1**
  - Level of DC line in IDLE phase
- **unsigned int dc_cmd_level : 1**
  - Level of DC line in CMD phase
- **unsigned int dc_dummy_level : 1**
  - Level of DC line in DUMMY phase
- **unsigned int dc_data_level : 1**
  - Level of DC line in DATA phase

**struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels**

Each i80 device might have its own D/C control logic
unsigned int **cs_active_high**: 1
   If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse_color_bits**: 1
   Reverse the data bits, D[N:0] -> D[0:N]

unsigned int **swap_color_bytes**: 1
   Swap adjacent two color bytes

unsigned int **pclk_active_neg**: 1
   The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk_idle_low**: 1
   The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

Type Definitions

typedef void *esp_lcd_spi_bus_handle_t
   Type of LCD SPI bus handle

typedef void *esp_lcd_i2c_bus_handle_t
   Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
   Type of LCD intel 8080 bus handle

typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
   esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been waken up by this function
Parameters
   • [in] panel_io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
   • [in] edata: Panel IO event data, fed by driver
   • [in] user_ctx: User data, passed from esp_lcd_panel_io_xxx_config_t

Header File
   • components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

esp_err_t **esp_lcd_panel_reset**(esp_lcd_panel_handle_t panel)
   Reset LCD panel.

   Note Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

   Return
      • ESP_OK on success

   Parameters
      • [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

esp_err_t **esp_lcd_panel_init**(esp_lcd_panel_handle_t panel)
   Initialize LCD panel.

   Note Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().

   Return
      • ESP_OK on success

   Parameters
      • [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)

Deinitialize the LCD panel.

Return
• ESP_OK on success

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

esp_err_t esp_lcd_panel_draw_bitmap(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)

Draw bitmap on LCD panel.

Return
• ESP_OK on success

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] x_start: Start index on x-axis (x_start included)
• [in] y_start: Start index on y-axis (y_start included)
• [in] x_end: End index on x-axis (x_end not included)
• [in] y_end: End index on y-axis (y_end not included)
• [in] color_data: RGB color data that will be dumped to the specific window range

esp_err_t esp_lcd_panel_mirror(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

Note Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] mirror_x: Whether the panel will be mirrored about the x axis
• [in] mirror_y: Whether the panel will be mirrored about the y axis

esp_err_t esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)

Swap/Exchange x and y axis.

Note Combined with esp_lcd_panel_mirror(), one can realize screen rotation

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] swap_axes: Whether to swap the x and y axis

esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Return
• ESP_OK on success

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] x_gap: Extra gap on x axis, in pixels
• [in] y_gap: Extra gap on y axis, in pixels
**esp_err_t esp_lcd_panel_invert_color** *(esp_lcd_panel_handle_t panel, bool invert_color_data)*

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] invert_color_data: Whether to invert the color data

**esp_err_t esp_lcd_panel_disp_off** *(esp_lcd_panel_handle_t panel, bool off)*

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] off: Whether to turn off the screen

**Header File**
- components/esp_lcd/include/esp_lcd_panel_rgb.h

**Header File**
- components/esp_lcd/include/esp_lcd_panel_vendor.h

**Functions**

**esp_err_t esp_lcd_new_panel_st7789** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model ST7789.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_nt35510** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model NT35510.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_ssd1306** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model SSD1306.
Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

Structures

struct esp_lcd_panel_dev_config_t
Configuration structure for panel device.

Public Members

int reset_gpio_num
    GPIO used to reset the LCD panel, set to -1 if it's not used

.esp_lcd_color_space_t color_space
    Set the color space used by the LCD panel

unsigned int bits_per_pixel
    Color depth, in bpp

unsigned int reset_active_high
    Setting this if the panel reset is high level active

2.3.8 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. Timer Configuration by specifying the PWM signal’s frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.
Chapter 2. API Reference

Fig. 11: Key Settings of LED PWM Controller’s API

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`. Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding get function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.
The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2^{\text{duty_resolution}}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

### Change PWM Duty Cycle using Hardware
The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

### Change PWM Frequency
The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

### More Control Over PWM
There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

### Use Interrupts
When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### LEDC High and Low Speed Mode
High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

### Supported Range of Frequency and Duty Resolutions
The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of -0.012% (\(2^{13} \approx 8192\) discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller.
Chapter 2. API Reference

timer which in turn clocks the channel (see timer configuration and the ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc fade.

The LEDC basic example: peripherals/ledc/ledc basic.

**API Reference**

**Header File**

- components/driver/include/driver/ledc.h

**Functions**

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

Parameters

- `timer_conf`: Pointer of LEDC timer configure struct
**esp_err_t** **ledc_update_duty** (*ledc_mode_t speed_mode, ledc_channel_t channel*)

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t** **ledc_set_pin** (*int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel*)

Set LEDC output gpio.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *gpio_num*: The LEDC output gpio
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *ledc_channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t** **ledc_stop** (*ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level*)

LEDC stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- *idle_level*: Set output idle level after LEDC stops.

**esp_err_t** **ledc_set_freq** (*ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz*)

LEDC set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_num*: LEDC timer index (0-3), select from ledc_timer_t
- *freq_hz*: Set the LEDC frequency

**uint32_t** **ledc_get_freq** (*ledc_mode_t speed_mode, ledc_timer_t timer_num*)

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- timer_num: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value. Only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- hpoint: Set the LEDC hpoint value (max: 0xfffff)

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty. This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty.

**Return**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
**Chapter 2. API Reference**

```c
esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
            ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t
duty_cycle_num, uint32_t duty_scale)
```

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function
can take effect.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.
Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- `duty`: Set the start of the gradient duty, the range of duty setting is [0, \((2^{*duty\_resolution}) - 1\]
- `fade_direction`: Set the direction of the gradient
- `step_num`: Set the number of the gradient
- `duty_cycle_num`: Set how many LEDC tick each time the gradient lasts
- `duty_scale`: Set gradient change amplitude

```c
esp_err_t ledc_isr_register(void (*fn) void * arg, int intr_alloc_flags,
            ledc_isr_handle_t *handle)
```

Register LEDC interrupt handler, the handler is an
ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error

**Parameters**
- `fn`: Interrupt handler function.
- `arg`: User-supplied argument passed to the handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred)
  ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set(ledc_mode_t speed_mode, ledc_timer_t timer_sel,
            uint32_t clock_divider,
            uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Return**
- (-1) Parameter error
- Other Current LEDC duty

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
- `timer_sel`: Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider`: Timer clock divide value, the timer clock is divided from the selected clock
  source
- `duty_resolution`: Resolution of duty setting in number of bits. The range of duty values is
  [0, \((2^{*duty\_resolution})\]
- `clk_src`: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Reset LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets
  support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from ledc_timer_t
**esp_err_t** **ledc_timer_pause**( *ledc_mode_t* *speed_mode*, *ledc_timer_t* *timer_sel*)

Pause LEDC timer counter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_sel*: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** **ledc_timer_resume**( *ledc_mode_t* *speed_mode*, *ledc_timer_t* *timer_sel*)

Resume LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_sel*: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** **ledc_bind_channel_timer**( *ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, *ledc_timer_t* *timer_sel*)

Bind LEDC channel with the selected timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- *timer_sel*: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** **ledc_set_fade_with_step**( *ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, uint32_t*target_duty*, uint32_t*scale*, uint32_t*cycle_num*)

Set LEDC fade function.

**Note** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- *target_duty*: Target duty of fading [0, (2^{duty_resolution}) - 1]
- *scale*: Controls the increase or decrease step scale.
- *cycle_num*: increase or decrease the duty every cycle_num cycles

**esp_err_t** **ledc_set_fade_with_time**( *ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, uint32_t*target_duty*, int*max_fade_time_ms*)

Set LEDC fade function, with a limited time.
Chapter 2. API Reference

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**(duty_resolution) - 1]`)
- `max_fade_time_ms`: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```
Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_ values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall (void)
```
Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```
Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done.

```c
esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```
A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is [0, (2**(duty_resolution) - 1]`)
- `hpoint`: Set the LEDC hpoint value(max: 0xfffff)
esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

Note Call ledc_fade_func_install() once, before calling this function.
Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- max_fade_time_ms: The maximum time of the fading (ms).
- fade_mode: choose blocking or non-blocking mode

esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)

A thread-safe API to set and start LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function.
Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every cycle_num cycles
- fade_mode: choose blocking or non-blocking mode

esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)

LEDC callback registration function.

Note The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- cbs: Group of LEDC callback functions
- user_arg: user registered data for the callback function
Structures

```c
struct ledc_channel_config_t
```
Configuration parameters of LEDC channel for `ledc_channel_config` function.

### Public Members

- `int gpio_num`
  - the LEDC output gpio_num, if you want to use gpio16, `gpio_num = 16`
- `ledc_mode_t speed_mode`
  - LEDC speed speed_mode, high-speed mode or low-speed mode
- `ledc_channel_t channel`
  - LEDC channel (0-7)
- `ledc_intr_type_t intr_type`
  - configure interrupt, Fade interrupt enable or Fade interrupt disable
- `ledc_timer_t timer_sel`
  - Select the timer source of channel (0 - 3)
- `uint32_t duty`
  - LEDC channel duty, the range of duty setting is \([0, (2^{duty\_resolution})]\)
- `int hpoint`
  - LEDC channel hpoint value, the max value is 0xfffff
- `unsigned int output_invert : 1`
  - Enable (1) or disable (0) gpio output invert

```c
struct ledc_channel_config_t::[anonymous] flags
```
LEDC flags

```c
struct ledc_timer_config_t
```
Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

### Public Members

- `ledc_mode_t speed_mode`
  - LEDC speed speed_mode, high-speed mode or low-speed mode
- `ledc_timer_bit_t duty_resolution`
  - LEDC channel duty resolution
- `ledc_timer_bit_t bit_num`
  - Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1
- `ledc_timer_t timer_num`
  - The timer source of channel (0 - 3)
- `uint32_t freq_hz`
  - LEDC timer frequency (Hz)

```c
struct ledc_clk_cfg_t clk_cfg
```
Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`

```c
struct ledc_cb_param_t
```
LEDC callback parameter.
Public Members

```c
ledc_cb_event_t event
    Event name
```

```c
uint32_t speed_mode
    Speed mode of the LEDC channel group
```

```c
uint32_t channel
    LEDC channel (0 - LEDC_CHANNEL_MAX-1)
```

```c
uint32_t duty
    LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]
```

```c
struct ledc_cbs_t
    Group of supported LEDC callbacks.
```

**Note** The callbacks are all running under ISR environment

Public Members

```c
ledc_cb_t fade_cb
    LEDC fade_end callback function
```

Macros

```c
LEDC_APB_CLK_HZ
LEDC_REF_CLK_HZ
LEDC_ERR_DUTY
LEDC_ERR_VAL
```

Type Definitions

```c
typedef intr_handle_t ledc_isr_handle_t
```

```c
typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
    Type of LEDC event callback.
```

**Parameters**

- `param`: LEDC callback parameter
- `user_arg`: User registered data

Enumerations

```c
enum ledc_cb_event_t
    LEDC callback event type.
```

**Values**:

```c
LEDC_FADE_END_EVT
    LEDC fade end event
```

Header File

- components/hal/include/hal/ledc_types.h

Enumerations

```c
enum ledc_mode_t
    Values:
```

```c
LEDC_HIGH_SPEED_MODE = 0
    LEDC high speed speed_mode
```
LEDC_LOW_SPEED_MODE
   LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX
   LEDC speed limit

enum ledc_intr_type_t
   Values:
   LEDC_INTR_DISABLE = 0
      Disable LEDC interrupt
   LEDC_INTR_FADE_END
      Enable LEDC interrupt
   LEDC_INTR_MAX

enum ledc_duty_direction_t
   Values:
   LEDC_DUTY_DIR_DECREASE = 0
      LEDC duty decrease direction
   LEDC_DUTY_DIR_INCREASE = 1
      LEDC duty increase direction
   LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t
   Values:
   LEDC_SLOW_CLK_RTC8M = 0
      LEDC low speed timer clock source is 8MHz RTC clock
   LEDC_SLOW_CLK_APB
      LEDC low speed timer clock source is 80MHz APB clock

enum ledc_clk_cfg_t
   In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.
   Values:
   LEDC_AUTO_CLK = 0
      The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer
   LEDC_USE_APB_CLK
      LEDC timer select APB clock as source clock
   LEDC_USE_RTC8M_CLK
      LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
   LEDC_USE_REF_TICK
      LEDC timer select REF_TICK clock as source clock

enum ledc_clk_src_t
   Values:
   LEDC_REF_TICK = LEDC_USE_REF_TICK
      LEDC timer clock divided from reference tick (1Mhz)
   LEDC_APB_CLK = LEDC_USE_APB_CLK
      LEDC timer clock divided from APB clock (80Mhz)
   LEDC_SCLK = LEDC_USE_APB_CLK
      Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL
enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0
  LEDC timer 0

LEDC_TIMER_1
  LEDC timer 1

LEDC_TIMER_2
  LEDC timer 2

LEDC_TIMER_3
  LEDC timer 3

LEDC_TIMER_MAX

enum ledc_channel_t
Values:

LEDC_CHANNEL_0 = 0
  LEDC channel 0

LEDC_CHANNEL_1
  LEDC channel 1

LEDC_CHANNEL_2
  LEDC channel 2

LEDC_CHANNEL_3
  LEDC channel 3

LEDC_CHANNEL_4
  LEDC channel 4

LEDC_CHANNEL_5
  LEDC channel 5

LEDC_CHANNEL_6
  LEDC channel 6

LEDC_CHANNEL_7
  LEDC channel 7

LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
Values:

LEDC_TIMER_1_BIT = 1
  LEDC PWM duty resolution of 1 bits

LEDC_TIMER_2_BIT
  LEDC PWM duty resolution of 2 bits

LEDC_TIMER_3_BIT
  LEDC PWM duty resolution of 3 bits

LEDC_TIMER_4_BIT
  LEDC PWM duty resolution of 4 bits

LEDC_TIMER_5_BIT
  LEDC PWM duty resolution of 5 bits

LEDC_TIMER_6_BIT
  LEDC PWM duty resolution of 6 bits

LEDC_TIMER_7_BIT
  LEDC PWM duty resolution of 7 bits
### LEDC_TIMER_8_BIT
- LEDC PWM duty resolution of 8 bits

### LEDC_TIMER_9_BIT
- LEDC PWM duty resolution of 9 bits

### LEDC_TIMER_10_BIT
- LEDC PWM duty resolution of 10 bits

### LEDC_TIMER_11_BIT
- LEDC PWM duty resolution of 11 bits

### LEDC_TIMER_12_BIT
- LEDC PWM duty resolution of 12 bits

### LEDC_TIMER_13_BIT
- LEDC PWM duty resolution of 13 bits

### LEDC_TIMER_14_BIT
- LEDC PWM duty resolution of 14 bits

### LEDC_TIMER_15_BIT
- LEDC PWM duty resolution of 15 bits

### LEDC_TIMER_16_BIT
- LEDC PWM duty resolution of 16 bits

### LEDC_TIMER_17_BIT
- LEDC PWM duty resolution of 17 bits

### LEDC_TIMER_18_BIT
- LEDC PWM duty resolution of 18 bits

### LEDC_TIMER_19_BIT
- LEDC PWM duty resolution of 19 bits

### LEDC_TIMER_20_BIT
- LEDC PWM duty resolution of 20 bits

### LEDC_TIMER_BIT_MAX

```c
enum ledc_fade_mode_t
{
    LEDC_FADE_NO_WAIT = 0,
    LEDC_FADE_WAIT_DONE,
    LEDC_FADE_MAX
};
```

#### 2.3.9 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled `PWMxA / PWMxB`.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as `SYNC SIGNALS`, detect `FAULT SIGNALS` like motor overcurrent or overvoltage, as well as obtain feedback with `CAPTURE SIGNALS` on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s `Timer` and `Generator` submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a `Fault Handler`, signal `Capture` and `Carrier`. 
Fig. 12: MCPWM Overview

Fig. 13: MCPWM Block Diagram
Chapter 2. API Reference

Contents

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Synchronize** sync timers to work together
- **Capture** external signals to provide additional control over the outputs
- **Use** Fault Handler to detect and manage faults
- **Add** a higher frequency Carrier, if output signals are passed through an isolation transformer
- **Extra configuration of** Resolution

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

![Fig. 14: Example of Brushed DC Motor Control with MCPWM](image)

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.
Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].
Chapter 2. API Reference

Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking mcpwm_sync_configure(), selecting desired signal input from mcpwm_sync_signal_t, and setting the desired phase range from 0 to 999 which is mapped to 0%-99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking mcpwm_set_timer_sync_output() and selecting desired event to generate sync output from mcpwm_timer_sync_trigger_t.

To sync with GPIO positive edge input (negative edge requires mcpwm_sync_invert_gpio_synchro()):

Configuring GPIOs to act as the sync signal inputs by calling functions mcpwm_gpio_init() or mcpwm_set_pin(), which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with mcpwm_sync_disable().

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions mcpwm_gpio_init() or mcpwm_set_pin(), that were described in section Configure.
2. Enabling of the functionality itself by invoking mcpwm_capture_enable_channel(), selecting desired signal input from mcpwm_capture_channel_id_t, setting the signal edge, signal count prescaler and user callback within mcpwm_capture_config_t.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling mcpwm_capture_signal_get_value(). The edge of the last signal may be checked with mcpwm_capture_signal_get_edge(). Those data are also provided inside callback function as event data cap_event_data_t.

If not required anymore, the capture functionality may be disabled with mcpwm_capture_disable_channel().

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal.
For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.
The function call parameters include selection of one of three fault inputs defined in \texttt{mcpwm_fault_signal_t} and specific action on outputs A and B defined in \texttt{mcpwm_action_on_pwmxa_t} and \texttt{mcpwm_action_on_pwmxb_t}. Particular fault signal may be disabled at the runtime by calling \texttt{mcpwm_fault_deinit()}. 

\textbf{Carrier} 

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100\% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible. 

To use the carrier submodule, it should be first initialized by calling \texttt{mcpwm_carrier_init()}. The carrier parameters are defined in \texttt{mcpwm_carrier_config_t} structure invoked within the function call. Then the carrier functionality may be enabled by calling \texttt{mcpwm_carrier_enable()}. 

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the \texttt{mcpwm_carrier_config_t} structure, like \texttt{mcpwm_carrier_set_period()}, \texttt{mcpwm_carrier_set_duty_cycle()}, \texttt{mcpwm_carrier_output_invert()}, etc. 

This includes enabling and setting duration of the first pulse of the carrier with \texttt{mcpwm_carrier_oneshot_mode_enable()}. For more details, see \textit{ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule [PDF]}. 

To disable carrier functionality call \texttt{mcpwm_carrier_disable()}. 

\textbf{Interrupts} 

Registering of the MCPWM interrupt handler is possible by calling \texttt{mcpwm_isr_register()}. Note if \texttt{mcpwm_capture_enable_channel()} is used then a default ISR routine will be installed hence please do not call this function to register any more. 

\textbf{Resolution} 

The default resolution for MCPWM group and MCPWM timer are configured to \textbf{10MHz} and \textbf{1MHz} in \texttt{mcpwm_init()}, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: \texttt{mcpwm_group_set_resolution()} and \texttt{mcpwm_timer_set_resolution()}. 

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call \texttt{mcpwm_set_frequency()} and \texttt{mcpwm_set_duty()} accordingly. 

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value. 

\textbf{Application Example} 

MCPWM example are located under: \texttt{peripherals/mcpwm}: 

- Control of BLDC (brushless DC) motor with hall sensor feedback - \texttt{peripherals/mcpwm/mcpwm_bldc_hall_control} 
- Brushed DC motor control - \texttt{peripherals/mcpwm/mcpwm_bdc_speed_control} 
- Servo motor control - \texttt{peripherals/mcpwm/mcpwm_servo_control} 
- HC-SR04 sensor with capture - \texttt{peripherals/mcpwm/mcpwm_capture_hr04}

Enumerations

enum mcpwm_timer_direction_t

* Values:

- MCPWM_TIMER_DIRECTION_UP
  Counting direction: Increase

- MCPWM_TIMER_DIRECTION_DOWN
  Counting direction: Decrease

enum mcpwm_timer_event_t

* Values:

- MCPWM_TIMER_EVENT_ZERO
  MCPWM timer counts to zero

- MCPWM_TIMER_EVENT_PEAK
  MCPWM timer counts to peak

enum mcpwm_timer_count_mode_t

* Values:

- MCPWM_TIMER_COUNT_MODE_PAUSE
  MCPWM timer paused

- MCPWM_TIMER_COUNT_MODE_UP
  MCPWM timer counting up

- MCPWM_TIMER_COUNT_MODE_DOWN
  MCPWM timer counting down

- MCPWM_TIMER_COUNT_MODE_UP_DOWN
  MCPWM timer counting up and down

enum mcpwm_timer_execute_cmd_t

* Values:

- MCPWM_TIMER_STOP_AT_ZERO
  MCPWM timer stops when counting to zero

- MCPWM_TIMER_STOP_AT_PEAK
  MCPWM timer stops when counting to peak

- MCPWM_TIMER_START_NO_STOP
  MCPWM timer starts counting

- MCPWM_TIMER_START_STOP_AT_ZERO
  MCPWM timer starts counting and stops when counting to zero

- MCPWM_TIMER_START_STOP_AT_PEAK
  MCPWM timer starts counting and stops when counting to peak

enum mcpwm_generator_action_t

* Values:

- MCPWM_GEN_ACTION_KEEP
  Generator action: Keep the same level

- MCPWM_GEN_ACTION_LOW
  Generator action: Force to low level
**MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

**MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

```c
enum mcpwm_trip_type_t
Values:
```

**MCPWM_TRIP_TYPE_CBC**
CBC trip type, shut down the operator cycle by cycle

**MCPWM_TRIP_TYPE_OST**
OST trip type, shut down the operator in one shot

**Header File**
- components/driver/include/driver/mcpwm.h

**Functions**

```c
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
This function initializes each gpio signal for MCPWM.
```

**Note**
This function initializes one gpio at a time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

```c
esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
Initialize MCPWM gpio structure.
```

**Note**
This function initialize a group of MCPWM GPIOs at a time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- mcpwm_pin: MCPWM pin structure

```c
esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
Initialize MCPWM parameters.
```

**Note**
The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm_conf: configure structure mcpwm_config_t

```c
esp_err_t mcpwm_group_set_resolution(mcpwm_unit_t mcpwm_num, unsigned long int resolution)
Set resolution of the MCPWM group.
```
Chapter 2. API Reference

**Note** This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_timer_set_resolution(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)
```

Set resolution of each timer.

**Note** This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)
```

Set frequency(in Hz) of MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

```c
esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty_in_us: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```
Set duty either active high or active low (out of phase/inverted)

**Note** Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- `duty_type`: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Get frequency of timer.

**Return**
- frequency of timer

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
float mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```
Get duty cycle of each operator.

**Return**
- duty cycle in % of each operator(56.7 means duty is 56.7%)

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
uint32_t mcpwm_get_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```
Get duty cycle of each operator in us.

**Return**
- duty cycle in us of each operator

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```
Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_low(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```
Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• `gen`: set the operator(MCPWMX/YPWMX), ‘x’ is timer number selected

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num,
                        mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num,
                     mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num,
                              mcpwm_timer_t timer_num,
                              const mcpwm_carrier_config_t *carrier_conf)
```
Initialize carrier configuration.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_conf`: configure structure `mcpwm_carrier_config_t`

```c
esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num,
                                mcpwm_timer_t timer_num)
```
Enable MCPWM carrier submodule, for respective timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num,
                                 mcpwm_timer_t timer_num)
```
Disable MCPWM carrier submodule, for respective timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num,
                                    mcpwm_timer_t timer_num,
                                    uint8_t carrier_period)
```
Set period of carrier.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
Chapter 2. API Reference

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_period**: set the carrier period of each timer, carrier period = (carrier_period + 1) * 800ns (carrier_period <= 15)

```c
esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty_cycle of carrier.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_duty**: set duty_cycle of carrier, carrier duty cycle = carrier_duty * 12.5% (chop_duty <= 7)

```c
esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)
```

Enable and set width of first pulse in carrier oneshot mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **pulse_width**: set pulse width of first pulse in oneshot mode, width = (carrier_period) * (pulse_width + 1) (pulse_width <= 15)

```c
esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable oneshot mode, width of first pulse = carrier period.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)
```

Enable or disable carrier output inversion.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_ivt_mode**: enable or disable carrier output inversion

```c
esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t t_red, uint32_t t_fed)
```

Enable and initialize deadtime for each MCPWM timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **mcpwm_num**: set MCPWM unit (0-1)
- **timer_num**: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
Chapter 2. API Reference

- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = red*100ns
- `fed`: set rising edge delay = fed*100ns

```c
esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Enable deadtime on MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level,
                           mcpwm_fault_signal_t fault_sig)
```

Initialize fault submodule, currently low level triggering is not supported.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_sig`: set the fault pin, which needs to be enabled

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                                       mcpwm_fault_signal_t fault_sig,
                                       mcpwm_output_action_t action_on_pwmxa,
                                       mcpwm_output_action_t action_on_pwmxb)
```

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

Note currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num,
                                   mcpwm_fault_signal_t fault_sig,
                                   mcpwm_output_action_t action_on_pwmxa,
                                   mcpwm_output_action_t action_on_pwmxb)
```

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

Note currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for cyc mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
Chapter 2. API Reference

- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit (mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- fault_sig: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable (mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig,
                                 mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```

Initialize capture submodule.

**Note** Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by mcpwm_isr_register, and in there, query the capture data.

**Note** The capture timer uses APB_CLK (typically 80MHz) as the count source.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- cap_sig: capture pin, which needs to be enabled
- num_of_pulse: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

```c
esp_err_t mcpwm_capture_disable (mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Disable capture signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable_channel (mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)
```

Enable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_channel: capture channel, which needs to be enabled
- cap_conf: capture channel configuration

```c
esp_err_t mcpwm_capture_disable_channel (mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel)
```

Disable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- cap_channel: capture channel, which needs to be disabled
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Get capture value.

**Return**
Captured value

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel on which value is to be measured

uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Get edge of capture signal.

**Return**
Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel of whose edge is to be determined

esp_err_t mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Note**
Count direction is undefined within this API

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization input signal
- `phase_val`: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

esp_err_t mcpwm_sync_configure(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_sync_config_t *sync_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_conf`: sync configuration on this timer

esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable sync submodule on given timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- trigger: set the trigger that will cause the timer to generate a software sync signal. Specifically, `MCPWM_SWSYNC_SOURCE_DISABLED` will disable the timer from generating sync signal.

```c
esp_err_t mcpwm_timer_trigger_soft_sync(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Trigger a software sync event and sends it to a specific timer.

**Note** This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if `MCPWM_SWSYNC_SOURCE_SYNCIN` is selected via `mcpwm_set_timer_sync_output()`
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and cannot be propagated to others.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_sync_invert_gpio_synchro(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)
```

Set external GPIO sync input inverter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- sync_sig: set sync signal of MCPWM, only supports GPIO sync signal
- invert: whether GPIO sync source input is inverted (to get negative edge trigger)

```c
esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void(*fn)(void *arg), intr_alloc_flags intr_alloc_flags, intr_handle_t *handle)
```

Register MCPWM interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- fn: interrupt handler function.
- arg: user-supplied argument passed to the handler function.
- intr_alloc_flags: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Structures**

```c
struct mcpwm_pin_config_t
```

- pin number for MCPWM

**Public Members**

- int mcpwm0a_out_num
  - MCPWM0A out pin
- int mcpwm0b_out_num
  - MCPWM0B out pin
- int mcpwm1a_out_num
  - MCPWM0A out pin
struct cap_event_data_t
  event data that will be passed into ISR callback

Public Members

  mcpwm_capture_on_edge_t cap_edge
  Which signal edge is detected

  uint32_t cap_value
  Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct mcpwm_config_t
  MCPWM config structure.

Public Members

  uint32_t frequency
  Set frequency of MCPWM in Hz

  float cmpx_a
  Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3

  float cmpx_b
  Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0

  mcpwm_duty_type_t duty_mode
  Set type of duty cycle

  mcpwm_counter_type_t counter_mode
  Set type of MCPWM counter
struct mcpwm_carrier_config_t
   MCPWM carrier configuration structure.

Public Members

uint8_t carrier_period
   Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

uint8_t carrier_duty
   Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t pulse_width_in_os
   Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less than 16

mcpwm_carrier_os_t carrier_os_mode
   Enable or disable carrier one shot mode

mcpwm_carrier_out_ivt_t carrier_ivt_mode
   Invert output of carrier

struct mcpwm_capture_config_t
   MCPWM config capture structure.

Public Members

mcpwm_capture_on_edge_t cap_edge
   Set capture edge

uint32_t cap_prescale
   Prescale of capture signal, ranging from 1 to 256

cap_isr_cb_t capture_cb
   User defined capture event callback, running under interrupt context

void *user_data
   User defined ISR callback function args

struct mcpwm_sync_config_t
   MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t sync_sig
   Set sync input signal that will cause timer to sync

uint32_t timer_val
   Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

mcpwm_timer_direction_t count_direction
   Counting direction to be set after sync

Macros
MCPWM_OPR_A
MCPWM_OPR_B
MCPWM_OPR_MAX
MCPWM_SELCT_SYNC0
MCPWM_SELCT_SYNC1
MCPWM_SELCT_SYNC2
Chapter 2. API Reference

typedef mcpwm_generator_t mcpwm_operator_t

typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t

typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t

typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t

MCPWM capture channel ID alias.

typedef bool (*cap_isr_cb_t)(mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel,
                             const cap_event_data_t *edata, void *user_data)

Type of capture event callback.

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR (usually has `_ISR` postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters

• mcpwm: MCPWM unit (0-1)
• cap_channel: capture channel ID
• edata: Capture event data, contains capture edge and capture value, fed by the driver
• user_data: User registered data, passed from mcpwm_capture_config_t

Enumerations

enum mcpwm_io_signals_t

IO signals for the MCPWM.

• 6 MCPWM output pins that generate PWM signals
• 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
• 3 MCPWM sync input pins to synchronize MCPWM outputs signals
• 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
PWM0A output pin

MCPWM0B
PWM0B output pin

MCPWM1A
PWM1A output pin

MCPWM1B
PWM1B output pin

MCPWM2A
PWM2A output pin

MCPWM2B
PWM2B output pin

MCPWM_SYNC_0
SYNC0 input pin

MCPWM_SYNC_1
SYNC1 input pin

MCPWM_SYNC_2
SYNC2 input pin

MCPWM_FAULT_0
FAULT0 input pin

MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

MCPWM_UNIT_0
MCPWM unit0 selected

MCPWM_UNIT_1
MCPWM unit1 selected

MCPWM_UNIT_MAX
Max number of MCPWM units

enum mcpwm_timer_t
Select MCPWM timer.

Values:

MCPWM_TIMER_0
Select MCPWM timer0

MCPWM_TIMER_1
Select MCPWM timer1

MCPWM_TIMER_2
Select MCPWM timer2

MCPWM_TIMER_MAX
Max number of timers in a unit

enum mcpwm_generator_t
Select MCPWM operator.

Values:

MCPWM_GEN_A
Select MCPWMXA, where ‘X’ is operator number

MCPWM_GEN_B
Select MCPWMXB, where ‘X’ is operator number
Chapter 2. API Reference

MCPWM_GEN_MAX
Num of generators to each operator of MCPWM

enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

Values:

MCPWM_ONESHOT_MODE_DIS
Enable oneshot mode

MCPWM_ONESHOT_MODE_EN
Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

MCPWM_CARRIER_OUT_IVT_DIS
Enable carrier output inversion

MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion

enum mcpwm_fault_signal_t
MCPWM select fault signal input.

Values:

MCPWM_SELECT_F0
Select F0 as input

MCPWM_SELECT_F1
Select F1 as input

MCPWM_SELECT_F2
Select F2 as input

enum mcpwm_sync_signal_t
MCPWM select sync signal input.

Values:

MCPWM_SELECT_NO_INPUT
No sync input selected

MCPWM_SELECT_TIMER0_SYNC
Select software sync signal from timer0 as input

MCPWM_SELECT_TIMER1_SYNC
Select software sync signal from timer1 as input

MCPWM_SELECT_TIMER2_SYNC
Select software sync signal from timer2 as input

MCPWM_SELECT_GPIO_SYNC0
Select GPIO SYNC0 as input

MCPWM_SELECT_GPIO_SYNC1
Select GPIO SYNC1 as input

MCPWM_SELECT_GPIO_SYNC2
Select GPIO SYNC2 as input

enum mcpwm_timer_sync_trigger_t
MCPWM timer sync event trigger.

Values:
Chapter 2. API Reference

MCPWM_SWSYNC_SOURCE_SYNCIN
the input sync signal will be routed to its sync output path

MCPWM_SWSYNC_SOURCE_TEZ
sync signal generated when timer counts to zero

MCPWM_SWSYNC_SOURCE_TEP
sync signal generated when timer counts to peak

MCPWM_SWSYNC_SOURCE_DISABLED
timer does not generate sync signals

enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.

Values:

MCPWM_LOW_LEVEL_TGR
Fault condition occurs when fault input signal goes from high to low

MCPWM_HIGH_LEVEL_TGR
Fault condition occurs when fault input signal goes low to high

enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.

Values:

MCPWM_NEG_EDGE = BIT(0)
Capture the negative edge

MCPWM_POS_EDGE = BIT(1)
Capture the positive edge

MCPWM_BOTH_EDGE = BIT(1) | BIT(0)
Capture both edges

enum mcpwm_intr_t
Interrupt masks for MCPWM capture.

Values:

MCPWM_LL_INTR_CAP0 = BIT(27)
Capture 0 happened.

MCPWM_LL_INTR_CAP1 = BIT(28)
Capture 1 happened.

MCPWM_LL_INTR_CAP2 = BIT(29)
Capture 2 happened.

enum mcpwm_counter_type_t
Select type of MCPWM counter.

Values:

MCPWM_FREEZE_COUNTER
Counter freeze

MCPWM_UP_COUNTER
For asymmetric MCPWM

MCPWM_DOWN_COUNTER
For asymmetric MCPWM

MCPWM_UP_DOWN_COUNTER
For symmetric MCPWM, frequency is half of MCPWM frequency set

MCPWM_COUNTER_MAX
Maximum counter mode
enum mcpwm_duty_type_t
Select type of MCPWM duty cycle mode.

Values:

MCPWM_DUTY_MODE_0 = 0
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

MCPWM_DUTY_MODE_1
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted)

MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH
MCPWM_DUTY_MODE_MAX
Num of duty cycle modes

enum mcpwm_deadtime_type_t
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

Values:

MCPWM_DEADTIME_BYPASS = 0
Bypass the deadtime

MCPWM_BYPASS_RED
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_BYPASS_FED
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

MCPWM_ACTIVE_HIGH_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_LOW_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with complement of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA
MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX
Maximum number of supported dead time modes

enum mcpwm_output_action_t
MCPWM select action to be taken on the output when event happens.

Values:
MCPWM_ACTION_NO_CHANGE = 0
No change in the output

MCPWM_ACTION_FORCE_LOW
Make output low

MCPWM_ACTION_FORCE_HIGH
Make output high

MCPWM_ACTION_TOGGLE
Make output toggle

enum mcpwm_capture_signal_t
MCPWM select capture signal input.
Values:
MCPWM_SELECT_CAP0
Select CAP0 as input
MCPWM_SELECT_CAP1
Select CAP1 as input
MCPWM_SELECT_CAP2
Select CAP2 as input

2.3.10 Pulse Counter (PCNT)

Introduction
The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview
Description of functionality of this API has been broken down into four sections:
- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration
The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:
- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.
Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Operating the Counter**

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

**Filtering Pulses**

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in **Configuration**
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`
API Reference

Header File

- components/driver/include/driver/pcnt.h

Functions

**esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)**

Configure Pulse Counter unit.

**Note** This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_config: Pointer of Pulse Counter unit configure parameter

**esp_err_t pcnt_get_counter_value (pcnt_unit_t pcnt_unit, int16_t *count)**

Get pulse counter value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: Pulse Counter unit number
- count: Pointer to accept counter value

**esp_err_t pcnt_counter_pause (pcnt_unit_t pcnt_unit)**

Pause PCNT counter of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number

**esp_err_t pcnt_counter_resume (pcnt_unit_t pcnt_unit)**

Resume counting for PCNT counter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

**esp_err_t pcnt_counter_clear (pcnt_unit_t pcnt_unit)**

Clear and reset PCNT counter value to zero.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

**esp_err_t pcnt_intr_enable (pcnt_unit_t pcnt_unit)**

Enable PCNT interrupt for PCNT unit.
Note: Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

```c
esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)
```
Disable PCNT interrupt for PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

```c
esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Enable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

```c
esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Disable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

```c
esp_err_t pcnt_set_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)
```
Set PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Counter value for PCNT event

```c
esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)
```
Get PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters
- **unit**: PCNT unit number
- **evt_type**: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value**: Pointer to accept counter value for PCNT event

```c
esp_err_t pcnt_get_event_status (pcnt_unit_t unit, uint32_t *status)
```
Get PCNT event status of PCNT unit.

Return
- **ESP_OK** Success
- **ESP_ERR_INVALID_STATE** PCNT driver has not been initialized
- **ESP_ERR_INVALID_ARG** Parameter error

Parameters
- **unit**: PCNT unit number
- **status**: Pointer to accept event status word

```c
esp_err_t pcnt_isr_unregister (pcnt_isr_handle_t handle)
```
Unregister PCNT interrupt handler (registered by pcnt_isr_register), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by pcnt_isr_service_install, please call pcnt_isr_service_uninstall instead.

Return
- **ESP_OK** Success
- **ESP_ERR_NOT_FOUND** Cannot find the interrupt that matches the flags.
- **ESP_ERR_INVALID_ARG** Function pointer error.

Parameters
- **handle**: handle to unregister the ISR service.

```c
esp_err_t pcnt_isr_register (void (*fn) void *, void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)
```
Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

Return
- **ESP_OK** Success
- **ESP_ERR_NOT_FOUND** Cannot find the interrupt that matches the flags.
- **ESP_ERR_INVALID_ARG** Function pointer error.

Parameters
- **fn**: Interrupt handler function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling pcnt_isr_unregister to unregister this ISR service if needed, but only if the handle is not NULL.

```c
esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)
```
Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

Return
- **ESP_OK** Success
- **ESP_ERR_INVALID_STATE** PCNT driver has not been initialized
- **ESP_ERR_INVALID_ARG** Parameter error

Parameters
- **unit**: PCNT unit number
- **channel**: PCNT channel number
- **pulse_io**: Pulse signal input GPIO
- **ctrl_io**: Control signal input GPIO

```c
esp_err_t pcnt_filter_enable (pcnt_unit_t unit)
```
Enable PCNT input filter.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

```c
esp_err_t pcnt_filter_disable(pcnt_unit_t unit)
```

Disable PCNT input filter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

```c
esp_err_t pcnt_set_filter_value(pcnt_unit_t unit, uint16_t filter_val)
```

Set PCNT filter value.

Note: filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value(pcnt_unit_t unit, uint16_t* filter_val)
```

Get PCNT filter value.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- filter_val: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode(pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```

Set PCNT counter mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- channel: PCNT channel number
- pos_mode: Counter mode when detecting positive edge
- neg_mode: Counter mode when detecting negative edge
- hctrl_mode: Counter mode when control signal is high level
- lctrl_mode: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add(pcnt_unit_t unit, void (*isr_handler)(void *args)) void *
```

Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.
The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- isr_handler: Interrupt handler function.
- args: Parameter for handler function

```c
esp_err_t pcnt_isr_service_install (int intr_alloc_flags)
```
Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

**Parameters**
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void pcnt_isr_service_uninstall (void)
```
Uninstall PCNT ISR service, freeing related resources.

```c
esp_err_t pcnt_isr_handler_remove (pcnt_unit_t unit)
```
Delete ISR handler for specified unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number

**Structures**

```c
struct pcnt_config_t
```
Pulse Counter configuration for a single channel.

**Public Members**

```c
int pulse_gpio_num
```
Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

```c
int ctrl_gpio_num
```
Control signal input GPIO number, a negative value will be ignored

```c
pcnt_ctrl_mode_t lctrl_mode
```
PCNT low control mode

```c
pcnt_ctrl_mode_t hctrl_mode
```
PCNT high control mode
Chapter 2. API Reference

```c
pcnt_count_mode_t pos_mode
   PCNT positive edge count mode

pcnt_count_mode_t neg_mode
   PCNT negative edge count mode

int16_t counter_h_lim
   Maximum counter value

int16_t counter_l_lim
   Minimum counter value

pcnt_unit_t unit
   PCNT unit number

pcnt_channel_t channel
   the PCNT channel
```

**Macros**

PCNT_PIN_NOT_USED
   When selected for a pin, this pin will not be used

PCNT_MODE_KEEP
   Control mode: won’t change counter mode

PCNT_MODE_REVERSE
   Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE
   Control mode: Inhibit counter(counter value will not change in this condition)

PCNT_MODE_MAX

PCNT_COUNT_DIS
   Counter mode: Inhibit counter(counter value will not change in this condition)

PCNT_COUNT_INC
   Counter mode: Increase counter value

PCNT_COUNT_DEC
   Counter mode: Decrease counter value

PCNT_COUNT_MAX

**Type Definitions**

typedef intr_handle_t pcnt_isr_handle_t

typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t
   Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

   **Note** Configuration covers two actions, one for high, and one for low level on the control input

typedef pcnt_channel_edge_action_t pcnt_count_mode_t
   Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.

   **Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input

**Enumerations**

enum pcnt_port_t
   PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

   **Values:**

   PCNT_PORT_0
      PCNT port 0
Chapter 2. API Reference

```
PCNT_PORT_MAX
    PCNT port max

enum pcnt_unit_t
    Selection of all available PCNT units.
    Values:
    PCNT_UNIT_0
        PCNT unit 0
    PCNT_UNIT_1
        PCNT unit 1
    PCNT_UNIT_2
        PCNT unit 2
    PCNT_UNIT_3
        PCNT unit 3
    PCNT_UNIT_4
        PCNT unit 4
    PCNT_UNIT_5
        PCNT unit 5
    PCNT_UNIT_6
        PCNT unit 6
    PCNT_UNIT_7
        PCNT unit 7
    PCNT_UNIT_MAX

enum pcnt_channel_t
    Selection of channels available for a single PCNT unit.
    Values:
    PCNT_CHANNEL_0
        PCNT channel 0
    PCNT_CHANNEL_1
        PCNT channel 1
    PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
    Selection of counter events the may trigger an interrupt.
    Values:
    PCNT_EVT_THRES_1 = 1 << 2
        PCNT watch point event: threshold1 value event
    PCNT_EVT_THRES_0 = 1 << 3
        PCNT watch point event: threshold0 value event
    PCNT_EVT_L_LIM = 1 << 4
        PCNT watch point event: Minimum counter value
    PCNT_EVT_H_LIM = 1 << 5
        PCNT watch point event: Maximum counter value
    PCNT_EVT_ZERO = 1 << 6
        PCNT watch point event: counter value zero event
    PCNT_EVT_MAX
```
Header File

- components/hal/include/hal/pcnt_types.h

Enumerations

enum pcnt_channel_level_action_t
PCNT channel action on control level.

Values:

PCNT_CHANNEL_LEVEL_ACTION_KEEP
Keep current count mode

PCNT_CHANNEL_LEVEL_ACTION_INVERSE
Invert current count mode (increase -> decrease, decrease -> increase)

PCNT_CHANNEL_LEVEL_ACTION_HOLD
Hold current count value

enum pcnt_channel_edge_action_t
PCNT channel action on signal edge.

Values:

PCNT_CHANNEL_EDGE_ACTION_HOLD
Hold current count value

PCNT_CHANNEL_EDGE_ACTION_INCREASE
Increase count value

PCNT_CHANNEL_EDGE_ACTION_DECREASE
Decrease count value

enum pcnt_unit_count_sign_t
PCNT unit counter value’s sign.

Values:

PCNT_UNIT_COUNT_SIGN_ZERO_POS
Positive value to zero

PCNT_UNIT_COUNT_SIGN_ZERO_NEG
Negative value to zero

PCNT_UNIT_COUNT_SIGN_NEG
Counter value negative

PCNT_UNIT_COUNT_SIGN_POS
Counter value positive

2.3.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
Chapter 2. API Reference

Fig. 16: RMT Transmitter Overview

Fig. 17: RMT Receiver Overview
4. **Use Interrupts**

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

**Configure Driver**

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

**Common Parameters**

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many **memory blocks** will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
  - When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See `power_management` for more information.
  - When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1.. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in flags, RMT source clock is changed to REF_TICK or XTAL.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in **Transmit Mode** or **Receive Mode**.

**Transmit Mode** When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`

**Receive Mode** In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
Finalize Configuration  Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in Use Interrupts.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

```
Fig. 18: Structure of RMT items (L - signal level)
```

For a simple example how to define a block of items see `peripherals/rmt/morse_code`.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

**Warning:** RMT RX channel can’t receive packet whose items are larger than its memory block size. If you set the memory block number to 1, then this RX channel can’t receive packet with more than 64 items. This is a hardware limitation.
Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

**Change Operation Parameters**

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

**Receive Mode Parameters**

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

**Use Interrupts**

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
• The number of events the transmitter has sent matches a threshold value \texttt{rmt\_set\_tx\_thr\_intr\_en()}
• Ownership to the RMT memory block has been violated - \texttt{rmt\_set\_err\_intr\_en()}

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling \texttt{rmt\_set\_intr\_enable\_mask()} or \texttt{rmt\_clr\_intr\_enable\_mask()}.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as \texttt{RMT.int.clr.val.chN\_event\_name} and defined as a volatile struct in \texttt{soc/esp32/include/soc/rmt\_struct.h}, where \(N\) is the RMT channel number \([0, n]\) and the \texttt{event\_name} is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function \texttt{rmt\_isr\_deregister()}.  

**Warning:** It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called \texttt{rmt\_driver\_isr\_default}. Instead, if what you want is to get a notification when transaction is done, go ahead with \texttt{rmt\_register\_tx\_end\_callback()}.  

**Uninstall Driver**

If the RMT driver has been installed with \texttt{rmt\_driver\_install()} for some specific period of time and then not required, the driver may be removed to free allocated resources by calling \texttt{rmt\_driver\_uninstall()}.  

**Application Examples**

• Using RMT to send morse code: \texttt{peripherals/rmt/morse\_code}.
• Using RMT to drive RGB LED strip: \texttt{peripherals/rmt/led\_strip}.
• NEC remote control TX and RX example: \texttt{peripherals/rmt/ir\_protocols}.
• Musical buzzer example: \texttt{peripherals/rmt/musical\_buzzer}.

**API Reference**

**Header File**

• components/driver/include/driver/rmt.h

**Functions**

\texttt{esp\_err\_t \texttt{rmt\_set\_clk\_div}(rmt\_channel\_t channel, uint8\_t div\_cnt)}

Set RMT clock divider, channel clock is divided from source clock.

\texttt{Return}

• ESP\_ERR\_INVALID\_ARG Parameter error
• ESP\_OK Success

\texttt{Parameters}

• channel: RMT channel
• div\_cnt: RMT counter clock divider

\texttt{esp\_err\_t \texttt{rmt\_get\_clk\_div}(rmt\_channel\_t channel, uint8\_t \*div\_cnt)}

Get RMT clock divider, channel clock is divided from source clock.

\texttt{Return}

• ESP\_ERR\_INVALID\_ARG Parameter error
• ESP\_OK Success

\texttt{Parameters}

• channel: RMT channel
• div\_cnt: pointer to accept RMT counter divider
**esp_err_t rmt_set_rx_idle_thresh**(rmt_channel_t channel, uint16_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

**esp_err_t rmt_get_rx_idle_thresh**(rmt_channel_t channel, uint16_t* thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

**esp_err_t rmt_set_mem_block_num**(rmt_channel_t channel, uint8_t rmt_mem_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

**esp_err_t rmt_get_mem_block_num**(rmt_channel_t channel, uint8_t* rmt_mem_num)

Get RMT memory block number.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

**esp_err_t rmt_set_tx_carrier**(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.
Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier.
- low_level: Low level duration of carrier.
- carrier_level: Configure the way carrier wave is modulated for channel.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

\texttt{esp_err_t rmt_set_mem_pd} (rmt_channel_t channel, bool pd_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1: memory is in low power state.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: RMT memory low power enable.

\texttt{esp_err_t rmt_get_mem_pd} (rmt_channel_t channel, bool *pd_en)

Get RMT memory low power mode.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: Pointer to accept RMT memory low power mode.

\texttt{esp_err_t rmt_tx_start} (rmt_channel_t channel, bool tx_idx_rst)

Set RMT start sending data from memory.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

\texttt{esp_err_t rmt_tx_stop} (rmt_channel_t channel)

Set RMT stop sending.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel

\texttt{esp_err_t rmt_rx_start} (rmt_channel_t channel, bool rx_idx_rst)

Set RMT start receiving data.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.
```c
esp_err_t rmt_rx_stop (rmt_channel_t channel)
Set RMT stop receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

esp_err_t rmt_tx_memory_reset (rmt_channel_t channel)
Reset RMT TX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

esp_err_t rmt_rx_memory_reset (rmt_channel_t channel)
Reset RMT RX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

esp_err_t rmt_set_memory_owner (rmt_channel_t channel, rmt_mem_owner_t owner)
Set RMT memory owner.

Note Setting memory is only valid for RX channel.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• owner: To set when the transmitter or receiver can process the memory of channel.

esp_err_t rmt_get_memory_owner (rmt_channel_t channel, rmt_mem_owner_t *owner)
Get RMT memory owner.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• owner: Pointer to get memory owner.

esp_err_t rmt_set_tx_loop_mode (rmt_channel_t channel, bool loop_en)
Set RMT tx loop mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

esp_err_t rmt_get_tx_loop_mode (rmt_channel_t channel, bool *loop_en)
Get RMT tx loop mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
```
Parameters
• channel: RMT channel
• loop_en: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```
Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_filter_en: To enable RMT receiver filter.
• thresh: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```
Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• base_clk: To choose source clock for RMT module.

```c
esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)
```
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• src_clk: Pointer to accept source clock for RMT module.

```c
esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
```
Set RMT idle output level for transmitter.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• idle_out_en: To enable idle level output.
• level: To set the output signal’s level for channel in idle state.

```c
esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
```
Get RMT idle output level for transmitter.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
**Chapter 2. API Reference**

- **channel**: RMT channel
- **idle_out_en**: Pointer to accept value of enable idle.
- **level**: Pointer to accept value of output signal’s level in idle state for specified channel.

```c
esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
```

Get RMT status.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **status**: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

```c
esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
```

Set RMT RX interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **en**: enable or disable RX interrupt.

```c
esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)
```

Set RMT RX error interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **en**: enable or disable RX err interrupt.

```c
esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)
```

Set RMT TX interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **en**: enable or disable TX interrupt.

```c
esp_err_t rmt_set_tx_thr_intr_en (rmt_channel_t channel, bool en, uint16_tevt_thresh)
```

Set RMT TX threshold event interrupt enable. An interrupt will be triggered when the number of transmitted items reaches the threshold value.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **en**: enable or disable TX event interrupt.
- **evt_thresh**: RMT event interrupt threshold value

```c
esp_err_t rmt_set_gpio (rmt_channel_t channel, rmt_mode_t mod, gpio_num_t gpio_num, bool in-
vert_signal)
```

Configure the GPIO used by RMT channel.

**Return**
- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully
Parameters

- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

```c
esp_err_t rmt_config(const rmt_config_t *rmt_param)
```

Configure RMT parameters.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- rmt_param: RMT parameter struct

```c
esp_err_t rmt_isr_register(void (*fn) void *) void *, void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
```

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, cannot register ISR handler for RMT

**Parameters**

- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

```c
esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)
```

Deregister previously registered RMT interrupt handler.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**

- handle: Handle obtained from rmt_isr_register

```c
esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)
```

Fill memory data of channel with given RMT items.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- channel: RMT channel
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.

```c
esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)
```

Initialize RMT driver.

**Return**

- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Chapter 2. API Reference

Parameters

- **channel**: RMT channel
- **rx_buf_size**: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- **intr_alloc_flags**: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

```c
esp_err_t rmt_driver_uninstall(rmt_channel_t channel)
```

Uninstall RMT driver.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- **channel**: RMT channel

```c
esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)
```

Get the current status of eight channels.

**Note** Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

**Return**

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

**Parameters**

- **[out] channel_status**: store the current status of each channel

```c
esp_err_t rmt_get_counter_clock(rmt_channel_t channel, uint32_t *clock_hz)
```

Get speed of channel’s internal counter clock.

**Return**

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

**Parameters**

- **channel**: RMT channel
- **[out] clock_hz**: counter clock speed, in hz

```c
esp_err_t rmt_write_items(rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)
```

RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items.

If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- **channel**: RMT channel
- **rmt_item**: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- **item_num**: RMT data item number.
- **wait_tx_done**:  
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

```c
esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)
```

Wait RMT TX finished.

**Return**
Chapter 2. API Reference

- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters
- channel: RMT channel
- wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

`esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t *buf_handle)`

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

`esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)`

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return
- ESP_FAIL Init fail.
- ESP_OK Init success.

Parameters
- channel: RMT channel
- fn: Point to the data conversion function.

`esp_err_t rmt_translator_set_context(rmt_channel_t channel, void *context)`

Set user context for the translator of specific channel.

Return
- ESP_FAIL Set context fail
- ESP_OK Set context success

Parameters
- channel: RMT channel number
- context: User context

`esp_err_t rmt_translator_get_context(const size_t *item_num, void **context)`

Get the user context set by ‘rmt_translator_set_context’.

Note This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

Return
- ESP_FAIL Get context fail
- ESP_OK Get context success

Parameters
- item_num: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
- context: Returned User context

`esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)`

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

Return
- ESP_FAIL Send fail
- ESP_OK Send success

Parameters
Chapter 2. API Reference

- channel: RMT channel.
- src: Pointer to the raw data.
- src_size: The size of the raw data.
- wait_tx_done: Set true to wait all data sent done.

`rmt_tx_end_callback_t rmt_register_tx_end_callback (rmt_tx_end_fn_t function, void *arg)`

Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

**Note** Requires `rmt_driver_install` to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

`esp_err_t rmt_memory_rw_rst (rmt_channel_t channel)`

Reset RMT TX/RX memory index.

**Return**
- ESP.ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

`void rmt_set_intr_enable_mask (uint32_t mask)`

Set mask value to RMT interrupt enable register.

**Parameters**
- mask: Bit mask to set to the register

`void rmt_clr_intr_enable_mask (uint32_t mask)`

Clear mask value to RMT interrupt enable register.

**Parameters**
- mask: Bit mask to clear the register

`esp_err_t rmt_set_pin (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`

Set RMT pin.

**Return**
- ESP.ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- mode: TX or RX mode for RMT
- gpio_num: GPIO number to transmit or receive the signal.

**Structures**

`struct rmt_item32_t`

Definition of RMT item.

**Public Members**

`uint32_t duration0 : 15`

Duration of level0

`uint32_t level0 : 1`

Level of the first part

`uint32_t duration1 : 15`

Duration of level1
uint32_t level1
    Level of the second part

uint32_t val
    Equivalent unsigned value for the RMT item

struct rmt_tx_config_t
    Data struct of RMT TX configure parameters.

Public Members

uint32_t carrier_freq_hz
    RMT carrier frequency

rmt_carrier_level_t carrier_level
    Level of the RMT output, when the carrier is applied

rmt_idle_level_t idle_level
    RMT idle level

uint8_t carrier_duty_percent
    RMT carrier duty (%)

bool carrier_en
    RMT carrier enable

bool loop_en
    Enable sending RMT items in a loop

bool idle_output_en
    RMT idle level output enable

struct rmt_rx_config_t
    Data struct of RMT RX configure parameters.

Public Members

uint16_t idle_threshold
    RMT RX idle threshold

uint8_t filter_ticks_thresh
    RMT filter tick number

bool filter_en
    RMT receiver filter enable

struct rmt_config_t
    Data struct of RMT configure parameters.

Public Members

rmt_mode_t rmt_mode
    RMT mode: transmitter or receiver

rmt_channel_t channel
    RMT channel

gpio_num_t gpio_num
    RMT GPIO number

uint8_t clk_div
    RMT channel counter divider
```c
uint8_t mem_block_num
    RMT memory block number

uint32_t flags
    RMT channel extra configurations. OR’d with RMT_CHANNEL_FLAGS_[*]

rmt_tx_config_t tx_config
    RMT TX parameter

rmt_rx_config_t rx_config
    RMT RX parameter

struct rmt_tx_end_callback_t
    Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t function
    Function which is called on RMT TX end

void *arg
    Optional argument passed to function

Macros

RMT_CHANNEL_FLAGS_AWARE_DFS
    Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG
    Invert RMT signal

RMT_MEM_ITEM_NUM
    Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)
    Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)
    Default configuration for RX channel.

Type Definitions

typedef intr_handle_t rmt_isr_handle_t
    RMT interrupt handle.

typedef void (*rmt_tx_end_fn_t)(rmt_channel_t channel, void *arg)
    Type of RMT Tx End callback function.

typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
    User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

This function may be called from an ISR, so, the code should be short and efficient.

Note In fact, item_num should be a multiple of translated_size, e.g.: When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters

    • src: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
    • [out] dest: Pointer to the buffer storing the rmt format data.
    • src_size: The raw data size.
    • wanted_num: The number of rmt format data that wanted to get.
    • [out] translated_size: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
```
Chapter 2. API Reference

- [out] item_num: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. It should return 0 if no data was converted.

Header File

- components/hal/include/hal/rmt_types.h

Structures

struct rmt_channel_status_result_t
Data struct of RMT channel status.

Public Members

\[ \text{rmt\_channel\_status\_t \ status[RMT\_CHANNEL\_MAX]} \]
Store the current status of each channel

Enumerations

enum rmt_channel_t
RMT channel ID.

Values:

\[ \text{RMT\_CHANNEL\_0} \]
RMT channel number 0
\[ \text{RMT\_CHANNEL\_1} \]
RMT channel number 1
\[ \text{RMT\_CHANNEL\_2} \]
RMT channel number 2
\[ \text{RMT\_CHANNEL\_3} \]
RMT channel number 3
\[ \text{RMT\_CHANNEL\_4} \]
RMT channel number 4
\[ \text{RMT\_CHANNEL\_5} \]
RMT channel number 5
\[ \text{RMT\_CHANNEL\_6} \]
RMT channel number 6
\[ \text{RMT\_CHANNEL\_7} \]
RMT channel number 7
\[ \text{RMT\_CHANNEL\_MAX} \]
Number of RMT channels

enum rmt_mem_owner_t
RMT Internal Memory Owner.

Values:

\[ \text{RMT\_MEM\_OWNER\_TX} \]
RMT RX mode, RMT transmitter owns the memory block
\[ \text{RMT\_MEM\_OWNER\_RX} \]
RMT RX mode, RMT receiver owns the memory block
\[ \text{RMT\_MEM\_OWNER\_MAX} \]
enum rmt_source_clk_t
Clock Source of RMT Channel.

Values:

-RMT_BASECLK_REF = 0
   RMT source clock is REF_TICK, 1MHz by default

-RMT_BASECLK_APB = 1
   RMT source clock is APB CLK, 80Mhz by default

-RMT_BASECLK_MAX

enum rmt_data_mode_t
RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:

-RMT_DATA_MODE_FIFO
-RMT_DATA_MODE_MEM
-RMT_DATA_MODE_MAX

enum rmt_mode_t
RMT Channel Working Mode (TX or RX)

Values:

-RMT_MODE_TX
   RMT TX mode

-RMT_MODE_RX
   RMT RX mode

-RMT_MODE_MAX

enum rmt_idle_level_t
RMT Idle Level.

Values:

-RMT_IDLE_LEVEL_LOW
   RMT TX idle level: low Level

-RMT_IDLE_LEVEL_HIGH
   RMT TX idle level: high Level

-RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
RMT Carrier Level.

Values:

-RMT_CARRIER_LEVEL_LOW
   RMT carrier wave is modulated for low Level output

-RMT_CARRIER_LEVEL_HIGH
   RMT carrier wave is modulated for high Level output

-RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
RMT Channel Status.

Values:
2.3.12 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see *MTDI Strapping Pin* below.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

#### Systems on a Chip (SoCs)

- **ESP32 (except for D2WD versions, see ESP32 datasheet):**
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2** for models with 3.3 V flash chip
- **ESP32-D2WD:**
  - **No Pull-ups**
  - **No Pull-up on GPIO12**

#### Systems in Packages (SIP)

- **ESP32-PICO-D4:**
  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**

#### Modules

  - **No Pull-ups**
  - **Conflicts Between Bootstrap and SDIO on DAT2**
- **ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I**
– **No Pull-ups**
  - ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
    – **No Pull-ups**
    – **Conflicts Between Bootstrap and SDIO on DAT2**

**Development Boards**

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  – **No Pull-ups**
  – **Conflicts Between Bootstrap and SDIO on DAT2**
  – **Download Mode Not Working (minor issue)**
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  – **No Pull-ups**
  – **Conflicts Between Bootstrap and SDIO on DAT2**
  – **Download Mode Not Working (minor issue)**
- ESP-WROVER-KIT
  – Required pull-ups are provided
  – **Pull-up Conflicts on GPIO13** (v4.1, v3, v2, and v1)
  – **Conflicts Between Bootstrap and SDIO on DAT2** (v4.1, v2, and v1)
  – **Download Mode Not Working (minor issue)** (v2, v1)
  You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
    – ESP32-WROVER-B on v4.1
    – ESP32-WROVER on v3
    – ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSC
  – Required pull-ups are provided
  – **Conflicts Between Bootstrap and SDIO on DAT2**
- ESP32-LyraT
  – Required pull-ups are provided
  – **Pull-up Conflicts on GPIO13**

**Non-Espressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

**Solutions**

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to *Development Boards*.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13** If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2** There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see *MTDI Strapping Pin*.

To resolve the conflict, you have the following options:
1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on [http://www.espressif.com/](http://www.espressif.com/). If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.  
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.  
This is an irreversible operation. 
Type 'BURN' (all capitals) to continue. 
BURN 
VDD_SDIO setting complete. 
```

To check the status of the eFuses, run:

```
"components/esptool_py/esptool/espefuse.py summary"
```

If running from an automated flashing script, espefuse.py has an option --do-not-confirm.

For more details, see ESP32 Technical Reference Manual [PDF].

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:

   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option SDIO_SLAVE_FLAG_DAT2_DISABLED and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

   - For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
   - For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
     - **LEDs** would not affect operation in most cases.
     - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.
Related Information

MTDI Strapping Pin  MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see Overview of Compatibility.

Internal Pull-ups and Strapping Requirements  Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

2.3.13 SDMMC Host Driver

Overview

ESP32’s SDMMC host peripheral has two slots:

- Slot 0 ([SDMMC_HOST_SLOT_0](#)) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 ([SDMMC_HOST_SLOT_1](#)) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the gpio_cd and gpio_wp members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1_*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

**Supported Speed Modes**

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

**Using the SDMMC Host Driver**

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

**Configuring Bus Width and Frequency**

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.
In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

See [SD/SDIO/MMC Driver](#) for the higher level driver which implements the protocol layer.

See [SD SPI Host Driver](#) for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See [SD Pull-up Requirements](#) for pullup support and compatibilities of modules and development kits.

### API Reference

#### Header File

- components/driver/include/driver/sdmmc_host.h

#### Functions

- `esp_err_t sdmmc_host_init(void)`
  
  Initialize SDMMC host peripheral.

  **Note** This function is not thread safe

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
  - ESP_ERR_NO_MEM if memory cannot be allocated

- `esp_err_t sdmmc_host_init_slot(int slot, const sdmmc_slot_config_t *slot_config)`

  Initialize given slot of SDMMC peripheral.

  On the ESP32, SDMMC peripheral has two slots:
  - Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
  - Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

  Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

  **Note** This function is not thread safe

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

- `esp_err_t sdmmc_host_set_bus_width(int slot, size_t width)`

  Select bus width to be used for data transfer.

  SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. `SD_APP_SET_BUS_WIDTH`)

  **Note** This function is not thread safe

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if slot number or width is not valid
Chapter 2. API Reference

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width**: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

`size_t sdmmc_host_get_slot_width (int slot)`
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

Return configured bus width of the specified slot.

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

`esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)`
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note This function is not thread safe

Return
- ESP_OK on success
- other error codes may be returned in the future

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz**: card clock frequency, in kHz

`esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)`
Enable or disable DDR mode of SD interface.

Return
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled**: enable or disable DDR mode

`esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)`
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

Attention Data buffer passed in cmdinfo->data must be in DMA capable memory

Return
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo**: pointer to structure describing command and data to transfer

`esp_err_t sdmmc_host_io_int_enable (int slot)`
Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

Return returns ESP_OK, other errors possible in the future

Parameters
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
**esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `timeout_ticks`: number of RTOS ticks to wait for the interrupt

**esp_err_t sdmmc_host_deinit (void)**

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

**esp_err_t sdmmc_host_pullup_en (int slot, int width)**

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in sdmmc_slot_config_t::flags instead.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**
- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**
- `slot`: Slot to use, normally set it to 1.
- `width`: Bit width of your configuration, 1 or 4.

**Structures**

**struct sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

- `gpio_num_t gpio_cd`
  
  GPIO number of card detect signal.

- `gpio_num_t cd`
  
  GPIO number of card detect signal; shorter name.

- `gpio_num_t gpio_wp`
  
  GPIO number of write protect signal.

- `gpio_num_t wp`
  
  GPIO number of write protect signal; shorter name.

- `uint8_t width`
  
  Bus width used by the slot (might be less than the max width supported)

- `uint32_t flags`
  
  Features used by this slot.

**Macros**

- `SDMMC_HOST_SLOT_0`
  
  SDMMC slot 0.
**SDMMC_HOST_SLOT_1**
SDMMC slot 1.

**SDMMC_HOST_DEFAULT()**
Default `sdmmc_host_t` structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

**SDMMC_SLOT_FLAG_INTERNAL_PULLUP**
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC_SLOT_NO_CD**
indicates that card detect line is not used

**SDMMC_SLOT_NO_WP**
indicates that write protect line is not used

**SDMMC_SLOT_WIDTH_DEFAULT**
use the maximum possible width for the slot

**SDMMC_SLOT_CONFIG_DEFAULT()**
Macro defining default configuration of SDMMC host slot

### 2.3.14 SD SPI Host Driver

**Overview**

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (`spi_bus_initialize`).

This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See SDMMC Host) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

**How to Use**

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!
Chapter 2. API Reference

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see *Sharing the SPI bus among SD card and other SPI devices*.

Related Docs

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD cad, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency. If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.
**DC loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

**Initialization sequence**

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.
   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

**API Reference**

**Header File**

- components/driver/include/driver/sdspi_host.h

**Functions**

```c
esp_err_t sdspi_host_init(void)
```

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

```c
esp_err_t sdspi_host_init_device(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)
```

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe

**Note** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
• other errors from the underlying spi_master and gpio drivers

**Parameters**
- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

```c
esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)
```
Remove an SD SPI device.

**Return**
Always ESP_OK

**Parameters**
- `handle`: Handle of the SD SPI device

```c
esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)
```
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note**
This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- `handle`: Handle of the sdspi device
- `cmdinfo`: pointer to structure describing command and data to transfer

```c
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note**
This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- `host`: Handle of the sdspi device
- `freq_khz`: card clock frequency, in kHz

```c
esp_err_t sdspi_host_deinit (void)
```
Release resources allocated using `sdspi_host_init`.

**Note**
This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdspi_host_init` function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
```
Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
- `handle`: Handle of the sdspi device

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

**Return**
- ESP_OK on success

**Parameters**
Chapter 2. API Reference

```
• handle: Handle of the sdspi device
• timeout_ticks: Ticks to wait before timeout.

esp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)
Initialize SD SPI driver for the specific SPI controller.

Note This function is not thread safe
Note The SDIO over dspi needs an extra interrupt line. Call gpio_install_isr_service() before this function.

Parameters
• slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
• slot_config: pointer to slot configuration structure

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
• ESP_ERR_NO_MEM if memory cannot be allocated
• other errors from the underlying spi_master and gpio drivers

Structures

struct sdspi_device_config_t
Extra configuration for SD SPI device.

Public Members

spi_host_device_t host_id
SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t gpio_cs
GPIO number of CS signal.

gpio_num_t gpio_cd
GPIO number of card detect signal.

gpio_num_t gpio_wp
GPIO number of write protect signal.

gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.

struct sdspi_slot_config_t
Extra configuration for SPI host.

Public Members

gpio_num_t gpio_cs
GPIO number of CS signal.

gpio_num_t gpio_cd
GPIO number of card detect signal.

gpio_num_t gpio_wp
GPIO number of write protect signal.

gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.

gpio_num_t gpio_miso
GPIO number of MISO signal.

gpio_num_t gpio_mosi
GPIO number of MOSI signal.
```
### gpi_num_t gpio_sck
GPIO number of SCK signal.

### int dma_channel
DMA channel to be used by SPI driver (1 or 2).

### Macros

**SDSPI_DEFAULT_HOST**

SDSPI_HOST_DEFAULT()
Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an `sdspi` device initialized by `sdspi_host_init_device()`.

**SDSPI_SLOT_NO_CD**
indicates that card detect line is not used

**SDSPI_SLOT_NO_WP**
indicates that write protect line is not used

**SDSPI_SLOT_NO_INT**
indicates that interrupt line is not used

**SDSPI_DEVICE_CONFIG_DEFAULT**()
Macro defining default configuration of SD SPI device.

**SDSPI_SLOT_CONFIG_DEFAULT**()
Macro defining default configuration of SPI host

### Type Definitions

typedef int sdspi_dev_handle_t
Handle representing an SD SPI device.

### 2.3.15 SDIO Card Slave Driver

### Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

#### Connections

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>
<th>Slot1</th>
<th>Slot2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLK</td>
<td>SCLK</td>

<td>9</td>
<td>12</td>
</tr>
<tr>
<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.
**Note:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 kOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check *Overview of Compatibility* to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See *Overview of Compatibility* to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- **Modules:** ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- **Kits:** ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to *SD Pull-up Requirements* for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology** The SDIO slave driver uses the following terms:

- **Transfer:** a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending:** slave to host transfers.
- **Receiving:** host to slave transfers.

**Note:** Register names in *ESP32 Technical Reference Manual > SDIO Slave Controller [PDF]* are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using `tx` or `rx` in the driver to avoid ambiguities.

- **FIFO:** specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \( \text{requested length} = 0x1F800\text{-address} \).
- **Ownership:** When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length:** The length requested in one transfer determined by the FIFO address.
- **Transfer length:** The length requested in one transfer determined by the CMD53 byte/block count field.

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the *requested length* rather than the *transfer length*. The *transfer length* should be no shorter than the *requested length*, and the rest part will be...
Chapter 2. API Reference

Communication with ESP SDIO Slave

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO Slave Initialization.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to ESP SDIO Slave Protocol. There is also a component ESP Serial Slave Link for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

Interrupts

There are interrupts from host to slave, and from slave to host to help communicating conveniently.

Slave Interrupts

The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.

Note: The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

Host Interrupts

The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see sdio_slave_hostint_t for more information.

Shared Registers

There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by sdio_slave_read_reg and sdio_slave_write_reg. The host can access (R/W) the register by CMD52 or CMD53.

Receiving FIFO

When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling sdio_slave_recv_register_buf, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to sdio_slave_recv_load_buf.
3. Get the received data by calling sdio_slave_recv or sdio_slave_recv_packet. If non-blocking call is needed, set wait=0.
Chapter 2. API Reference

The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.

If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.

4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

---

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode:** when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- **Packet Mode:** the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the wait is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.

2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t* buffer;
    size_t size;
    int id;
} sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,

    // (continues on next page)
```
### Chapter 2. API Reference (continued from previous page)

```c
.id = 3, // the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

// ... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void**)arg, portMAX_DELAY);
ESP_LOGI("tag", "(\%d) successfully send \%d bytes of \%p", arg->id, arg->size, ...
-arg->buffer);
some_post_callback(arg); // do more things
```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256] = {1, 2, 3, 4, 5, 6, 7, 8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

// ... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see `peripherals/sdio`.

### Application Example

Slave/master communication: `peripherals/sdio`.

### API Reference

#### Header File

- components/hal/include/hal/sdio_slave_types.h

#### Enumerations

`enum sdio_slave_hostint_t`

Mask of interrupts sending to the host.

**Values:**

- `SDIO_SLAVE_HOSTINT_BIT0` = BIT(0)
  - General purpose interrupt bit 0.
- `SDIO_SLAVE_HOSTINT_BIT1` = BIT(1)
- `SDIO_SLAVE_HOSTINT_BIT2` = BIT(2)
- `SDIO_SLAVE_HOSTINT_BIT3` = BIT(3)
- `SDIO_SLAVE_HOSTINT_BIT4` = BIT(4)
- `SDIO_SLAVE_HOSTINT_BIT5` = BIT(5)
- `SDIO_SLAVE_HOSTINT_BIT6` = BIT(6)
- `SDIO_SLAVE_HOSTINT_BIT7` = BIT(7)
**SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET** = BIT(23)

New packet available.

**enum sdio_slave_timing_t**

Timing of SDIO slave.

Values:

**SDIO_SLAVE_TIMING_PSEND_PSAMPLE** = 0

Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.

**SDIO_SLAVE_TIMING_NSEND_PSAMPLE**

Send at negedge, and sample at posedge. Default value for DS mode and below.

**SDIO_SLAVE_TIMING_PSEND_NSAMPLE**

Send at posedge, and sample at negedge.

**SDIO_SLAVE_TIMING_NSEND_NSAMPLE**

Send at negedge, and sample at negedge.

**enum sdio_slave_sending_mode_t**

Configuration of SDIO slave mode.

Values:

**SDIO_SLAVE_SEND_STREAM** = 0

Stream mode, all packets to send will be combined as one if possible.

**SDIO_SLAVE_SEND_PACKET** = 1

Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

**Header File**

- components/driver/include/driver/sdio_slave.h

**Functions**

```c
esp_err_t sdio_slave_initialize(sdio_slave_config_t *config)

Initialize the sdio slave driver
```

Return

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

Parameters

- **config**: Configuration of the sdio slave driver.

```c
void sdio_slave_deinit (void)

De-initialize the sdio slave driver to release the resources.
```

```c
esp_err_t sdio_slave_start (void)

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.
```

Note

The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.

Return

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

```c
void sdio_slave_stop (void)

Stop hardware from sending and receiving, also set IOREADY1 to 0.
```

Note

This will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call sdio_slave_reset to do that.
**esp_err_t** `sdio_slave_reset` *(void)*

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Return**

always return **ESP_OK**.

**sdio_slave_buf_handle_t** `sdio_slave_recv_register_buf` *(uint8_t *start)*

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note**

The driver will use and only use the amount of space specified in the **recv_buffer_size** member set in the **sdio_slave_config_t**. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return**

The buffer handle if success, otherwise **NULL**.

**Parameters**

- **start**: The start address of the buffer.

**esp_err_t** `sdio_slave_recv_unregister_buf` *(sdio_slave_buf_handle_t handle)*

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return**

**ESP_OK** if success, **ESP_ERR_INVALID_ARG** if the handle is **NULL** or the buffer is being used.

**Parameters**

- **handle**: Handle to the buffer to release.

**esp_err_t** `sdio_slave_recv_load_buf` *(sdio_slave_buf_handle_t handle)*

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by **sdio_slave_send_get_finished** after the transaction is finished.

**Return**

- **ESP_ERR_INVALID_ARG** if invalid handle or the buffer is already in the queue. Only after the buffer is returned by **sdio_slave_recv** can you load it again.
- **ESP_OK** if success

**Parameters**

- **handle**: Handle to the buffer ready to receive data.

**esp_err_t** `sdio_slave_recv_packet` *(sdio_slave_buf_handle_t *handle_ret, TickType_t wait)*

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is **ESP_ERR_NOT_FINISHED**, you should call this API iteratively until the return value is **ESP_OK**. All the continuous buffers returned with **ESP_ERR_NOT_FINISHED**, together with the last buffer returned with **ESP_OK**, belong to one packet from the host.

You can call simpler **sdio_slave_recv** instead, if the host never send data longer than the Receiving buffers size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

**Note**

Call **sdio_slave_load_buf** with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from **sdio_slave_get_buffer**.

**Return**

- **ESP_ERR_INVALID_ARG** if **handle_ret** is **NULL**
- **ESP_ERR_TIMEOUT** if timeout before receiving new data
- **ESP_ERR_NOT_FINISHED** if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- **ESP_OK** if success

**Parameters**

- **handle_ret**: Handle of the buffer holding received data. Use this handle in **sdio_slave_recv_load_buf**() to receive in the same buffer again.
- **wait**: Time to wait before data received.

**esp_err_t** `sdio_slave_recv` *(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)*

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note**

Call **sdio_slave_load_buf** with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from **sdio_slave_get_buffer**.
sdio_slave_get_buffer.

Return
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

Parameters
- handle_ret: Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
- [out] out_addr: Output of the start address, set to NULL if not needed.
- [out] out_len: Actual length of the data in the buffer, set to NULL if not needed.
- wait: Time to wait before data received.

uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)

Retrieve the buffer corresponding to a handle.

Return buffer address if success, otherwise NULL.

Parameters
- handle: Handle to get the buffer.
- len_o: Output of buffer length

esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TickType_t wait)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Return
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

Parameters
- addr: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- len: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- arg: Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- wait: Time to wait if the buffer is full.

esp_err_t sdio_slave_send_get_finished(void **out_arg, TickType_t wait)

Return the ownership of a finished transaction.

Return ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

Parameters
- out_arg: Argument of the finished transaction. Set to NULL if unused.
- wait: Time to wait if there’s no finished sending transaction.

esp_err_t sdio_slave_transmit(uint8_t *addr, size_t len)

Start a new sending transfer, and wait for it (blocked) to be finished.

Return
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

Parameters
- addr: Start address of the buffer to send
- len: Length of buffer to send.

uint8_t sdio_slave_read_reg(int pos)

Read the spi slave register shared with host.

Note register 28 to 31 are reserved for interrupt vector.

Return value of the register.

Parameters
- pos: register address, 0-27 or 32-63.
esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)
  Write the spi slave register shared with host.

  Note  register 29 and 31 are used for interrupt vector.
  Return  ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.
  Parameters
  • pos: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
  • reg: the value to write.

sdio_slave_hostint_t sdio_slave_get_host_intena (void)
  Get the interrupt enable for host.
  Return  the interrupt mask.

void sdio_slave_set_host_intena (sdio_slave_hostint_t mask)
  Set the interrupt enable for host.
  Parameters
  • mask: Enable mask for host interrupt.

esp_err_t sdio_slave_send_host_int (uint8_t pos)
  Interrupt the host by general purpose interrupt.
  Return
  • ESP_ERR_INVALID_ARG if interrupt num error
  • ESP_OK otherwise
  Parameters
  • pos: Interrupt num, 0-7.

void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
  Clear general purpose interrupt to host.
  Parameters
  • mask: Interrupt bits to clear, by bit mask.

esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)
  Wait for general purpose interrupt from host.
  Note  this clears the interrupt at the same time.
  Return  ESP_OK if success, ESP_ERR_TIMEOUT if timeout.
  Parameters
  • pos: Interrupt source number to wait for. is set.
  • wait: Time to wait before interrupt triggered.

Structures

struct sdio_slave_config_t
  Configuration of SDIO slave.

Public Members

sdio_slave_timing_t timing
  timing of sdio_slave. see sdio_slave_timing_t.

sdio_slave_sending_mode_t sending_mode
  mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible;
  SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

int send_queue_size
  max buffers that can be queued before sending.

size_t recv_buffer_size
  If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is
  too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers
  are easily run out. Should be set according to length of data really transferred. All data that do not fully
fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

```c
sdio_event_cb_t event_cb
```
when the host interrupts slave, this callback will be called with interrupt number (0-7).

```c
uint32_t flags
```
Features to be enabled for the slave, combinations of `SDIO_SLAVE_FLAG_*`.

### Macros

- **SDIO_SLAVE_RECV_MAX_BUFFER**
- **SDIO_SLAVE_FLAG_DAT2_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

- **SDIO_SLAVE_FLAG_HOST_INTR_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

- **SDIO_SLAVE_FLAG_INTERNAL_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

### Type Definitions

```c
typedef void (*sdio_event_cb_t)(uint8_t event)
typedef void* sdio_slave_buf_handle_t
```
Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

### 2.3.16 Sigma-delta Modulation

#### Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

#### Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`
The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Fig. 19: Sallen-Key Low Pass Filter](image)

**Application Example**

Sigma-delta Modulation example: `peripherals/sigmadelta`.

**API Reference**

**Header File**

- `components/driver/include/driver/sigmadelta.h`

**Functions**

```c
esp_err_t sigmadelta_config(const sigmadelta_config_t *config)
```

Configure Sigma-delta channel.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters

- **config**: Pointer of Sigma-delta channel configuration struct

```c
esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)
```

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{VDDIO}{256} \times duty + \frac{VDDIO}{2} \), where \( VDDIO \) is the power supply voltage.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **channel**: Sigma-delta channel number
- **duty**: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

```c
esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)
```

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **channel**: Sigma-delta channel number
- **prescale**: The divider of source clock, ranges from 0 to 255

```c
esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)
```

Set Sigma-delta signal output pin.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **channel**: Sigma-delta channel number
- **gpio_num**: GPIO number of output pin.

Structures

```c
struct sigmadelta_config_t
```

Sigma-delta configure struct.

Public Members

```c
sigmadelta_channel_t channel
```

Sigma-delta channel number

```c
int8_t sigmadelta_duty
```

Sigma-delta duty, duty ranges from -128 to 127.

```c
uint8_t sigmadelta_prescale
```

Sigma-delta prescale, prescale ranges from 0 to 255.

```c
uint8_t sigmadelta_gpio
```

Sigma-delta output io number, refer to gpio.h for more details.
Header File

- components/hal/include/hal/sigmadelta_types.h

Enumerations

```
enum sigmadelta_port_t
    SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX-1).

    Values:
    SIGMADELTA_PORT_0
        SIGMADELTA port 0
    SIGMADELTA_PORT_MAX
        SIGMADELTA port max
```

```
enum sigmadelta_channel_t
    Sigma-delta channel list.

    Values:
    SIGMADELTA_CHANNEL_0
        Sigma-delta channel 0
    SIGMADELTA_CHANNEL_1
        Sigma-delta channel 1
    SIGMADELTA_CHANNEL_2
        Sigma-delta channel 2
    SIGMADELTA_CHANNEL_3
        Sigma-delta channel 3
    SIGMADELTA_CHANNEL_4
        Sigma-delta channel 4
    SIGMADELTA_CHANNEL_5
        Sigma-delta channel 5
    SIGMADELTA_CHANNEL_6
        Sigma-delta channel 6
    SIGMADELTA_CHANNEL_7
        Sigma-delta channel 7
    SIGMADELTA_CHANNEL_MAX
        Sigma-delta channel max
```

2.3.17 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

Overview of ESP32’s SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus.

  There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.
Terminology

The terms used in relation to the SPI master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assert</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>Deassert</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transact</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launedge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latchedge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

Warning: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using xSemaphoreCreateMutex.
Chapter 2. API Reference

SPI Features

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
- There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.
The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>
<thead>
<tr>
<th>Mode name</th>
<th>Command Line Width</th>
<th>Address Line Width</th>
<th>Data Line Width</th>
<th>Transaction Flag</th>
<th>Bus IO setting Flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal SPI</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dual Output</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td><code>SPI_TRANS_MODE_DIO</code></td>
<td><code>SPICOMMON_BUSFLAG_DUAL</code></td>
</tr>
<tr>
<td>Dual I/O</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td><code>SPI_TRANS_MODE_DIO</code></td>
<td><code>SPI_TRANS_MULTILINE_ADDR</code></td>
</tr>
<tr>
<td>Quad Output</td>
<td>1</td>
<td>1</td>
<td>4</td>
<td><code>SPI_TRANS_MODE_QIO</code></td>
<td><code>SPICOMMON_BUSFLAG_QUAD</code></td>
</tr>
<tr>
<td>Quad I/O</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td><code>SPI_TRANS_MODE_QIO</code></td>
<td><code>SPI_TRANS_MULTILINE_ADDR</code></td>
</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the
rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see `Transaction Line Mode`.

### Write and Read Phases

Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If `external PSRAM is enabled`, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPIDEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in `Transaction Line Mode`.

**Note:** Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see `Known Issues`.

### Bus Acquiring

Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus.initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.
Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus

Note: Though the SPI Bus Lock feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other devices are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between `spi_device_acquire_bus()` and `spi_device_release_bus()`.
   - Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`).
During the time above, all other tasks and most ISRs will be disabled (see *IRAM-Safe Interrupt Handlers*). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a *Cache disabled but cached memory region accessed* exception. For differences between IRAM, DRAM, and flash cache, please refer to the *application memory layout* documentation.

To place functions into the IRAM, you can either:

1. Add `IRAM_ATTR` (include “esp_attr.h”) to the function like:
   ```c
   IRAM_ATTR void foo(void)
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.

2. Use the `noflash` placement in the `linker.elf`. See more in *Linker Script Generation*. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:

1. Add `DRAM_ATTR` (include “esp_attr.h”) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;
   ```

2. Use the `noflash` placement in the `linker.elf`. See more in *Linker Script Generation*.

Please also see the example `peripherals/spi_master/hd_eeprom`.

**GPIO Matrix and IO_MUX**  Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.
**Transaction Duration**  
Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See **Interrupt Transactions**. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see **Polling Transactions**.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.
- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

**SPI Clock Frequency**  
Transferring each byte takes eight times the clock period $8/f_{spi}$.

If the clock frequency is too high, the use of some functions might be limited. See **Timing Considerations**.

**Cache Miss**  
The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz][us]$ for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see **IRAM-Safe Interrupt Handlers**.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.
The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33-77% in comparison to the existing `input delay`. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the Host only writes data, the dummy bit workaround and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

**spi_device_interface_config_t::flags**

The SPI master driver still works even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.
Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{\left(\text{floor}(\text{MISO delay[ns]}/12.5) + 1\right)}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>

<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used.
If such transactions are required, you have to use one of the alternative solutions:
1. Use full-duplex transactions instead.
2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:
   ```c
   ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
   ```
   This can prohibit you from transmitting and receiving data longer than 64 bytes. 3. Try using the command and address fields to replace the write phase.
2. Full-duplex transactions are not compatible with the dummy bit workaround, hence the frequency is limited. See dummy bit speed-up workaround.
3. dummy_bits in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- components/hal/include/hal/spi_types.h

Structures

```c
struct spi_line_mode_t
```
Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

- `uint8_t cmd_lines`
  The line width of command phase, e.g. 2-line-cmd-phase.
- `uint8_t addr_lines`
  The line width of address phase, e.g. 1-line-addr-phase.
- `uint8_t data_lines`
  The line width of data phase, e.g. 4-line-data-phase.

Enumerations

```c
enum spi_host_device_t
```
Enum with the three SPI peripherals that are software-accessible in it.

Values:

- `SPI1_HOST = 0`
  SPI1.
- `SPI2_HOST = 1`
  SPI2.
- `SPI3_HOST = 2`
  SPI3.
- `SPI_HOST_MAX`
  invalid host value

```c
enum spi_event_t
```
SPI Events.

Values:
SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File

- components/driver/include/driver/spi_common.h

Functions

```c
esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma_chan)
```

Initialize a SPI bus.

**Warning** SPI0/1 is not supported
**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**
- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral that controls this bus
- bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_bus_free(spi_host_device_t host_id)
```

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
• ESP_OK on success

Parameters
• host_id: SPI peripheral to free

Structures

struct spi_bus_config_t
This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix
to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are
-1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note Be advised that the slave driver does not use the quadwp/quadhd lines and fields in spi_bus_config_t
refering to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int mosi_io_num
    GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int data0_io_num
    GPIO pin for sphi0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
    GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
    GPIO pin for sphi1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
    GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
    GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
    GPIO pin for sphi2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
    GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
    GPIO pin for sphi3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
    GPIO pin for sphi4 signal in octal mode, or -1 if not used.

int data5_io_num
    GPIO pin for sphi5 signal in octal mode, or -1 if not used.

int data6_io_num
    GPIO pin for sphi6 signal in octal mode, or -1 if not used.

int data7_io_num
    GPIO pin for sphi7 signal in octal mode, or -1 if not used.

int max_transfer_sz
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to
    SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
    Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.
int intr_flags
   Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
   the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
   is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX (DATA, LEN)
   Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
   E.g. to send 9 bits of data, you can:

   ```c
   uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
   ```
   Then points tx_buffer to &data.

Parameters
   •  DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
   •  LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the
data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
   Transform received data of length <= 32 bits to the format of an unsigned integer.
   E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

   ```c
   uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
   ```

Parameters
   •  DATA: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
   •  LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the
data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
   Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
   Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
   Check using iOMUX pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS
   Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
   Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
   Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
   Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL
   Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
   Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
   Check existing of MOSI/MISO/ WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7
   Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.
**Chapter 2. API Reference**

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WD/HD/SPIO4/SPIO5/SPIO6/SPIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**
typedef spi_common_dma_t spi_dma_chan_t

**Enumerations**
enum spi_common_dma_t
SPI DMA channels.

*Values:*
- SPI_DMA_DISABLED = 0
  Do not enable DMA for SPI.
- SPI_DMA_CH1 = 1
  Enable DMA, select DMA Channel 1.
- SPI_DMA_CH2 = 2
  Enable DMA, select DMA Channel 2.
- SPI_DMA_CH_AUTO = 3
  Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master**

**Header File**
- components/driver/include/driver/spi_master.h

**Functions**

```c
esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```
Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

```c
esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
```
Remove a device from the SPI bus.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success
Parameters

- **handle**: Device handle to free

**esp_err_t spi_device_queue_trans** ((**spi_device_handle_t** handle, **spi_transaction_t** *trans_desc, **TickType_t** ticks_to_wait))

Queue a SPI transaction for interrupt transaction execution. Get the result by **spi_device_get_trans_result**.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- **ESP_ERR_INVALID_ARG** if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- **ESP_ERR_TIMEOUT** if there was no room in the queue before ticks_to_wait expired
- **ESP_ERR_NO_MEM** if allocating DMA-capable temporary buffer failed
- **ESP_ERR_INVALID_STATE** if previous transactions are not finished
- **ESP_OK** on success

Parameters

- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute
- **ticks_to_wait**: Tick to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**esp_err_t spi_device_get_trans_result** (**spi_device_handle_t** handle, **spi_transaction_t** **trans_desc**, **TickType_t** ticks_to_wait))

Get the result of a SPI transaction queued earlier by **spi_device_queue_trans**.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_ERR_TIMEOUT** if there was no completed transaction before ticks_to_wait expired
- **ESP_OK** on success

Parameters

- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by **spi_device_get_trans_result**.
- **ticks_to_wait**: Tick to wait until there’s a returned item; use portMAX_DELAY to never time out.

**esp_err_t spi_device_transmit** (**spi_device_handle_t** handle, **spi_transaction_t** *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling **spi_device_queue_trans()** followed by **spi_device_get_trans_result()**. Do not use this when there is still a transaction separately queued (started) from **spi_device_queue_trans()** or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_OK** on success

Parameters

- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute

**esp_err_t spi_device_polling_start** (**spi_device_handle_t** handle, **spi_transaction_t** *trans_desc, **TickType_t** ticks_to_wait)

Immediately start a polling transaction.
Chapter 2. API Reference

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; currently only port-MAX_DELAY is supported.

```c
esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**
- ESP_ERR_INVALID_ARG: wait is not set to portMAX_DELAY.
- ESP_OK : Success.

**Parameters**
- device: The device to occupy the bus.
- wait: Time to wait before the the bus is occupied by the device. Currently MUST set to port-MAX_DELAY.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.
Chapter 2. API Reference

Parameters
• dev: The device to release the bus.

int spi_cal_clock (int fapb, int hz, int duty_cycle, uint32_t *reg_o)
Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters
• fapb: The frequency of apb clock, should be APB_CLK_FREQ.
• hz: Desired working frequency
• duty_cycle: Duty cycle of the spi clock
• reg_o: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

int spi_get_actual_clock (int fapb, int hz, int duty_cycle)
Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters
• fapb: The frequency of apb clock, should be APB_CLK_FREQ.
• hz: Desired working frequency
• duty_cycle: Duty cycle of the spi clock

void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
Calculate the timing setting of specified frequency and settings.

Note If **dummy_o is not zero, it means dummy bits should be applied in half duplex mode, and full duplex
mode may not work.

Parameters
• gpio_is_used: True if using GPIO matrix, or False if iomux pins are used.
• input_delay_ns: Input delay from SCLK launched geto MISO data valid.
• eff_clk: Effective clock frequency (in Hz) from spi_cal_clock.
• dummy_o: Address of dummy bits used output. Set to NULL if not needed.
• cycles_remain_o: Address of cycles remaining (after dummy bits are used) output.
  – -1 If too many cycles remaining, suggest to compensate half a clock.
  – 0 If no remaining cycles or dummy bits are not used.
  – positive value: cycles suggest to compensate.

int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit,
full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Return Frequency limit of current configurations.

Parameters
• gpio_is_used: True if using GPIO matrix, or False if native pins are used.
• input_delay_ns: Input delay from SCLK launch edge to MISO data valid.

Structures
struct spi_device_interface_config_t
This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t command_bits
Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not
used, otherwise ignored.

uint8_t address_bits
Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not
used, otherwise ignored.
Chapter 2. API Reference

uint8_t dummy_bits
Amount of dummy bits to insert between address and data phase.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
CS GPIO pin for this device, or -1 if not used.

uint32_t flags
Bitwise OR of SPI_DEVICE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
Command data, of which the length is set in the command_bits of spi_device_interface_config_t.
NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

`uint64_t addr`
Address data, of which the length is set in the address_bits of `spi_device_interface_config_t`.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

`size_t length`
Total data length, in bits.

`size_t rxlength`
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

`void *user`
User-defined variable. Can be used to store eg transaction ID.

`const void *tx_buffer`
Pointer to transmit buffer, or NULL for no MOSI phase.

`uint8_t tx_data[4]`
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

`void *rx_buffer`
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

`uint8_t rx_data[4]`
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

`struct spi_transaction_ext_t`
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

**Public Members**

`struct spi_transaction_t base`
Transaction data, so that pointer to `spi_transaction_t` can be converted into `spi_transaction_ext_t`.

`uint8_t command_bits`
The command length in this transaction, in bits.

`uint8_t address_bits`
The address length in this transaction, in bits.

`uint8_t dummy_bits`
The dummy length in this transaction, in bits.

**Macros**

`SPI_MASTER_FREQ_8M`
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

- 8MHz
- 8.89MHz
- 10MHz
Chapter 2. API Reference

**SPI_MASTER_FREQ_11M**
11.43MHz

**SPI_MASTER_FREQ_13M**
13.33MHz

**SPI_MASTER_FREQ_16M**
16MHz

**SPI_MASTER_FREQ_20M**
20MHz

**SPI_MASTER_FREQ_26M**
26.67MHz

**SPI_MASTER_FREQ_40M**
40MHz

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPIDEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_HALFDUPLEX**
If the frequency is related to whether iomux pins are used, valid time after slave sees the clock.
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.
SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_CS_KEEP_ACTIVE
Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions
typedef struct spi_transaction_t spi_transaction_t
typedef void (* transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.3.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

• SPI2, sometimes referred to as HSPI
• SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
</tbody>
</table>

- **MISO**  
  Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.

- **MOSI**  
  Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.

- **SCLK**  
  Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.

- **CS**  
  Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.

- **QUADWP**  
  Write Protect signal. Only used for 4-bit (qio/qout) transactions.

- **QUADHD**  
  Hold signal. Only used for 4-bit (qio/qout) transactions.

- **Assertion**  
  The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
Chapter 2. API Reference

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device \texttt{spi_slave_interface_config_t}, and transaction configuration structure \texttt{spi_slave_transaction_t}.

As not every transaction requires both writing and reading data, you have a choice to configure the \texttt{spi_transaction_t} structure for TX only, RX only, or TX and RX transactions. If \texttt{spi_slave_transaction_t::rx_buffer} is set to NULL, the read phase will be skipped. If \texttt{spi_slave_transaction_t::tx_buffer} is set to NULL, the write phase will be skipped.

\textbf{Note:} A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see \textit{Transaction Interval}.

\subsection*{Driver Usage}

- Initialize an SPI peripheral as a Device by calling the function \texttt{spi_slave_initialize}. Make sure to set the correct I/O pins in the structure \texttt{bus_config}. Set the unused signals to -1.

  If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter \texttt{dma_chan} to 1 or 2 respectively. Otherwise, set \texttt{dma_chan} to 0.

- Before initiating transactions, fill one or more \texttt{spi_slave_transaction_t} structs with the transaction parameters required. Either queue all transactions by calling the function \texttt{spi_slave_queue_trans()} and, at a later time, query the result by using the function \texttt{spi_slave_get_trans_result()}, or handle all requests individually by feeding them into \texttt{spi_slave_transmit()}. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call \texttt{spi_slave_free()}. 

\subsection*{Transaction Data and Master/Slave Length Mismatches}

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the \texttt{rx_buffer} and \texttt{tx_buffer} members of the \texttt{spi_transaction_t} structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using \texttt{pvPortMallocCaps(size, MALLOC_CAP_DMA)}.

The amount of data that the driver can read or write to the buffers is limited by the member \texttt{spi_transaction_t::length}. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member \texttt{spi_slave_transaction_t::trans_len}.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the \texttt{length} member will be sent and received. In this case, \texttt{trans_len} is set to \texttt{length} instead of the actual transaction length. To meet the actual transaction length requirements, set \texttt{length} to a value greater than the maximum \texttt{trans_len} expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

\subsection*{GPIO Matrix and IO_MUX}

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.
The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2 GPIO Number</th>
<th>SPI3 GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

### Speed and Timing Considerations

**Transaction Interval**   The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements**   The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th>IO_MUX</th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>43.75</td>
<td>&lt;11.4</td>
<td></td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency is equal to the limitation, it can lead to random errors. 2. The clock uncertainty between Host and Device (12.5ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.
Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

![Timing Diagram]

If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

Application Example

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

API Reference

Header File

- components/driver/include/driver/spi_slave.h

Functions

```c
esp_err_t spi_slave_initialize (spi_host_device_t host, const spi_bus_config_t *bus_config, 
const spi_slave_interface_config_t *slave_config, 
spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- host: SPI peripheral to use as a slave interface
- bus_config: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- slave_config: Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
Chapter 2. API Reference

- **dma_chan**:
  - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**esp_err_t spi_slave_free(spi_host_device_t host)**

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to free

**esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_init.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral that is acting as a slave
- **trans_desc**: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)**

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to that is acting as a slave
- **[out] trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.
Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- host: SPI peripheral to that is acting as a slave
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Structures

struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

int spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb / post_setup_cb
Callback called after the SPI registers are loaded with new data.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb / post_trans_cb
Callback called after a transaction is done.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.
void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary ($rx\_buffer\%4==0$), and has length of a multiple of 4 bytes.

void *user
    User-defined variable. Can be used to store eg transaction ID.

**Macros**

- **SPI_SLAVE_TXBIT_LSBFIRST**
  Transmit command/address/data LSB first instead of the default MSB first.

- **SPI_SLAVE_RXBIT_LSBFIRST**
  Receive data LSB first instead of the default MSB first.

- **SPI_SLAVE_BIT_LSBFIRST**
  Transmit and receive LSB first.

**Type Definitions**

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

### 2.3.19 ESP32-WROOM-32SE (Secure Element)

**Overview**

The ESP32-WROOM-32SE has integrated Microchip's ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

**Application Example**

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

**How to configure and provision ESP32-WROOM-32SE for TLS**

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility

**How to use ATECC608A of ESP32-WROOM-32SE for TLS**

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer ATECC608A with ESP-TLS in ESP-TLS documentation.

### 2.3.20 Touch Sensor

**Introduction**

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32 can support up to 10 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.
For design, operation, and control registers of a touch sensor, see ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note.

For more information about testing touch sensors in various configurations, please check the Guide for ESP32-Sense-Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization

Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several "_DEFAULT" driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

Configuration

Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`.

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

Touch State Measurements

The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`  
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

Note: Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section Filtering of Measurements.

For the demonstration of how to read the touch pad data, check the application example peripherals/touch_sensor/touch_sensor_v1/touch_pad_read.

Optimization of Measurements

A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.
Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Diagram showing the relationship between measurement parameters](image)

**Fig. 20:** Touch pad - relationship between measurement parameters

The last chart `Output` represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform
touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thres()`. 

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`. 

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()` 
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()` 

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

**Wakeup from Sleep Mode** If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()` 
- `touch_pad_clear_group_mask()`

**Application Examples**

- Touch sensor read example: peripherals/touch_sensor/touch_sensor_v1/touch_pad_read. 
- Touch sensor interrupt example: peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt.

**API Reference**

**Header File**

```
• components/driver/esp32/include/driver/touch_sensor.h
```

**Functions**

`esp_err_t touch_pad_config (touch_pad_t touch_num, uint16_t threshold)` 

Configure touch pad interrupt threshold.

**Note** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Return**

- ESP_OK Success 
- ESP_ERR_INVALID_ARG if argument wrong 
- ESP_FAIL if touch pad not initialized
Parameters

- `touch_num`: touch pad index
- `threshold`: interrupt threshold,

```c
esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t* touch_value)
```

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_read_filtered(touch_pad_t touch_num, uint16_t* touch_value)
```

get filtered touch sensor counter value by IIR filter.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t* touch_value)
```

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_set_filter_read_cb(filter_cb_t read_cb)
```

Register the callback function that is called after each IIR filter calculation.

**Note** The ‘read_cb’ callback is called in timer task in each filtering cycle.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG set error

```c
esp_err_t touch_pad_isr_register(intr_handler_t fn, void* arg)
```

Register the touch pad interrupt handler.

**Note** If the `fn` is NULL, the handler will be disabled.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

Parameters
- fn: Pointer to ISR handler
- arg: Parameter for ISR

```c
esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_cycle)
```
Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

Note The greater the duty cycle of the measurement time, the more system power is consumed.

Return
- ESP_OK on success

Parameters
- sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. \( t_{sleep} = \frac{sleep\_cycle}{RTC\_SLOW\_CLK\ \text{frequency}} \). The approximate frequency value of RTC\_SLOW\_CLK can be obtained using \( \text{rtc\_clk\_slow\_freq\_get\_hz} \) function.
- meas_cycle: The duration of the touch sensor measurement. \( t_{meas} = \frac{meas\_cycle}{8M} \), the maximum measure time will be \( 0xffff/8M = 8.19 \text{ ms} \)

```c
esp_err_t touch_pad_get_meas_time(uint16_t *sleep_cycle, uint16_t *meas_cycle)
```
Get touch sensor measurement and sleep time.

Return
- ESP_OK on success

Parameters
- sleep_cycle: Pointer to accept sleep cycle number
- meas_cycle: Pointer to accept measurement cycle count.

```c
esp_err_t touch_pad_sw_start(void)
```
Trigger a touch sensor measurement, only support in SW mode of FSM.

Return
- ESP_OK on success

```c
esp_err_t touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)
```
Set touch sensor interrupt threshold.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- touch_num: touch pad index
- threshold: threshold of touchpad count, refer to touch_pad_set_trigger_mode to see how to set trigger mode.

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint16_t *threshold)
```
Get touch sensor interrupt threshold.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- touch_num: touch pad index
- threshold: pointer to accept threshold

```c
esp_err_t touch_pad_set_trigger_mode(touch_trigger_mode_t mode)
```
Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.
Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• mode: touch sensor interrupt trigger mode

\texttt{esp_err_t touch_pad_get_trigger_mode (touch_trigger_mode_t* mode)}

Get touch sensor interrupt trigger mode.

Return
• ESP_OK on success

Parameters
• mode: pointer to accept touch sensor interrupt trigger mode

\texttt{esp_err_t touch_pad_set_trigger_source (touch_trigger_src_t src)}

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• src: touch sensor interrupt trigger source

\texttt{esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t* src)}

Get touch sensor interrupt trigger source.

Return
• ESP_OK on success

Parameters
• src: pointer to accept touch sensor interrupt trigger source

\texttt{esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)}

Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is ‘touched’. This function will set the register bits according to the given bitmask.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• set1_mask: bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask: bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask: bitmask of touch sensor work enable, it’s a 10-bit value

\texttt{esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)}

Get touch sensor group mask.

Return
• ESP_OK on success

Parameters
• set1_mask: pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask: pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask: pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

\texttt{esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)}

Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

Return
• ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **set1_mask**: bitmask touch sensor signal group1, it’s a 10-bit value
- **set2_mask**: bitmask touch sensor signal group2, it’s a 10-bit value
- **en_mask**: bitmask of touch sensor work enable, it’s a 10-bit value

```c
esp_err_t touch_pad_intr_enable (void)
To enable touch pad interrupt.
```
Return
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable (void)
To disable touch pad interrupt.
```
Return
- ESP_OK on success

```c
esp_err_t touch_pad_intr_clear (void)
To clear touch pad interrupt.
```
Return
- ESP_OK on success

```c
esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)
set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs
```
Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- **new_period_ms**: filter period, in ms

```c
esp_err_t touch_pad_get_filter_period (uint32_t *p_period_ms)
get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs
```
Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- **p_period_ms**: pointer to accept period

```c
esp_err_t touch_pad_filter_start (uint32_t filter_period_ms)
start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs
```
Note
This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

**Parameters**
- **filter_period_ms**: filter calibration period, in ms

```c
esp_err_t touch_pad_filter_stop (void)
stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs
```
Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
```c
esp_err_t touch_pad_filter_delete(void)
delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE driver state error
```

**Type Definitions**

```c
typedef void(*filter_cb_t)(uint16_t*raw_value, uint16_t*filtered_value)
```

Callback function that is called after each IIR filter calculation.

**Note** This callback is called in timer task in each filtering cycle.

**Note** This callback should not be blocked.

**Parameters**

- `raw_value`: The latest raw data (touch sensor counter value) that points to all channels (`raw_value[0..TOUCH_PAD_MAX-1]`).
- `filtered_value`: The latest IIR filtered data (calculated from raw data) that points to all channels (`filtered_value[0..TOUCH_PAD_MAX-1]`).

**Header File**

- `components/driver/include/driver/touch_sensor_common.h`

**Functions**

```c
esp_err_t touch_pad_init(void)
Initialize touch module.

Note If default parameter don’t match the usage scenario, it can be changed after this function.

Return
  • ESP_OK Success
  • ESP_ERR_NO_MEM Touch pad init error
  • ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL
```

```c
esp_err_t touch_pad_deinit(void)
Un-install touch pad driver.

Note After this function is called, other touch functions are prohibited from being called.

Return
  • ESP_OK Success
  • ESP_FAIL Touch pad driver not initialized
```

```c
esp_err_t touch_pad_io_init(touch_pad_t touch_num)
Initialize touch pad GPIO.

Return
  • ESP_OK on success
  • ESP_ERR_INVALID_ARG if argument is wrong

Parameters
  • `touch_num`: touch pad index
```

```c
esp_err_t touch_pad_set_voltage(touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)
Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

Return
  • ESP_OK on success
  • ESP_ERR_INVALID_ARG if argument is wrong

Parameters
  • `refh`: the value of DREFH
  • `refl`: the value of DREFL
```
Chapter 2. API Reference

- **atten**: the attenuation on DREFH

```c
esp_err_t touch_pad_get_voltage(touch_high_volt_t *refh, touch_low_volt_t *refl,
                                 touch_volt_atten_t *atten)
```

Get touch sensor reference voltage.

**Return**
- ESP_OK on success

**Parameters**
- **refh**: pointer to accept DREFH value
- **refl**: pointer to accept DREFL value
- **atten**: pointer to accept the attenuation on DREFH

```c
esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope,
                                  touch_tie_opt_t *opt)
```

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **touch_num**: touch pad index
- **slope**: touch pad charge/discharge speed
- **opt**: the initial voltage

```c
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope,
                                  touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **touch_num**: touch pad index
- **slope**: pointer to accept touch pad charge/discharge slope
- **opt**: pointer to accept the initial voltage

```c
esp_err_t touch_pad_isr_deregister(void (*fn) void * arg)
```

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

**Parameters**
- **fn**: handler function to call (as passed to `touch_pad_isr_handler_register`)
- **arg**: argument of the handler (as passed to `touch_pad_isr_handler_register`)

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: pointer to touch pad which caused wakeup

```c
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Return**
- ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters

• mode: FSM mode

```c
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

Return

• ESP_OK on success

Parameters

• mode: pointer to accept FSM mode

```c
esp_err_t touch_pad_clear_status(void)
```

To clear the touch sensor channel active status.

Note The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

Return

• ESP_OK on success

```c
uint32_t touch_pad_get_status(void)
```

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

Return

• The touch sensor status. e.g. Touch1 trigger status is status_mask & (BIT1).

```c
bool touch_pad_meas_is_done(void)
```

Check touch sensor measurement status.

Return

• True measurement is under way
• False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. TOUCH_PAD_NUM5_GPIO_NUM is the GPIO number of channel 5 (12);
2. TOUCH_PAD_GPIO4_CHANNEL is the channel number of GPIO 4 (channel 0).

**Header File**

• components/soc/esp32/include/soc/touch_sensor_channel.h

**Macros**

TOUCH_PAD_GPIO4_CHANNEL
TOUCH_PAD_NUM0_GPIO_NUM
TOUCH_PAD_GPIO0_CHANNEL
TOUCH_PAD_NUM1_GPIO_NUM
TOUCH_PAD_GPIO2_CHANNEL
TOUCH_PAD_NUM2_GPIO_NUM
TOUCH_PAD_GPIO15_CHANNEL
TOUCH_PAD_NUM3_GPIO_NUM
TOUCH_PAD_GPIO13_CHANNEL
TOUCH_PAD_NUM4_GPIO_NUM
TOUCH_PAD_GPIO12_CHANNEL
Chapter 2. API Reference

- TOUCH_PAD_SLOPE_DEFAULT  
- TOUCH_PAD_TIE_OPT_DEFAULT  
- TOUCH_PAD_BIT_MASK_MAX  
- TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD  
- TOUCH_PAD_LOW_VOLTAGE_THRESHOLD  
- TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD  
- TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT  
- TOUCH_PAD_THRESHOLD_MAX  
  If set touch threshold max value, The touch sensor can’t be in touched status  
- TOUCH_PAD_SLEEP_CYCLE_DEFAULT  
  The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff  
- TOUCH_PAD_MEASURE_CYCLE_DEFAULT  
  The timer frequency is 8Mhz, the max value is 0x7fff  
- TOUCH_FSM_MODE_DEFAULT  
  The touch FSM my bestarted by the software or timer  
- TOUCH_TRIGGER_MODE_DEFAULT  
  Interrupts can be triggered if sensor value gets below or above threshold  
- TOUCH_TRIGGER_SOURCE_DEFAULT  
  The wakeup trigger source can be SET1 or both SET1 and SET2  

** Enumerations  
- enum touch_pad_t  
  Touch pad channel  
  Values:  
  - TOUCH_PAD_NUM0 = 0  
    Touch pad channel 0 is GPIO4(ESP32)  
  - TOUCH_PAD_NUM1  
    Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
Chapter 2. API Reference

TOUCH_PAD_NUM2
Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

TOUCH_PAD_NUM3
Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

TOUCH_PAD_NUM4
Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

TOUCH_PAD_NUM5
Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

TOUCH_PAD_NUM6
Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

TOUCH_PAD_NUM7
Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

TOUCH_PAD_NUM8
Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

TOUCH_PAD_NUM9
Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

TOUCH_PAD_MAX

enum touch_high_volt_t
Touch sensor high reference voltage

Values:

TOUCH_HVOLT_KEEP = -1
Touch sensor high reference voltage, no change

TOUCH_HVOLT_2V4 = 0
Touch sensor high reference voltage, 2.4V

TOUCH_HVOLT_2V5
Touch sensor high reference voltage, 2.5V

TOUCH_HVOLT_2V6
Touch sensor high reference voltage, 2.6V

TOUCH_HVOLT_2V7
Touch sensor high reference voltage, 2.7V

TOUCH_HVOLT_MAX

enum touch_low_volt_t
Touch sensor low reference voltage

Values:

TOUCH_LVOLT_KEEP = -1
Touch sensor low reference voltage, no change

TOUCH_LVOLT_0V5 = 0
Touch sensor low reference voltage, 0.5V

TOUCH_LVOLT_0V6
Touch sensor low reference voltage, 0.6V

TOUCH_LVOLT_0V7
Touch sensor low reference voltage, 0.7V

TOUCH_LVOLT_0V8
Touch sensor low reference voltage, 0.8V

TOUCH_LVOLT_MAX
enum touch_volt_atten_t
Touch sensor high reference voltage attenuation

Values:

TOUCH_HVOLT_ATTEN_KEEP = -1
Touch sensor high reference voltage attenuation, no change

TOUCH_HVOLT_ATTEN_1V5 = 0
Touch sensor high reference voltage attenuation, 1.5V attenuation

TOUCH_HVOLT_ATTEN_1V = 1
Touch sensor high reference voltage attenuation, 1.0V attenuation

TOUCH_HVOLT_ATTEN_0V5 = 2
Touch sensor high reference voltage attenuation, 0.5V attenuation

TOUCH_HVOLT_ATTEN_0V = 3
Touch sensor high reference voltage attenuation, 0V attenuation

TOUCH_HVOLT_ATTEN_MAX = 4

enum touch_cnt_slope_t
Touch sensor charge/discharge speed

Values:

TOUCH_PAD_SLOPE_0 = 0
Touch sensor charge / discharge speed, always zero

TOUCH_PAD_SLOPE_1 = 1
Touch sensor charge / discharge speed, slowest

TOUCH_PAD_SLOPE_2 = 2
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_3 = 3
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_4 = 4
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_5 = 5
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_6 = 6
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_7 = 7
Touch sensor charge / discharge speed, fast

TOUCH_PAD_SLOPE_MAX = 8

enum touch_tie_opt_t
Touch sensor initial charge level

Values:

TOUCH_PAD_TIE_OPT_LOW = 0
Initial level of charging voltage, low level

TOUCH_PAD_TIE_OPT_HIGH = 1
Initial level of charging voltage, high level

TOUCH_PAD_TIE_OPT_MAX = 2

enum touch_fsm_mode_t
Touch sensor FSM mode

Values:
TOUCH_FSM_MODE_TIMER = 0
To start touch FSM by timer

TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t
Values:

TOUCH_TRIGGER_BELOW = 0
Touch interrupt will happen if counter value is less than threshold.

TOUCH_TRIGGER_ABOVE = 1
Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t
Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

2.3.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. TWAI Protocol Summary
2. Signals Lines and Transceiver
3. Driver Configuration
4. Driver Operation
5. Examples

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).
**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely **Error Active**, **Error Passive**, and **Bus-Off**.

- **Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

- **Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

- **Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller’s source clock (APB Clock).
Note: An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes

The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts

The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:
## Table 5: TWAI Driver Alerts

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_below_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT правитель ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_above_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_above_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_below_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

### Bit Timing

The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the `brp` can be any even number from 2 to 128.

If the ESP32 is a revision 2 or later chip, the `brp` will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling Triple Sampling will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The Synchronization Jump Width is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can range from 1 to 4.
Chapter 2. API Reference

**Fig. 22:** Bittiming configuration for 500kbit/s given BRP = 8

**Note:** Multiple combinations of \( \text{brp}, \text{tseg}_1, \text{tseg}_2, \) and \( \text{sjw} \) can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver:

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`

Revision 2 or later of the ESP32 also supports the following bit rates:

- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it.** Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask.**

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode.** Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Fig. 23:** Bit layout of single filter mode (Right side MSBit)
**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Bit layout of dual filter mode](image)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)
### Driver States

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

### Message Fields and Flags

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

### Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.
```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    // Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    // Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    // Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...

// Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

// Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.
#include "driver/twai.h"

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the twai_stop() and twai_driver_uninstall() functions.

#include "driver/twai.h"

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}
Multiple ID Filter Configuration  

The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000

//Acceptance Mask
MASK = 11'b000 0000 1101
```

**Application Examples**  

**Network Example:** The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via `peripherals/twai/twai_self_test`.

**API Reference**

**Header File**

- `components/hal/include/hal/twai_types.h`

**Structures**

```
struct twai_message_t
    Structure to store a TWAI message.
    
    `Note` The flags member is deprecated
```

**Public Members**

```
uint32_t `extd`: 1
    Extended Frame Format (29bit ID)

uint32_t `rtr`: 1
    Message is a Remote Frame
```
Chapter 2. API Reference

uint32_t ss: 1
Transmit as a Single Shot Transmission. Unused for received.

uint32_t self: 1
Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp: 1
Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved: 27
Reserved bits

uint32_t flags
Deprecated: Alternate way to set bits using message flags

uint32_t identifier
11 or 29 bit identifier

uint8_t data_length_code
Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
Data bytes (not relevant in RTR frame)

struct twai_timing_config_t
Structure for bit timing configuration of the TWAI driver.

Note Macro initializers are available for this structure

Public Members

uint32_t brp
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note Macro initializers are available for this structure

Public Members

uint32_t acceptance_code
32-bit acceptance code

uint32_t acceptance_mask
32-bit acceptance mask

bool single_filter
Use Single Filter Mode (see documentation)
Chapter 2. API Reference

Macros

**TWAI_EXTD_ID_MASK**
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**
Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**
Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**
EFF ID requires 4 bytes (29bit)

**TWAI_FRAME_STD_ID_LEN_BYTES**
SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**
Error counter threshold for error passive

Enumerations

**enum twai_mode_t**
TWAI Controller operating modes.
Values:

**TWAI_MODE_NORMAL**
Normal operating mode where TWAI controller can send/receive/acknowledge messages

**TWAI_MODE_NO_ACK**
Transmission does not require acknowledgment. Use this mode for self testing

**TWAI_MODE_LISTEN_ONLY**
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- components/driver/include/driver/twai.h

Functions

```c
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
```
Install TWAI driver.
This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the TWAI driver, call twai_driver_uninstall() first

**Return**
- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

**Parameters**
- [in] g_config: General configuration structure
- [in] t_config: Timing configuration structure
- [in] f_config: Filter configuration structure
**esp_err_t** **twai_driver_uninstall**(void)
Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t** **twai_start**(void)
Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Return**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

**esp_err_t** **twai_stop**(void)
Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until **twai_start**() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

**esp_err_t** **twai_transmit**(const **twai_message_t** *message, **TickType_t** ticks_to_wait)
Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

**esp_err_t** **twai_receive**(const **twai_message_t** *message, **TickType_t** ticks_to_wait)
Receive a TWAI message.
This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] message`: Received message
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t twai_read_alerts(uint32_t* alerts, TickType_t ticks_to_wait)
```
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] alerts`: Bit field of raised alerts (see documentation for alert flags)
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block for alert

```c
esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t* current_alerts)
```
Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[in] alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- `[out] current_alerts`: Bit field of currently raised alerts. Set to NULL if unused

```c
esp_err_t twai_initiate_recovery(void)
```
Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```c
esp_err_t twai_get_status_info(twai_status_info_t* status_info)
```
Get current status information of the TWAI driver.

**Return**
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid

• ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**

- [out] status_info: Status information

```c
esp_err_t twai_clear_transmit_queue (void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**Return**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_receive_queue (void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when twai_start() is called.

**Return**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

```c
struct twai_general_config_t
```

Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

```c
twai_mode_t mode
```

Mode of TWAI controller

```c
gpio_num_t tx_io
```

Transmit GPIO number

```c
gpio_num_t rx_io
```

Receive GPIO number

```c
gpio_num_t clkout_io
```

CLKOUT GPIO number (optional, set to -1 if unused)

```c
gpio_num_t bus_off_io
```

Bus off indicator GPIO number (optional, set to -1 if unused)

```c
uint32_t tx_queue_len
```

Number of messages TX queue can hold (set to 0 to disable TX Queue)

```c
uint32_t rx_queue_len
```

Number of messages RX queue can hold

```c
uint32_t alerts_enabled
```

Bit field of alerts to enable (see documentation)

```c
uint32_t clkout_divider
```

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

```c
int intr_flags
```

Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

```c
struct twai_status_info_t
```

Structure to store status information of TWAI driver.
Public Members

`twai_state_t state`
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`
Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`
Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`
Current value of Transmit Error Counter

`uint32_t rx_error_counter`
Current value of Receive Error Counter

`uint32_t tx_failed_count`
Number of messages that failed transmissions

`uint32_t rx_missed_count`
Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

`uint32_t rx_overrun_count`
Number of messages that were lost due to a RX FIFO overrun

`uint32_t arb_lost_count`
Number of instances arbitration was lost

`uint32_t bus_error_count`
Number of instances a bus error has occurred

Macros

`TWAI_IO_UNUSED`
Marks GPIO as unused in TWAI configuration

Enumerations

`enum twai_state_t`
TWAI driver states.

Values:

`TWAI_STATE_STOPPED`
Stopped state. The TWAI controller will not participate in any TWAI bus activities

`TWAI_STATE_RUNNING`
Running state. The TWAI controller can transmit and receive messages

`TWAI_STATE_BUS_OFF`
Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

`TWAI_STATE_RECOVERING`
Recovering state. The TWAI controller is undergoing bus recovery

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.
The ESP32 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

### Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

### Setting Communication Parameters

UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>
Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins**  After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation**  Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
                                uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication**  Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting**  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```
Chapter 2. API Reference

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t *)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as UART_INTR_MASK.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.
The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in `peripherals/uart/uart_events`.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note**: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the...
user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the -RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options**  This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

**Note:**

- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

---

**Circuit A: Collision Detection Circuit**

```
VCC ------------------
          |               |
RXD   <----| R       x------B        |
        |         |               |
      TXD ----->| D ADM483 |
        |         |       RS485 bus side |
        |         |               |
      RTS ----->| DE       | A|<--|--| A
        |         |               |
      +----| /RE   |
       |       |
      GND     GND
```

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

```
VCC ------------------
          |               |
RXD   <----| R       x------B        |
        |         |               |
      TXD ----->| D ADM483 |
        |         |       RS485 bus side |
        |         |               |
      RTS ----->| DE       | A|<--|--| A
        |         |               |
      +----| /RE   |
       |       |
      GND     GND
```

---

Submit Document Feedback
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

`esp_err_t uart_driver_delete(uart_port_t uart_num)`

Uninstall UART driver.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

`bool uart_is_driver_installed(uart_port_t uart_num)`

Checks whether the driver is installed or not.

**Return**
- true driver is installed
- false driver is not installed

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`

Set UART data bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `data_bit`: UART data bits

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`

Get the UART data bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `data_bit`: Pointer to accept value of UART data bits.

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`

Set UART stop bits.
Return
- ESP_OK Success
- ESP_FAIL Fail

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: Pointer to accept value of UART stop bits.

`esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)`
Set UART parity mode.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

`esp_err_t uart_get_parity(uart_port_t uart_num, uint32_t *parity_mode)`
Get the UART parity mode configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: Pointer to accept value of UART parity mode.

`esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)`
Set UART baud rate.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: UART baud rate.

`esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)`
Get the UART baud rate configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: Pointer to accept value of UART baud rate

`esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)`
Set UART line inverse mode.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of uart_signal_inv_t

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- flow_ctrl: Hardware flow control mode
- rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```

Set software flow control.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- enable: switch on or off
- rx_thresh_xon: low water mark
- rx_thresh_xoff: high water mark

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```

Get the UART hardware flow control configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- flow_ctrl: Option for different flow control mode.

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```

Clear UART interrupt status.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- clr_mask: Bit mask of the interrupt status to be cleared.

```c
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```

Set UART interrupt enable.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- enable_mask: Bit mask of the enable bits.

```c
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• disable_mask: Bit mask of the disable bits.

`esp_err_t uart_enable_rx_intr(uart_port_t uart_num)`
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_disable_rx_intr(uart_port_t uart_num)`
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_disable_tx_intr(uart_port_t uart_num)`
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number

`esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)`
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• enable: 1: enable; 0: disable
• thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

`esp_err_t uart_isr_register(uart_port_t uart_num, void (*fn)(void,* arg), int intr_alloc_flags, uart_isr_handle_t* handle)`
Register UART interrupt handler (ISR).

Note
UART ISR handler will be attached to the same CPU core that this function is running on.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• fn: Interrupt handler function.
• arg: parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

`esp_err_t uart_isr_free(uart_port_t uart_num)`
Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

Return
### Chapter 2. API Reference

#### ESP_OK Success
- Success

#### ESP_FAIL Parameter error
- Parameter error

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

#### esp_err_t uart_set_pin (uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
Assign signals of a UART peripheral to GPIO pins.

**Note** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

#### Return
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **tx_io_num**: UART TX pin GPIO number.
- **rx_io_num**: UART RX pin GPIO number.
- **rts_io_num**: UART RTS pin GPIO number.
- **cts_io_num**: UART CTS pin GPIO number.

#### esp_err_t uart_set_rts (uart_port_t uart_num, int level)
Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

#### Return
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **level**: 1: RTS output low (active); 0: RTS output high (block)

#### esp_err_t uart_set_dtr (uart_port_t uart_num, int level)
Manually set the UART DTR pin level.

#### Return
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **level**: 1: DTR output low (active); 0: DTR output high

#### esp_err_t uart_set_tx_idle_num (uart_port_t uart_num, uint16_t idle_num)
Set UART idle interval after tx FIFO is empty.

#### Return
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **idle_num**: idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

#### esp_err_t uart_param_config (uart_port_t uart_num, const uart_config_t *uart_config)
Set UART configuration parameters.

#### Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait: Timeout, count in RTOS ticks

int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note  This function should only be used when UART TX buffer is not enabled.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• buffer: data buffer address
• len: data length to send

int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• src: data buffer address
• size: data length to send

int uart_write_bytes_with_break(uart_port_t uart_num, const void *src, size_t size, int brk_len)
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.
Otherwise, if the \texttt{tx_buffer_size} > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**

\begin{itemize}
  \item (-1) Parameter error
  \item OTHERS (>=0) The number of bytes pushed to the TX FIFO
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
  \item \texttt{src}: data buffer address
  \item \texttt{size}: data length to send
  \item \texttt{brk_len}: break signal duration (unit: the time it takes to send one bit at current baudrate)
\end{itemize}

\begin{verbatim}
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
\end{verbatim}

UART read bytes from UART buffer.

**Return**

\begin{itemize}
  \item (-1) Error
  \item OTHERS (>=0) The number of bytes read from UART FIFO
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
  \item \texttt{buf}: pointer to the buffer.
  \item \texttt{length}: data length
  \item \texttt{ticks_to_wait}: sTimeout, count in RTOS ticks
\end{itemize}

\begin{verbatim}
esp_err_t uart_flush (uart_port_t uart_num)
\end{verbatim}

Alias of \texttt{uart_flush_input}. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use \texttt{uart_wait_tx_done} function.

**Return**

\begin{itemize}
  \item ESP_OK Success
  \item ESP_FAIL Parameter error
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
\end{itemize}

\begin{verbatim}
esp_err_t uart_flush_input (uart_port_t uart_num)
\end{verbatim}

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use \texttt{uart_wait_tx_done} function.

**Return**

\begin{itemize}
  \item ESP_OK Success
  \item ESP_FAIL Parameter error
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
\end{itemize}

\begin{verbatim}
esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)
\end{verbatim}

UART get RX ring buffer cached data length.

**Return**

\begin{itemize}
  \item ESP_OK Success
  \item ESP_FAIL Parameter error
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
  \item \texttt{size}: Pointer of size_t to accept cached data length
\end{itemize}

\begin{verbatim}
esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)
\end{verbatim}

UART disable pattern detect function. Designed for applications like \texttt{AT commands}. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**

\begin{itemize}
  \item ESP_OK Success
  \item ESP_FAIL Parameter error
\end{itemize}

**Parameters**

\begin{itemize}
  \item \texttt{uart_num}: UART port number, the max port number is (UART_NUM_MAX - 1).
\end{itemize}
uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_enable_pattern_det_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Note** This function only works for esp32. And this function is deprecated, please use `uart_enable_pattern_det_baud_intr` instead.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char.
- `post_idle`: idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle`: idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

int uart_pattern_get_pos (uart_port_t uart_num)
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.
The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return
• ESP_ERR_NO_MEM No enough memory
• ESP_ERR_INVALID_STATE Driver not installed
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• queue_length: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
UART set communication mode.

Note This function must be executed after uart_driver_install(), when the driver object is initialized.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
• mode: UART UART mode to set

esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
Set uart threshold value for RX fifo full.

Note If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• threshold: Threshold value above which RX fifo full interrupt is generated

esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)
Set uart threshold values for TX fifo empty.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• threshold: Threshold value below which TX fifo empty interrupt is generated

\[ \text{esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)} \]
UART set threshold timeout for TOUT feature.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
• tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

\[ \text{esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)} \]
Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• uart_num: Uart number to configure the max port number is (UART_NUM_MAX -1).
• collision_flag: Pointer to variable of type bool to return collision flag.

\[ \text{esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)} \]
Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it cannot be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

Note in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of \([3, 0x3ff]\) range.

Parameters
• uart_num: UART number, the max port number is (UART_NUM_MAX -1).
• wakeup_threshold: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

\[ \text{esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)} \]
Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.
Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

Parameters
- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
- [out] out_wakeup_threshold: output, set to the current value of wakeup threshold for the given UART.

\texttt{esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)}
Wait until UART tx memory empty and the last char send ok (polling mode).

• Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters
- uart_num: UART number

\texttt{esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)}
Configure TX signal loop back to RX module, just for the test usage.

• Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters
- uart_num: UART number
- loop_back_en: Set true to enable the loop back function, else set it false.

\texttt{void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)}
Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters
- uart_num: UART number
- always_rx_timeout_en: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures
\
struct uart_intr_config_t

UART interrupt configuration parameters for uart_intr_config function.

Public Members

\texttt{uint32_t intr_enable_mask}
UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

\texttt{uint8_t rx_timeout_thresh}
UART timeout interrupt threshold (unit: time of sending one byte)

\texttt{uint8_t txfifo_empty_intr_thresh}
UART TX empty interrupt threshold.

\texttt{uint8_t txfifo_full_thresh}
UART RX full interrupt threshold.

\texttt{struct uart_event_t}
Event structure used in UART event queue.
Chapter 2. API Reference

Public Members

```c
uart_event_type_t type
UART event type
```

```c
size_t size
UART data size for UART_DATA event
```

```c
bool timeout_flag
UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
```

Macros

<table>
<thead>
<tr>
<th>Macro</th>

<td>UART_BITRATE_MAX</td>
<td>Maximum configurable bitrate.</td>
</tr>
</tbody>
</table>

Type Definitions

```c
typedef intr_handle_t uart_isr_handle_t
```

Enumerations

```c
enum uart_event_type_t
UART event types used in the ring buffer.
```

Values:

```c
UART_DATA
UART data event
```

```c
UART_BREAK
UART break event
```

```c
UART_BUFFER_FULL
UART RX buffer full event
```

```c
UART_FIFO_OVF
UART FIFO overflow event
```

```c
UART_FRAME_ERR
UART RX frame error event
```

```c
UART_PARITY_ERR
UART RX parity event
```

```c
UART_DATA_BREAK
UART TX data and break event
```
UART_PATTERN_DET
UART pattern detected

UART_EVENT_MAX
UART event max index

Header File
- components/hal/include/hal/uart_types.h

Structures
struct uart_at_cmd_t
UART AT cmd char configuration parameters Note that this function may differ on different chip. Please refer to the TRM at configuration.

Public Members
- uint8_t cmd_char
  UART AT cmd char
- uint8_t char_num
  AT cmd char repeat number
- uint32_t gap_tout
  gap time (in baud-rate) between AT cmd char
- uint32_t pre_idle
  the idle time (in baud-rate) between the non AT char and first AT char
- uint32_t post_idle
  the idle time (in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members
- uint8_t xon_char
  Xon flow control char
- uint8_t xoff_char
  Xoff flow control char
- uint8_t xon_thrd
  If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent
- uint8_t xoff_thrd
  If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members
- int baud_rate
  UART baud rate
- uart_word_length_t data_bits
  UART byte size
**Chapter 2. API Reference**

```c
uart_parity_t parity
    UART parity mode

uart_stop_bits_t stop_bits
    UART stop bits

uart_hw_flowcontrol_t flow_ctrl
    UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
    UART HW RTS threshold

uart_sclk_t source_clk
    UART source clock selection

bool use_ref_tick
    Deprecated method to select ref tick clock source, set source_clk field instead
```

**Type Definitions**

```c
typedef int uart_port_t
    UART port number, can be UART_NUM_0 ~ UART_NUM_MAX.
```

**Enumerations**

```c
enum uart_mode_t
    UART mode selection.

    Values:
    UART_MODE_UART = 0x00
        mode: regular UART mode
    UART_MODE_RS485_HALF_DUPLEX = 0x01
        mode: half duplex RS485 UART mode control by RTS pin
    UART_MODE_IRDA = 0x02
        mode: IRDA UART mode
    UART_MODE_RS485_COLLISION_DETECT = 0x03
        mode: RS485 collision detection UART mode (used for test purposes)
    UART_MODE_RS485_APP_CTRL = 0x04
        mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
    UART word length constants.

    Values:
    UART_DATA_5_BITS = 0x0
        word length: 5bits
    UART_DATA_6_BITS = 0x1
        word length: 6bits
    UART_DATA_7_BITS = 0x2
        word length: 7bits
    UART_DATA_8_BITS = 0x3
        word length: 8bits
    UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
    UART stop bits number.

    Values:
```
UART_STOP_BITS_1 = 0x1
stop bit: 1bit

UART_STOP_BITS_1_5 = 0x2
stop bit: 1.5bits

UART_STOP_BITS_2 = 0x3
stop bit: 2bits

UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
UART parity constants.
Values:

UART_PARITY_DISABLE = 0x0
Disable UART parity

UART_PARITY_EVEN = 0x2
Enable UART even parity

UART_PARITY_ODD = 0x3
Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.
Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
disable hardware flow control

UART_HW_FLOWCTRL_RTS = 0x1
enable RX hardware flow control (rts)

UART_HW_FLOWCTRL_CTS = 0x2
enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
enable hardware flow control

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
UART signal bit map.
Values:

UART_SIGNAL_INV_DISABLE = 0
Disable UART signal inverse

UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
inverse the UART irda_tx signal

UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
inverse the UART irda_rx signal

UART_SIGNAL_RXD_INV = (0x1 << 2)
inverse the UART rxd signal

UART_SIGNAL_CTS_INV = (0x1 << 3)
inverse the UART cts signal

UART_SIGNAL_DSR_INV = (0x1 << 4)
inverse the UART dsr signal

UART_SIGNAL_TXD_INV = (0x1 << 5)
inverse the UART txd signal
UART_SIGNAL_RTS_INV = (0x1 << 6)
inversethe UART rts signal

UART_SIGNAL_DTR_INV = (0x1 << 7)
inversethe UART dtr signal

enum uart_sclk_t
UART source clock.

Values:

UART_SCLK_APB = 0x0
UART source clock from APB

UART_SCLK_REF_TICK = 0x3
UART source clock from REF_TICK

**GPIO Lookup Macros** The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- components/soc/esp32/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO22_DIRECT_CHANNEL
- UART_NUM_0_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO1_DIRECT_CHANNEL
- UART_RXD_GPIO3_DIRECT_CHANNEL
- UART_CTS_GPIO19_DIRECT_CHANNEL
- UART_RTS_GPIO22_DIRECT_CHANNEL

UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_gpio17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO8_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.4 Application Protocols

2.4.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.
**Supported features**  
ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from
- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:
- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include
- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

**Application Example**

ESP examples are based on standard asio protocols/asio:
- protocols/asio/udp_echo_server
- protocols/asio/tcp_echo_server
- protocols/asio/asio_chat
- protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

### 2.4.2 ESP-MQTT

**Overview**

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

**Features**

- Supports MQTT over TCP, SSL with mbedTLS, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

**Application Example**

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

**Configuration**

**URI**

- Currently support `mqtt, mqtts, ws, wss` schemes
- MQTT over TCP samples:
Chapter 2. API Reference

- `mqtt://mqtt.eclipseprojects.io:` MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
- `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password

- **MQTT over SSL samples:**
  - `mqtts://mqtt.eclipseprojects.io:8883`
  - `mqtts://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884

- **MQTT over Websocket samples:**
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
  - `wss://mqtt.eclipseprojects.io:443/mqtt`

- **Minimal configurations:**

  ```c
  const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
  };
  esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
  esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ...
  esp_mqtt_client_start(client);
  ```

- **Note:** By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

**SSL**

- **Get certificate from server, example:** `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883` 
  ```
  </dev/null 2>/dev/null openssl x509 -outform PEM >mqtt_eclipse_org.pem
  ```
- **Check the sample application:** examples/mqtt_ssl

- **Configuration:**

  ```c
  const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
  };
  ```

If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see esp-tls.h for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_cert_len`: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
Chapter 2. API Reference

- lwt_msg_len: length of the LWT message, required if lwt_msg is not null-terminated
- lwt_qos: quality of service for the LWT message
- lwt_retain: specifies the retain flag of the LWT message

Other Configuration Parameters

- disable_clean_session: determines the clean session flag for the connect message, defaults to a clean session
- keepalive: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- disable_auto_reconnect: enable to stop the client from reconnecting to server after errors or disconnects
- user_context: custom context that will be passed to the event handler
- task_prio: MQTT task priority, defaults to 5
- task_stack: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- buffer_size: size of MQTT send/receive buffer, default is 1024 bytes
- username: pointer to the username used for connecting to the broker
- password: pointer to the password used for connecting to the broker
- client_id: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
- host: MQTT broker domain (ipv4 as string), setting the uri will override this
- port: MQTT broker port, specifying the port in the uri will override this
- transport: sets the transport protocol, setting the uri will override this
- refresh_connection_after_ms: refresh connection after this value (in milliseconds)
- event_handle: handle for MQTT events as a callback in legacy mode
- event_loop_handle: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

Change settings in Project Configuration Menu  The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

- CONFIG_MQTT_PROTOCOL_311: Enables 3.1.1 version of MQTT protocol
- CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- CONFIG_MQTT_CUSTOM_OUTBOX: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- MQTT_EVENT_BEFORE_CONNECT: The client is initialized and about to start connecting to the broker.
- MQTT_EVENT_CONNECTED: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- MQTT_EVENT_DISCONNECTED: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- MQTT_EVENT_SUBSCRIBED: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- MQTT_EVENT_UNSUBSCRIBED: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- MQTT_EVENT_PUBLISHED: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
Chapter 2. API Reference

- **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
- **MQTT_EVENT_ERROR**: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

**API Reference**

**Header File**

- components/mqtt/esp-mqtt/include/mqtt_client.h

**Functions**

- **esp_mqtt_client_init**

  \[
  \text{esp_mqtt_client_init(esp_mqtt_client_config_t *config)}
  \]

  Creates mqtt client handle based on the configuration.

  \[
  \text{ Returns: mqtt_client_handle if successfully created, NULL on error}
  \]

  \[
  \text{ Parameters: config: mqtt configuration structure}
  \]

- **esp_mqtt_client_set_uri**

  \[
  \text{esp_mqtt_client_set_uri(esp_mqtt_client_t client, const char *uri)}
  \]

  Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

  \[
  \text{ Returns: ESP_FAIL if URI parse error, ESP_OK on success}
  \]

  \[
  \text{ Parameters: client: mqtt client handle}
  \]

- **esp_mqtt_client_start**

  \[
  \text{esp_mqtt_client_start(esp_mqtt_client_t client)}
  \]

  Starts mqtt client with already created client handle.

  \[
  \text{ Returns: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error}
  \]

  \[
  \text{ Parameters: client: mqtt client handle}
  \]

- **esp_mqtt_client_reconnect**

  \[
  \text{esp_mqtt_client_reconnect(esp_mqtt_client_t client)}
  \]

  This api is typically used to force reconnection upon a specific event.

  \[
  \text{ Returns: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state}
  \]

  \[
  \text{ Parameters: client: mqtt client handle}
  \]

- **esp_mqtt_client_disconnect**

  \[
  \text{esp_mqtt_client_disconnect(esp_mqtt_client_t client)}
  \]

  This api is typically used to force disconnection from the broker.

  \[
  \text{ Returns: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization}
  \]

  \[
  \text{ Parameters: client: mqtt client handle}
  \]

- **esp_mqtt_client_stop**

  \[
  \text{esp_mqtt_client_stop(esp_mqtt_client_t client)}
  \]

  Stops mqtt client tasks.

  \[
  \text{ Notes: Cannot be called from the mqtt event handler}
  \]

  \[
  \text{ Returns: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state}
  \]

  \[
  \text{ Parameters: client: mqtt client handle}
  \]
int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters

- client: mqtt client handle
- topic:
- qos:

int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the subscribe message on success -1 on failure

Parameters

- client: mqtt client handle
- topic:

int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’ t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure

Parameters

- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag

int esp_mqtt_client_enqueue(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’ s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters

- client: mqtt client handle
- topic: topic string
• data: payload string (set to NULL, sending empty payload message)
• len: data length, if set to 0, length is calculated from payload string
• qos: qos of publish message
• retain: retain flag
• store: if true, all messages are enqueued; otherwise only qos 1 and qos 2 are enqueued

`esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)`
Destroys the client handle.

Notes:
• Cannot be called from the mqtt event handler

Return ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

Parameters
• client: mqtt client handle

`esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`
Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

Parameters
• client: mqtt client handle
• config: mqtt configuration structure

`esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`
Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

Parameters
• client: mqtt client handle
• event: event type
• event_handler: handler callback
• event_handler_arg: handlers context

`int esp_mqtt_client_get_outbox_size (esp_mqtt_client_handle_t client)`
Get outbox size.

Return outbox size 0 on wrong initialization

Parameters
• client: mqtt client handle

Structures

`struct esp_mqtt_error_codes`
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_espr, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |
Public Members

`esp_err_t esp_tls_last_esp_err`
- last `esp_err` code reported from esp-tls component

`int esp_tls_stack_err`
- tls specific error code reported from underlying tls stack

`int esp_tls_cert_verify_flags`
- tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t error_type`
- error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`
- connection refused error code reported from MQTT broker on connection

`int esp_transport_sock_errno`
- errno from the underlying socket

`struct esp_mqtt_event_t`  
- MQTT event configuration structure

Public Members

`esp_mqtt_event_id_t event_id`
- MQTT event type

`esp_mqtt_client_handle_t client`
- MQTT client handle for this event

`void *user_context`
- User context passed from MQTT client config

`char *data`
- Data associated with this event

`int data_len`
- Length of the data for this event

`int total_data_len`
- Total length of the data (longer data are supplied with multiple events)

`int current_data_offset`
- Actual offset for the data associated with this event

`char *topic`
- Topic associated with this event

`int topic_len`
- Length of the topic for this event associated with this event

`int msg_id`
- MQTT message id of message

`int session_present`
- MQTT session_present flag for connection event

`esp_mqtt_error_codes_t *error_handle`
- esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

`bool retain`
- Retained flag of the message associated with this event

`int qos`
- qos of the messages associated with this event
bool dup
dup flag of the message associated with this event

struct esp_mqtt_client_config_t
MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

bool set_null_client_id
Selects a NULL client id

const char *client_id
Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

int task_prio
MQTT task priority, default is 5, can be changed in make menuconfig
int task_stack
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

const char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len.

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
overrides URI transport

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

esp_err_t (*crt_bundle_attach)(void *conf)
Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int reconnect_timeout_ms
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
NULL-terminated list of supported application protocols to be used for ALPN

const char *client_password
Client key decryption password string

int client_password_len
String length of the password pointed to by client_password

esp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size
bool skip_cert_common_name_check
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
enable secure element for enabling SSL connection

void *ds_data
carrier of handle for digital signature parameters

int network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
Path in the URI

int message_retransmit_timeout
timeout for retransmit of failed packet

Macros

MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

Enumerations

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

• user_context - user data from esp_mqtt_client_config_t
• client - mqtt client handle
• various other data depending on event type

Values:
```c
MQTT_EVENT_ANY = -1

MQTT_EVENT_ERROR = 0
on error event, additional context: connection return code, error handle from esp_tls (if supported)

MQTT_EVENT_CONNECTED
connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
disconnected event

MQTT_EVENT_SUBSCRIBED
subscribed event, additional context:
  • msg_id message id
  • data pointer to the received data
  • data_len length of the data for this event

MQTT_EVENT_UNSUBSCRIBED
unsubscribed event

MQTT_EVENT_PUBLISHED
published event, additional context: msg_id

MQTT_EVENT_DATA
data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received
  • retain retain flag of the message
  • qos qos level of the message
  • dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
The event occurs before connecting

MQTT_EVENT_DELETED
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  • Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0
Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
MQTT connection refused reason: Server unavailable
```
Chapter 2. API Reference

**MQTT_CONNECTION_REFUSE_BAD_USERNAME**
MQTT connection refused reason: Wrong user

**MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
MQTT connection refused reason: Wrong username or password

```c
enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event
```
Values:

- **MQTT_ERROR_TYPE_NONE** = 0
- **MQTT_ERROR_TYPE_TCP_TRANSPORT**
- **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

```c
enum esp_mqtt_transport_t
```
Values:

- **MQTT_TRANSPORT_UNKNOWN** = 0x0
- **MQTT_TRANSPORT_OVER_TCP**
  MQTT over TCP, using scheme: `mqtt`
- **MQTT_TRANSPORT_OVER_SSL**
  MQTT over SSL, using scheme: `mqtts`
- **MQTT_TRANSPORT_OVER_WS**
  MQTT over Websocket, using scheme: `ws`
- **MQTT_TRANSPORT_OVER_WSS**
  MQTT over Websocket Secure, using scheme: `wss`

```c
enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection
```
Values:

- **MQTT_PROTOCOL_UNDEFINED** = 0
- **MQTT_PROTOCOL_V_3_1**
- **MQTT_PROTOCOL_V_3_1_1**

### 2.4.3 ESP-TLS

**Overview**

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()` for opening a new TLS connection.
- `esp_tls_conn_read()` for reading from the connection.
- `esp_tls_conn_write()` for writing into the connection.
- `esp_tls_conn_destroy()` for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).
Chapter 2. API Reference

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the esp_tls_cfg_t structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the esp_tls_cfg_t structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in esp_tls_cfg_t structure must be set.
  - cacert_buf: pointer to the buffer which contains the CA cert.
  - cacert_bytes: size of the CA certificate in bytes.
- **use_global_ca_store**: The global_ca_store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set use_global_ca_store = true in their respective esp_tls_cfg_t structure. See API Reference section below on information regarding different API used for initializing and setting up the global_ca_store.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle
- **psk_hint_key**: To use pre-shared keys for server verification, CONFIG_ESP_TLS_PSK_VERIFICATION should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the esp_tls_cfg_t structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling CONFIG_ESP_TLS_INSECURE and CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the esp_tls_cfg_t structure. WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

**Note**: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.
How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project:

1) Directly add wolfssl as a component in your project with following three commands:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.
   • Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedTLS as its underlying SSL/TLS stack. ESP-TLS uses mbedts as its underlying TLS/SSL stack by default unless changed manually.

Note: ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer esp_cryptoauth_utility

To enable the secure element support, and use it in you project for TLS connection, you will have to follow below steps

1) Add esp-cryptoauthlib in your project, for details please refer esp-cryptoauthlib with ESP_IDF
2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```
3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

To know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit ATECC608A chip type

4) Enable use of ATECC608A in ESP-TLS by providing following config option in `esp_tls_cfg_t`

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

### API Reference

**Header File**

- `components/esp-tls/esp_tls.h`

**Functions**

```c
esp_tls_t *esp_tls_init (void)
```

Create TLS connection.

**Return**

- Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

```c
esp_tls_t *esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
```

Create a new blocking TLS/SSL connection.

**Return**

- Pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**

- `[in]` hostname: Hostname of the host.
- `[in]` port: Port number of the host.
- `[in]` cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

```c
int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg,
                          esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection.

**Return**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

**Parameters**

- `[in]` hostname: Hostname of the host.
- `[in]` port: Port number of the host.
- `[in]` cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- `[in]` tls: Pointer to esp-tls as esp-tls handle.
**esp_tls_t** *esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)*

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return** pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

**int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)**

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- [in] tls: pointer to esp-tls as esp-tls handle.

**int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)**

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

**static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)**

Write from buffer ‘data’ into specified tls connection.

**Return**

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

**Parameters**

- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

**static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)**

Read from specified tls connection into the buffer ‘data’.
Return
- >0 if read operation was successful, the return value is the number of bytes actually read from the
  TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken
  by the calling process.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer to hold read data.
- [in] datalen: Length of data buffer.

void esp_tls_conn_delete (esp_tls_t *tls)
Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy (esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or
esp_tls_conn_http_new() APIs.

Return
- 0 on success
- -1 if socket error or an invalid argument

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Return
- -1 in case of invalid arg
- bytes available in the application data record read buffer

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.

Return
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
- [in] tls: handle to esp_tls context
- [out] sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store (void)
Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This
function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be
effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls
esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Return
• ESP_OK if adding certificates was successful.
• Other if an error occurred or an action must be taken by the calling process.

Parameters
• [in] cacert_pembuf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

void esp_tls_free_global_ca_store(void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
• ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK (0) if no error occurred
• specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
• [in] h: esp-tls error handle.
• [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
• [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

Return
• ESP_ERR_INVALID_STATE if invalid parameters
• ESP_OK if a valid error returned and was cleared

Parameters
• [in] h: esp-tls error handle.
• [in] err_type: specific error type
• [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

mbedtls_x509_crt *esp_tls_get_global_ca_store(void)
Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

Note Modifying the pointer might cause a failure in verifying the certificates.

Return
• Pointer to the global CA store currently being used if successful.
• NULL if there is no global CA store set.

esp_err_t esp_tls_plain_tcp_connect(const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters
• [in] host: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
• [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
• [out] sockfd: Socket descriptor if successfully connected on TCP layer

**Structures**

```c
struct psk_key_hint
ESP-TLS preshared key and hint structure.
```

**Public Members**

```c
const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the Key

const char *hint
hint in PSK authentication mode in string format
```

```c
struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure
```

**Public Members**

```c
bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count
```

```c
struct esp_tls_cfg
ESP-TLS configuration parameters.
```

**Note**

This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).

Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.

Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

**Public Members**

```c
const char * **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = [ "h2", NULL ];

• where ‘h2’ is the protocol name

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.
bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled
with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification,
must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than
TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with
esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

struct esp_tls
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
TLS/SSL context

mbedtls_entropy_context entropy
mbedtls entropy context structure

mbedtls_ctr_drbg_context ctr_drbg
mbedtls ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config conf
TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context server_fd
mbedtls wrapper type for sockets

mbedtls_x509_crt cacert
Container for the X.509 CA certificate

mbedtls_x509_crt *cacert_ptr
Pointer to the cacert being used.

mbedtls_x509_crt clientcert
Container for the X.509 client certificate

mbedtls_pk_context clientkey
Container for the private key of the client certificate

int sockfd
Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
Callback function for writing data to TLS/SSL connection.
**Chapter 2. API Reference**

**esp_tls_conn_state_t conn_state**
ESP-TLS Connection state

fd_set rset
read file descriptors

fd_set wset
write file descriptors

bool is_tls
indicates connection type (TLS or NON-TLS)

**esp_tls_role_t role**
esp-tls role
- ESP_TLS_CLIENT
- ESP_TLS_SERVER

**esp_tls_error_handle_t**
handle to error descriptor

---

**Type Definitions**

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx
Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
ESP-TLS configuration parameters.

**Note**
Note about format of certificates:
- This structure includes certificates of a Certificate Authority, of client or server as well as private
  keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL
terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could
  be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing
  backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM
  format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t
ESP-TLS Connection Handle.

---

**Enumerations**

enum esp_tls_conn_state
ESP-TLS Connection State.

*Values:*

ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE
enum esp_tls_role
Values:

ESP_TLS_CLIENT = 0
ESP_TLS_SERVER

2.4.4 OpenSSL-APIs

Note: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in openssl directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter Introduction

• Chapter 1. SSL Context Method Create
• Chapter 2. SSL Context Function
• Chapter 3. SSL Function
• Chapter 4. SSL X509 Certification and Private Key Function

Chapter 1. SSL Context Method Create

1.1 const SSL_METHOD* SSLv3_client_method (void)

Arguments:

none

Return:

SSLV3.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 const SSL_METHOD* TLSv1_client_method (void)

Arguments:

none

Return:
Chapter 2. API Reference

TLSV1.0 version SSL context client method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```

1.3 const SSL_METHOD* TLSv1_1_client_method (void)

Arguments:
none

Return:
TLSV1.1 version SSL context client method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ...
}
```

1.4 const SSL_METHOD* TLSv1_2_client_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context client method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.5 const SSL_METHOD* TLS_client_method (void)
Chapter 2. API Reference

Arguments:

none

Return:

TLSV1.2 version SSL context client method point

Description:

create the default SSL context method, it's always to be TLSV1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.6  const SSL_METHOD* SSLv3_server_method (void)

Arguments:

none

Return:

SSLV3.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

1.7  const SSL_METHOD* TLSv1_server_method (void)

Arguments:

none

Return:

TLSV1.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```
1.8 const SSL_METHOD* TLSv1_1_server_method (void)

Arguments:

none

Return:

TLSV1.1 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}
```

1.9 const SSL_METHOD* TLSv1_2_server_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context server method point

Description:
create the default SSL context method, it's always to be TLSV1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

### Chapter 2. SSL Context Function

#### 2.1 `SSL_CTX* SSL_CTX_new(const SSL_METHOD * method)`

**Arguments:**

- `method` - the SSL context method pointer

**Return:**

- SSL context pointer

**Description:**

create a SSL context

**Example:**

```c
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

#### 2.2 `void SSL_CTX_free(SSL_CTX * ctx)`

**Arguments:**

- `ctx` - the SSL context pointer

**Return:**

- None

**Description:**

free a SSL context

**Example:**

```c
void example(void)
{
    SSL_CTX *ctx;
    ...
    SSL_CTX_free(ctx);
}
```
2.3 int SSL_CTX_set_ssl_version (SSL_CTX * ctx, const SSL_METHOD * meth)

Arguments:

tctx - SSL context point
meth - SSL method point

Return:

1 : OK
0 : failed

Description:

set the SSL context version

Example:

void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
    ...
    SSL_CTX_set_ssl_version(ctx, meth);
}

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX * ctx)

Arguments:

ctx - SSL context point

Return:

SSL context method

Description:

get the SSL context method

Example:

void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;
    ...
    method = SSL_CTX_get_ssl_method(ctx);
}

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:

ctx - SSL context point
Return:

SSL method

Description:

create a SSL

Example:

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ssl = SSL_new(ctx);
}
```

3.2 void SSL_free (SSL * ss)

Arguments:

ssl - SSL point

Return:

none

Description:

free SSL

Example:

```c
void example(void)
{
    SSL *ssl;
    ...
    SSL_free(ssl);
}
```

3.3 int SSL_do_handshake (SSL * ss)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

perform the SSL handshake

Example:
3.4 int SSL_connect (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

connect to the remote SSL server

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_connect(ssl);
}
```

3.5 int SSL_accept (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

accept the remote connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_accept(ssl);
}
```
Chapter 2. API Reference

(continued from previous page)

```c
ret = SSL_accept(ssl);
}
```

3.6 int SSL_shutdown (SSL * ssl)

Arguments:

- `ssl` - SSL point

Return:

- 1 : OK
- 0 : failed, connect is close by remote
- -1 : a error catch

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    
    ret = SSL_shutdown(ssl);
}
```

3.7 int SSL_clear (SSL * ssl)

Arguments:

- `ssl` - SSL point

Return:

- 1 : OK
- 0 : failed

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    
    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:
3.9 int SSL_write (SSL *ssl, const void *buffer, int len)

Arguments:

ssl - SSL point
buffer - data buffer point
len - data length

Return:

> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch

Description:

send the data to remote

Example:

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ...
    ...
    ret = SSL_write(ssl, buf, len);
}
```

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL *ssl)

Arguments:
Chapter 2. API Reference

3.10

ssl - SSL point

Return:

SSL context

Description:

get SSL context of the SSL

Example:

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ctx = SSL_get_SSL_CTX(ssl);
}
```

3.11

int SSL_get_shutdown (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

shutdown mode

Description:

get SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    int mode;
    ...
    mode = SSL_get_SSL_CTX(ssl);
}
```

3.12

void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

ssl - SSL point

Return:

shutdown mode

Description:

set SSL shutdown mode

Example:
### 3.13 `const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)`

**Arguments:**

- `ssl` - SSL point

**Return:**

SSL method

**Description:**

Set SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
    method = SSL_get_ssl_method(ssl);
}
```

### 3.14 `int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)`

**Arguments:**

- `ssl` - SSL point
- `meth` - SSL method point

**Return:**

- `1` : OK
- `0` : failed

**Description:**

Set the SSL method

**Example:**

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
}
```

(continues on next page)
3.15 int SSL_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

data bytes

Description:

get received data bytes

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;

    ... ...
    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : Yes
0 : No

Description:

check if data is received

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;

    ... ...
    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:
Chapter 2. API Reference

3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the read only socket of the SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_rfd(ssl);
}

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the write only socket of the SSL

Example:
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_wfd(ssl);
}

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:

ssl - SSL point
fd - socket id

Return:

1 : OK
0 : failed

Description:

set socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_fd(ssl, socket);
}

3.21 int SSL_set_rfd (SSL * ssl, int fd)

Arguments:

ssl - SSL point
fd - socket id

Return:

1 : OK
0 : failed

Description:

set read only socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
}  

(continues on next page)
... ...
ret = SSL_set_rfd(ssl, socket);
}

### 3.22 int SSL_set_wfd (SSL * ssl, int fd)

**Arguments:**

- ssl - SSL point
- fd - socket id

**Return:**

- 1 : OK
- 0 : failed

**Description:**

set write only socket to SSL

**Example:**

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}
```

### 3.23 int SSL_version (const SSL * ssl)

**Arguments:**

- ssl - SSL point

**Return:**

SSL version

**Description:**

get SSL version

**Example:**

```c
void example(void)
{
    int version;
    SSL *ssl;
    ...
    version = SSL_version(ssl);
}
```

### 3.24 const char* SSL_get_version (const SSL * ssl)

...
Arguments:
ssl - SSL point

Return:
SSL version string

Description:
get the SSL current version string

Example:

```c
void example(void)
{
    char *version;
    SSL *ssl;
    ...
    version = SSL_get_version(ssl);
}
```

3.25 OSSL_HANDSHAKE_STATE  
SSL_get_state (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
SSL state

Description:
get the SSL state

Example:

```c
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;
    ...
    state = SSL_get_state(ssl);
}
```

3.26 const char* SSL_alert_desc_string (int value)

Arguments:
value - SSL description

Return:
alert value string

Description:
get alert description string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string(val);
}
```

3.27 const char* `SSL_alert_desc_string_long` (int value)

Arguments:

value - SSL description

Return:

alert value long string

Description:

get alert description long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string_long(val);
}
```

3.28 const char* `SSL_alert_type_string` (int value)

Arguments:

value - SSL type description

Return:

alert type string

Description:

get alert type string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
}
```
str = SSL_alert_type_string(val);

3.29 const char* SSL_alert_type_string_long (int value)

Arguments:

value - SSL type description

Return:

alert type long string

Description:

get alert type long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string_long(val);
}
```

3.30 const char* SSL_rstate_string (SSL * ssl)

Arguments:

ssl - SSL point

Return:

state string

Description:

get the state string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_rstate_string(ssl);
}
```

3.31 const char* SSL_rstate_string_long (SSL * ssl)

Arguments:

ssl - SSL point

Return:
state long string

Description:
get the state long string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_rstate_string_long(ssl);
}
```

3.32 const char* SSL_state_string (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

state string

Description:
get the state string

Example:

```c
void example(void)
{
    SSL *ssl;
    const char *str;
    ...
    str = SSL_state_string(ssl);
}
```

3.33 char* SSL_state_string_long (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

state long string

Description:
get the state long string

Example:
Chapter 2. API Reference

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_state_string(ssl);
}
```

3.34 int SSL_get_error (const SSL * ssl, int ret_code)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>- SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>ret_code</td>
<td>- SSL return code</td>
</tr>
</tbody>
</table>

Return:

SSL error number

Description:

get SSL error code

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    int err;
    ...
    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)

Arguments:

| ssl | - SSL point |

Return:

specifical statement

Description:

get the SSL specifical statement

Example:

```c
void example(void)
{
    SSL *ssl;
    int state;
    ...
    state = SSL_want(ssl);
}
```
3.36 int SSL_want_nothing (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want nothing

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_nothing(ssl);
}
```

3.37 int SSL_want_read (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want to read

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_read(ssl);
}
```

3.38 int SSL_want_write (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true
Chapter 2. API Reference

Description:

check if SSL want to write

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_write(ssl);
}
```

Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:

cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes

Return:

X509 certification object point

Description:

load a character certification context into system context. If '*cert' is...
...pointed to the certification, then load certification into it. Or create a new X509...
...certification object

Example:

```c
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ...
    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:

ssl - SSL point
x - CA certification point

Return:

1 : OK
0 : failed
Description:
add CA client certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;

    ... ...
    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX *ctx, X509 *x)

Arguments:

- ctx - SSL context point
- x - CA certification point

Return:

- 1 : OK
- 0 : failed

Description:
add CA client certification into the SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;

    ... ...
    ret = SSL_CTX_add_client_CA(ctx, new);
}
```

4.4 X509* SSL_get_certificate (const SSL *ssl)

Arguments:

- ssl - SSL point

Return:

SSL certification point

Description:
get the SSL certification point

Example:
void example(void)
{
    SSL *ssl;
    X509 *cert;
    ...

cert = SSL_get_certificate(ssl);
}

4.5 long SSL_get_verify_result (const SSL * ssl)
Arguments:
ssl - SSL point

Return:
the result of verifying

Description:
get the verifying result of the SSL certification

Example:

void example(void)
{
    SSL *ssl;
    long ret;
    ...
    ret = SSL_get_verify_result(ssl);
}

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)
Arguments:
ctx - the SSL context point
pkey - certification object point

Return:
1 : OK
0 : failed

Description:
load the certification into the SSL_CTX or SSL object

Example:

void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;
    ...
}
4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)

Arguments:

ctx - SSL context point
len - certification length
d - data point

Return:

1 : OK
0 : failed

Description:

load the ASN1 certification into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;
    ...
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}
```

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX * ctx, EVP_PKEY * pkey)

Arguments:

cxt - SSL context point
pkey - private key object point

Return:

1 : OK
0 : failed

Description:

load the private key into the context object

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;
    ...
    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}
```
4.9 int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

- ctx - SSL context point
- d - data point
- len - private key length

Return:

- 1 : OK
- 0 : failed

Description:

load the ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    int pk;
    SSL_CTX * ctx;
    const unsigned char * buf;
    long len;

    ...

    ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

- ctx - SSL context point
- d - data point
- len - private key length

Return:

- 1 : OK
- 0 : failed

Description:

load the RSA ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX * ctx;
    const unsigned char * buf;
    long len;

    ...

    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)
Chapter 2. API Reference

Arguments:

- ssl - SSL point
- len - data bytes
- d - data point

Return:

- 1 : OK
- 0 : failed

Description:

Load certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;
    ...
    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}
```

4.12 X509* SSL_get_peer_certificate (const SSL* ssl)

Arguments:

- ssl - SSL point

Return:

Peer certification

Description:

Get peer certification

Example:

```c
void example(void)
{
    SSL *ssl;
    X509 *peer;
    ...
    peer = SSL_get_peer_certificate(ssl);
}
```

2.4.5 ESP HTTP Client

Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:
• **esp_http_client_init()**: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.

• **esp_http_client_perform()**: Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).

• **esp_http_client_cleanup()**: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at [protocols/esp_http_client](https://example.com/protocols/esp_http_client).

### Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

### Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

### HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note**: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)

### HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

• **esp_http_client_init()**: Create a HTTP client handle
• **esp_http_client_set_** or **esp_http_client_delete_**: Modify the HTTP connection parameters (optional)
**API Reference**

- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection.
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`.
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the content-length from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

**HTTP Authentication**

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

**Examples of Authentication Configuration**

- Authentication with URI

  ```c
  esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

- Authentication with username and password entry

  ```c
  esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

**API Reference**

**Header File**

- `components/esp_http_client/include/esp_http_client.h`

**Functions**

```c
esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)
```

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.
Return
• esp_http_client_handle_t
• NULL if any errors

Parameters
• [in] config: The configurations, see http_client_config_t

esp_err_t esp_http_client_perform(esp_http_client_handle_t client)
Invoke this function after esp_http_client_init and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(), is_async member of esp_http_client_config_t must be set while making a call to esp_http_client_init() API. You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use esp_http_client_set_** between the invokes to set options for the following esp_http_client_perform.

Note You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close.

Return
• ESP_OK on successful
• ESP_FAIL on error

Parameters
• client: The esp_http_client handle

esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)
Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [in] url: The url

esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)
Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [in] data: post data pointer
• [in] len: post length

int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)
Get current post field information.

Return Size of post data

Parameters
• [in] client: The client
• [out] data: Point to post data pointer

**esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)**

Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [in] value: The header value

**esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)**

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [out] value: The header value

**esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)**

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The username value

**esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)**

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] username: The username value

**esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)**

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The password value

**esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)**

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.
Chapter 2. API Reference

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] password: The password value

```
esp_err_t esp_http_client_set_auth_type(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
esp_http_client_set_auth_type
```
Set http request auth_type.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] auth_type: The esp_http_client auth type

```
int esp_http_client_get_errno(esp_http_client_handle_t client)
get http client session errno.
```

Return
• (-1) if invalid argument
• errno

Parameters
• [in] client: The esp_http_client handle

```
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)
esp_http_client_set_method
```
Set http request method.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] method: The method

```
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
esp_http_client_set_timeout_ms
```
Set http request timeout.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] timeout_ms: The timeout value

```
esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)
delete http request header.
```

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [in] key: The key

```
esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)
```
This function will be open the connection, write all header strings and return.

Return
• ESP_OK
• ESP_FAIL
Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle
• \texttt{[in]} \texttt{write\_len}: HTTP Content length need to write to the server

\texttt{int esp\_http\_client\_write (esp\_http\_client\_handle\_t client, const char *buffer, int len)}

This function will write data to the HTTP connection previously opened by \texttt{esp\_http\_client\_open()}

Return
• (-1) if any errors
• Length of data written

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle
• \texttt{buffer}: The buffer
• \texttt{[in]} \texttt{len}: This value must not be larger than the \texttt{write\_len} parameter provided to \texttt{esp\_http\_client\_open()}

\texttt{int64\_t esp\_http\_client\_fetch\_headers (esp\_http\_client\_handle\_t client)}

This function need to call after \texttt{esp\_http\_client\_open}, it will read from http stream, process all receive headers.

Return
• (0) if stream doesn’t contain content-length header, or chunked encoding (checked by \texttt{esp\_http\_client\_is\_chunked\_response})
• (-1: ESP\_FAIL) if any errors
• Download data length defined by content-length header

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle

\texttt{bool esp\_http\_client\_is\_chunked\_response (esp\_http\_client\_handle\_t client)}

Check response data is chunked.

Return true or false

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle

\texttt{int esp\_http\_client\_read (esp\_http\_client\_handle\_t client, char *buffer, int len)}

Read data from http stream.

Return
• (-1) if any errors
• Length of data was read

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle
• \texttt{buffer}: The buffer
• \texttt{[in]} \texttt{len}: The length

\texttt{int esp\_http\_client\_get\_status\_code (esp\_http\_client\_handle\_t client)}

Get http response status code, the valid value if this function invoke after \texttt{esp\_http\_client\_perform}

Return Status code

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle

\texttt{int64\_t esp\_http\_client\_get\_content\_length (esp\_http\_client\_handle\_t client)}

Get http response content length (from header Content-Length) the valid value if this function invoke after \texttt{esp\_http\_client\_perform}

Return
• (-1) Chunked transfer
• Content-Length value as bytes

Parameters
• \texttt{[in]} \texttt{client}: The \texttt{esp\_http\_client} handle

\texttt{esp\_err\_t esp\_http\_client\_close (esp\_http\_client\_handle\_t client)}

Close http connection, still kept all http request resources.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)
This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)
Get transport type.

Return
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)
Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

void esp_http_client_add_auth (esp_http_client_handle_t client)
On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters
• [in] client: The esp_http_client handle

bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)
Checks if entire data in the response has been read without any error.

Return
• true
• false

Parameters
• [in] client: The esp_http_client handle

int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)
Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

Return
• Length of data was read

Parameters
• [in] client: The esp_http_client handle
• buffer: The buffer
• [in] len: The buffer length

`esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)`

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Return**
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**Parameters**
- [in] client: The esp_http_client handle
- len: Length of data discarded

`esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)`

Get URL from client.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [inout] url: The buffer to store URL
- [in] len: The buffer length

`esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)`

Get Chunk-Length from client.

**Return**
- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

**Parameters**
- [in] client: The esp_http_client handle
- [out] len: Variable to store length

**Structures**

```c
struct esp_http_client_event

HTTP Client events data.
```

**Public Members**

```c
esp_http_client_event_id_t event_id

event_id, to know the cause of the event
```

```c
esp_http_client_handle_t client

esp_http_client_handle_t context
```

```c
void *data

data of the event
```

```c
int data_len

data length of data
```

```c
void *user_data

user_data context, from esp_http_client_config_t user_data
```
Chapter 2. API Reference

char *header_key
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct esp_http_client_config_t
HTTP configuration.

Public Members

const char *url
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
Domain or IP as string

int port
Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
Using for Http authentication

const char *password
Using for Http authentication

esp_http_client_auth_type_t auth_type
Http authentication type, see esp_http_client_auth_type_t

const char *path
HTTP Path, if not set, default is /

const char *query
HTTP query

const char *cert_pem
SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t method
HTTP Method

int timeout_ms
Network timeout in milliseconds
bool disable_auto_redirect
    Disable HTTP automatic redirects

int max_redirection_count
    Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
    Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
    HTTP Event Handle

esp_http_client_transport_t transport_type
    HTTP transport type, see esp_http_client_transport_t

int buffer_size
    HTTP receive buffer size

int buffer_size_tx
    HTTP transmit buffer size

void *user_data
    HTTP user_data context

bool is_async
    Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
    Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach)(void *conf)
    Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
    Keep-alive interval time. Default is 5 (second)

int keep_alive_count
    Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
    The name of interface for data to go through. Use the default interface without setting

Macros
DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
    Starting number of HTTP error codes
ESP_ERR_HTTP_MAX_REDIRECT
    The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT
    Error open the HTTP connection
ESP_ERR_HTTP_WRITE_DATA
    Error write HTTP data

Submit Document Feedback
Chapter 2. API Reference

ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
Read FIN from peer and the connection closed

Type Definitions
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations
enum esp_http_client_event_id_t
HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

enum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl
enum esp_http_client_method_t
  HTTP method.

  Values:
  
  HTTP METHOD_GET = 0
  HTTP GET Method

  HTTP METHOD_POST
  HTTP POST Method

  HTTP METHOD_PUT
  HTTP PUT Method

  HTTP METHOD_PATCH
  HTTP PATCH Method

  HTTP METHOD_DELETE
  HTTP DELETE Method

  HTTP METHOD_HEAD
  HTTP HEAD Method

  HTTP METHOD_NOTIFY
  HTTP NOTIFY Method

  HTTP METHOD_SUBSCRIBE
  HTTP SUBSCRIBE Method

  HTTP METHOD_UNSUBSCRIBE
  HTTP UNSUBSCRIBE Method

  HTTP METHOD_OPTIONS
  HTTP OPTIONS Method

  HTTP METHOD_COPY
  HTTP COPY Method

  HTTP METHOD_MOVE
  HTTP MOVE Method

  HTTP METHOD_LOCK
  HTTP LOCK Method

  HTTP METHOD_UNLOCK
  HTTP UNLOCK Method

  HTTP METHOD_PROPFIND
  HTTP PROPFIND Method

  HTTP METHOD_PROPPATCH
  HTTP PROPPATCH Method

  HTTP METHOD_MKCOL
  HTTP MKCOL Method

  HTTP METHOD_MAX

enum esp_http_client_auth_type_t
  HTTP Authentication type.

  Values:

  HTTP_AUTH_TYPE_NONE = 0
  No authentication

  HTTP_AUTH_TYPE_BASIC
  HTTP Basic authentication
HTTP AUTH_TYPE_DIGEST
HTTP Digest authentication

denum HttpStatus_Code
Enum for the HTTP status codes.

Values:

HttpStatus_Ok = 200
HttpStatus_MultipleChoices = 300
HttpStatus_MovedPermanently = 301
HttpStatus_Found = 302
HttpStatus_TemporaryRedirect = 307
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

2.4.6 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

• httpd_start(): Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

• httpd_stop(): This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

• httpd_register_uri_handler(): A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

(continues on next page)
/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. 
    * httpd_req_recv() accepts char* only, but content could 
    * as well be any binary data (needs type casting). 
    * In case of string data, null termination will be absent, and 
    * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) {/* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling 
            * httpd_req_recv(), but to keep it simple, here we 
            * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will 
        * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */

    (continues on next page)
httpd_register_uri_handler(server, \&uri_get);
httpd_register_uri_handler(server, \&uri_post);
}

/* If server failed to start, handle will be NULL */
return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP server example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));  /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ...............
    ...............
    ...............

    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.
Websocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see CONFIG_HTTPD_WS_SUPPORT. Please check the example under protocols/http_server/ws_echo_server

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

esp_err_t httpd_register_uri_handler (httpd_handle_t handle, const httpd_uri_t *uri_handler)

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv , Process and Send
    ....
    ....
    ....
    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }
    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note URI handlers can be registered in real time as long as the server handle is valid.

Return

- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered
**esp_err_t** `httpd_unregister_uri_handler` (**httpd_handle_t** `handle`, **const** **char** * `uri`,
**httpd_method_t** `method`)

Unregister a URI handler.

**Return**
- ESP_OK: On successfully deregistering the handler
- ESP.ERR_INVALID_ARG: Null arguments
- ESP.ERR_NOT_FOUND: Handler with specified URI and method not found

**Parameters**
- **[in]** `handle`: handle to HTTPD server instance
- **[in]** `uri`: URI string
- **[in]** `method`: HTTP method

**esp_err_t** `httpd_unregister_uri` (**httpd_handle_t** `handle`, **const** **char** * `uri`)

Unregister all URI handlers with the specified uri string.

**Return**
- ESP_OK: On successfully deregistering all such handlers
- ESP.ERR_INVALID_ARG: Null arguments
- ESP.ERR_NOT_FOUND: No handler registered with specified uri string

**Parameters**
- **[in]** `handle`: handle to HTTPD server instance
- **[in]** `uri`: uri string specifying all handlers that need to be deregistered

**esp_err_t** `httpd_sess_set_recv_override` (**httpd_handle_t** `hd`, **int** `sockfd`, **httpd_recv_func_t** `recv_func`)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- ESP_OK: On successfully registering override
- ESP.ERR_INVALID_ARG: Null arguments

**Parameters**
- **[in]** `hd`: HTTPD instance handle
- **[in]** `sockfd`: Session socket FD
- **[in]** `recv_func`: The receive function to be set for this session

**esp_err_t** `httpd_sess_set_send_override` (**httpd_handle_t** `hd`, **int** `sockfd`, **httpd_send_func_t** `send_func`)

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- ESP_OK: On successfully registering override
- ESP.ERR_INVALID_ARG: Null arguments

**Parameters**
- **[in]** `hd`: HTTPD instance handle
- **[in]** `sockfd`: Session socket FD
- **[in]** `send_func`: The send function to be set for this session

**esp_err_t** `httpd_sess_set_pending_override` (**httpd_handle_t** `hd`, **int** `sockfd`, **httpd_pending_func_t** `pending_func`)

Override web server’s pending function (by session FD)
This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] pending_func: The receive function to be set for this session

```c
int httpd_req_to_sockfd (httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Return**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**
- [in] r: The request whose socket descriptor should be found

```c
int httpd_req_recv (httpd_req_t *r, char* buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK_ERR_INVALID : Invalid arguments
- HTTPD SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv() 
- HTTPD SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that the data will be read into
- [in] buf_len: Length of the buffer

```c
size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)
```

Search for a field in request headers and return the string length of it’s value.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
Chapter 2. API Reference

- Length: If field is found in the request URL.
- Zero: Field not found / Invalid request / Null arguments

**Parameters**
- `[in] r`: The request being responded to
- `[in] field`: The header field to be searched in the request

```c
esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)
```

Get the value string of a field from the request headers.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length

**Return**
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

**Parameters**
- `[in] r`: The request being responded to
- `[in] field`: The field to be searched in the header
- `[out] val`: Pointer to the buffer into which the value will be copied if the field is found
- `[in] val_size`: Size of the user buffer “val”

```c
size_t httpd_req_get_url_query_len(httpd_req_t *r)
```

Get Querystring length from the request URL.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid

**Return**
- Length: Query is found in the request URL
- Zero: Query not found / Null arguments / Invalid request

**Parameters**
- `[in] r`: The request being responded to

```c
esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char *buf, size_t buf_len)
```

Get Query string from the request URL.

**Note**
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (e.g. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**
- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated

Parameters
• [in] r: The request being responded to
• [out] buf: Pointer to the buffer into which the query string will be copied (if found)
• [in] buf_len: Length of output buffer

esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note
• The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
• If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return
• ESP_OK: Key is found in the URL query string and copied to buffer
• ESP_ERR_NOT_FOUND: Key not found
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

Parameters
• [in] qry: Pointer to query string
• [in] key: The key to be searched in the query string
• [out] val: Pointer to the buffer into which the value will be copied if the key is found
• [in] val_size: Size of the user buffer “val”

esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char *cookie_name, char *val, size_t* val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return
• ESP_OK: Key is found in the cookie string and copied to buffer
• ESP_ERR_NOT_FOUND: Key not found
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
• ESP_ERR_NO_MEM: Memory allocation failure

Parameters
• [in] req: Pointer to the HTTP request
• [in] cookie_name: The cookie name to be searched in the request
• [out] val: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
• [inout] val_size: Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “*?” to make the previous character optional, and if present, allow anything to follow.

Example:
• * matches everything
• /foo/? matches /foo and /foo/
• /foo/* (sans the backslash) matches /foo and /foo/bar, but not /foo or /fo
• /foo/? or /foo/?? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return true if a match was found

Parameters
Chapter 2. API Reference

- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

```c
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: `httpdRespSetStatus()` - for setting the HTTP status string, `httpdRespSetType()` - for setting the Content Type, `httpdRespSetHdr()` - for appending any additional field value entries in the response header.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

**Parameters**
- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```c
esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpdRespSend()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: `httpdRespSetStatus()` - for setting the HTTP status string, `httpdRespSetType()` - for setting the Content Type, `httpdRespSetHdr()` - for appending any additional field value entries in the response header.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK: On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that stores the data
• [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```c
static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)
```

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] str: String to be sent as response body

```c
static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)
```

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)

```c
esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)
```

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] status: The HTTP status code of this response

```c
esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)
```

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
Chapter 2. API Reference

• Make sure that the lifetime of the type string is valid till send function is called.

Return
• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] type: The Content Type of the response

esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Return
• ESP_OK: On successfully appending new header
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] field: The field name of the HTTP header
• [in] value: The value of this HTTP header

esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)

For sending out error code in response to HTTP request.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
• [in] req: Pointer to the HTTP request for which the response needs to be sent
• [in] error: Error type to send
• [in] msg: Error message string (pass NULL for default message)

static esp_err_t httpd_resp_send_404(httpd_req_t *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Return

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• [in] r: The request being responded to

static esp_err_t httpd_resp_send_408(httpd_req_t *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• [in] r: The request being responded to

static esp_err_t httpd_resp_send_500(httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• [in] r: The request being responded to

int httpd_send(httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()
Chapter 2. API Reference

- Bytes: Number of bytes that were sent successfully
- HTTPD SOCK ERR INVALID: Invalid arguments
- HTTPD SOCK ERR TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD SOCK ERR FAIL: Unrecoverable error while calling socket send()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Buffer from where the fully constructed packet is to be read
- [in] buf_len: Length of the buffer

int httpd_socket_send(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

*Note* This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Return**
- Bytes: The number of bytes sent successfully
- HTTPD SOCK ERR INVALID: Invalid arguments
- HTTPD SOCK ERR TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD SOCK ERR FAIL: Unrecoverable error while calling socket send()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

int httpd_socket_recv(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

*Note* This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK ERR INVALID: Invalid arguments
- HTTPD SOCK ERR TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD SOCK ERR FAIL: Unrecoverable error while calling socket recv()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

**esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)**

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

**Return**
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

**Parameters**
- [in] handle: HTTP server handle
- [in] error: Error type
• [in] handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

Return

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

```c
esp_err_t httpd_stop(httpd_handle_t handle)
```

 Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Return

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

Parameters

- [in] handle: Handle to server returned by httpd_start
esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)
Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return
• ESP_OK : On successfully queueing the work
• ESP_FAIL : Failure in ctrl socket
• ESP_ERR_INVALID_ARG : Null arguments

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] work: Pointer to the function to be executed in the HTTPD’s context
• [in] arg: Pointer to the arguments that should be passed to this function

void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return
• void*: Pointer to the context associated with this session
• NULL : Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Context object to assign to the session
• [in] free_fn: Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See httpd_sess_get_ctx()

Return
• void*: Pointer to the transport context associated with this session
• NULL : Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session ‘transport’ context by socket descriptor.

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Transport context object to assign to the session
• [in] free_fn: Function that should be called to free the transport context
void *httpd_get_global_user_ctx (httpd_handle_t handle)
Get HTTDP global user context (it was set in the server config struct)

Return global user context
Parameters
  • [in] handle: Handle to server returned by httpd_start

void *httpd_get_global_transport_ctx (httpd_handle_t handle)
Get HTTDP global transport context (it was set in the server config struct)

Return global transport context
Parameters
  • [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_sess_trigger_close (httpd_handle_t handle, int sockfd)
Trigger an httpd session close externally.

Note Calling this API is only required in special circumstances wherein some application requires to close an
httpd client session asynchronously.

Return
  • ESP_OK : On successfully initiating closure
  • ESP_FAIL : Failure to queue work
  • ESP_ERR_NOT_FOUND : Socket fd not found
  • ESP_ERR_INVALID_ARG : Null arguments

Parameters
  • [in] handle: Handle to server returned by httpd_start
  • [in] sockfd: The socket descriptor of the session to be closed

esp_err_t httpd_sess_update_lru_counter (httpd_handle_t handle, int sockfd)
Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic.
When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions
is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used
(LRU) logic, even though it might not have received traffic for some time. This is useful when all open sock-
ets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open,
irrespective of when it last exchanged a packet.

Note Calling this API is only necessary if the LRU Purge Enable option is enabled.

Return
  • ESP_OK : Socket found and LRU counter updated
  • ESP_ERR_NOT_FOUND : Socket not found
  • ESP_ERR_INVALID_ARG : Null arguments

Parameters
  • [in] handle: Handle to server returned by httpd_start
  • [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

esp_err_t httpd_get_client_list (httpd_handle_t handle, size_t *fds, int *client_fds)
Returns list of current socket descriptors of active sessions.

Note Size of provided array has to be equal or greater than maximum number of opened sockets, configured
upon initialization with max_open_sockets field in httpd_config_t structure.

Return
  • ESP_OK : Successfully retrieved session list
  • ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

Parameters
  • [in] handle: Handle to server returned by httpd_start
  • [inout] fds: In: Size of provided client_fds array Out: Number of valid client fds returned in
    client_fds,
  • [out] client_fds: Array of client fds
**Structures**

```c
struct httpd_config
```

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

- **unsigned** `task_priority`  
  Priority of FreeRTOS task which runs the server

- **size_t** `stack_size`  
  The maximum stack size allowed for the server task

- **BaseType_t** `core_id`  
  The core the HTTP server task will run on

- **uint16_t** `server_port`  
  TCP Port number for receiving and transmitting HTTP traffic

- **uint16_t** `ctrl_port`  
  UDP Port number for asynchronously exchanging control signals between various components of the server

- **uint16_t** `max_open_sockets`  
  Max number of sockets/clients connected at any time

- **uint16_t** `max_uri_handlers`  
  Maximum allowed uri handlers

- **uint16_t** `max_resp_headers`  
  Maximum allowed additional headers in HTTP response

- **uint16_t** `backlog_conn`  
  Number of backlog connections

- **bool** `lru_purge_enable`  
  Purge “Least Recently Used” connection

- **uint16_t** `recv_wait_timeout`  
  Timeout for recv function (in seconds)

- **uint16_t** `send_wait_timeout`  
  Timeout for send function (in seconds)

- **void*** `global_user_ctx`  
  Global user context.
  This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.
  When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field.
  If you wish to use a custom function for freeing the global user context, please specify that here.

  ```c
  httpd_free_ctx_fn_t global_user_ctx_free_fn
  Free function for global user context
  ```

- **void*** `global_transport_ctx`  
  Global transport context.
  Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

  ```c
  httpd_free_ctx_fn_t global_transport_ctx_free_fn
  Free function for global transport context
  ```
httpd_open_func_t open_fn
Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx().

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, close(sockfd) should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t uri_match_fn
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using httpd_register_uri_handler()

Available options are: 1) NULL : Internally do basic matching using strncmp() 2) httpd_uri_match_wildcard(): URI wildcard matcher

Users can implement their own matching functions (See description of the httpd_uri_match_func_t function prototype)

struct httpd_req
HTTP Request Data Structure.

Public Members

httpd_handle_t handle
Handle to server instance

int method
The type of HTTP request, -1 if unsupported method

const char uri[HTTPD_MAX_URI_LEN + 1]
The URI of this request (1 byte extra for null termination)

size_t content_len
Length of the request body

void *aux
Internally used members

void *user_ctx
User context pointer passed during URI registration.

void *sess_ctx
Session Context Pointer
Chapter 2. API Reference

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

`httpd_free_ctx_fn_t free_ctx`

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.

If you wish to use a custom function for freeing the session context, please specify that here.

`bool ignore_sess_ctx_changes`

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

`struct httpd_uri`

Structure for URI handler.

**Public Members**

`const char *uri`

The URI to handle

`httpd_method_t method`

Method supported by the URI

`esp_err_t (*handler)(httpd_req_t *r)`

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

`void *user_ctx`

Pointer to user context data which will be available to handler

**Macros**

`HTTPD_MAX_REQ_HDR_LEN`

`HTTPD_MAX_URI_LEN`

`HTTPD_SOCK_ERR_FAIL`

`HTTPD_SOCK_ERR_INVALID`

`HTTPD_SOCK_ERR_TIMEOUT`

`HTTPD_200`

HTTP Response 200

`HTTPD_204`

HTTP Response 204

`HTTPD_207`

HTTP Response 207

`HTTPD_400`

HTTP Response 400
HTTPD_404
HTTP Response 404
HTTPD_408
HTTP Response 408
HTTPD_500
HTTP Response 500
HTTPD_TYPE_JSON
HTTP Content type JSON
HTTPD_TYPE_TEXT
HTTP Content type text/HTML
HTTPD_TYPE_OCTET
HTTP Content type octet-stream
HTTPD_DEFAULT_CONFIG()
ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated
ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK
Failed to launch server task/thread
HTTPD_RESP_USE_STRLEN

Type Definitions
typedef struct httpd_req httpd_req_t
HTTPRequest Data Structure.
typedef struct httpd_uri httpd_uri_t
Structure for URI handler.
typedef int (*httpd_send_func_t) (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of errno,
and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value
of httpd_send() function

Return
• Bytes : The number of bytes sent successfully
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()
Chapter 2. API Reference

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd.Handle_t hd, int sockfd, char *buf, size_t buf_len, int flags);

Prototype for HTTPD's low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd.Handle_t hd, int sockfd);

Prototype for HTTPD's low-level “get pending bytes” function.

Note User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error);

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Return
- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

Parameters
- [in] req: HTTP request for which the error needs to be handled
Chapter 2. API Reference

- [in] error: Error type

```c
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

```c
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

```c
typedef void(*httpd_free_ctx_fn_t)(void *ctx)
```

Prototype for freeing context data (if any)

**Parameters**
- [in] ctx: object to free

```c
typedef esp_err_t(*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**
- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef void(*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef bool(*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

**Return** true on match

**Parameters**
- [in] reference_uri: URI/template with respect to which the other URI is matched
- [in] uri_to_match: URI/template being matched to the reference URI/template
- [in] match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

```c
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```c
typedef void(*httpd_work_fn_t)(void *arg)
```

Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

**Parameters**
- [in] arg: The arguments for this work function

**Enumerations**

```c
enum httpd_err_code_t
```

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.
Values:

HTTPD_500_INTERNAL_SERVER_ERROR = 0
HTTPD_501_METHOD_NOT_IMPLEMENTED
HTTPD_505_VERSION_NOT_SUPPORTED
HTTPD_400_BAD_REQUEST
HTTPD_401_UNAUTHORIZED
HTTPD_403_FORBIDDEN
HTTPD_404_NOT_FOUND
HTTPD_405_METHOD_NOT_ALLOWED
HTTPD_408_REQ_TIMEOUT
HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
HTTPD_ERR_CODE_MAX

2.4.7 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config_t.global_transport_ctx
  - httpd_config_t.global_transport_ctx_free_fn
  - httpd_config_t.open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.
The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

**Performance**

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

**API Reference**

**Header File**

- components/esp_https_server/include/esp_https_server.h

**Functions**

```c
esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)
```

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

**Parameters**

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

```c
void httpd_ssl_stop(httpd_handle_t handle)
```

Stop the server. Blocks until the server is shut down.

**Parameters**

- [in] handle:

**Structures**

```c
struct esp_https_server_user_cb_arg
```

Callback data struct, contains the ESP-TLS connection handle.

```c
struct httpd_ssl_config
```

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

**Public Members**

```c
httpd_config_t httpd
```

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```c
const uint8_t *cacert_pem
```

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in `https_server` component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of `client_verify_cert_pem` var) 2)There should be another variable `servercert` which should hold servers own certificate (should inherit current role of cacert var)

```c
size_t cacert_len
```

CA certificate byte length

```c
const uint8_t *client_verify_cert_pem
```

Client verify authority certificate (CA used to sign clients, or client cert itself
size_t client_verify_cert_len
   Client verify authority cert len

const uint8_t *prvkey_pem
   Private key

size_t prvkey_len
   Private key byte length

httpd_ssl_transport_mode_t transport_mode
   Transport Mode (default secure)

uint16_t port_secure
   Port used when transport mode is secure (default 443)

uint16_t port_insecure
   Port used when transport mode is insecure (default 80)

bool session_tickets
   Enable tlts session tickets

esp_https_server_user_cb *user_cb
   User callback for esp_https_server

Macros
HTTPD_SSL_CONFIG_DEFAULT()
   Default config struct init

   (http_server default config had to be copied for customization)

   Notes:

   • port is set when starting the server, according to ‘transport_mode’
   • one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
   • SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
   • Stack size may need adjustments depending on the user application

Type Definitions
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
   Callback data struct, contains the ESP-TLS connection handle.

typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
   Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

   Parameters
   • user_cb: Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations
enum httpd_ssl_transport_mode_t
   Values:

   HTTPD_SSL_TRANSPORT_SECURE

   HTTPD_SSL_TRANSPORT_INSECURE

2.4.8 ICMP Echo
Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\n", str); // "foo"

    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));

    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
            recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));

    printf("%d packets transmitted, %d received, %d lost, round-trip = %d ms\n",
            transmitted, received, (transmitted-received), total_time_ms);
}
```

(continues on next page)
void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) res->ai_addr)->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_
    ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, _
    can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by
esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping
session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with
esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called
esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different
runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File
Chapter 2. API Reference

- components/lwip/include/apps/ping/ping_sock.h

**Functions**

```c
esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)
```

Create a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

**Parameters**

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

```c
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
```

Delete a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

**Parameters**

- `hdl`: handle of ping session

```c
esp_err_t esp_ping_start(esp_ping_handle_t hdl)
```

Start the ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

**Parameters**

- `hdl`: handle of ping session

```c
esp_err_t esp_ping_stop(esp_ping_handle_t hdl)
```

Stop the ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

**Parameters**

- `hdl`: handle of ping session

```c
esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)
```

Get runtime profile of ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**

- `hdl`: handle of ping session
- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

**Structures**

```c
struct esp_ping_callbacks_t
```

Type of “ping” callback functions.
Public Members

`void *cb_args`
arguments for callback functions

`void (*on_ping_success)(esp_ping_handle_t hdl, void *args)`
Invoked by internal ping thread when received ICMP echo reply packet.

`void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)`
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

`void (*on_ping_end)(esp_ping_handle_t hdl, void *args)`
Invoked by internal ping thread when a ping session is finished.

`struct esp_ping_config_t`
Type of “ping” configuration.

Public Members

`uint32_t count`
A “ping” session contains count procedures

`uint32_t interval_ms`
Milliseconds between each ping procedure

`uint32_t timeout_ms`
Timeout value (in milliseconds) of each ping procedure

`uint32_t data_size`
Size of the data next to ICMP packet header

`uint8_t tos`
Type of Service, a field specified in the IP header

`ip_addr_t target_addr`
Target IP address, either IPv4 or IPv6

`uint32_t task_stack_size`
Stack size of internal ping task

`uint32_t task_prio`
Priority of internal ping task

`uint32_t interface`
Netif index, interface=0 means NETIF_NO_INDEX

Macros

`ESP_PING_DEFAULT_CONFIG()`
Default ping configuration.

`ESP_PING_COUNT_INFINITE`
Set ping count to zero will ping target indefinitely

Type Definitions

`typedef void *esp_ping_handle_t`
Type of “ping” session handle.

Enumerations

`enum esp_ping_profile_t`
Profile of ping session.

`Values:`
Chapter 2. API Reference

ESP_PING_PROF_SEQNO
Sequence number of a ping procedure

ESP_PING_PROF_TTL
Time to live of a ping procedure

ESP_PING_PROF_REQUEST
Number of request packets sent out

ESP_PING_PROF_REPLY
Number of reply packets received

ESP_PING_PROF_IPADDR
IP address of replied target

ESP_PING_PROF_SIZE
Size of received packet

ESP_PING_PROF_TIMEGAP
Elapsed time between request and reply packet

ESP_PING_PROF_DURATION
Elapsed time of the whole ping session

2.4.9 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                   * ---------------------------------------> MSB */
                0x21,
                0xd5,
                0x3b,
                0x8d,
                0xbd,
                0x75,
                0x68,
                0x8a,
                0xb4,
                0x42,
                0xeb,
                0x31,
                0x4a,
                0x1e,
                0x98,
                0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOM_SEC0,
            .custom_handle = NULL,
            .pop = NULL,
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
};
```

(continues on next page)
/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

Similarly for HTTPS transport:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL,
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

You may set security for transport in ESP local control using following options:

1. `PROTOCOM_SEC1`: specifies that end to end encryption is used.
2. `PROTOCOM_SEC0`: specifies that data will be exchanged as a plain text.
3. `PROTOCOM_SEC_CUSTOM`: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

Creating a property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a type (e.g. enum), flags (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For
fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
  .name = "timestamp",
  .type = TYPE_TIMESTAMP,
  .size = sizeof(int32_t),
  .flags = READONLY,
  .ctx = func_get_time,
  .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a ctx field, which is set to point to some custom func_get_time(). This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of get_prop_values() handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props,
                                       esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value. */
            /* This is essential because the value has to be valid even after this function returns. */
            /* Alternative is to use dynamic allocation and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",props[i].name);
        }
    }
}
```

(continues on next page)
return ESP_ERR_INVALID_ARG; 
}  
else {  
ESP_LOGI(TAG, "Setting %s", props[i].name);  
/* For keeping it simple, lets only log the incoming data */  
ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,  
    prop_values[i].size, ESP_LOG_INFO);  
}  
return ESP_OK;  
}  

For complete example see protocols/esp_local_ctrl

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. **get_prop_count**: This should simply return the total number of properties supported by the service
2. **get_prop_values**: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. **set_prop_values**: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call get_prop_count and then get_prop_values, hence form an index to name mapping for all properties. Now when calling set_prop_values for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
Function for obtaining BLE transport mode.

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
Start local control service.

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] config: Pointer to configuration structure

esp_err_t esp_local_ctrl_stop (void)
Stop local control service.

esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that can be added is limited by configuration option max_properties

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] prop: Property description structure

esp_err_t esp_local_ctrl_remove_property (const char *name)
Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Return
• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Failure

Parameters
• [in] name: Name of the property to remove

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known

Return
• Pointer to property
• NULL if not found

Parameters
• [in] name: Name of the property to find

esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
Chapter 2. API Reference

- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

Unions

union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h>  Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop
Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:
- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.
Public Members

```c
void *data
```
Pointer to memory holding property value

```c
size_t size
```
Size of property value

```c
void (*free_fn)(void *data)
```
This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp_local_ctrl_handlers**
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

```c
esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```
Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes: InternalError

**Parameters**
- `[in] props_count`: Total elements in the `props` array
- `[in] props`: Array of properties, the current values for which have been requested by the client
- `[out] prop_values`: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by `props` argument
- `[in] usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```
Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes: InternalError

**Parameters**
- `[in] props_count`: Total elements in the `props` array
- `[in] props`: Array of properties, the values for which the client requests to change
- `[in] prop_values`: Array of property values, the elements of which need to be used for updating those properties specified by `props` argument
- `[in] usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
void *usr_ctx
```
Context pointer to be passed to above handler functions upon invocation. This is different from the
property level context, as this is valid throughout the lifetime of the \texttt{esp\_local\_ctrl} service, and freed only when the service is stopped.

```c
void (*\texttt{usr\_ctx\_free\_fn})(\texttt{void *}usr\_ctx)
```

Pointer to function which will be internally invoked on \texttt{usr\_ctx} for freeing the context resources when \texttt{esp\_local\_ctrl\_stop()} is called.

```c
struct esp\_local\_ctrl\_proto\_sec\_cfg
```

Protocom security configs

**Public Members**

```c
\texttt{esp\_local\_ctrl\_proto\_sec\_cfg}\_t version
```

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via \texttt{proto\_sec\_custom\_handle} below

```c
void *\texttt{custom\_handle}
```

Custom security handle if security is set custom via \texttt{proto\_sec} above This handle must follow proto comm\_security\_t signature

```c
void *\texttt{pop}
```

Proof of possession to be used for local control. Could be NULL.

```c
struct esp\_local\_ctrl\_config
```

Configuration structure to pass to \texttt{esp\_local\_ctrl\_start()}

**Public Members**

```c
const \texttt{esp\_local\_ctrl\_transport\_t} *\texttt{transport}
```

Transport layer over which service will be provided

```c
\texttt{esp\_local\_ctrl\_transport\_config\_t} transport\_config
```

Transport layer over which service will be provided

```c
\texttt{esp\_local\_ctrl\_proto\_sec\_cfg\_t} proto\_sec
```

Security version and POP

```c
\texttt{esp\_local\_ctrl\_handlers\_t} handlers
```

Register handlers for responding to get/set requests on properties

```c
size_t max\_properties
```

This limits the number of properties that are available at a time

**Macros**

```c
\texttt{ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE}
\texttt{ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD}
```

**Type Definitions**

```c
typedef struct \texttt{esp\_local\_ctrl\_prop} \texttt{esp\_local\_ctrl\_prop\_t}
```

Property description data structure, which is to be populated and passed to the \texttt{esp\_local\_ctrl\_add\_property()} function.

Once a property is added, its structure is available for read-only access inside \texttt{get\_prop\_values()} and \texttt{set\_prop\_values()} handlers.

```c
typedef struct \texttt{esp\_local\_ctrl\_prop\_val} \texttt{esp\_local\_ctrl\_prop\_val\_t}
```

Property value data structure. This gets passed to the \texttt{get\_prop\_values()} and \texttt{set\_prop\_values()} handlers for the purpose of retrieving or setting the present value of a property.

```c
typedef struct \texttt{esp\_local\_ctrl\_handlers} \texttt{esp\_local\_ctrl\_handlers\_t}
```

Handlers for receiving and responding to local control commands for getting and setting properties.
typedef struct esp_local_ctrl_transport **esp_local_ctrl_transport_t
Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config **esp_local_ctrl_transport_config_ble_t
Configuration for transport mode BLE.

This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config **esp_local_ctrl_transport_config_httpd_t
Configuration for transport mode HTTPD.

This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h.

typedef enum esp_local_ctrl_proto_sec **esp_local_ctrl_proto_sec_t
Security types for esp_local_control.

typedef struct esp_local_ctrl_proto_sec_cfg **esp_local_ctrl_proto_sec_cfg_t
Protocom security configs

typedef struct esp_local_ctrl_config **esp_local_ctrl_config_t
Configuration structure to pass to esp_local_ctrl_start()

Enumerations
enum esp_local_ctrl_proto_sec
Security types for esp_local_control.
Values:
    PROTOCOM_SEC0 = 0
    PROTOCOM_SEC1
    PROTOCOM_SEC_CUSTOM

2.4.10 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

mDNS Properties

- hostname: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32 will resolve to my-esp32.local
- default_instance: friendly name for your device, like Jhon’s ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
    }
}
```
mDNS Services  
mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- **instance_name**: friendly name for your service, like Jhon's EESP32 Web Server. If not defined, default_instance will be used.
